   a. Select Administration from the NFA console menu.
      The Administration page opens.
   b. Select System: Enable Interfaces in the Administration menu.
      The Available Interfaces page opens.
3. Expand the router details to display the interface list: Click the arrow to the left of the router name.
4. Review the list to review whether the interfaces are enabled.
5. Change the interface status: Select the check box next to one or more interfaces, then click Enable or Disable.
   The selected interfaces are immediately enabled or disabled.
6. Repeat these steps for each router.

Verify That the Interfaces Are Visible in the NFA Console

Make sure that the configured interfaces are visible in the NFA console.

1. Verify that interfaces are visible on the Enterprise Overview page:
   a. Log in to the NFA console.
   b. Click Enterprise Overview in the main menu.
   c. Make sure the report views show interfaces.
2. Verify that interfaces are visible in the Interface Index:
   a. Click Interfaces in the NFA console menu.
      The Interface Index opens.
   b. Make sure that the Interface Index includes the interfaces that you expect to see.
      You can locate interfaces by expanding router details to view interfaces. Alternatively, you can use the Search box to find routers or interfaces by entering all or part of a name or description.
3. If interfaces are not visible, perform the following preliminary troubleshooting tasks:
   – Verify that the CA Network Flow Analysis services are running on the NFA console server.
   – Review the logs. View the logs in the NFA console or open the logs from the <install_path>\reporter\Logs directory.

Network Flow Analysis Views in NetOps Portal

You can view Network Flow Analysis data in NetOps Portal in the following ways:

Built-in CAPC Dashboards with Enterprise-Wide Data

- **Infrastructure Overview dashboard**:
  – Interfaces Over Threshold
  – Routers with the Most Flow Traffic
  – Top Enterprise Hosts by Volume
  – Top Enterprise Protocols by Volume
  – Top Flows by Interface
  – Top IP Interface Utilization (Flow)
- **Management: Management Overview dashboard**:

  - Top Flows by Interface
  - Top IP Interface Utilization (Flow)
- **Management: Network Overview dashboard**:
  - Top Enterprise Hosts by Volume
  - Top Enterprise Protocols by Volume
- **Capacity Planning: Router/Switch Capacity Watch Lists dashboard**:
  - Routers with the Most Flow Traffic

Custom CAPC Dashboard Views with Interface-Specific Data

Display interface-specific CA Network Flow Analysis data by adding the following views with an interface context type:

- Calendar Heat Chart (Flow)
- Stacked Protocol Trend
- Stacked ToS Trend
- Top Conversations (Bar)
- Top Conversations (Pie)
- Top Conversations (Table)
- Top Hosts (Bar)
- Top Hosts (Pie)
- Top Hosts (Table)
- Top Protocols (Bar)
- Top Protocols (Pie)
- Top Protocols (Table)
- ToS Summary (Pie)
- ToS Summary (Table)

For more information about customizing and adding views to a dashboard, see Manage Dashboards.

Built-In CAPC Interface Page Views with CA Network Flow Analysis Data

- **IP Performance tab**:
  - Stacked Protocol Trend
  - Top Conversations (Pie)
  - Top Hosts (Pie)
  - ToS Summary (Pie)
- **CBQoS tab**:
  - Stacked Protocol Trend
  - Stacked ToS Trend

Enterprise-Level Views

You can view enterprise-wide data from CA Network Flow Analysis in several NetOps Portal dashboard views, which are described in the following topics.

- Interfaces Over Threshold
- Routers with the Most Flow Traffic
- Top Enterprise Hosts by Volume
- Top Enterprise Protocols by Volume
- Top Flows by Volume
- Top IP Interface Utilization

The top interfaces, hosts, protocols, or ToS have the highest traffic volume during the reporting period.

Interfaces Over Threshold

The Interfaces Over Threshold view lists the most heavily used interfaces throughout the enterprise. A table summary shows the interfaces with utilization that exceeds the configured thresholds.

The Interfaces Over Threshold view shows the interfaces whose traffic exceeded the configured thresholds during the reporting period. The view includes the following information for up to ten top interfaces:

- **Status**
  Identifies the interface status as Critical (Red - Meets or exceeds the user-defined Critical threshold) or Warning (Orange - Meets or exceeds the user-defined Warning threshold).
- **Interface Name**
  Identifies the interface by its name. (Depending on the application setting for the name format, the name may be prefixed by the device name.)
- **Traffic Direction**
  Shows whether the data was inbound or outbound on the interface.
- **Speed**
  (CAPC) Records the data speed that is defined for the interface.
- **Average Utilization**
  Measures the average percentage of interface capacity that was used.
- **Percent Time Critical**
  Shows the percentage of the reporting period that the interface met or exceeded the Critical threshold.
- **Percent Time Warning**
  Shows the percentage of the reporting period that the interface met or exceeded the Warning threshold.

NetOps Portal views show the data from the time range that is defined for the page.

Contents

Opening the View

To see this view, go to one of the following locations:

- (CAPC) Infrastructure Overview dashboard; Summary context view in a custom dashboard
- (NPC) Enterprise, Traffic Analysis, Routers/Switches Overview, or custom dashboard

Available Actions

You can perform several actions in this view:

- Change the thresholds, view name, and utilization settings as described in this topic.
- (CAPC) Change the columns that are shown in the table: click near a column border, click Columns, then choose the columns to display.
- Click an interface name to open the Interface context pages. You can review details or open additional views of interface data.

Change the View Settings

Follow these steps:

1. Open the dialog for editing the view:

- (CAPC) Click the Edit icon in the view title bar, and then click Edit.
- (NPC) Click the arrow next to the title name, and select Edit from the menu.

The dialog opens.

2. (Optional) Edit the text in the Title field to change the name in the view title bar.
3. (Optional) Edit the thresholds by changing any of the following values in the Interfaces Over Threshold Settings section:
   - **Critical - % Utilization**: Specify the utilization percentage for flagging interfaces with a status of Critical, the highest level of concern. If the utilization for an interface has met or exceeded this percentage, it is marked with a red (Critical) status symbol.
   - **Warning - % Utilization**: Specify the utilization percentage for flagging interfaces with a status of Warning. If the utilization for an interface has met or exceeded this percentage, but has not met the Critical threshold, the interface is marked with an orange (Warning) status symbol.
   - **Affected % of reporting period**: Specify the percentage of the reporting period that a utilization percentage must be violated in order for the threshold to be met.
     For example, if the 'Affected % of reporting period' value is 25, the threshold is met for the interfaces that have a utilization level at or above the threshold level during 25% of the reporting period. With the default reporting period of 24 hours, the list includes interfaces at or above the threshold value for six hours or more during the previous 24 hours.
4. (Optional) (NPC) Define a new context to filter the interfaces that can appear in the view: select the Filter by value, and select a context type and setting in the Select Context dialog.
   Interfaces that are not in the selected group do not appear in the view, even if they violate a threshold. If you select a group, the defined context appears under the view title.
5. Select the scope of your changes from the **Apply Changes** drop-down.
6. Click **Save** to save your changes.

Find the Comparable View in the Network Flow Analysis (NFA) Console

The Interfaces Over Threshold view is similar to the Interface Utilization view on the Enterprise Overview page in the NFA console.

Routers with the Most Flow Traffic

The Routers with the Most Flow Traffic view displays the routers in your network that have the highest traffic. Traffic use is measured for both inbound and outbound traffic during the reporting period, as reported by CA Network Flow Analysis.

The view includes the following information for a maximum of 10 routers:

- **Name**
  Consists of the router's IP address and device name (Y-Axis). If an administrator defined an alias for the device item, the alias is displayed. Otherwise, the discovered device name is displayed.
- **Volume**
  Measures the total amount of traffic for the router expressed in megabytes, for example (X-Axis).

NetOps Portal views show the data from the time range that is defined for the page.

Opening the View

To see this view, go to the following location:

- Infrastructure Overview and Router/Switch Capacity Watch Lists dashboards; Summary-type view in a custom dashboard

Available Actions

You can perform several actions in this view:

- Change the view name by editing the view settings.
- Display details in a tooltip by hovering over a bar.
- Click a router bar to view details in the NetOps Portal Router pages.

Top Enterprise Hosts by Volume

The Top Enterprise Hosts by Volume view shows the enterprise hosts that have the highest traffic volume, as reported by CA Network Flow Analysis.

The view shows a bar for each of a maximum of 10 hosts that have the highest traffic volume. The bar chart includes the following information:

- **Host**
  Identifies the host server by its name and IP address (Y-Axis). If an administrator has defined an alias for the device, the alias is displayed. Otherwise, the discovered device name is displayed.
- **Volume**
  Measures the total amount of data sent to or from the host, expressed in a scale that is appropriate for the highest-volume host (X-Axis).

Data appears from the time range that is defined for the page.

Opening the View

To see this view, go to one of the following locations:

- (CAPC) Infrastructure Overview, Network Overview, or Summary context custom dashboard

Available Actions

You can perform several actions in this view:

- Change the view name by editing the view settings.
- Display details in a tooltip by hovering over a bar.
- Click a name or bar to open the related views in the NFA console.

Find the Comparable View in the NFA Console

The Top Enterprise Hosts by Volume view is similar to the Top Hosts view on the Enterprise Overview page in the NFA console.

Top Enterprise Protocols by Volume

The **Top Enterprise Protocols by Volume** view shows the protocols with the highest volume of network traffic across the enterprise.

The view includes the following information for a maximum of ten protocols that are associated with the highest traffic during the reporting period:

- **Protocol**
  Identifies the protocol by its keyword (Y-axis).
- **Volume**

Measures the total amount of data associated with the protocol expressed in a scale that is appropriate for the highest-volume protocol (X-axis).

Data appears from the time range that is defined for the page.

Opening the View

To see this view, go to one of the following locations:

- (CA PC) Infrastructure Overview or Network Overview dashboard; Summary context view in a custom dashboard
- (NPC) Enterprise, Traffic Analysis, Network Overview, and custom dashboards

Available Actions

You can perform several actions in this view:

- Change the view name in the view settings.
- Display details in a Tooltip by holding your cursor over a bar.
- Click a name or bar to open related views in the NFA console.

Find the Comparable View in the NFA Console

The Top Enterprise Protocols by Volume view is similar to the Top Protocols view on the Enterprise Overview page in the NFA console.

Top Flows by Volume

The Top Flows by Volume views show the interfaces across the enterprise that have the highest volume of inbound or outbound traffic.

The view shows the following information for a maximum of 10 top interfaces:

- **Name**
  Identifies the interface by its device name (such as its router name), followed by a colon (:) and the interface name (Y-Axis).
- **Volume**
  Measures the volume of flow data on the interface (X-Axis) expressed in a scale that is appropriate for the highest-volume interface.

NetOps Portal views show the data from the time range that is defined for the page.

Opening the View

To see this view, go to one of the following locations:

- (CAPC) Infrastructure Overview and Management Overview dashboards; Summary context view in a custom dashboard
- (NPC) Custom dashboard

Available Actions

You can perform several actions in this view, including the following ones:

- Change the data direction or the view name by editing the view settings.
- Display details in a tooltip by hovering over a bar. The tooltip identifies the interface position among the top 10, with Interface 0 as the one with the highest traffic volume.
- Click a name or bar to open related information on the interface context pages.

Find Flow Volume Data in the Network Flow Analysis (NFA) Console

To see the flow volume of multiple top interfaces in the NFA console, create and run a Custom report. For example, you can view flow volume for the top interfaces in summary pie charts, summary tables, trend charts, and stacked trend charts. For instructions, see the topic "Set Up Custom Reports" in the *CA Network Flow Analysis Operator Guide.*

To see the flow volume of a single top interface in the NFA console, drill into details from the Enterprise Overview page:

1. Click an interface name or bar in one of the Top Interfaces views on the NFA console Enterprise Overview page.
2. Select Flows from the list labeled "For this interface, show me" on the Interface page that opens.
3. Click the gray bar on the left side of the page to change the presentation mode.
4. Click Volume in the Presentation menu that opens.
   The Flows views display a trend chart of inbound flow volume and outbound flow volume.
   To jump to the NetOps Portal Interface Pages data for the selected interface, click the arrow next to the Flows title, and select CAPC/NPC Interface Performance.

Top IP Interface Utilization

The Top IP Interface Utilization (Flow) views show the high-utilization interfaces from across the enterprise.

The view includes the following information for a maximum of 10 top interfaces during the reporting period:

- **Name**
  Identifies the interface by its device name/interface name (Y-Axis).
- **Percent (Utilization)**
  Measures the percentage of interface capacity that was used (X-Axis). The view shows the utilization of either inbound or outbound capacity.

NetOps Portal views show the data from the time range that is defined for the page.

Opening the View

To see this view, go to one of the following locations:

- (CAPC) Infrastructure Overview and Management Overview dashboards; Summary-type view in a custom dashboard
- (NPC) Traffic Analysis and custom dashboards

Available Actions

You can perform several actions in this view:

- Change the data direction, view name, and context (the interfaces that are used) by editing the view settings.
- (NPC) Change the utilization thresholds.
- Display details in a tooltip by holding your cursor over a bar.
- Click a name or bar to open related information on the Interface context pages.

Find the Comparable View in the Network Flow Analysis (NFA) Console

The Top IP Interface Utilization (Flows) view is similar to the Interface Utilization view on the Enterprise Overview page in the NFA console.

Interface Stacked Trend View

The Stacked Trend views show the top protocol or Type of Service (ToS) values that DX NetOps Performance Management uses for traffic on the currently selected interface. The following Stacked Trend views are available:

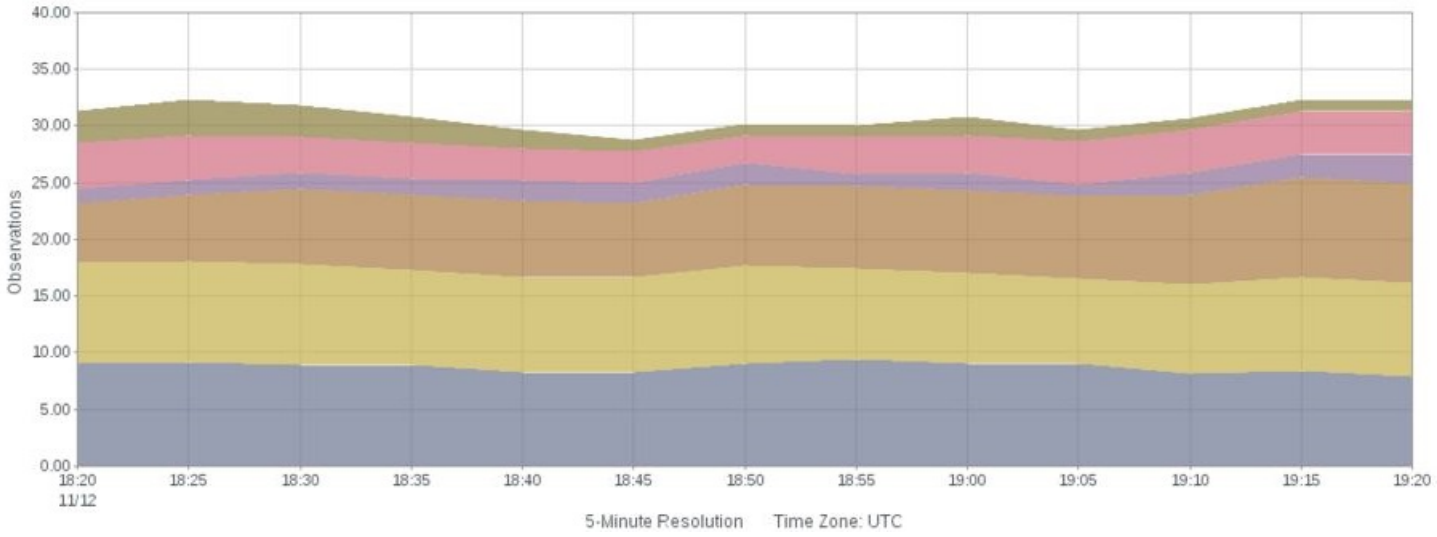
- Stacked Protocol Trend
- Stacked ToS Trend

Stacked ToS Trend

The Stacked Typy of Service (ToS) Trend views show the interface traffic for the top ToS, including the time that the traffic occurred. A timeline of rates is included for each ToS value. You can configure the view to display rate, utilization, or volume information.

The stacked chart shows the value of rate, utilization, and volume as stacked lines. The value of the first metric is measured from the X axis. The value of each of the other metrics is measured from the top of the stacked line to the previous metric. For example, if the top of the first trend line indicates 10, and the second line indicates 25, the value of the second metric is 15.

The following chart shows an example of a stacked trend chart. At 18:55, the value of the metric that is represented by the blue color is approximately ten. At the same time, the value of the metric that is represented by the yellow color is approximately seven. The value of the metric in yellow is calculated by subtracting the value at the bottom of the yellow trend line from the value at the top.



The view includes the following information:

- **Identifier**
  Identifies the interface that is used for the report. The identifier string consists of the router name, interface name, and interface description (under the view title).
  (NPC) The identifier line also includes the interface speed.
- **ToS Bands**
  Show the data rate, data volume, or interface capacity utilization for each top ToS that is associated with traffic on the interface.
- **Time**
  Point in time during data transmission, expressed in hours and minutes (X-Axis).
- **Measurement Setting:**

  - **Rate:** Data transfer rate at each point in time, expressed in kilobits per second or a rate that is appropriate for the highest-volume ToS (Y-Axis). The rate is calculated by dividing the data volume by the elapsed transmission time.
  - **Bytes** (Volume): Data volume at each point in time, expressed in a scale that is appropriate for the highest-volume ToS (Y-Axis).
  - **Percent** (Utilization): Percentage of the total interface capacity that the ToS traffic uses (Y-Axis). The utilization percentage is calculated by dividing the data rate by the data speed.

Depending on the data direction, the view shows inbound, outbound, or total data on the interface:

- **Legend**
  Identifies the ToS for each color band by ToS number and label (bottom of the view).

NetOps Portal views show the data from the time range that is defined for the page.

In this article:

Open the View

To see this view in console, go to one of the following locations:

- (CAPC) Custom dashboard; Interface Pages (with an interface selected): CBQoS tab
- (NPC) Interface Pages (with an interface selected): Interface QoS and custom tabs

> **NOTE**
> You can add Multi-Interface Stacked ToS Trend views to a custom dashboard or to a custom tab in the Interface pages of the console. This view consists of a group of interface-specific stacked ToS trend charts.

Available Actions

You can perform several actions in this view, including:

- Change the traffic direction (In, Out, or Total), the type of measurement (Rate, Volume, or Utilization), and the view name by editing the view settings. If the view is on a custom interface context dashboard in the console, you can change the interface.
- (CAPC) Zoom in to narrow the time frame.
- (CAPC) Display only the data for a single ToS: Right-click a ToS in the legend at the bottom of the view, and then click Focus. This menu is available for a view that has multiple ToS values. (This option is active when the view contains multiple ToS values.)
- (CAPC) Hide data for one of multiple ToS values: Right-click a ToS in the legend at the bottom of the view, and then click Hide.
- (CAPC) Position your cursor over legend items to display explanatory Tooltips.
- Jump to details on an NFA console Interface page by double-clicking a ToS value in the legend.

Find ToS Trend Data in the NFA Console

You can display ToS volume in trend charts or stacked trend charts in the NFA console for a selected interface:

- **Overview**
  - **Report type:** Overview
  - **Presentation menu options:** Mixed Chart or Mixed Trend; Volume.
  - **Views:** Stacked ToS Trend (In and Out) for the Top N ToS, plus other overview views.
- **Top N ToS, Stacked Trends**

  - **Report type:** ToS
  - **Filter:** Top N ToS
  - **Presentation menu options:** Stacked Trend Chart; Volume.
  - **Views:** Stacked Trend for the Top N ToS (In, Out, and Total).
- **Top N ToS, Trends**
  - **Report type:** ToS
  - **Filter:** Top N ToS
  - **Presentation menu options:** Trend Chart; Volume
  - **Views:** Trend (In, Out, and Total) for each of the Top N ToS
- **Single ToS, Stacked Trends/Trends**
  - **Report type:** ToS
  - **Filter:** Single ToS value
  - **Presentation menu options:** Mixed Trend; Volume
  - **Views:** Trend (In and Out with baselines), Stacked ToS Trend (In and Out).
- **Single ToS, Trends**
  - **Report type:** ToS
  - **Filter:** Single ToS value. Presentation menu options: Mixed Chart; Volume.
  - **Views:** Stacked ToS Trend (In and Out).
- **Conversation**
  - **Report type:** Conversations
  - **Filter:** Single conversation source and destination.
  - **Report subtype:** Protocols
  - **Presentation menu options:** Volume.
  - **Views:** Conversation Trend (maximum of seven views for different timespans).

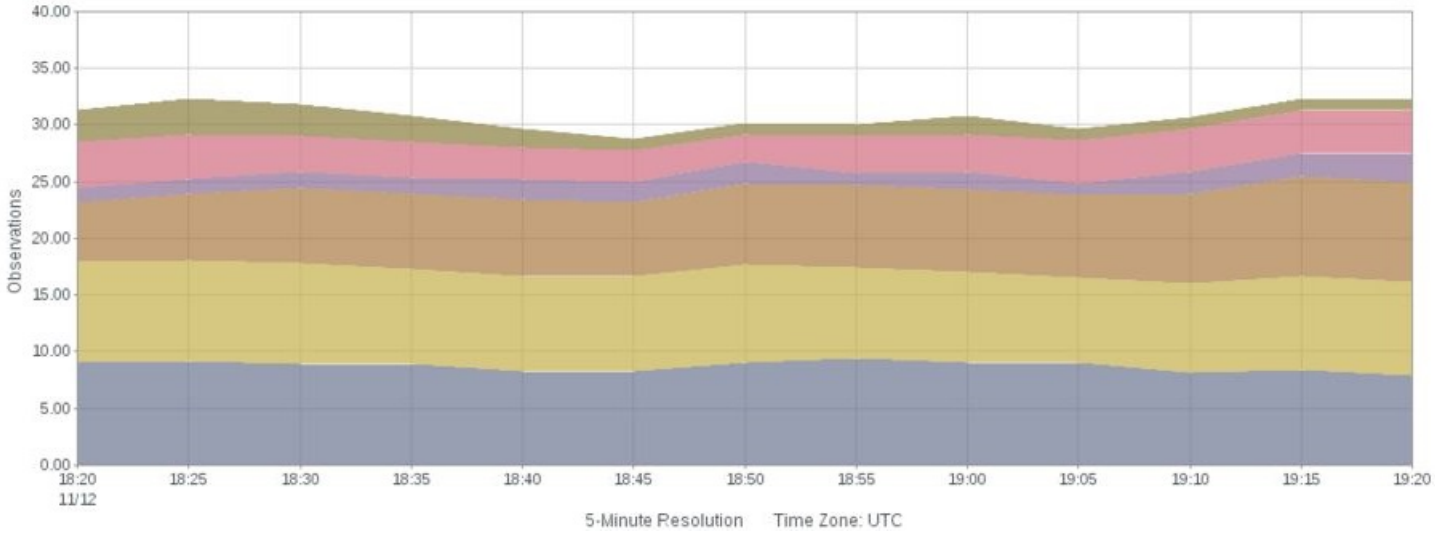
To display Flow Forensics-level detail, click the Flow Forensics link and run a Flow Forensics report.

Stacked Protocol Trend

The Stacked Protocol Trend views show the protocols that are used the most heavily for traffic on the selected interface. The views also show when the traffic occurred. A timeline of rates is included for each listed ToS value. You can configure the view to display rate, utilization, or volume information.

The stacked chart shows the value of rate, utilization, and volume as stacked lines. The value of the first metric is measured from the X axis. The value of each of the other metrics is measured from the top of the stacked line to the previous metric. For example, if the top of the first trend line indicates 10, and the second line indicates 25, the value of the second metric is 15.

The following chart shows an example of a stacked trend chart. At 18:55, the value of the metric that is represented by the blue color is approximately ten. At the same time, the value of the metric that is represented by the yellow color is approximately seven. The value of the metric in yellow is calculated by subtracting the value at the bottom of the yellow trend line from the value at the top.



The views include the following information:

- **Identifier**
  Identifies the interface that is used for the report. The identifier string consists of the router name, interface name, and interface description (under the view title).
  (NPC) The identifier line also includes the interface speed.
- **Protocol Bands**
  Show the data rate, the data volume, or the interface capacity utilization for each top protocol that is associated with traffic on the interface.
- **Time (All Views)**
  Point in time during data transmission--expressed in hours and minutes (X-Axis).
- **Measurement Setting:**
  - **Rate:** Data rate at each point in time. For example, the rate can be expressed in kilobits per second (Y-Axis). The rate is calculated by dividing the data volume by the elapsed transmission time.
  - **Bytes** (Volume): Data volume at each point in time. For example, the volume can be expressed in kilobytes, (Y-Axis).
  - **Percent** (Utilization): Percentage of the total interface capacity that the protocol uses (Y-Axis). The utilization percentage is calculated by dividing the data rate by the data speed.

Depending on the data direction, the view shows inbound, outbound, or total data on the interface.

- **Legend**
  Identifies the protocol for each color band by protocol keyword and tcp/udp port (bottom of the view).

NetOps Portal views show the data from the time range that is defined for the page.

Contents

Opening the Views

To see these views in the console, go to one of the following locations:

- (CAPC) Interface Pages (with an interface selected): Custom dashboard, IP Performance, and CBQoS tabs
- (NPC) Interface Pages (with an interface selected): Interface Capacity, Interface QoS, and custom tabs

> **NOTE**
> You can add Multi-Interface Stacked Protocol Trend views to a custom dashboard or to a custom tab in the Interface pages in the console. This view consists of a group of interface-specific stacked protocol trend charts

Available Actions

You can perform several actions in this view, including the following ones:

- Change the traffic direction, the type of measurement (Rate, Volume, or Utilization), and the view name by editing the view settings. If the view is on a custom interface context dashboard in the console, you can change the interface.
- (CAPC) Zoom in to narrow the time frame.
- (CAPC) Display only the data for a single protocol: Right-click a protocol in the legend at the bottom of the view, and click Focus. This menu is available for a view that has multiple protocols. (This option is active when the legend contains multiple protocols.)
- (CAPC) Hide data for one of multiple protocols: Right-click a protocol in the legend at the bottom of the view and, click Hide.
- (CAPC) Position your cursor over legend items to display explanatory Tooltips.
- Jump to details on an NFA console Interface page by double-clicking a protocol in the legend.
- (NPC) Jump to details on the corresponding Interface page by double-clicking a protocol band in the view. To select a destination tab on the Interface page, right-click the protocol band and select a tab from the menu.

Find Protocol Trend Data in the NFA Console

You can display protocol volume in the NFA console in trend charts or stacked trend charts for a selected interface:

- **Overview**
  - Report type: Overview
  - Presentation menu options: Mixed Chart; Volume
  - Views: Stacked Protocol Trend (In and Out) for the Top N Protocols, plus other overview views.
- **Top N Protocols, Stacked Trends**
  - Report type: Protocols.
  - Filter: Top N Protocols.
  - Presentation menu options: Stacked Trend Chart; Volume.
  - Views: Stacked Trend for the Top N Protocols (In, Out, and Total).
- **Top N Protocols, Trends**
  - Report type: Protocols. Filter: Top N ToS. Presentation menu options: Trend Chart; Volume. Views: Trend (In, Out, and Total) for each of the Top N Protocols.
- **Single Protocol**
  - Report type: Protocols.
  - Filter: Single protocol.
  - Views: (Depending on the selected report subtype): trends, stacked trends, trend summaries, and multi-trend summaries for protocols, protocol hosts, and protocols in conversations.

To display Flow Forensics-level detail, click the Flow Forensics link, and run a Flow Forensics report.

Interface ToS Summaries

The ToS Summary views show the Type of Service (ToS) values for traffic on the selected interface. The views are described in the following topics:

ToS Summary (Pie)

The ToS Summary (Pie) view shows an overview of the Type of Service (ToS) values for traffic on the selected interface.

The view includes a pie chart and table of information about the high-volume ToS values in use on the selected interface. The table includes the following information by default:

- **Identifier**
  Identifies the interface that is used for the report. The identifier string consists of the router name, interface name, and interface description (under the view title).
  (NPC) The identifier line also includes the interface speed.
- **Type of Service**
  Name of the ToS values associated with high-volume traffic, identified by number and label.
- **Total**
  Shows the total data volume for the reporting period.
- **Percent**
  (CAPC) Lists the percentage of the total data volume for the Top N ToS.

NetOps Portal views show the data from the time range that is defined for the page.

Opening the Views

To see these views in the NetOps Portal Console, go to one of the following locations:

- (CAPC) Interface Pages (with an interface selected): IP Performance tab; Custom dashboard
- (NPC) Interface Pages (with an interface selected): Custom tab

Available Actions

You can perform several actions in this view, including the following ones:

- Change the traffic direction and view name by editing the view settings. If the view is on a custom interface context dashboard in the console, you can change the interface.
- (CAPC) Change the type of measurement.
- Jump to details on an NFA console Interface page by double-clicking a ToS name.

Find ToS Summary Pie Charts in the NFA Console

You can display pie charts of ToS summary data in the NFA console for a selected interface:

- **Overview**
  - **Report type:** Overview
  - **Presentation menu option:** Pie Chart
  - **View:** ToS Summary (In and Out) for the Top N ToS
- **Top N ToS Summary**
  - **Report type:** ToS
  - **Filter:** Top N ToS
  - **Presentation menu option:** Pie Chart
  - **View:** ToS Summary (In, Out, and Total) for the Top N ToS
- **Single ToS Summaries**
  - **Report type:** ToS
  - **Filter:** Single ToS
  - **Report subtype:** Overview
  - **Presentation menu option:** Pie Chart
  - **Views:** ToS Protocol Summary (In and Out) for the single ToS; ToS Hosts Summary (From and To) for the single ToS; ToS Conversations Summary (Total) for the single ToS.

    NOTE
    You can view additional versions of the summary pie charts by selecting Protocols, Hosts, or Conversations as the report subtype.

To display Flow Forensics-level detail, click the Flow Forensics link and run a Flow Forensics report.

ToS Summary (Table)

The ToS Summary (Table) views show rate, volume, or utilization for the top ToS values of the traffic on a particular interface. You can use this information to compare traffic for each of the top ToS values.

The example graphic shows the view in the console. The table shows the rate for each listed ToS value. You can configure the view to display rate, utilization, or volume information.

An interface identification string is shown under the view title. The table contains a row for each ToS with the Type of Service identifier (EF/AF, DSCP, and ToS values) and the following rate, volume, or utilization information:

- **Rate:**
  - (CAPC/NPC) Average rate of total, inbound, and outbound data for each ToS (Average Total. Average Out, and Average In)
  - (CAPC) Maximum rate of data that is outbound or inbound on the interface for each ToS (Maximum Out and Maximum In)

  The rate is calculated by dividing the data volume by the elapsed transmission time.
- **Volume:** Volume of outbound, inbound, and all data for each ToS (Out, In, and Total), expressed in a scale that is appropriate for the highest-volume ToS.
- Utilization:
  - (CA PC/NPC) Average utilization of total, outbound, and inbound data that each ToS consumes (Average Total. Average In, and Average Out)
  - (CAPC) Maximum percentage of interface capacity that the outbound or inbound utilizes for each ToS (Maximum Out and Maximum In)

  The utilization percentage is calculated by dividing the data rate by the data speed.

NetOps Portal views show the data from the time range that is defined for the page.

Opening the View

To see this view in the console, go to one of the following locations:

- (CA PC) Custom dashboard
- (NPC) Interface Pages (with an interface selected): Interface QoS or custom tab

Available Actions

You can perform several actions in this view:

- Change the type of measurement (Rate, Volume, or Utilization) and the view name by editing the view settings.
- (CAPC) Change the interface.
- Re-sort the table data by clicking a column heading. Click again to toggle between descending and ascending order.
- Change the Max Per Page value to show more or fewer items on each table page.
- (CAPC) Change the columns that are shown in the table: Click near a column border, click Columns, and then choose the columns to display.
- Click a Type of Service link to display more information about the ToS on Interface report pages in the NFA console.

Find ToS Summary Tables in the NFA Console

You can display ToS summary tables in the NFA console for a selected interface:

- **Top N ToS Summary**

  - **Report type:** ToS.
  - **Filter:** Top N ToS.
  - **Presentation menu options:** Summary Table; Volume.
  - **View:** ToS Summary Table for the Top N ToS.
- **Protocol Summary for a Single ToS**
  - **Report type:** ToS.
  - **Filter:** Single ToS.
  - **Report subtype:** Protocols.
  - **Subtype filter:** Top N Protocols.
  - **Presentation menu options:** Summary Table; Volume.
  - **Views:** ToS Protocol Summary Table for the single ToS.
- **Host Summary for a Single ToS**
  - **Report type:** ToS.
  - **Filter:** Single ToS.
  - **Report subtype:** Hosts.
  - **Subtype filter:** Top N Hosts.
  - **Presentation menu options:** Summary Table; Volume.
  - **Views:** ToS Hosts Summary Table for the single ToS.
- **Conversation Summary for a Single ToS**
  - **Report type:** ToS.
  - **Filter:** Single ToS.
  - **Report subtype:** Conversations.
  - **Subtype filter:** Top N Conversations.
  - **Presentation menu options:** Summary Table; Volume.
  - **Views:** ToS Conversations Summary Table for the single ToS.

To display Flow Forensics-level detail, click the Flow Forensics link and run a Flow Forensics report.

Interface Top Conversations

The following Top Conversations views show the conversations that generate the highest traffic on the currently selected interface:

Top Conversations (Bar)

The Top Conversations (Bar) views show the conversations that have the highest traffic on the selected interface. A bar graph shows the volume for each conversation.

For example, use conversation information to determine the IP addresses of high-volume hosts. Contact the host owners or users to investigate the nature and purpose of the traffic.

You can view the conversations for incoming data, outgoing data, or all data.

The view includes a bar for each top conversation on the selected interface. A maximum of 10 conversations are shown. The view includes the following information:

- **Identifier**
  Identifies the interface that is used for the report. The identifier string consists of the router name, interface name, and interface description (under the view title).
  (NPC) The identifier line also includes the interface speed.
- **Conversation Pair**

Identifies the conversation source and destination servers by their names (the fully qualified DNS names, if they are available), followed by the IP addresses (Y-Axis).

- **Volume**
  Measures the total amount of data that was exchanged in the conversation expressed in a scale that is appropriate for the highest-volume conversation (X-Axis).

NetOps Portal views show the data from the time range that is defined for the page.

Opening the View

To see this view in the NetOps Portal Console, go to one of the following locations:

- (CAPC) Custom dashboard
- (NPC) Interface Pages (with an interface selected): Interface Capacity or custom tab

Available Actions

You can perform several actions in this view:

- Change the view name by editing the view settings.
- (CAPC) Change the traffic direction and the interface.
- Display details in a Tooltip by holding your cursor over a bar.
- Jump to conversation details on an NFA console Interface report page by clicking a bar or name.

Find Conversation Data in the NFA Console

You can view conversation volume trend charts in the NFA console for any interface that you have selected:

- **Overview Multi-Trend**
  - **Report type:** Overview.
  - **Presentation menu options:** Mixed Trend; Volume.
  - **View:** Conversations Multi Trend Summary (Total) for the Top N Conversations, plus other views.
- **Top N Conversations Trend**
  - **Report type:** Conversations.
  - **Filter:** Top N Conversations.
  - **Presentation menu options:** Trend Chart; Volume.
  - **View:** Conversations Trend for the Top N Conversations.
- **Conversations for a Single Protocol**
  - **Report type:** Protocols.
  - **Filter:** Single protocol.
  - **Report subtype:** Conversations.
  - **Conversation Filter:** Top N Conversations.
  - **Presentation menu option:** Trend Chart.
  - **View:** Protocol Conversations Summary (Total) for a single protocol.
- **Conversations for a Single ToS**
  - **Report type:** ToS.
  - **Filter:** Single ToS.
  - **Report subtype:** Conversations.
  - **Conversation Filter:** Top N Conversations.
  - **Presentation menu options:** Trend Chart; Volume.
  - **View:** ToS Trend view for each conversation that uses the single ToS.

NOTE
To see trend charts for a single conversation, click Top N Conversations and select a single conversation as the filter.

To display Flow Forensics-level detail, click the Flow Forensics link and run a Flow Forensics report.

Top Conversations (Pie)

The Top Conversations (Pie) view includes a pie chart of the conversations that account for the most traffic on the selected interface.

The view includes a pie chart and a table of information about the high-volume conversations on the selected interface. A text string near the top of the view identifies the interface whose data is displayed. The table includes the following information by default:

- **Identifier**
  Identifies the interface that is used for the report. The identifier string consists of the router name, interface name, and interface description (under the view title).
  (NPC) The identifier line also includes the interface speed.
- **Source - Destination Name**
  Identifies the host servers that initiated and received the conversation data by their fully qualified DNS names (if available) and IP addresses.
- **Total**
  Shows the total amount of data in the conversation expressed in a scale that is appropriate for the conversation with the highest volume.
- **Percent**
  (CAPC) Records how much the conversation consumes out of the total traffic that is displayed.

NetOps Portal views show the data from the time range that is defined for the page.

Opening the Views

To see these views in the NetOps Portal Console, go to one of the following locations:

- (CAPC) Custom dashboard; Interface Pages (with an interface selected): IP Performance tab
- (NPC) Interface Pages (with an interface selected): Interface QoS or custom tab

Available Actions

You can perform several actions in this view, including the following ones:

- Change the view name by editing the view settings.
- (CAPC) Change the traffic direction and the type of measurement. If the view is on a custom interface context dashboard in the CA NetOps Portal Console, you can change the interface.
- (CAPC) Change the columns that are shown in the table: Click near a column border, click Columns, and then choose the columns to display.
- Jump to details on an NFA console Interface page by clicking a link.

Find Conversation Pie Charts in the NFA Console

You can display conversation pie charts in the NFA console for any interface that you have selected:

- **Overview**

  - **Report type:** Overview
  - **Presentation menu option:** Pie Chart
  - **View:** Conversations Summary (Total) for the Top N Conversations, plus other overview views
- **Top N Conversations**
  - **Report type:** Conversations
  - **Filter:** Top N Conversations
  - **Presentation menu option:** Pie Chart.
  - **View:** Conversations Summary (Total) for the Top N Conversations
- **Conversations for a Single Protocol**
  - **Report type:** Protocols
  - **Filter:** Single protocol
  - **Report subtype:** Conversations or Overview
  - **Conversations Filter:** Top N Conversations. Presentation menu option: Pie Chart or Mixed Chart
  - **View:** Protocol Conversations Summary (Total) for a single protocol.
- **Conversations for a Single ToS**
- **Report type:** ToS
- **Filter:** Single ToS
- **Report subtype:** Conversations
- **Conversation Filter:** Top N Conversations
- **Presentation menu option:** Pie Chart
- **View:** ToS Conversations Summary (Total) for a single ToS

To display Flow Forensics-level detail, click the Flow Forensics link and run a Flow Forensics report.

Top Conversations (Table)

The Top Conversations (Table) views show data for the top highest volume conversations on a particular interface. The maximum number of top conversations that are shown is 10. You can configure the view to show rate, utilization, or volume information.

The table contains a row for each conversation with the source and destination. Each conversation contains the fully qualified DNS host name (if available) and IP address of the servers that initiated and received the conversation data. The table also contains the following rate, volume, or utilization information:

- **Rate:**
  - (CAPC/NPC) For each conversation, the average rate of total data (Average Total), data that goes to the destination host (Average To), and data that comes from the source host (Average From).
  - (CAPC) For each conversation, the maximum rate of data that comes from the source host (Maximum From) and goes to the destination host (Maximum To).

  The rate is calculated by dividing the data volume by the elapsed transmission time.
- **Volume:** For each conversation, the total amount of data (Total), data that comes from the source host (From), and data that goes to the destination host (To), expressed in a scale that is appropriate for the highest-volume conversation.
- **Utilization:**
  - (CAPC/NPC) For each conversation, the average utilization by data that comes from the source host (Average From), data that goes to the destination host (Average To), and total data (Average Total).
  - (CA PC) For each conversation, the maximum percentage of interface capacity that is used by the data that comes from the source host (Maximum From) or that goes to the destination host (Maximum To).

  The utilization percentage is calculated by dividing the data rate by the data speed.

NetOps Portal views show the data from the time range that is defined for the page.

Opening the View

To see this view in the NetOps Portal Console, go to one of the following locations:

- (CAPC) Custom dashboard
- (NPC) Interface Pages (with an interface selected): Custom tab

Available Actions

You can perform several actions in this view:

- Change the type of measurement (Rate, Volume, or Utilization) and the view name by editing the view settings.
- (CAPC) Change the interface.
- (CAPC) Change the columns that are shown in the table: Click near a column border, click Columns, and then choose the columns to display.
- Click one of the links to jump to a pre-filtered Interface page report in the NFA console.

Find Conversation Tables in the NFA Console

You can display tables with conversation volumes in the NFA console for a selected interface:

- **Top N Conversations**
  - **Report type:** Conversations.
  - **Filter:** Top N Conversations.
  - **Presentation menu option:** Summary Table; Volume.
  - **View:** Conversation Summary Table for the Top N Conversations.
- **Conversations for a Single Protocol**
  - **Report type:** Protocols.
  - **Filter:** Single protocol.
  - **Report subtype:** Conversations.
  - **Subtype filter:** Top N Conversations.
  - **Presentation menu option:** Summary Table; Volume.
  - **View:** Protocol Conversation Summary Table for a single protocol.
- **Conversations for a Single ToS**
  - **Report type:** ToS.
  - **Filter:** Single ToS.
  - **Report subtype:** Conversations.
  - **Subtype filter:** Top N Conversations.
  - **Presentation menu options:** Summary Table; Volume.
  - **View:** ToS Conversations Summary Table for a single ToS.

To display Flow Forensics-level detail, click the Flow Forensics link and run a Flow Forensics report.

Interface Top Hosts

The Top Hosts views show the hosts that generate the highest traffic on the currently selected interface. The views are described in the following topics:

Top Hosts (Bar)

The Top Hosts (Bar) views show the top high-volume hosts for a particular interface. You can use this view to determine the IP addresses of hosts that are responsible for high volumes of network traffic. You can then contact the owner or user of each host to investigate the nature and purpose of the traffic. You can view the hosts for incoming flows, outgoing flows, or all flows.

The bar chart includes the following information for a maximum of 10 hosts:

- **Identifier**
  Identifies the interface that is used for the report. The identifier string consists of the router name, interface name, and interface description (under the view title).
- **Host Name**
  Identifies the host server by its fully qualified DNS name (if available) and IP address (Y-Axis).
- **Volume**
  Measures the total amount of data for the host on the interface, expressed in a scale that is appropriate for the highest-volume host (X-Axis).

NetOps Portal views show the data from the time range that is defined for the page.

Opening the View

To see this view in the console, go to one of the following locations:

- (CA PC) Custom dashboard

Available Actions

You can perform several actions in this view:

- Change the traffic direction and the view name by editing the view settings.
- (CAPC) Change the interface.
- Display details in a tooltip by holding your cursor over a bar.
- Jump to details for a specific host on an NFA console Interface page by clicking a bar.

Find Host Trend Views in the NFA Console

The Enterprise Overview page in the NFA console shows traffic volume for the top hosts in a bar chart.

You also can display host volume in trend charts for a selected interface:

- **Overview**
  - **Report type:** Overview.
  - **Presentation menu options:** Mixed Trend; Volume.
  - **View:** Hosts Multi Trend Summary (From and To) for the Top N Hosts, plus other overview views.
- **Top N Host Trend**
  - **Report type:** Hosts.
  - **Filter:** Top N Hosts.
  - **Presentation menu options:** Trend Chart; Volume.
  - **View:** Host Trend for each of the Top N Hosts.

    NOTE

    To see trend charts for a single host, click Top N Hosts and select a host as the filter.

To display Flow Forensics-level detail, click the Flow Forensics link and run a Flow Forensics report.

Top Hosts (Pie)

The Top Hosts (Pie) views show the hosts that account for the highest volumes of network traffic on the selected interface.

The table includes the following information by default:

- **Identifier**
  Identifies the interface that is used for the report. The identifier string consists of the router name, interface name, and interface description (under the view title).
- **Host Name**
  Identifies the host server by its fully qualified DNS name (if available) and IP address.
- **Total**
  Records the total amount of data for the host on the interface, expressed in a scale that is appropriate for the host with the highest volume.
- **Percent**
  (CAPC) Records the amount of traffic the host consumes out of the total traffic that is displayed.

NetOps Portal views show the data from the time range that is defined for the page.

Opening the Views

To see these views in the NetOps Portal Console, go to one of the following locations:

- (CAPC) Custom dashboard; Interface Pages (with an interface selected): IP Performance tab

Available Actions

You can perform several actions in this view, including the following ones:

- Change the traffic direction and the view name by editing the view settings. If the view is on a custom interface context dashboard in the console, you can change the interface.
- (CAPC) Change the columns that are shown in the table: Click near a column border, click Columns, and then choose the columns to display.
- Jump to details on an Interface report page in the NFA console by clicking a host link in the view.

Find Host Pie Charts in the NFA Console

You can display pie charts with host volumes in the NFA console for a selected interface:

- **Overview**
  - **Report type:** Overview
  - **Presentation menu option:** Pie Chart
  - **View:** Host Summary (From and To) for the Top N Hosts, plus other overview views.
- **Top N Hosts Summary**
  - **Report type:** Hosts
  - **Filter:** Top N Hosts
  - **Presentation menu option:** Pie Chart
  - **View:** Host Summary (From, To, and Total) for the Top N Hosts
- **Hosts for a Single Protocol**

  - **Report type:** Protocols.
  - **Filter:** Single protocol.
  - **Report subtype:** Overview.
  - **Presentation menu option:** Pie Chart.
  - **View:** Protocol Hosts Summary (From, To, and Total) for the single protocol.

To display Flow Forensics-level detail, click the Flow Forensics link and run a Flow Forensics report.

Top Hosts (Table)

The Top Hosts (Table) views show rate, volume, or utilization for the hosts that exchange the highest volume of data on a particular interface. The view is configured to show the rate for each listed host. You can configure the view to display rate, utilization, or volume information.

The view contains an interface identification string and a table. The table contains a row for each host with the fully qualified DNS host name (if available) and IP address, as well as the following rate, volume, or utilization information (by default):

- **Rate:**
  - (CAPC/NPC) For each host, the average rate of total data (Average Total), data that goes to the host (Average To), and data that comes from the host (Average From).
  - (CAPC) For each host, the maximum rate of data that comes from the host (Maximum From) and goes to the host (Maximum To).

  The rate is calculated by dividing the data volume by the elapsed transmission time.
- **Volume:** For each host, the total amount of data (Total), data from the host (From), and data to the host (To), expressed in a scale that is appropriate for the highest-volume host.
- **Utilization:**
  - (CAPC/NPC) For each host, the average utilization by data that comes from the host (Average From), data that goes to the host (Average To), and total data (Average Total).
  - (CAPC) For each host, the maximum percentage of interface capacity that is used by the data from the host (Maximum From) or that goes to the host (Maximum To).

  The utilization percentage is calculated by dividing the data rate by the data speed.

NetOps Portal views show the data from the time range that is defined for the page.

Opening the View

To see this view in the NetOps Portal Console, go to one of the following locations:

- (CAPC) Custom dashboard
- (NPC) Interface Pages (with an interface selected): Custom tab

Available Actions

You can perform several actions in this view:

- Change the type of measurement and the view name by editing the view settings.
- (CAPC) Change the interface.
- (CAPC) Change the columns that are shown in the table: Click near a column border, click Columns, then choose the columns to display.
- Click a name to jump to a pre-filtered Interface page report in the NFA console.

Find Host Tables in the NFA Console

You can display tables with host volumes in the NFA console for a selected interface:

- **Top N Hosts Summary**
  - **Report type:** Hosts.
  - **Filter:** Top N Hosts.
  - **Presentation menu option:** Summary Table; Volume.
  - **View:** Host Summary Table for the Top N Hosts.
- **Hosts for a Single Protocol**
  - **Report type:** Protocols.
  - **Filter:** Single protocol.
  - **Report subtype:** Overview.
  - **Presentation menu option:** Summary Table; Volume.
  - **View:** Protocol Host Summary Table for the single protocol.
- **Hosts for a Single ToS**
  - **Report type:** ToS.
  - **Filter:** Single ToS.
  - **Report subtype:** Hosts.
  - **Subtype filter:** Top N Hosts.
  - **Presentation menu options:** Summary Table; Volume.
  - **View:** ToS Hosts Summary Table for the single ToS.

To display Flow Forensics-level detail, click the Flow Forensics link and run a Flow Forensics report.

Interface Top Protocols

The Top Protocols views show the protocols that are associated with the highest traffic on the interface that you have selected. The views are described in the following topics:

Top Protocols (Bar)

The Top Protocols (Bar) views show the top high-volume IP protocols for traffic on a particular interface. A bar chart shows which protocols account for the most traffic on the selected interface.

This view gives you an overall picture of the amount of data that is associated with particular protocols--and, therefore, with applications--on the interface. The view also lets you determine whether the application protocols are related to business-critical processes, or are related to low-priority or non-business related processes such as unauthorized web use. You can view protocol traffic for incoming flows, outgoing flows, or all flows.

The bar chart includes the following information for a maximum of 10 protocols:

- **Identifier**
  Identifies the interface that is used for the report. The identifier string consists of the router name, interface name, and interface description (under the view title).
  (NPC) The identifier line also includes the interface speed.
- **Protocol**
  Identifies the protocol by its descriptor (Y-Axis).
- **Volume**
  Measures the total amount of protocol data expressed in a scale that is appropriate for the highest-volume protocol (X-Axis).

NetOps Portal views show the data from the time range that is defined for the page.

Opening the View

To see this view in the console, go to one of the following locations:

- (CAPC) Custom dashboard
- (NPC) Interface Pages (with an interface selected): Custom tab

Available Actions

You can perform several actions in this view, including the following ones:

- Change the traffic direction and the view name by editing the view settings.
- (CAPC) Change the interface.
- Display details in a Tooltip by holding your cursor over a bar.
- Jump to details for a specific protocol on an NFA console Interface page by clicking a bar or name.

Find the Comparable View in the NFA Console

The Top Protocols bar charts in the console are similar to the Top Protocol view on the Enterprise Overview page in the NFA console.

Top Protocols (Pie)

The Top Protocols (Pie) views show the protocols that are associated with the highest traffic volumes on the selected interface.

The table includes the following information by default:

- **Identifier**
  Identifies the interface that is used for the report. The identifier string consists of the router name, interface name, and interface description (under the view title).
  (NPC) The identifier line also includes the interface speed.
- **Protocol Name**
  Identifies the protocol by its keyword and TCP/UDP port assignment.
- **Total**
  Records the total volume of network traffic on the interface that is associated with the protocol
- **Percent**
  (CAPC) Records how much the protocol consumes out of the total traffic that is displayed.

NetOps Portal views show the data from the time range that is defined for the page.

Opening the Views

To see these views in the console, go to one of the following locations:

- (CAPC) Custom dashboard
- (NPC) Interface Pages (with an interface selected): Interface QoS or custom tab

Available Actions

You can perform several actions in this view:

- Change the traffic direction and the view name by editing the view settings.
- (CAPC) Change the interface.
- (CAPC) Change the columns that are shown in the table: Click near a column border, click Columns, and then choose the columns to display.
- Jump to details on an NFA console Interface page by clicking a protocol name.

Find Protocol Pie Charts in the NFA Console

You can display pie charts with protocol traffic volumes in the NFA console for a selected interface:

- **Overview**
  - **Report type:** Overview.
  - **Presentation menu option:** Pie Chart.
  - **View:** Protocol Summary (In and Out) for the Top N Protocols, plus other overview views.
- **Top N Protocol Summaries**
  - **Report type:** Protocols.
  - **Filter:** Top N Protocols.
  - **Presentation menu option:** Pie Chart.
  - **View:** Protocol Summary (In, Out, and Total) for the Top N Protocols.
- **Hosts or Conversations for Single Protocol**
  - **Report type:** Protocols.
  - **Filter:** Single protocol.
  - **Presentation menu option:** Pie Chart.
  - **Views:** Protocol Hosts Summary (From and To) for the single protocol; Protocol Conversations Summary (Total) for the single protocol.

To display Flow Forensics-level detail, click the Flow Forensics link and run a Flow Forensics report.

Top Protocols (Table)

The Top Protocols (Table) views show the rate, volume, or utilization for the protocol traffic with the highest volume on a particular interface. For example, you can use this information to compare the data volume or utilization for particular protocols.

The view is set to show the traffic volume for each listed protocol. You can configure the view to display rate, utilization, or volume information.

The view contains an interface identification string and table. The table has a row for each protocol with the protocol name (keyword and TCP/UDP port assignment) and the following rate, volume, or utilization information (by default):

- **Rate:**
  - (CAPC/NPC) Average rate of total (Average Total), inbound (Average In), and outbound data (Average Out) for each protocol.
  - (CAPC) Maximum rate of data that is outbound, inbound, or both outbound and inbound (Maximum Out, Maximum In, and Maximum Total) on the interface for each protocol

  The rate is calculated by dividing the data volume by the elapsed transmission time.
- **Volume:** Number of bytes/megabytes of outbound data (Out), inbound data (To), and all data (Total) for each protocol.
- **Utilization:**
  - (CAPC/NPC) Average utilization by inbound data (Average In), outbound data (Average Out), and total data (Average Total) for each protocol.
  - (CAPC) Maximum percentage of interface capacity that the outbound (Maximum Out) or inbound protocol data utilizes (Maximum In)

The utilization percentage is calculated by dividing the data rate by the data speed.

NetOps Portal views show the data from the time range that is defined for the page.

Opening the View

To see this view in the NetOps Portal Console, go to one of the following locations:

- (CAPC) Custom dashboard
- (NPC) Interface Pages (with an interface selected): Custom tab

Available Actions

You can perform several actions in this view:

- Change the type of measurement (Rate, Volume, or Utilization) and the view name by editing the view settings.
- (CAPC) Change the interface.
- Re-sort the table data by clicking a column heading. Click again to toggle between descending and ascending order.
- Change the Max Per Page value to show more or fewer items on each table page.
- (CAPC) Change the columns that are shown in the table: Click near a column border, click Columns, and then choose the columns to display.
- Click a name to jump to a pre-filtered Interfaces report in CA Network Flow Analysis.

Find Protocol Tables in the NFA Console

You can use these ways to display tables of protocol volume data in the NFA console for a selected interface:

- **Top N Protocols**
  - **Report type:** Protocols.
  - **Filter:** Top N Protocols.
  - **Presentation menu options:** Summary Table; Volume.
  - **View:** Protocol Summary Table for the Top N Protocols, plus other overview views.
- **Protocols for a Single Host**
  - **Report type:** Hosts.
  - **Filter:** Single host.
  - **Report subtype:** Protocols.
  - **Presentation menu options:** Summary Table; Volume.
  - **View:** Host Protocol Summary Table for the single host.
- **Protocols for a Single Conversation**
  - **Report type:** Conversations.
  - **Filter:** Single conversation.
  - **Report subtype:** Protocols.
  - **Presentation menu options:** Summary Table; Volume.
  - **View:** Conversation Protocol Summary Table for the single conversation.

To display Flow Forensics-level detail, click the Flow Forensics link and run a Flow Forensics report.

Anomaly Detector Dashboard

The Anomaly Detector dashboard provides data from the Anomaly Detector component for Network Flow Analysis. The Anomaly Detector monitors baselines and analyzes the flow patterns that can indicate misconfiguration, malicious attacks, or poor application delivery. For more information, see the Network Flow Analysis documentation.

By default, this dashboard contains the following views:

Anomaly Activity

The Anomaly Activity view shows the number of anomalies and anomaly clusters that occurred in relation to all the processed records.

The number of records is shown in the hundreds of thousands (Y-Axis) over a 24-hour period. Activity is shown along the X-Axis each time that the program runs (usually at 15-minute intervals).

You can edit the following view settings:

- Time frame for all views on the page, as described in Set a Custom Time Frame.
  By changing the time frame for the page, you can discover when the issue began, and look for patterns.
- View title and context.

Anomaly Detector Overall Status

The Anomaly Detector Overall Status table shows the number of records that were processed during the selected time frame, the number of anomalies, and the number of anomaly clusters.

You can edit the following view settings:

- Time frame for all views on the page, as described in Set a Custom Time Frame
- View title and context

This view is included by default on the Anomaly Detector page in the NetOps Portal Console.

Anomaly Drill-In

The Anomaly Drill-In table lists the following information for each anomaly:

- Probability
- Value
- Originating router and interface
- Time that the anomaly occurred

If you drill into an anomaly cluster from the Enterprise-wide Correlated Anomalies view, the Anomaly Drill-In table opens. You can use the Date link to drill into a trend chart that shows the value and probability over time.

The Anomaly Drill-In view provides the following information about each anomaly:

- **Anomaly Type**
  The type of anomalous behavior. For a description of each anomaly type that you can enable for monitoring, refer to Sensors Overview.
- **Host**
  The name or IP address of the host on which the anomalous behavior is detected. The host may be a client system, a server, a router, or an interface. The program attempts to resolve the hostname of any IP address and displays that name in this field.
- **Host Link**
  Click a Host link to go to more granular information about the device that has the anomaly. Clicking a Host link may be the first step in troubleshooting the anomaly.
  Host link destinations are based on the sensor type. For many CA Network Flow Analysis sensors, the Host link opens the page for defining a Flow Forensics report in the NFA console, which has pre-populated report filters.
- **Prob(%)**
  The calculated likelihood that flagged packet flows are truly anomalous.

Probability is expressed as a percentage. For example, if the probability for an anomaly type is 91%, the packet flows that triggered the reported anomalous behavior are calculated to have a 91% probability of being truly anomalous. In this case, the packet flows have a low probability of occurring normally on this network.
For more information about the probability algorithm, see Probability Thresholds.

- **Value**
  The value that triggered the report of anomalous behavior, expressed in the units of measure shown in the Unit column. For example, the value could be the number of gigabytes of data in the anomalous flow.
- **Metric/Unit**
  The unit of measurement that is used to express the Value, such as packets, flows, or destination hosts.
- **Discovered by**
  The router, interface, or data source that detected the anomalous data.
- **Discovered by Link**
  Click a Discovered By link to view details. The link destination is determined by the type of anomaly:
  – CA Network Flow Analysis Anomalies: router or interface page in the NetOps Portal Console
  – Anomalies from other data sources: main page for the originating product
- **Date**
  The date and time that the anomalous behavior is detected. The time may vary by up to 15 minutes from the exact time when the flows took place. Data is pulled from the harvesters for analysis at 15-minute polling intervals.
- **Date Link**
  Click the Date link to view the Anomaly Trend view. This view shows the value and probability of the anomaly over time.

You can edit the following view settings:

- Time frame, as described in Set a Custom Time Frame.
- View title.

NOTE
You can use the zoom feature to limit the time frame.

Anomaly Trend

The Anomaly Trend view shows the value and probability of the anomaly over time. To display this trend chart, click a link in the Date column in either the Anomaly Drill-in view or the Enterprise-Wide Anomalies view.

The view shows the pattern of deviation from normal network behavior. A longer term view can help to determine patterns over days, weeks, or months. The recorded values are shown as a blue trend line on the X-Axis. The probability that the behavior is a true anomaly is shown as a pink trend line on the Y-Axis.

You can edit the following view settings:

- Time frame, as described in Set a Custom Time Frame
- View title

NOTE

You can use the Zoom feature to limit the time frame.

Enterprise-Wide Anomalies

The Enterprise-Wide Anomalies view is a comprehensive summary of the anomalous behavior during the reporting time frame, with details about the anomaly type, location, and size.

This view is useful for examining problematic behavior, or for initiating troubleshooting procedures to stop an attack. The view provides more detailed information about the anomalies that you see in other views. This view also identifies network locations that you should investigate.

You can edit the following view settings:

- Time frame for all views on the page, as described in Set a Custom Time Frame
- View title and context

This view is not included by default on the Anomaly Detector page in the NetOps Portal Console. To see this view, add it to a page.

The view provides the following information about anomalous network behavior:

- **Anomaly Type**
  The type of anomalous behavior. For a description of each anomaly type that you can enable for monitoring, see Sensors Overview.
- **Host**
  The name or IP address of the host on which the anomalous behavior is detected. The host may be a client system, a server, a router, or an interface. The program attempts to resolve the hostname of any IP address and displays that name in this field.
- **Probability**
  The calculated likelihood that flagged packet flows are truly anomalous.
  Probability is expressed as a percentage. For example, if the probability for an anomaly type is 91%, the packet flows that triggered the reported anomalous behavior are calculated to have a 91% probability of being truly anomalous. In this case, the packet flows have a low probability of occurring normally on this network.
  For more information about the probability algorithm, see Probability Thresholds.
- **Date**
  The date and time that the anomalous behavior is detected. The time may vary by up to 15 minutes from the time when the flows actually took place. Data is pulled from the Harvesters for analysis at 15-minute polling intervals.

Enterprise-Wide Correlated Anomalies

The Enterprise-Wide Correlated Anomalies table summarizes the anomalous behaviors that can damage the network. This view identifies network locations that you can investigate if you suspect malicious activity.

Anomaly clusters are better indicators for problems than single anomalies. Many types of attacks involve multiple instances of anomalous network behavior. Instances are often clustered around a group of a few hosts at first. The behavior then spreads out, and seemingly unrelated devices are affected; unexpected traffic is produced from multiple sources.

Correlation is performed by using an algorithm that considers the typical patterns for each type of monitored network traffic.

An anomaly is *correlated* when the following requirements are met:

- Three or more anomaly instances exist
- Two different anomaly types are present, or have an Anomaly Index above 2.0
- One device is the source of the anomalies

You can change the time frame for this view and all views on the page, as described in Set a Custom Time Frame.

You can edit the following view settings:

- Time frame for all views on the page, as described in Set a Custom Time Frame
- View title and context

This view is included by default on the Anomaly Detector page in the NetOps Portal Console.

The view provides the following information about anomalous network behavior:

- **Host**
  The IP address of the host that displays the anomalous behavior. The host may be a client computer, a server, a router, or an interface. The program attempts to resolve the hostname of the IP address, and displays that name in the Host field.
- **Anomaly Index**
  The count of the anomalies in the cluster, weighted by their role as either primary or secondary. The anomaly correlation algorithm compares each particular behavior to the typical patterns for the network traffic type. A higher index number indicates a more severe issue.
- **Types**
  The number of different types of anomalous network behaviors that occurred during the reporting period.
- **Date**
  The date and time of the first correlated anomaly on the host.
  The time may vary by up to 15 minutes from the time when the flows actually took place. Data is pulled from the Harvesters for analysis at 15-minute intervals.
- **Date Link**
  Click the Date link In the Enterprise-Wide Correlated Anomalies view to view the Anomaly Detector Drill-In table.

Links and Detail Pages

Links are included in some views to help start anomaly troubleshooting. Use the links to view preconfigured reports or more details. The following views include links:

- Enterprise-Wide Correlated Anomalies
- Enterprise-wide Anomalies
- Anomaly Detector Drill-In

The following links are available in these views:

- **Date Link**
  Opens the Anomaly Trend view. This view shows the value and probability of an anomaly over time.
- **Discovered by Link**
  View the details of an anomaly. The link destination is determined by the type of anomaly:
  - CA Network Flow Analysis Anomalies: router or interface page in the NetOps Portal Console
  - Anomalies from other data sources: main page for the originating product
- **Host Link**
  View more granular information about the device that has the anomaly. Click this link to start troubleshooting the anomaly.
  Host link destinations are based on the sensor type. For many CA Network Flow Analysis sensors, the Host link opens the page for defining a Flow Forensics report in the NFA console, which has pre-populated report filters.

Top Anomalies by Host

The Top Anomalies by Host pie chart shows the top anomalous hosts, ranked by the number of anomalies for the reporting time frame. A maximum of ten hosts are included. The number of instances is shown next to each sector.

You can edit the following view settings:

- Time frame for all views on the page, as described in Set a Custom Time Frame
- View title and context

This view is included by default on the Anomaly Detector page in the NetOps Portal Console.

Top Anomalies by Interface

The Top Anomalies by Interface pie chart shows the anomalies for the top interfaces, ranked by number of anomalies. A maximum of ten anomalies are included. The number of instances is shown next to each sector.

You can edit the following view settings:

- Time frame for all views on the page, as described in Set a Custom Time Frame
- View title and context

This view is included by default on the Anomaly Detector page in the NetOps Portal Console.

Top Enterprise-Wide Network Anomalies

The Top Enterprise-Wide Network Anomalies pie chart shows the top anomaly types for the reporting time frame. This view shows the type of network traffic that had the highest proportion of anomalous traffic. This data may give you the first insight into poor network performance. The legend identifies the number of instances and the colors for each anomaly type. Anomaly types are named for the corresponding sensors. For a description of each sensor, see Sensors Overview.

The Top Enterprise-Wide Network Anomalies view is most useful for tracking sudden changes in network behavior. For example, suppose that the Enterprise-Wide Network Anomalies view shows that the Large DNS Packet Sources category accounts for 25% of all potentially anomalous behavior for the past week. If the summary indicates that Large ICMP Packets account for 50% of such traffic today, you can start to investigate.

You can edit the following view settings:

- Time frame for all views on the page, as described in Set a Custom Time Frame
- View title and context

This view is included by default on the Anomaly Detector page in the NetOps Portal Console.

Calendar Chart (Flow)

The Calendar Heat Chart (Flow) view maps the utilization percentage of the selected interface over time to help you find recurring data patterns. Finding a pattern can help you to identify the source of high traffic rates and potential performance issues. For example, the view can show the hour of each day when utilization is the highest.

Each color represents a severity range that is calculated as a percentage of total capacity. High utilization is shown in orange and red. Low utilization is shown in green and blue.

The view includes the following information:

- **Identifier**
  Consists of the router name, interface name, and interface description (under the view title). The interface description consists of the ifDescr value by default, and can differ from the interface description that is shown in the NFA console.
- **Month, Date, and Day of the Week**
  Identify the day that the traffic occurred (X-Axis columns).
- **Hour**
  Identifies the hour of the day that the traffic occurred (Y-Axis).

To see the Calendar Heat Chart view in the CA NetOps Portal (CAPC) Console, add it to a custom dashboard.

You can perform several actions in this view:

- Change the data direction and view name, as described in this topic.
- (CAPC) Display details in a Tooltip by holding your cursor over a cell.
- (CAPC) Click Show All and choose a pattern-matching filter. For example, select Busy Hour to show only the data for the busiest hour of each day.

Find the Comparable View in the NFA Console

To display Calendar Chart data for an interface in the NFA console, select an interface on the Interface page and select the following options:

- Report type: Utilization.
- Presentation menu option: Direction In or Direction Out.

To display Flow Forensics-level detail, click the Flow Forensics link and run a Flow Forensics report.

Change the View Settings

You can adjust several settings in the Calendar Heat Chart.

Follow these steps:

1. (CAPC) Click the Edit icon in the view title bar and click Edit.
2. (Optional) Edit any of the following settings in the Calendar Heat Chart (Flow) Settings section:
   - **Title:** Change the name that appears in the view title bar.
   - (**CAPC) Time Display Format:** Select the time format for the chart, either 12 hours or 24 hours.
   - **(CAPC) Zone Start:** Set the starting value of each heat zone. The defaults are based on IT industry standards for performance. For example, the default Red Zone Start value is 70 percent utilization.
     Defaults: Green Zone Start = 0, Yellow Zone Start = 50, Orange Zone Start = 60, Red Zone Start = 70.
   - **(CAPC) Business Week Start:** Select the day that starts the business week.
     Default: Monday.
   - **(CAPC) Direction Settings:** Select the direction of traffic on the selected interface to include in the report:
     - **Out:** Outbound on the interface.
     - **In:** Inbound on the interface.
     - **Total:** Combination of inbound and outbound traffic.
3. (Optional) (CAPC) Change the context for the view data: Select a different interface from the Context Settings table.
4. Select the scope of your changes from the **Apply Changes** drop-down.
5. Click **Save** to save your changes.
   The settings dialog closes. The view refreshes to reflect your updates.

UC Monitor Views in NetOps Portal

The following topics discuss the CA Unified Communications Monitor dashboards and views that are available in NetOps Portal:

Call Quality Breakdown

The Call Quality Breakdown pie chart shows a rollup of systemwide call quality for the selected time frame. The percentage of all call minutes that fell into each severity range is displayed in the chart.

The call quality data in this chart comes from the Mean Opinion Scores (MOS) of every call leg that was measured within that time frame. MOS values are evaluated according to the Call Quality performance thresholds that are assigned to the Locations where call activity occurred. The thresholds determine which MOS values are rated Normal, Minor, or Major. The threshold values in these severity categories can be customized per location or assigned automatically per codec.

MOS values do not apply to video streams. Network MOS is not included.

A unique color is assigned to each severity level shown in the pie chart. A legend explains the color assignments. Data that is unrated can indicate that the Minimum Observations threshold for that location was not met during the selected time frame.

Call Quality Service Level Agreement

The Call Quality Service Level Agreement (SLA) view lets Managed Service Providers (MSPs) prove to a customer that they are meeting the SLA commitment for audio call quality by codec. MSPs create one Call Quality SLA view for each customer.

The Call Quality SLA view provides the following information:

- **Calls Meeting SLA**
  The number of calls that met the SLA commitment during the selected interval, based on your selections on the Settings dialog.
  If both legs of a call have MOS or Network MOS, then both legs must meet the SLA commitment for the call to be included in the Calls Meeting SLA value.
  Calls are not included in the Calls Meeting SLA value when one leg meets the commitment, but the other leg does not.
- **Calls Not Meeting SLA**
  The number of calls that did not meet the SLA commitment during the selected interval.
- **Total Calls**
  Total number of calls observed during the selected interval. Only Calls that had MOS or Network MOS for at least one of the two legs in the call are included in the total. The total includes the number of calls that met the SLA.

  NOTE
  The total does not include calls that do not have MOS or Network MOS, such as short calls, abandoned calls, and calls with setup failures.

  The number in this column is a link to the Calls Overview report in the CA UC Monitor management console. The Calls Overview report can contain up to a week's worth of data, and can therefore take a long time to open.
- **Percent**
  The percentage of calls that met the SLA commitment during the selected interval.
- **Importance**
  Indicates whether the SLA commitment was met, or indicates the importance of a failure to meet the SLA, based on your selections in the Settings dialog.

Call Quality Trend

The Call Quality Trend view provides an enterprise-level view of Mean Opinion Score (MOS) data from all calls detected during the selected timeframe.

About the Call Quality Trend View

The trend chart does not include an indication of the number of call minutes used to derive the metrics. To determine the number of observations behind the trend, navigate to the UC Monitor data source and view the Call Performance Overview report. Click the Metric Details link at the top of the report. MOS values do not apply to video streams. Network MOS is not included.

NOTE
This view does not support data from multiple data sources. If you registered multiple instances of UC Monitor, edit the view to filter by one data source. You can also change the dashboard group context by clicking the Group link. Using either method, you can select one data source in the Groups tree to serve as the view context.

Call Quality Trend View Settings

The Settings dialog provides filtering and display options for the view.

- **Title**
  The default title is Call Quality Trend. You can change the title as necessary.
- **Context Settings**
  Select another managed item to change the source of the data in the view.
- **Apply Changes**
  Select the scope of your changes from the **Apply Changes** drop-down.

Performance Overview Dashboard

The Performance Overview dashboard provides a network manager or higher-level executive with a daily or weekly summary of overall VoIP and video call performance.

You can click a link in a dashboard view and access the related report in the CA UC Monitor management console, with the appropriate context selected. The management console provides more details for the data that is summarized in the dashboard.

Performance by Call Server

The call servers shown in the Performance by Call Server view handled calls during the selected time frame. Their performance ratings are derived from the Locations that they served. The name of each server is a link that allows further investigation.

The Call Performance category includes both call quality and call setup metrics. Where available, video metrics are included. The bar graph represents the number of originated calls or call minutes that were rated Normal, Minor, or Major.

- **Calls Originated:** Calls from endpoints that are registered to a call server.
- **Call Minutes:** Minutes of call activity that were reported by a call server.

The Calls Originated column provides the total number of calls that were set up by the indicated call servers. Calls not included in the Calls Originated total were routed by the call servers in this view, but were set up by a different call server.

Performance by Group

The Performance by Group view is available only when custom groups are defined in CA NetOps Portal (CAPC). You can drill down into individual group members and their data by clicking a group name.

The view rates call performance in the incoming direction to gauge the listening quality for VoIP and video users in that group. Groups are sorted by worst call performance.

Click a Location link to see ratings for performance metrics and for the components participating in calls to the Locations in this view.

The Performance by Group view displays calls between Locations in the selected group. The view also identifies all associated call servers, including calls servers that are not explicitly part of the group definition.

Performance by Location

The Performance by Location view lists all monitored Locations where endpoints had call activity. This view evaluates call performance in the incoming direction to gauge the listening quality for VoIP and video users.

Data that is unrated can indicate that the Minimum Observations threshold for that Location was not met during the selected time frame.

To see ratings for performance metrics and for the components participating in calls to the Locations listed in this view, click a Location link.

Performance by Media Device

The Performance by Media Device view shows incoming calls from the PSTN and outgoing calls from the IP network that the device handled.

The media device category includes voice gateways and other devices that support call routing and processing. The metrics available for each device vary according to the device type and the environment. In a Microsoft environment, SNMP polling of media devices is not possible. As a result, fewer metrics are available for Microsoft media devices than for Cisco voice gateways.

The Calls Originated column provides the total number of calls that originated at points in the PSTN.

Performance Overview Dashboard View Settings

The Settings dialog provides filtering and display options for each view in this dashboard:

- **Title**
  The default titles for the views in this dashboard are:
  - **Performance by Call Server**
  - **Performance by Group**
  - **Performance by Location**
  - **Performance By Media Device**

  You can change the titles as necessary.
- **Context Settings**
  Select another managed item to change the source of the data in the view.
- **Apply Changes**Select the scope of your changes from the **Apply Changes** drop-down.

Top Volume and Utilization Dashboard

The Top Volume and Utilization Dashboard helps network engineers plan for network growth and track usage statistics for their unified communications systems. Data from CA UC Monitor can help engineers plan for capacity needs by determining the current operating levels of key unified communications components.

You can click a link in a view to access the related report in the CA UC Monitor management console with the appropriate context selected. The management console provides more details for the data that is summarized in the dashboard.

Contents

Top Groups

The Top Groups Volume view compares the call volume of the groups of locations with the highest usage during the selected timeframe. The view provides a list of the top talkers at a particular point in time. All calls, including audio-only, video-only, and audio and video, are considered when compiling the list of top call volumes.

The Volume bar chart shows a comparison of call volumes among the groups of locations with the highest volumes. Each bar represents a relative activity level, which lets you easily compare call volumes among busy Locations.

The names in the Group column are links to the Top Volume report in the CA UC Monitor interface. You can see the volume statistics of individual group members in the context views included in this report.

By default, the Volume bar is calculated using the number of calls placed by locations in the indicated groups. You can select Call Minutes as the charted unit instead. Click the blue arrow to the left of the view name, and select Edit. In the dialog that opens, select Call Minutes from the “Calculate using” list.

Top Locations

The Top Locations Volume view compares the call volume of the locations with the highest usage during the selected timeframe. The view provides a list of the top talkers at a particular point in time. All calls, including audio-only, video-only, or audio and video, are considered when compiling the list of top call volumes.

The Volume bar chart shows a comparison of call volumes among the locations with the highest volumes. Each bar represents a relative activity level, which lets you easily compare call volumes among busy locations.

The names in the Location/Media Device column are links to the Top Volume report. A related view of the busiest endpoints from the selected Location is also included in the report.

By default, the Volume bar is calculated using the number of calls placed by Locations in the indicated groups. You can select Call Minutes as the charted unit instead. Click the blue arrow to the left of the view name, and select Edit. In the dialog that opens, you can select Call Minutes from the “Calculate using” list.

Top Phones

The Top Phones Volume view compares the call volume of the endpoints with the highest usage during the selected timeframe. The view provides a list of the top talkers at a particular point in time. All calls, including audio-only, video-only, and audio and video, are considered when compiling the list of top call volumes.

The Volume bar chart shows a comparison of call volumes among the endpoints with the highest volumes. Each bar represents a relative activity level so that you can compare call volumes among endpoints.

The numbers in the Phone Number column are links to the Phones report.

If no directory number is available for an endpoint, its IP address is provided in the IP Address column. The IP address can be a link to the endpoint web page. The endpoint name is also shown in the Name column.

Top Trunk Groups

The Top Trunk Groups view helps you understand trunk group usage, and provides individual trunk usage statistics. Use this page to find underutilized trunk groups and overburdened trunks, where performance can deteriorate.

Statistics for all known trunk groups are included. The most heavily used trunks are shown first.

- **Name**
  The name assigned to the trunk group. Click to drill down into an hourly breakdown of usage for this trunk group. The name of the trunk group is based on information from the monitored call traffic and the naming convention employed by the trunking equipment.
- **Utilization (%)**
  The average usage during the time period, expressed as a percentage of capacity. Average usage is based on the capacity divided by the timeframe.
  – (*Avaya only)* The trunk group capacity is discovered from SNMP polling of the Avaya Communication Manager. The usage for an Avaya trunk group is based on channel capacity, divided by the Centum Call Seconds **(**CCS) observed

for all active channels. Usage is a percentage of the trunk group channel capacity, divided by the observed CCS. The total is again divided by the selected timeframe.
  - (*Cisco only*) Usage is the percentage of total voice interface capacity in use during the selected timeframe. Total interface capacity is derived from the known capacity of each voice interface in the group.

  To identify underused trunk groups, sort this column to see the least used trunk group first.
- **Maximum Utilization**
  The highest recorded usage during the selected time period, expressed as a percentage of capacity. Maximum usage is a good indicator of potential capacity issues. Even when the average usage is low, the maximum usage is significant because it often indicates the usage during the “busy hour” of the day. Maximum usage is based on the capacity, multiplied by the timeframe.
  - (*Avaya only*) The capacity is based on information from the Avaya Communication Manager.
  - (*Cisco only*) The capacity is discovered when voice gateway devices are discovered.
- **Grade of Service (GoS)**
  (*Cisco only*) An estimation of the probability that a VoIP call will receive a busy signal. The GoS value (a decimal fraction) is always expressed with reference to the busy hour when the traffic intensity is the greatest. GoS is reported from the perspective of the origination Location or gateway device (the outgoing direction).
- **Call Minutes**
  The number of call minutes used to calculate usage statistics. This value provides a sense of the scope of activity, and helps to determine the significance of the data, based on sample size.
- **Call Minutes Capacity**
  The number of call minutes that were supported during the selected time period. The capacity is discovered during monitoring, or is manually supplied during configuration.

Top Voice Interfaces

The Top Voice Interfaces view helps you to understand voice gateway usage, and provides individual gateway voice interface statistics. Use this view to look for overburdened interfaces, where performance can deteriorate. The minimum timeframe for this view is one day; no data appears if a narrower timeframe is selected. This view contains:

- Statistics for all known gateway voice interfaces.
- The most heavily used interfaces, which are shown first.

Top Volume and Utilization View Settings

The Settings dialog provides filtering and display options for the views in this dashboard:

- **Title**
  The default titles for the views in this dashboard are:
  - **Top Groups**
  - **Top Locations**
  - **Top Phones**
  - **Top Trunk Groups**
  - **Top Voice Interfaces**

  You can change the title as necessary.
- **Context Settings**
  Select another managed item to change the source of the data in the view.
- **Apply Changes**
  Select the scope of your changes from the **Apply Changes** drop-down.

Worst Performance Dashboard

The Worst Performance Dashboard helps IT staff monitor the quality of unified communications system performance and summarize the performance data. By default, the Worst Performance dashboard provides the following views, which focus on the Locations and phones with the worst performance.

You can click a link in a view to access the related report in the CA UC Monitor management console, with the appropriate context selected. The management console provides more details of the data that is summarized in the dashboard.

Worst Locations

The Worst Locations view shows the pairs of Locations that had the lowest-quality metrics for the data traveling between them. The Worst Locations view provides the following information.

- **Name**
  The name of the location or media device that received the data stream with poor performance metrics. The Name could also refer to the name of the origination location for a data view filtered by a call setup metric.
- **Sending Name**
  The name of the location or media device that sent the low-performing call data to the other location in the pair.
- **Call Server**
  The call server that handled the calls for the shown severity breakdown.
- **Call Minutes**
  The number of minutes that calls were active between this pair of locations.
- **Calls**
  The number of distinct calls that ran between this pair of locations, and that also contributed to the “worst” performance metric displayed in the table.
- **Severity Breakdown**
  A stacked bar chart that shows applicable severity ratings as portions of the bars, which total 100 percent. Severity ratings are color-coded to match the severity indicators in other reports.
- **Unrated, Normal, Minor, Major**
  These columns show the actual severity percentages for the selected quality metric type. Percentages always total 100 percent.

  NOTE

  : An unrated metric indicates that a threshold is disabled, or that the threshold for minimum observations is too high for typical levels of call traffic.

Worst Locations Settings

The Settings dialog provides filtering and display options for the view:

- **Title**
  The default title is Worst Locations. You can change the title as necessary.
- **Metric Type**
  Select a different metric to change the type of data in the view.
- **Context Settings**
  Select another managed item to change the source of the data in the view.
- **Apply Changes**
  Select the scope of your changes from the **Apply Changes** drop-down.

Worst Phones

The Worst Phones view provides a list of endpoints with the lowest MOS for the selected timeframe. Endpoints are identified by the directory number or SIP URI, and by their IP address.

- **Phone Number**
  The directory number or SIP URI of the endpoint.
- **Name**
  The name, MAC address, or host name of the endpoint.
- **IP Address**
  The IP address of the endpoint.
- **Call Minutes**
  The number of minutes that calls were active on this endpoint during the selected timeframe.
- **Calls**
  The number of distinct calls placed or received.
- **Average Metric**
  The average MOS or Network MOS for all calls to and from this endpoint during the selected timeframe. Unlike the severity reflected in the bar chart, the average is not weighted by the duration of the calls. The contents of this column are determined by your selection in the Metric Type field in the Settings dialog.
- **Severity Breakdown**
  A stacked bar chart that shows each severity rating as a portion of the bar, which totals 100 percent. The severity ratings are color-coded to match the severity indicators in other reports.
- **Unrated, Normal, Minor, Major**
  Depending on your selection in the "Show breakdown values as" field on the Settings dialog, these columns display one of the following:
  – The percentage of calls in a severity category. Percentages always total 100 percent.
  – The number of calls in a severity category

  NOTE

  : An unrated metric indicates that a threshold is disabled, or that the threshold for minimum observations is too high for typical levels of call traffic. Set a lower minimum for observations, or assign different thresholds to the endpoints in question.

Worst Phones Settings

The Settings dialog provides filtering and display options for the view.

- **Title**
  The default title is Worst Phones. You can change the title as necessary.
- **Metric Type**
  Select MOS or Network MOS to determine the contents of the Average Metric and Severity Breakdown columns.
- **Show breakdown values as**
  Select Calls or Percent to determine the contents of the Unrated, Normal, Degraded, and Excessive columns.
- **Context Settings**
  Select another managed item to change the source of the data in the view.
- **Apply Changes**
  Select the scope of your changes from the **Apply Changes** drop-down.

Monitor Server Performance with DX Application Performance Management

The NetOps Portal, Data Aggregator, and Data Collector components are supported for instrumentation with CA Application Performance Management (APM). APM receives performance metrics about the component services and hosts. During installation of DX NetOps Performance Management components, the installer can configure the CA APM agent. You can also configure the APM agent for NetOps Portal, Data Aggregator, and Data Collector post-installation.

NOTE

After each configuration, restart the corresponding services to see that your changes take effect.

Follow these steps:

1. Log in to the host for the relevant component.
2. Change the working directory:

   ```
   cd Installation_Directory/wily
   ```

3. Run the following script:
   `setEMHost.sh`
   The script requests the following parameters:
   – CA APM hostname
   – CA APM port
   Default: 5001
4. On the NetOps Portal host, change the working directory:

   ```
   cd PC_Installation_Directory/PerformanceCenter/wily
   ```

   PC_Installation_Directory
   Specify the directory where NetOps Portal is installed.
5. Run the following commands:

   ```
   ./addWily.sh  PC_Installation_Directory/PerformanceCenter  PC_Installation_Directory/
   PerformanceCenter/PC/conf/wrapper-user.conf  PC

   ./addWily.sh  PC_Installation_Directory/PerformanceCenter  PC_Installation_Directory/
   PerformanceCenter/sso/conf/wrapper-user.conf  sso

   ./addWily.sh  PC_Installation_Directory/PerformanceCenter  PC_Installation_Directory/
   PerformanceCenter/DM/conf/wrapper-user.conf  DM

   ./addWily.sh  PC_Installation_Directory/PerformanceCenter  PC_Installation_Directory/
   PerformanceCenter/EM/conf/wrapper-user.conf  EM
   ```

6. If monitoring is configured for NetOps Portal, restart all NetOps Portal services:

   ```
   service caperfcenter_console restart
   service caperfcenter_devicemanager restart
   service caperfcenter_eventmanager restart
   service caperfcenter_sso restart
   ```

7. If monitoring is configured for the Data Aggregator, restart the ActiveMQ service for the Data Aggregator:

   ```
   service activemq stop

   service activemq start
   ```

8. If monitoring is configured for the Data Aggregator, do one of the following steps:
   – Stop the Data Aggregator service:

     ```
     service dadaemon stop
     ```

     NOTE

     For RHEL 7.x or OL, `service` invokes `systemctl` . You can use `systemctl` instead.
   – (Fault tolerant environment) If the local Data Aggregator is running, run one the following commands to shut it down and prevent it from restarting until maintenance is complete:
     - **RHEL 6.x:**

       ```
       service dadaemon maintenance
       ```

     - **RHEL 7.x, SLES, or OL:**

       ```
       DA_Install_Directory/scripts/dadaemon maintenance
       ```

9. If monitoring is configured for the Data Aggregator, do one of the following steps:
   – Start the Data Aggregator service:

     ```
     service dadaemon start
     ```

   – (Fault tolerant environment) Run one the following commands to enable the fault tolerant Data Aggregator so that it can start when necessary:
     - **RHEL 6.x:**

       ```
       service dadaemon activate
       ```

     - **RHEL 7.x, SLES, or OL:**

       DA_Install_Directory/scripts/dadaemon activate

10. If monitoring is configured for the Data Collector, restart all Data Collector services:

```
service activemq stop
service activemq start
service dcmd stop
service dcmd start
```

Generate MM Device Packs

DX NetOps Mediation Manager (MM) uses device packs to monitor data from non-SNMP devices or obtain data from the Element Management System (EMS). MM includes device packs that support many vendors and device types. To support a new device type or a new vendor, create and deploy device packs in your environment. Use the MM device pack generator application.

For more information, see the documentation for DX NetOps Mediation Manager.

Integrate DX Spectrum for Fault Management

The DX NetOps Spectrum integration with DX NetOps Performance Management shares models, Global Collections, and events between the two systems. DX NetOps Spectrum contributes devices, interfaces, and groups to the DX NetOps Performance Management inventory, which DX NetOps Performance Management can monitor. DX NetOps Performance Management contributes infrastructure performance events to DX NetOps Spectrum, so you can see performance events and fault alarms side by side in OneClick.

This following video examines the integration between these two products:

Integration Features

The following list identifies supported features in the integration between DX NetOps Spectrum and DX NetOps Performance Management:

Device Integration

From DX NetOps Spectrum, determine which devices to contribute to the DX NetOps Performance Management inventory. DX NetOps Performance Management creates discovery profiles to monitor those devices. DX NetOps Performance Management automatically discovers interfaces that are associated with those devices. If the devices exist in DX NetOps Performance Management, the devices are reconciled to a single item.

> **WARNING**
>
> DX NetOps Spectrum SNMP throttling does not apply to ongoing polling by Data Aggregator. This feature protects critical devices from failing in case too many polling flows are configured. The throttling mechanism applies to any monitoring or discovery activities. If you have configured throttling in DX NetOps Spectrum, apply the same setting in Data Aggregator. For more information, see Poll Sensitive and Critical Devices Without a Performance Impact.

Drill Down from OneClick to DX NetOps Performance Management Data

Access DX NetOps Performance Management data from DX NetOps Spectrum device and interface models, which provides rapid access to contextual information about device performance issues.

> **TIP**
>
> To navigate directly to NetOps Portal from OneClick, right-click a device or interface, and click **NetOps Portal** . A new window opens, and DX NetOps Performance Management loads the context page for the selected device or interface.

Model Classes and Device Subtypes

Synchronization uses the DX NetOps Spectrum model class to determine the DX NetOps Performance Management device subtype. The following list shows the model class followed by the device subtype:

- Router = Router
- Switch-Router = Router
- Switch = Switch
- Workstation-Server = Server

All other model classes are listed as **Other** in DX NetOps Performance Management.

WARNING

A device that is synchronized from DX NetOps Spectrum appears as pingable if any of the follow configuration issues occur:

- The SNMP profile in DX NetOps Performance Management does not have the correct contact information for the device.
- The SNMP profile is not assigned to the discovery profile.
- A local firewall is preventing communication from the Data Collector.

Synchronized Discovery

Synchronization reduces the administrative management that is required for device discovery. DX NetOps Performance Management adds the IP addresses of synchronized devices from DX NetOps Spectrum to a discovery profile. The discovery profile is specified for each IP domain. Run the discovery profile to identify the devices through SNMP. For more information, see Run Discovery.

To enable synchronized discovery, edit the Data Aggregator data source, and select **Discover devices from other data sources**. Synchronization occurs approximately every 5 minutes.

Life Cycle Status

You can configure DX NetOps Spectrum to control the life cycle state of devices in DX NetOps Performance Management. Changes in DX NetOps Spectrum trigger changes in DX NetOps Performance Management. If you change the state of a device in DX NetOps Performance Management, the state does not change again unless the state changes in DX NetOps Spectrum. With this option enabled, DX NetOps Performance Management uses the following behavior:

- Active devices in DX NetOps Spectrum are Active in DX NetOps Performance Management.
- Devices in Maintenance in DX NetOps Spectrum have the Maintenance state in DX NetOps Performance Management.
- The state of the device in DX NetOps Spectrum overwrites the state in DX NetOps Performance Management.

TIP

To avoid conflicts in device life cycle management, do not grant the Administer Life Cycle role to users in DX NetOps Performance Management.

To manage the life cycle state of a device from DX NetOps Spectrum, edit the DX NetOps Spectrum data source, and select **Synchronize device life cycle state from Spectrum**.

For more information about life cycle in DX NetOps Performance Management, see Manage Device Life Cycles.

Interface Synchronization

For each device that DX NetOps Spectrum sends to DX NetOps Performance Management, all the monitored interfaces from DX NetOps Spectrum are also synchronized. For each devices, DX NetOps Performance Management shows the following for interfaces:

- Interfaces that are synchronized from DX NetOps Spectrum.
- Interfaces that are discovered directly through SNMP
- Interfaces that are monitored by other data sources, such as CA Application Delivery Analysis or Network Flow Analysis.

NOTE

DX NetOps Performance Management does not show interfaces that are filtered out at the monitoring profile level. If you right-click an interface model in OneClick, the drill-down option is not available to you if that interface

is filtered out of the corresponding monitoring profile in DX NetOps Performance Management. For more information, see Configure Monitoring Profiles.

IP Domains

DX NetOps Performance Management IP domains are synchronized as CA NetOps Portal IP Domain models in OneClick. The IP domain models appear in the same area as Global Collections in the OneClick Navigation panel. The IP domain models have the same names as the DX NetOps Performance Management IP domain definitions. If you add a device model to the IP domain in OneClick, the device is synchronized to that IP domain in DX NetOps Performance Management.

NOTE

All IP domain definitions are synchronized, regardless of tenant associations.

Groups

DX NetOps Spectrum Global Collections and landscapes are synchronized to DX NetOps Performance Management as groups in the CA NetOps Portal Groups tree. The groups are created under Inventory/Data Sources in the group tree.

Use these groups for the following tasks:

- Create reporting groups.
- Define site membership.
- Drive the content of other custom groups and collections.

Multi-Tenancy

DX NetOps Spectrum devices that are synchronized to DX NetOps Performance Management belong to the tenant who owns the associated IP domain. For items that are shared among multiple tenants, add the items to the appropriate Service Provider groups in NetOps Portal. For more information, see Groups and Multi-tenancy.

Event Integration

Event integration converts DX NetOps Performance Management performance events to DX NetOps Spectrum alarm set or clear events that are asserted on models in each landscape. Polling for supported events begins when synchronization completes. Alarms that originate in DX NetOps Performance Management appear in the OneClick Console.

WARNING

When a device is modeled as a non-proxy model on multiple landscapes, event processing cannot map the event to the correct devices in DX NetOps Spectrum.

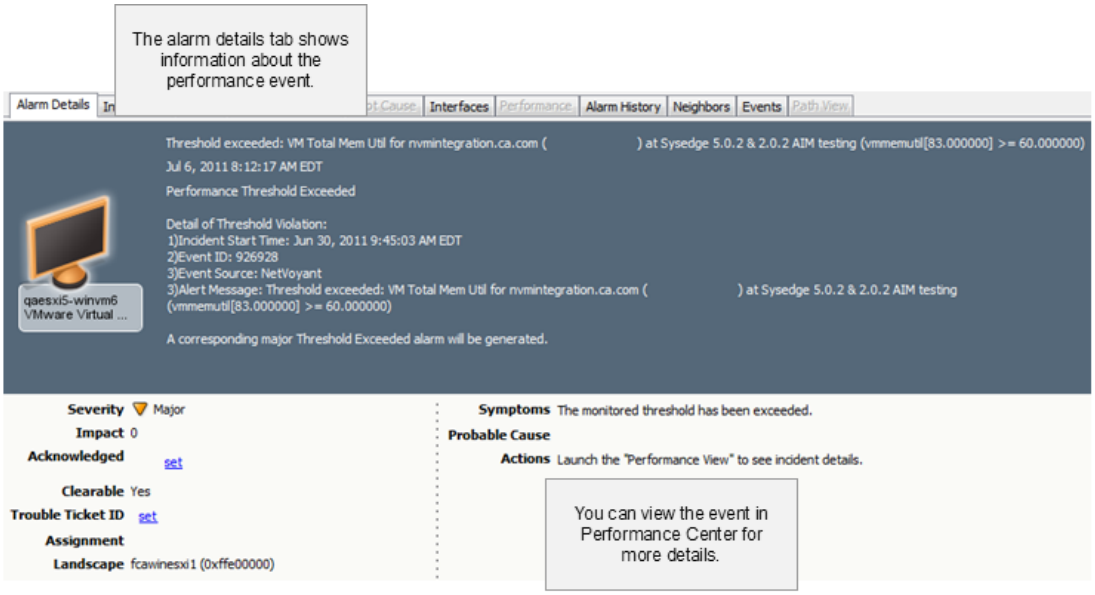
NOTE

When a device model is in maintenance mode, DX NetOps Spectrum does not process performance events that are synchronized from DX NetOps Performance Management.

By default, DX NetOps Spectrum supports events from Data Aggregator and Network Flow Analysis data sources. You can configure OneClick to handle other events from the Event Manager in DX NetOps Performance Management.

The following image shows the alarm details for a DX NetOps Performance Management performance event in the OneClick console. The alarm includes the alarm type, time of occurrence, event ID, and source:

Figure 64: Infrastructure Performance Events in CA Spectrum



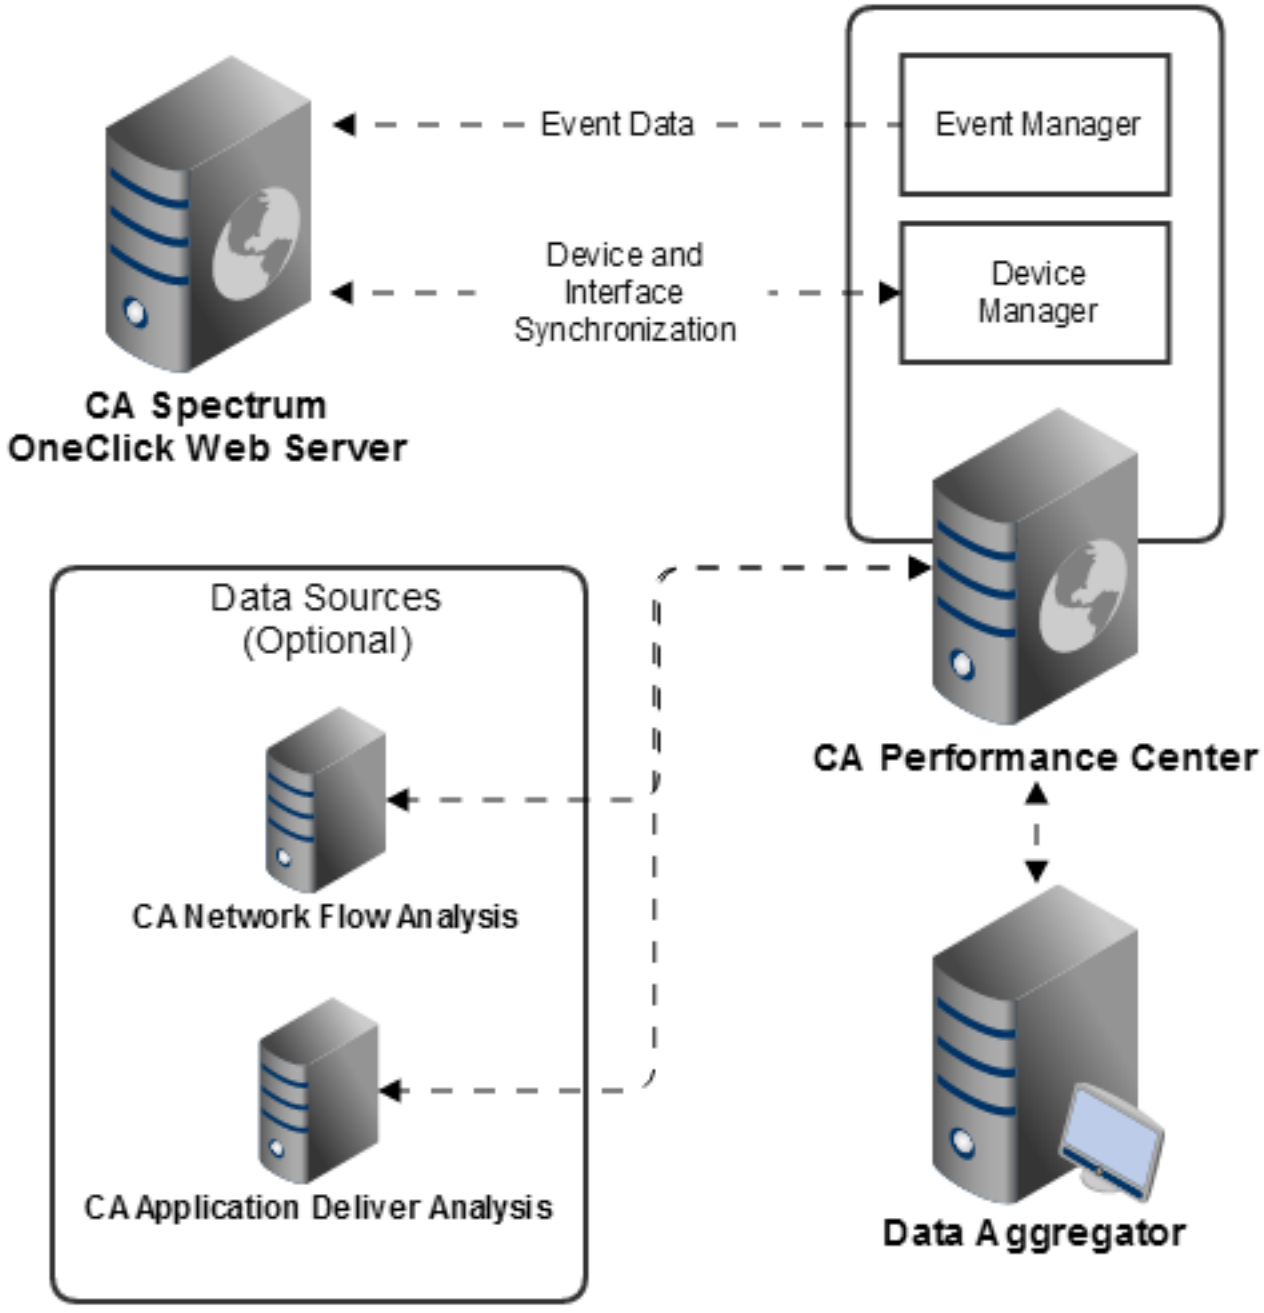
Alarm Integration

Alarms views in NetOps Portal let you view and manage DX NetOps Spectrum alarms. An alarms view provides a prioritized list of DX NetOps Spectrum alarms, which helps you quickly focus on resolving the most impactful problems. The alarms view also provides visibility into other, potentially related, issues on the same device, or connected to a device. For more information, see Alarms View.

Integration Architecture

The following image illustrates the architecture of the integration:

Figure 65: Solution Architecture with CA Spectrum and CA Performance Management



The OneClick server synchronizes devices with the device manager on the NetOps Portal host. The OneClick server polls the event manager for performance events.

- One SpectroSERVER or a Distributed SpectroSERVER (DSS) can be synchronized with DX NetOps Performance Management by specifying the OneClick web server as a data source.
- Each landscape in the DSS is defined as a NetOps Portal group.
- Devices and interfaces in the DSS are synchronized with DX NetOps Performance Management and added to the appropriate landscape group.
- OneClick polls the Event Manager for events that are relevant to a specified landscape group. This polling occurs every 60 seconds by default. Any retrieved events are then translated to DX NetOps Spectrum events, which can generate or clear alarms.
  DX NetOps Spectrum only processes alarms for devices and interfaces that are synchronized to DX NetOps Performance Management.

Integrate DX Spectrum with DX Performance Management

To monitor DX NetOps Spectrum devices and interfaces with DX NetOps Performance Management and process DX NetOps Performance Management events in DX NetOps Spectrum, configure the integration.

Verify the Prerequisites

To ensure a successful integration, confirm the following prerequisites:

- To verify that the product versions are compatible, see the Data Source Compatibility Matrix.

  NOTE

  To utilize DX NetOps Virtual Network Assurance 3.6 with DX NetOps Spectrum, install DX NetOps Virtual Network Assurance 3.6 or DX NetOps Virtual Network Assurance 3.5.1 (available from Support), and DX NetOps Spectrum 10.2.3 available from the Downloads area.
- To discover DX NetOps Spectrum devices with the Data Aggregator, verify that the Data Aggregator is configured correctly:
  a. Hover over **Administration**, and click **Data Sources: Data Sources**.
  b. Select the Data Aggregator data source, and click **Edit.**
  c. Select **Discover devices from other data sources**.
  d. Click **Save**.

  For more information, see Configure a Data Source.
- Create IP domains in NetOps Portal for each IP routing space that DX NetOps Spectrum monitors. For more information, see IP Domains.
- For each IP domain, install a Data Collector and assign it to that IP domain. For more information, see Install the Data Collectors.
- For event integration, verify that the DX NetOps Spectrum OneClick server can communicate to the NetOps Portal host on port 8281.

Configure DX NetOps Spectrum as a Data Source

To connect DX NetOps Performance Management and DX NetOps Spectrum, add DX NetOps Spectrum as a data source in NetOps Portal.

Follow these steps:

1. In NetOps Portal, hover over **Administration**, and click **Data Sources: Data Sources**.
2. Click **Add**.
3. Select **Spectrum Infrastructure Manager** in the **Source Type** field.
4. Specify the following information:
   – **Host Name**

The IP address or DNS host name of the OneClick server

- **Port**
  The communication port for the OneClick server
  Default: 8080 (Unix), 80 (Windows)

5. Select the communication protocol.
   Before you select **https**, ensure the following prerequisites:
   - SSL is enabled on the OneClick web server host by configuring the server.xml and axis2.xml files appropriately.
   - The OneClick SSL certificates and any intermediate certificates have been imported to the following file on the NetOps Portal host: `/opt/CA/jre/lib/security/cacerts`
     For more information, see the DX NetOps Spectrum documentation.
6. (Optional) Specify a display name for the data source.
   By default, the data source type and the hostname are combined to create the display name.
7. If the Web Console is *not* on the OneClick server, clear this option, and specify the host name, port, and protocol for the Web Console server.
8. (Optional) To enable DX NetOps Spectrum to control the life cycle state of items in DX NetOps Performance Management, select **Synchronize device life cycle state from Spectrum**.
9. Specify the username and password of an administrator account on DX NetOps Spectrum with access to the REST API.
10. Click **Test** to verify that DX NetOps Performance Management can contact the OneClick server and the Web Server.
11. Click **Save.**
    DX NetOps Performance Management begins synchronization with DX NetOps Spectrum. DX NetOps Performance Management IP domains appear in DX NetOps Spectrum.

Enable Monitoring in DX NetOps Performance Management

This integration configures DX NetOps Performance Management to monitor DX NetOps Spectrum devices for performance data.

Create SNMP Profiles

SNMP profiles provide authentication credentials to communicate with devices in the monitored network.

> **TIP**
>
> In a multi-tenant environment, create the SNMP profiles in the tenants that include the IP domain to which the DX NetOps Spectrum devices were added.

Follow these steps:

1. Hover over **Administration**, and click **Configuration Settings: SNMP Profiles**.
2. Click **New**.
3. Complete the fields, and change any default settings. Some fields apply only to SNMPv3.
   For complete details, see SNMP Profiles.
4. Click **Save**.
   The SNMP profile is added to the system and used for discovery and polling.

Add Device Models to IP Domain Models

To select which DX NetOps Spectrum devices are discovered in DX NetOps Performance Management, add those devices to the CA NetOps Portal IP domain Global Collections in OneClick. When synchronization occurs, all IP domains are sent to DX NetOps Spectrum. Use search rules to update IP domain membership dynamically in DX NetOps Spectrum.

DX NetOps Spectrum devices can only be members of a single IP domain. If you attempt to add a model to multiple IP domains, you see an error message.

IP domains are designated with the following icon in OneClick:

Add Devices to IP Domains Manually

Follow these steps:

1. In any topology, select a device model, right-click the model, and click **Add To, Global Collection(s)**.
   The Select Global Collections dialog opens. The IP Domain models appear in the list of Global Collections.
2. Select the IP domain model, and click **OK**.
   DX NetOps Spectrum adds the devices to the selected IP domain during synchronization.

Update IP Domain Membership Dynamically

Follow these steps:

1. In the **Explorer** tab of the **Navigation** panel, find the **Global Collections** node, and then locate the **NetOps Portal IP Domains**.
2. Right-click an IP domain, and then click **Edit Global Collection**.
   The Edit Global Collection dialog opens.
3. Click **Search Options**, and create search expressions according to the DX NetOps Spectrum Documentation.
4. To identify the landscapes to include when searching, click **Landscapes**.
5. Click **OK**.
   The search rules create dynamic membership for the NetOps Portal IP domain. Changes to the membership are automatically synchronized to DX NetOps Performance Management.

Discovery in DX NetOps Performance Management

During the next synchronization, DX NetOps Spectrum sends the device IP addresses to the selected IP domains in DX NetOps Performance Management. DX NetOps Performance Management reconciles the synchronized devices with existing devices. If the IP address does not belong to a device that the Data Aggregator already monitors, the IP address is added to a discovery profile with the following properties:

- The name of the discovery profiles is the same as the name of the IP domain.
- By default, the discovery profile runs daily.
- To avoid the buildup of IP addresses, the IP address is removed from the discovery profile after the device is discovered.

> **TIP**
> To enable rediscovery, add the IP address of the DX NetOps Spectrum devices to another discovery profile in DX NetOps Performance Management.

For more information about discovery in DX NetOps Performance Management, see Discovery.

Configure Monitoring

To control the performance metric polling from DX NetOps Performance Management, sort the DX NetOps Spectrum devices into collections and configure monitoring profiles. For more information, Configure Monitoring Profiles.

Configure Threshold Profiles

DX NetOps Performance Management analyzes configurable performance thresholds and creates events when performance metrics violate those thresholds. DX NetOps Spectrum process the events and creates alarms on the appropriate models. To create events, configure threshold profiles. For more information, see Configure Threshold Profiles.

Enable Event Polling in DX NetOps Spectrum

Configure event polling in DX NetOps Spectrum. The SpectroSERVER polls the NetOps Portal host for DX NetOps Performance Management threshold events on devices that are modeled in DX NetOps Spectrum. The alarms appear in DX NetOps Spectrum 1-2 minutes after the events occur in DX NetOps Performance Management.

> **TIP**
> You can customize event integration.
> For more information, see Customize Event Integration.

Follow these steps:

1. From the OneClick home page, click **Administration**.
2. In the left panel, click **NetOps Portal Integration Configuration**.
3. For Event Polling, specify the poll interval in seconds, and select **Enabled**.
   Default: 60 seconds
4. Click **Save**.
   DX NetOps Spectrum starts polling events on the next poll cycle.

Send Traps to DX NetOps Spectrum

To send traps to DX NetOps Spectrum, define a matching SNMP Profile in DX NetOps Spectrum and DX NetOps Performance Management. To map the traps from a device to specific DX NetOps Spectrum events, use the MIB Tools application in OneClick. Then complete event customization using Event Configuration. In Event Configuration, define event processing rules, create the event message to display to users, and set other parameters. For more information, see the CA Spectrum documentation.

Multi-tenancy and DX NetOps Spectrum

For more information about multi-tenancy and DX NetOps Spectrum, see Multi-tenancy and CA Spectrum.

Customize Event Integration

By default, DX NetOps Spectrum polls threshold violation and clear events only. You can also configure DX NetOps Spectrum to poll for any events in the DX NetOps Performance Management Event Manager database. To process other events from DX NetOps Performance Management, customize the events that DX NetOps Spectrum polls.

> **NOTE**
> For DX NetOps Spectrum to process an event, the device or port must be modeled in CA Spectrum and included in the synchronization process. To process events that are not associated with an item that is modeled in DX NetOps Spectrum, configure a DX NetOps Performance Management trap notification and use the DX NetOps Spectrum South Bound Gateway.

To determine the event types available to add to DX NetOps Spectrum, see the `em.event_types` table in the Event Manager database.

To configure DX NetOps Spectrum to poll for specific events, complete the following procedures:

Review the Integration Example

This example shows how to configure CA Spectrum to poll for a specific event in the Event Manager database. The event in this example identifies when a router device experiences high memory usage.

1. Identify a device or port for which you want DX NetOps Spectrum to poll for in the Event Manager database. If the device or port is not modeled in DX NetOps Spectrum, model the element. For example, to monitor specific events for a particular router, the router must be modeled in the DX NetOps Spectrum database.
2. Obtain a developer ID from CA Technical Support for use with DX NetOps Spectrum - DX NetOps Performance Management integration. This example uses the default developer ID value, 0xffff.
3. Identify the events for which DX NetOps Spectrum polls. For example, you can identify "Incident" events that originates from CA Application Delivery Analysis.
4. Define the event by modifying the XML file:
   a. Copy the following file to `<$SPECROOT> /custom/netqos/config/container/netqos-integration-application-config.xml:`
   `<$SPECROOT>\tomcat\webapps\spectrum\WEB-INF\netqos\config\container\netqos-integration-application-config.xml`
   b. Open the copied file for editing:
   `/custom/netqos/config/container/netqos-integration-application-config.xml`
   c. Define the custom event. Update the existing eventTypeManager element as follows: add the "Incident" event to the list of events for which to poll, establish an alarm map value, and specify a default alarm clear code.
   The following code shows these changes. Notice that the alarm clear code uses a developer ID.

```
<bean id="eventTypeManager"
   class="com.ca.im.netqos.integration.event.type.EventTypeManager">
   <property name="interestingEventTypes">
     <map>
       <entry key="ThresholdViolation" value-ref="thresholdViolationAlarmCodes" />
       <entry key="Incident" value-ref="IncidentAlarmCodes" />
     </map>
   </property>
   <property name="alarmClearCodes">
     <map>
       <entry key="ThresholdViolation" value="0x5c40009" />
       <entry key="Incident" value="0xffff0004" />
     </map>
   </property>
</bean>
```

   d. Define the alarm map by adding the following new bean element:

```
<bean id="IncidentAlarmCodes"
    class="org.springframework.beans.factory.config.MapFactoryBean">
    <property name="sourceMap">
      <map>
        <entry key="1" value="0xffff0001" />
        <entry key="2" value="0xffff0002" />
        <entry key="3" value="0xffff0003" />
      </map>
    </property>
</bean>
```

   e. Save and close the file.
5. Specify how DX NetOps Spectrum processes the encountered event by updating the Event Disposition file:
   a. Open the following file for editing:
   `<$SPECROOT>\SS\CsVendor\netqos\EventDisp`

b. Add the following map entries for the "Incident" event:

```
#Incident Event
0xffff0001E 50 A 1, 0xffff0001,107
0xffff0002E 50 A 2, 0xffff0002,107
0xffff0003E 50 A 3, 0xffff0003,107
0xffff0004E 50 C 0xffff0001,107 C 0xffff0002,107 C 0xffff0003,107
```

c. Save and close the file.

WARNING

Back up this file in case the contents are changed during a DX NetOps Spectrum upgrade.

6. Create an event format file for each of the alarm codes using the following naming convention (*AlarmCode* - *EventFormatFile*):
   - 0xffff0001 - Eventffff0001
   - 0xffff0002 - Eventffff0002
   - 0xffff0003 - Eventffff0003
   - 0xffff0004 - Eventffff0004
   - Create a text file containing content similar to the following text:

```
{d "%w- %d %m-, %Y - %T"} - {S 109} is reporting a minor threshold violation.
Detail of Threshold Violation:
        1) Incident Start Time: {D 111}
        2) Event ID: {S 107}
        3) Event Source: {S 113}
        4) Alert Message: {S 76620}
A corresponding minor Threshold Violation Alarm will be generated.
(event [{e}])
```

NOTE
When creating Eventffff0004, use appropriate wording for clearing an alarm.

   - Save the file to the following location:

```
<$SPECROOT>\SG-Support\CsEvFormat
```

   - Repeat steps a and b for each alarm code.
7. Create a probable cause file for each of the alarm codes using the following naming convention (*AlarmCode* - *ProbableCauseFile*):
   - 0xffff0001 - Probffff0001
   - 0xffff0002 - Probffff0002
   - 0xffff0003 - Probffff0003
   - 0xffff0004 - Probffff0004
   - Create a text file containing content similar to the following text:

```
A minor threshold violation has occurred.
SYMPTOMS:
The monitored threshold has been exceeded.
PROBABLE CAUSES:
RECOMMENDED ACTIONS:
Launch the "Performance View" to see incident details.
```

   - Save the file to the following location:

```
<$SPECROOT>\SG-Support\CsPCause
```

   - Repeat steps a and b for each alarm code.
8. Restart the SpectroSERVER and OneClick servers.
   When the integration is complete, DX NetOps Spectrum uses the updated files to poll for the "Incident" event, generating events and alarms as specified.

Obtain a Developer ID

When defining events for the DX NetOps Spectrum - DX NetOps Performance Management integration, you use identifying event codes. The first 2 bytes of any event code contain a developer ID. You can obtain a registered developer ID from CA so that you can specify unique codes for your events. Using a unique developer ID lets you easily recognize your new codes in OneClick. Doing so also prevents potential conflicts with other DX NetOps Spectrum event codes.

To obtain a developer ID from CA, contact CA Technical Support.

Update the netqos-integration-application-config.xml File

DX NetOps Spectrum uses the netqos-integration-application-config.xml file to determine the events for which to poll. DX NetOps Spectrum polls for ThresholdViolation events by default. To poll for more events, modify the netqos-integration-application-config.xml to define the event codes and associated alarms for each event.

The netqos-integration-application-config.xml file is located in the following directory:

```
$SPECROOT\tomcat\webapps\spectrum\WEB-INF\netqos\
config\container
```

Define Events

The eventTypeManager bean defines the events for which DX NetOps Spectrum polls. The entries for ThresholdViolation events appear in the file by default. You can manually add more events.

```
<bean id="eventTypeManager"
   class="com.ca.im.netqos.integration.event.type.EventTypeManager">
   <property name="interestingEventTypes">
     <map>
       <entry key="ThresholdViolation" value-ref="thresholdViolationAlarmCodes" />
       <entry key="TestEvent" value-ref="TestEventAlarmCodes" />
     </map>
   </property>
   <property name="alarmClearCodes">
     <map>
       <entry key="ThresholdViolation" value="0x5c40009" />
       <entry key="TestEvent" value="TestEventAlarmClearCode" />
     </map>
   </property>
</bean>
```

Update the following property elements to add events that DX NetOps Spectrum can include in polling:

- **interestingEventTypes**
  Specifies the types of events to include in polling. Each entry element identifies a specific event type and an alarm code map value. The ThresholdViolation entry is included by default. Add an entry element, as follows:
  ```
  <entry key="TestEvent" value-ref="TestEventAlarmCodes" />
  ```
  – ***TestEvent***
    Specifies the name of an event in the Event Manager database.
  – ***TestEventAlarmCodes***
    Specifies the value of the map that identifies the alarms for this event.

    NOTE
    The alarm code map is described in the next section.
- **alarmClearCodes**

Specifies the alarm clear codes for polled events. The default alarm clear code for the ThresholdViolation event is 0x5c40009. For each event, add an entry element, as follows:

```
<entry key="TestEvent" value="TestEventAlarmClearCode" />
```

– ***TestEvent***
Specifies the name of the event that was added for polling.
– ***TestEventAlarmClearCode***
Specifies the alarm clear code for the event.

Define Alarms

An alarm map defines the alarm code values that are associated with a particular event. For each polled event (or, each interestingEventTypes entry), a corresponding alarm map must be defined. The alarm map for the ThresholdViolation event appears in the file by default. An alarm map for each custom event must be added manually.

```
<bean id="thresholdViolationAlarmCodes"
    class="org.springframework.beans.factory.config.MapFactoryBean">
    <property name="sourceMap">
      <map>
        <entry key="1" value="0x5c40010" />
        <entry key="2" value="0x5c40011" />
        <entry key="3" value="0x5c40012" />
      </map>
    </property>
</bean>
<bean id="testEventAlarmCodes"
    class="org.springframework.beans.factory.config.MapFactoryBean">
    <property name="sourceMap">
      <map>
        <entry key="alarmSev1" value="alarmCode1" />
        <entry key="alarmSev2" value="alarmCode2" />
        <entry key="alarmSev3" value="alarmCode3" />
      </map>
    </property>
</bean>
```

To add alarm maps for custom events, add a bean element for each event and update the following values:

- ***testEventAlarmCodes***
Specifies the alarm code map value for a particular event. This value is established on the interestingEventTypes entry and must match that value.
- ***alarmSev1 - alarmCode1, alarmSev2 - alarmCode2, alarmSev3 - alarmCode3***
Specifies the *alarmSeverity* - *alarmCode* pairs for a particular event. For example, for the default ThresholdViolation event, the Minor (1), Major (2), and Critical (3) alarm codes are 0x5c40010, 0x5c40011, and 0x5c40012, respectively.

Update the Event Disposition File

The Event Disposition (EventDisp) file is used to determine how to process the events that are configured in the netqos-integration-application-config.xml file. Each event entry maps an event to a DX NetOps Spectrum event file.

The EventDisp file for DX NetOps Spectrum - DX NetOps Performance Management integration is located in:

```
<$SPECROOT>\SS\CsVendor\netqos
```

For the default ThresholdViolation event, the following entries map the alarm codes to individual DX NetOps Spectrum event files:

```
text#PC Threshold 0x5c40010 E 50 A 1,0x5c40010,107 0x5c40011 E 50 A 2,0x5c40011,107 0x5c40012 E 50 A
 3,0x5c40012,107 0x5c40009 E 50 C 0x5c40010,107 C 0x5c40011,107 C 0x5c40012,107
```

For each custom event, add new event map entries to the file. The following example shows syntax that generates or clears alarms that are based on the event code.

```
text#New Event alarmCode1E 50 A 1, alarmCode1_filename,107 alarmCode2E 50 A 2,
 alarmCode2_filename,107 alarmCode3E 50 A 3, alarmCode3_filename,107 alarmClearCode4E
 50 C alarmCode1,107 C alarmCode2,107 C alarmCode3,107
```

Create Event Format Files

An event format file contains the message about the event that is displayed to users on the Events tab in OneClick. Each new event that is defined in the netqos-integration-application-config.xml file requires an event format file. The file enables the event to display correctly in the OneClick Events view.

The file name must match the alarm code (for example, alarm code 0x5c40010 uses the file "Event05c40010"). And the file must exist in the following directory:

```
<$SPECROOT>\SG-Support\CsEvFormat
```

The following example shows the file format:

```
text{d "%w- %d %m-, %Y - %T"} - {S 109} is reporting a minor threshold violation. Detail of Threshold
 Violation: 1) Incident Start Time: {D 111} 2) Event ID: {S 107} 3) Event Source: {S 113} 4) Alert Message: {S
 76620} A corresponding minor Threshold Violation Alarm will be generated. (event [{e}])
```

Create Probable Cause Files

A probable cause file defines the symptoms, probable causes, and recommended corrective actions for an alarm. Each new alarm code requires a probable cause file so that the alarm displays correctly in the OneClick Alarms view.

The file name must match the alarm code (for example, alarm code 0x5c40010 uses the file "Prob05c40010"). And the file must exist in the following directory:

```
<$SPECROOT>\SG-Support\CsPCause
```

The following example shows the file format:

```
textA minor threshold violation has occurred. SYMPTOMS: The monitored threshold has been exceeded. PROBABLE
 CAUSES: RECOMMENDED ACTIONS: Launch the "Performance View" to see incident details.
```

Deploy the Changes

After you complete your configuration changes, restart the SpectroSERVER and OneClick servers.

Event polling now reflects your changes.

> **NOTE**
>
> If you have multiple SpectroSERVERs, distribute the event file configuration changes to all servers.

RouterHighMemor

Integrate CA Business Intelligence

The CA Business Intelligence integration with DX NetOps Performance Management offers access to CA Business Intelligence reports and dashboards through NetOps Portal.

CA Business Intelligence (CABI) reports for DX NetOps Performance Management offer portable graphical representations of DX NetOps Performance Management performance metrics. To run a CA Business Intelligence report for DX NetOps Performance Management, install the CA Business Intelligence JasperReports Server. DX NetOps Performance Management content is delivered through a Connector for the CA Business Intelligence JasperReports Server. For more information, see Install CA Business Intelligence Reports and Dashboards.

WARNING

CA Business Intelligence does not support FIPS-compliant encryption. If you enable FIPS-compliant encryption, you cannot register or use CA Business Intelligence. For more information, see FIPS-Compliant Encryption.

Run and access reports based on your DX NetOps Performance Management product privileges. View CA Business Intelligence dashboards in NetOps Portal to evaluate performance metrics including high-level representations of your sites and their monitored devices. For more information, see CA Business Intelligence Reports and Dashboards.

DX NetOps Performance Management integrates with CA Business Intelligence in two ways:

- DX NetOps Performance Management connects to a standalone CA Business Intelligence instance. In this deployment, CA Business Intelligence contains only DX NetOps Performance Management data.
- The *Unified Dashboards and Reporting for Infrastructure Management* solution lets you integrate a single instance of CA Business Intelligence with the following products:
- – DX NetOps Performance Management
  – CA Unified Infrastructure Management
  – DX NetOps Spectrum
  – CA Service Operations Insight

Sharing a single instance of CA Business Intelligence reduces the number of CA Business Intelligence instances that you are required to deploy and maintain. Sharing CA Business Intelligence also enables dashboards that span multiple products, giving you a new level of insight. For more information, see Unified Dashboards and Reporting for Infrastructure Management.

Verify the Prerequisites

For the following information, see the Compatibility Matrix and the CA Business Intelligence documentation:

NOTE

Java 8 is required on the machine where CA Business Intelligence is installed. Java 7 is not supported.

- The supported CA Business Intelligence JasperReports Server versions
- The required third-party tools for the CA Business Intelligence JasperReports Server installation
- The CA Business Intelligence JasperReports Server installation procedure

NOTE

Carefully review the CA Business Intelligence documentation for the list of RHEL Linux versions that support a GUI installation. Use the silent installation for all other versions.

Install CA Business Intelligence Reports and Dashboards

The following procedures apply to configuring the standalone CABI integration and the Unified Dashboards and Reporting for Infrastructure Management solution. For more information, see Unified Dashboards and Reporting for Infrastructure Management.

After you install the CA Business Intelligence JasperReports Server, use the following procedures to set up and run CA Business Intelligence reports in NetOps Portal.

WARNING
A Windows install is unsupported for CA Business Intelligence 7.1.1.

Install Reports on the CA Business Intelligence JasperReports Server

To make CA Business Intelligence reports that use DX NetOps Performance Management data available, install them on the CA Business Intelligence JasperReports Server.

The capm_reports-xxxx.zip package (where "xxxx" is the package version) is located in the *Installation_Directory*/PerformanceCenter/cabi folder after the DX NetOps Performance Management installation.

For CA Business Intelligence on Windows, before you install the reports, Powershell must be enabled.

The installation script can be used for a fresh installation or an upgrade. The script covers the following items:

- Data source connector files
- Data source connector configuration
- NetOps Portal host name, port, and schema definition
- Report files
- Dasboard/dashlets files
- Common folder structure to use in Shared CABI environment

User administration and authentication setting updates are excluded from the script and must be configured manually.

Follow these steps:

1. Verify that the CA Business Intelligence JasperReports Server is available.
2. Copy the capm_reports-xxxx.zip file to the CA Business Intelligence JasperReports Server host and unpack it into a folder for the reports.

   NOTE

   Ensure the report archive (capm_topn-x.x.x.zip) and the data source archive (capm_da-x.x.x.zip) are in the same folder on CA Business Intelligence JasperReports Server as the installation scripts.
3. Run the Install.bat (Windows) or Install.sh (Unix) installation script.

   WARNING

   The DX NetOps Performance Management CA Business Intelligence content installation requires a CA Business Intelligence tomcat instance restart. The CA Business Intelligence web interface is unavailable for approximately 10-15 minutes after the installation start. Ensure that the installation process is done during an appropriate maintenance window.
4. Complete the following prompts:
   - **Input a CA PC target host**
     Specify the NetOps Portal host name. Do not specify the Data Aggregator host name.
   - **Input the NetOps Portal GUID**

     NOTE

     This prompt appears only when the installer cannot connect to the NetOps Portal server and get GUID automatically.

   The NetOps Portal GUID (unique) is used as the default password, and must be configured correctly. The GUID passes to the Data Aggregator to ensure that the request is going to the correct NetOps Portal instance.
   The following web service call on the NetOps Portal host retrieves this information:
   `http://PC_host:8181/pc/center/webservice/datasources/performanceCenterGUID`
   Example Response:

```
<dataSourceGUID name="CA Performance Center" guid="66750a6b-57f6-440e-b501-
d79134d9bb61"/>
```

- **Input a target CA PC port [8181]**
  Specify the NetOps Portal port.
  Default: 8181
- **Input a target schema http/https [http]**
  Specify http or https.
  Default: http
- **CA PC admin user [admin]**
  Specify the NetOps Portal admin user.
  Default: admin
- **CA PC admin user password [admin]**
  Specify the password for the NetOps Portal admin user.
  Default: admin

The script can take up to 10 minutes to complete the installation.

5. To configure the values that are required for generating the OpenAPI token, go to the following location:
   CABIJasperReportsServer/WEB-INF/bundles
6. Edit the capc_config.properties file.

   NOTE

   The OpenAPI token setting values must match the parameter values on the Data Aggregator for (`cookieName` , `tokenEncryptionDecryptionKey` , and `tokenTimeoutInMinutes`) in the following location:

   ```
   /opt/IMDataAggregator/apache-karaf-2.4.3/etc/
   com.ca.im.odata.authservice.impl.AuthenticationService.cfg
   ```

   - **openAPIcookieName**
     The name of the cookie containing the token. This value should match the `cookieName` value.
   - **encryptionKey**
     The key that is used to decrypt incoming tokens. This value should match the `tokenEncryptionDecryptionKey` value.
   - **tokenTimeout**
     The length of time, after which, the token is invalidated. This value should match the `tokenTimeoutInMinutes` value.

Configure User Synchronization

When DX NetOps Performance Management integrates with CA Business Intelligence, you create and manage users in CA NetOps Portal. The users that you create in CA NetOps Portal are replicated in CA Business Intelligence. Replicated users can access reports and dashboards without having to log in to CABI.

NOTE

Note the following:

- User names that contain the following special characters are not synchronized with the CABI Server:
  – , \ | ` " ' ~ ! # $ % ^ & [ ] * + = ; : ? < > } {) (/
  – Spaces
- Synchronization between DX NetOps Performance Management and CA Business Intelligence occurs every 5 minutes. Users that you create in CA NetOps Portal may take up to 5 minutes to appear in CA Business Intelligence.

WARNING

LDAP support is planned for a future DX NetOps Performance Management release.

Follow these steps:

1. On the CA Business Intelligence system, copy the following files in <*CA Business Intelligence*> `/apache-tomcat/webapps/jasperserver-pro/WEB-INF/config`:
   - capm.properties
   - capm.jks
2. Add the copied files in the following location on the system where CA NetOps Portal is installed:
   <*CA NetOps Portal*>/PC/webapps/pc/WEB-INF/CABIKeystore
3. Add CA Business Intelligence Jaspersoft Server as a data source.

Add a Certificate for SSL-Enabled NetOps Portal

For reporting to work in an SSL-Enabled NetOps Portal instance, you must add the appropriate certificates to the CA Business Intelligence trust store. The appropriate certificates are the root or intermediate certificates comprising the chain of trust for the NetOps Portal public certificate. For more information, see Set Up SSL Certificates for Performance Center.

Follow these steps:

1. On the CA Business Intelligence server, enter the following URL in a browser to open CA NetOps Portal:
   https://<*capc_hostname*>:8182
   A warning about an un-trusted certificate appears in the browser.
   The browser prompts you to get the certificate.
2. Save the certificate with the following name in a local folder:
   capc_cert.cer
   The certificate that you saved is the CA NetOps Portal public certificate.

   WARNING

   If the CA NetOps Portal public certificate is not self-signed, you must import the root and intermediate certificates used for signing the CA NetOps Portal public certificate.

   To save the certificate:
   a. Click the certificate warning button near the URL.
   b. Click Details, Copy to File.
   c. Select (DER encoded binary X.509 (.CER)).
3. Open the command line by entering `cmd`.
4. CD to the folder `<CABI_INSTALL_FOLDER>/java/lib/security`
   The folder should contain the cacerts file. The cacerts file is the CA Business Intelligence trust store file.
   If the cacerts file is not in the security folder, search for the folder under the <*CABI_INSTALL_FOLDER*>.
5. Run the following command:
   ```
   <PATH_TO_JAVA>/bin/keytool -importcert -alias ALIAS -keystore cacerts -file <path>/capc_cert.cer
   ```

   NOTE

   In the -file parameter, <path> indicates the full path to the capc_cert.cer file.
6. Enter the password for the cacerts trust store. The default password is "changeit." Then, enter Yes.
7. CD to the folder `<CABI_INSTALL_FOLDER>/jre/lib/security`
   The folder should contain the cacerts file. The cacerts file is the CA Business Intelligence trust store file.
   If the cacerts file is not in the security folder, search for the folder under the <*CABI_INSTALL_FOLDER*>.
8. Run the following command:

```
<PATH_TO_JAVA>/bin/keytool -importcert -alias ALIAS -keystore cacerts -file <path>/
capc_cert.cer
```

NOTE

In the -file parameter, <path> indicates the full path to the capc_cert.cer file.

9. Enter the password for the cacerts trust store. The default password is "changeit." Then, enter Yes.
10. Restart the CA Business Intelligence service.

Configure the CA Business Intelligence Authentication

The following OpenAPI configuration file is available on the Data Aggregator in the /opt/IMDataAggregator/apache-karaf-2.4.3/etc directory:

- com.ca.im.odata.authservice.impl.AuthenticationService.cfg

Customize the following parameters to match the configuration on the CA Business Intelligence server:

- **cookieName**
  The name of the cookie containing the token. This value should match the `openAPIcookieName` value.
- **tokenEncryptionDecryptionKey**
  The key that is used to decrypt incoming tokens. This value should match the `encryptionKey` value.
- **tokenTimeoutInMinutes**
  The length of time, after which, the token is invalidated. This value should match the `tokenTimeout` value.

Verify Time Synchronization

Date and time settings in CA NetOps Portal and CA Business Intelligence must be synchronized. If the date and time settings are not synchronized, an error can occur when users access reports. The error occurs when the difference in time exceeds the Cookies Expiration Timeout set in CA NetOps Portal (Default: 20 minutes).

Silent Installation for CA Business Intelligence Reports and Dashboards

You can automate the installation of reports and dashboards by specifying installation responses in a configuration file, which is called by the install script. In this case, configuration is specified in a single file rather than as manual responses to the installation script.

The following procedures apply to configuring the standalone CABI integration and the Unified Dashboards and Reporting for Infrastructure Management solution. For more information, see Unified Dashboards and Reporting for Infrastructure Management.

After you install the CA Business Intelligence JasperReports Server, use the following procedures to set up and run CA Business Intelligence reports in NetOps Portal.

To perform a silent installation, follow these steps:

1. Complete the steps in Install CA Business Intelligence Reports and Dashboards. Instead of following the procedure in the section called *Install Reports on the CA Business Intelligence JasperReports Server*, complete steps 2 - 4 in this procedure.
2. Copy the capm_reports-xxxx.zip file to the CA Business Intelligence JasperReports Server host and unpack it into a folder for the reports.
   The capm_reports-xxxx.zip package (where "xxxx" is the package version) is located in the Installation_Directory/PerformanceCenter/cabi folder after the DX NetOps Performance Management installation.

NOTE

Ensure the report archive (capm_topn-x.x.x.zip) and the data source archive (capm_da-x.x.x.zip) are in the same folder on CA Business Intelligence JasperReports Server as the installation script

3. Create a Silent Installation configuration file to be used during the process. The file must have following structure:
   a.
   ```
   CABIPath="path_to_CABI"
   host=capc_hostname
   guid=capc_guid
   port=capc_port
   schema=[HTTP|HTTPS]
   JKSRECREATE=No
   ```

   Specify the following information in the configuration file:
   - **CABIPath**: Specify a path to the installed CA Business Intelligence JasperReports Server. If you specify a path with spaces in it, enclose the path in quotation marks.
     - **Default:** `/opt/CA/SharedComponents/CA Business Intelligence`

       WARNING

       Do not add the back slash character '\' or forward slash character "/" to the end of the CABIPath value.
   - **host:** Specify the NetOps Portal host name. Do not specify the Data Aggregator host name.
   - **guid**: Specify a PerformanceGUID for the data source. The NetOps Portal GUID (unique) is used when the password for the CA Business Intelligence web user is not available. This information passes to the Data Aggregator to ensure that the request is going to the correct NetOps Portal instance. A web service call on NetOps Portal retrieves this information.
     GUID Endpoint URL: `http://hostname:8181/pc/center/webservice/datasources/performanceCenterGUID`
   - **port**: Specify the CA NetOps Portal port that the data source uses for retrieval.
     Default: 8181
   - **schema**: Specify HTTP or HTTPS.
     Default: HTTP
     Note: On Linux, you must specify LF at the end of each line.

- Run install.bat on Windows or install.sh on Linux with –silent parameter and a path to a silent installation file. If path or file name contains spaces, enclose the complete path in quotes.
  Examples:
  Windows:
  ```
  install.bat –silent "D:\path to silent install file\silent_params.txt"
  install.bat –silent silentParams.txt
  ```
  Linux:
  ```
  ./install.sh –silent "/path to silent install file/silent_params.txt"
  ./install.sh –silent silentParams.txt
  ```

  WARNING

  Important! After you install the reports and dashboards, complete the steps in the following sections in Install CA Business Intelligence Reports and Dashboards:

  Manage Users

  Add a Certificate for SSL-Enabled NetOps Portal

  Configure the CA Business Intelligence Authentication

Troubleshooting

If the silent installation fails, review the install.log file that is located in the same directory as the installation script.

Symptom:

The install fails and the following error appears:

```
ERROR: The system was unable to find the specified registry key or value.
There is no java.exe in the directory
Installation failed
```

Solution:

For installing on Windows as a non-admin user, use the manual installation steps. For more information, see Install CA Business Intelligence Reports and Dashboards.

Silent Uninstall of the CA Business Intelligence Reports and Dashboards

You can specify uninstall responses in a configuration file to automate the uninstall of reports and dashboards. This silent uninstall removes all content and files related to CA Business Intelligence reports and dashboards.

Follow these steps:

1. Add the uninstall responses to a configuration file with the following structure:

```
CABIPath="CABI_path"

host=PC_host

port=PC_port

schema=Schema
CABIuser=CABI_user
CABIpwd=CABI_password
```

   - ***CABI_path***
     Specify a path to the CA Business Intelligence JasperReports Server. If you specify a path with spaces in it, enclose the path in quotation marks.
     Default: `/opt/CA/SharedComponents/CA Business Intelligence`
   - ***PC_host***
     Specify the local host name where CA Business Intelligence was installed.
     Default: `localhost`
   - ***PC_port***
     Specify the local tomcat port.
     Default: 8080
   - ***Schema***
     Specify HTTP or HTTPS.
     Default: http
   - ***CABI_user***
     Specify the user with administrative privilege.

Default: `superuser`

– ***CABI_password***
Specify the password for the user with administrative privilege.
Default: `superuser`

2. Run `install.bat` on Windows or `install.sh` on Linux with the `-silent` and `-uninstall` parameter and a path to the silent uninstall file. If the path or file name contains spaces, enclose the complete path in quotes.
Examples:
Windows:

```
install.bat -silent "D:\silent_uninstall_path\silent_uninstall_file.txt" -uninstall
install.bat -silent silent_uninstall_file.txt -uninstall
```

Linux:

```
./install.sh -silent "/silent_uninstall_path/silent_uninstall_file.txt" -uninstall
./install.sh -silent silent_uninstall_file.txt - uninstall
```

Troubleshooting

If the silent uninstall fails, review the install.log file that is located in the same directory as the installation script.

Configure High Availability with CA Business Intelligence

High Availability (HA) is the ability for the system to continue functioning after the failure of one or more of the servers. A part of High Availability is failover. Failover is the ability for user connections to migrate from one server to another. If there is a server failure, the user applications can continue to operate. Enabling High Availability (HA) helps achieve load balancing, failover, and scalability features. CA Business Intelligence JasperReports® Server uses an HTTP Server. As a result, the failover occurs for e-node and the load balancer or router is appropriate for HTTP Server-based application. For more information, see the CA Business Intelligence documentation.

Enable User Synchronization in a CABI HA Environment

If you have HA configured for CABI, the integration with DX NetOps Performance Management requires you to configure user synchronization.

Follow these steps:

1. Install Tomcat on the host where the load balancer installed.
2. Stop Tomcat and the Apache web server (httpd).
3. Add the following line to the *tomcat_home_directory*`/conf/server.xml` file to enable the AJP 1.3 connector on port 8009:

```
<Connector port="8009" protocol="AJP/1.3"/>
```

4. Copy the CABISync.war file to the *tomcat_home_directory*`/webapps` directory.
5. Modify the *apache_web_server_directory*`/conf/workers.properties` file as follows:

```
worker.list=loadbalancer,status,sync_listaner
worker.node1.port=8009
worker.node1.host=node1's server name/ip address
```

```
worker.node1.type=ajp13
worker.node1.lbfactor=1
worker.node2.port=8009
worker.node2.host=node2's server name/ip address
worker.node2.type=ajp13
worker.node2.lbfactor=1
worker.loadbalancer.type=lb
worker.loadbalancer.balance_workers=node1,node2
worker.loadbalancer.sticky_session=1
worker.status.type=status
worker.sync_listaner.type=ajp13
worker.sync_listaner.port=8009
worker.sync_listaner.host=localhost
```

6. Modify the *apache_web_server_directory*/conf/mod-jk.conf file as follows:

```
LoadModule jk_module modules/mod_jk.so
JkWorkersFile conf/workers.properties
JkLogFile logs/mod_jk.log
JkLogLevel info
JkLogStampFormat "[%a %b %d %H:%M:%S %Y]"
JkOptions +ForwardKeySize +ForwardURICompat -ForwardDirectories
JkRequestLogFormat "%w %V %T"
JkMount /<application-name> loadbalancer
JkMount /<application-name>/* loadbalancer
Jkmount /CABISync sync_listaner
Jkmount /CABISync/* sync_listaner
JkShmFile logs/jk.shm
<Location /jkstatus>
JkMount status
Order deny,allow
Allow from all
</Location>
```

– ***<application-name>***
  The name of CABI application, usually "`jasperserver-pro`"

8. Start Tomcat and the Apache web server.

Migrate Data to Unified Dashboards and Reporting for Infrastructure Management

The Unified Dashboards and Reporting for Infrastructure Management solution allows you to share a single CA Business Intelligence (CABI) server instance with multiple CA Agile Operations products. If you previously configured DX NetOps Performance Management to work CA Business Intelligence (CABI) server, you can migrate data from the standalone CABI to a shared CABI instance. For more information, see Unified Dashboards and Reporting for Infrastructure Management.

NOTE

The version of the standalone CABI instance must match the version of the shared CABI instance.

Follow these steps:

1. Export Content from the standalone CABI server as follows:
   a. Log in to the standalone CABI instance as a system administrator (for example, superuser).
   b. Navigate to **Manage**, **Server Settings**, and click **Export**.
   c. Specify the **Export Data File Name**.
   d. Select the content that you want to export, and then click **Export**.
2. Import the exported report content into the shared CABI server as follows:
   a. Log in to the shared CABI server as a system administrator.
   b. Navigate to **Manage**, **Server Settings**, then click **Import**.
   c. Select the file to import, then click **Import**.

Migrate CA Business Intelligence from Windows to Linux

Windows is unsupported with CA Business Intelligence 7.1.1. If you integrate with CA Business Intelligence on Windows, when you upgrade to 7.1.1, you must migrate your DX NetOps Performance Management and DX NetOps Spectrum content from the Windows CA Business Intelligence server to a Linux CA Business Intelligence server.

Follow these steps:

1. Export the content from the Windows CA Business Intelligence server:
   a. Log in to CA Business Intelligence on the Windows server as a system administrator (for example, superuser).
   b. Click **Manage**, **Server Settings**, and **Export**.
   c. Specify a file name for the export data.
   d. Select the content to export.
   e. Click **Export**
2. In NetOps Portal, delete the old Windows CA Business Intelligence data source.
3. Copy the `capm.jks` , `spectrum.jks` , `capm.properties` , and `spectrum.properties` files located in the following location from the old Windows CA Business Intelligence server to the new Linux CA Business Intelligence server:
   CABI_install_directory`/apache-tomcat/webapps/jasperserver-pro/WEB-INF/config`
4. Run the following command to install the DX NetOps Spectrum content on the Linux server:
   `java -jar spectrumConfigInstaller.jar -install`
5. Copy the `capm_reports-`*version*`.zip package` file located in the following location from the old Windows CA Business Intelligence server to the new Linux CA Business Intelligence server:
   PC_install_directory`/PerformanceCenter/cabi`
6. Run the following command to install the DX NetOps Performance Management reports on the Linux server:
   `Install.sh`
7. In NetOps Portal, add the new Linux CA Business Intelligence data source.
8. Wait for groups, users, and roles to synchronize.
9. Import the content to the Linux CA Business Intelligence server:
   a. Log in to CA Business Intelligence on the Linux server as a system administrator (for example, superuser).
   b. Click **Manage**, **Server Settings**, and **Import**.
   c. Select the content to import.
   d. Click **Import**

CA Business Intelligence Reports and Dashboards

DX NetOps Performance Management provides default reports and dashboards that you can use to view performance data.

CA Business Intelligence Reports

CA Business Intelligence (CABI) reports for DX NetOps Performance Management offer portable graphical representations of DX NetOps Performance Management performance metrics.

DX NetOps Performance Management includes the following default reports:

CA Business Intelligence Dashboards

Dashboards summarize data in a visual format. DX NetOps Performance Management includes the following dashboards:

- **Product Usage** - Provides a high-level representation of the network that is monitored by CA NetOps Portal. This dashboard provides the following information:
  - Total number of monitored devices
  - Number of monitored devices per site
  - Number of devices per type
  - Interfaces Inventory Capacity
- **Monitoring Status** - Shows the following information about DX NetOps Performance Management:
  - Status, host name, IP address, number of monitored devices, and version for data aggregators and data collectors. You click on a data collector name to view information about newly added monitored devices.
  - Number of new monitored devices for a selected data collector. You can view new devices added in the following time increments:
    - Last hour
    - Last 24 hours
    - Last 7 days
    - Last 30 days

Launch a Report or Dashboard from NetOps Portal

You can launch CA Business Intelligence reports from the NetOps Portal user interface. You must have the Administrator, Power User, or User product privilege set for the CA Business Intelligence data source and the **Drill Into Data Sources** role right. For more information, see Manage Product Access.

> **NOTE**
>
> You manage access to individual reports in CA Business Intelligence. Only users with user names in both NetOps Portal and CA Business Intelligence can access NetOps Portal reports.

Follow these steps:

1. Hover over **Reports**, and click **Report Management: CA Business Intelligence Reports**.
2. Click a report.
   The report opens in a new window.

You can also launch the CA Business Intelligence home page from CA NetOps Portal. Once you open the CABI home page, use the following instructions to open reports and dashboards.

> **NOTE**
>
> To view the version of installed Performance Management content, open the Top N report and scroll to the bottom of the input controls on the left side. The report version appears in a read-only text field.

Follow these steps:

1. Hover over **Inventory**, and click **Consoles: *Your_CABI_Data_Source.***

2. Select **View**, **Repository**.
3. In the Folders panel on the left, select **Public**, **ca**, **Performance Management**, **reports**.
4. Click **Report Name**.
5. Right-click a report (for example, **DX NetOps Performance Management Top N**) and select **Run** or **Run in New Tab**.
6. To select a report, click the appropriate row, and click **Run**.
7. Enter the required report parameters and click **Apply**.

Change the Logo

You can change the logo that appears in the CA Business Intelligence (CABI) reports for DX NetOps Performance Management.

Follow these steps:

1. Open the CA Business Intelligence JasperReports Server login page in a browser and log in with the CA Business Intelligence superuser account.
2. Select **View**, **Repository**.
3. In the Folders panel on the left, select **Public**, **ca**, **Performance Management**, **resources, images**.
4. Right-click **images**, export and back up the file.
5. In the right pane, select the **CA_Logo.png** file and click **Edit**.
6. Click **Choose File** and select your custom logo.

   NOTE

   The recommended logo size is approximately 52 x 48 pixels.
7. Click **Submit**.

Troubleshooting

If CABI reports and dashboards are missing from the NetOps Portal user interface, your reports and dashboards might exceed the maximum list limit. Update the `UniversalList.Limit` attribute, which defaults to 5000. For more information, see Cannot View More than 5000 Device Components in Inventory List.

Top N Report

Top N reports are tabular reports that list the top elements in a group that exceed or fall below the performance values that you specify. If you are troubleshooting infrastructure or planning for upgrades, Top N reports can identify the elements that need the most focus. You can also use these reports to specify a service goal against which you can compare the performance of the elements.

The following video shows how to generate multi-variable, large-scale Top N reports:

Configure the Top N Report

You can display a custom view of performance data by configuring the following options that DX NetOps Performance Management includes.

- **Time Interval**: Specify the period of time that the report reflects. You can select the following options:

  - Last Hour
  - Last 24 Hours
  - Last 7 Days
  - Last 30 Days
- **Time Zone**
- **Enable Business Hours**: Specify the days that you want DX NetOps Performance Management to use in the report. Specifying business days can limit data to high-traffic times.
- **Business Hour Start/End Time:** Specify the start and end of the business day to limit report data to that period of time.
- **Display Items As:** Select **Alias** or **Names** to determine how interfaces and devices are identified in the report. If you select **Alias**, DX NetOps Performance Management displays the alias as defined in NetOps Portal.
- **Select Group Name**: Specify the group that contains the devices that you want to view in the report.
- **Metric Family**: Select the metric family that contains the metric for the report.
- **Variable:** Select the metric that you want to view in the report.
- **Aggregation Function:** Select one of the following options:
  - **Average**
  - **Total**
  - **Maximum**
  - **Minimum**
  - **95th Percentile**
  - **96th Percentile**
  - **97th Percentile**
  - **98th Percentile**
  - **99th Percentile**
  - **Divide By Time**

    NOTE
    You can specify all non-percentile aggregation functions, or all percentile functions. You cannot mix an aggregation function, such as maximum, with a percentile.
- **Variable Filter Operation:** Specifies the variable's relation to the aggregation function. For example, you can specify Bits Per Second that are greater than or equal (>=) to the 95th percentile.
- **Top All:** Includes all data in the report.
- **Top N:** Limit the number of results to a specific number.
- **Sort Order:** Specify how the report displays the results.

Group Aggregate Trend Report

The Group Aggregate Trend (GAT) report aggregates data for a group of managed items for a specified period time. For example, you can generate a report that includes **bits per second in** for a group of interfaces in the previous month. The report provides this following data for up to four metrics:

- Number of items in the group
- The number reflects the count of active devices or components. The report does not include a device or component in the number in the following cases:

  - Polling is disabled for an item
  - The metric has no data for the selected time period
- Minimum value that is calculated for selected period and metric
- Maximum value that is calculated for selected period and metric
- 95-percentile value that is calculated for selected period and metric
- 98-percentile value that is calculated for selected period and metric

This article includes the following topics:

Configure the GAT Report

DX NetOps Performance Management includes the following options that you can configure to view aggregated group metrics.

- Time Period
- Time Granularity
- Custom Time Period
- Time Zone
- Group Name
- Metric Family
- Enable Variable *x*
  Select this option to add a metric to the report. You can specify up to 4 metrics.
- Variable *x*
  Specify the metric that the report will include.
- Rounding Pattern
- Locale
- Business Hours
  Specify the days that you want DX NetOps Performance Management to use in the report. Specifying business days can limit data to high-traffic times.

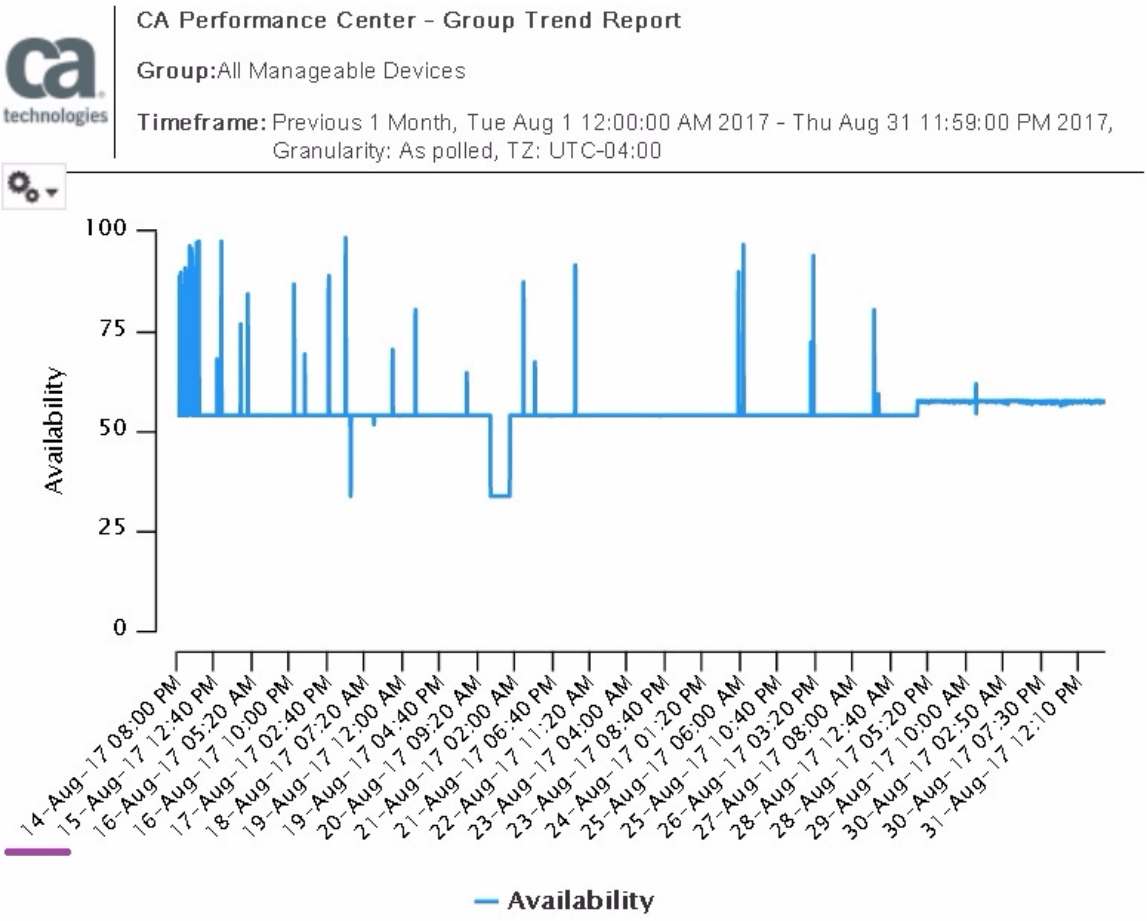
Understand the Time Granularity Selector

Sometimes, when a user selects a time period, the report shows data for only part of that period. For example, a report with the following settings is run on September 28:

- **Time Period:** Previous Month
- **Time Granularity:** As Polled

Instead of the report starting on August 1 as expected, it starts on August 14.

Figure 66: Group_Trend_Report_1



The report displays partial results for the time period because of the data retention settings.

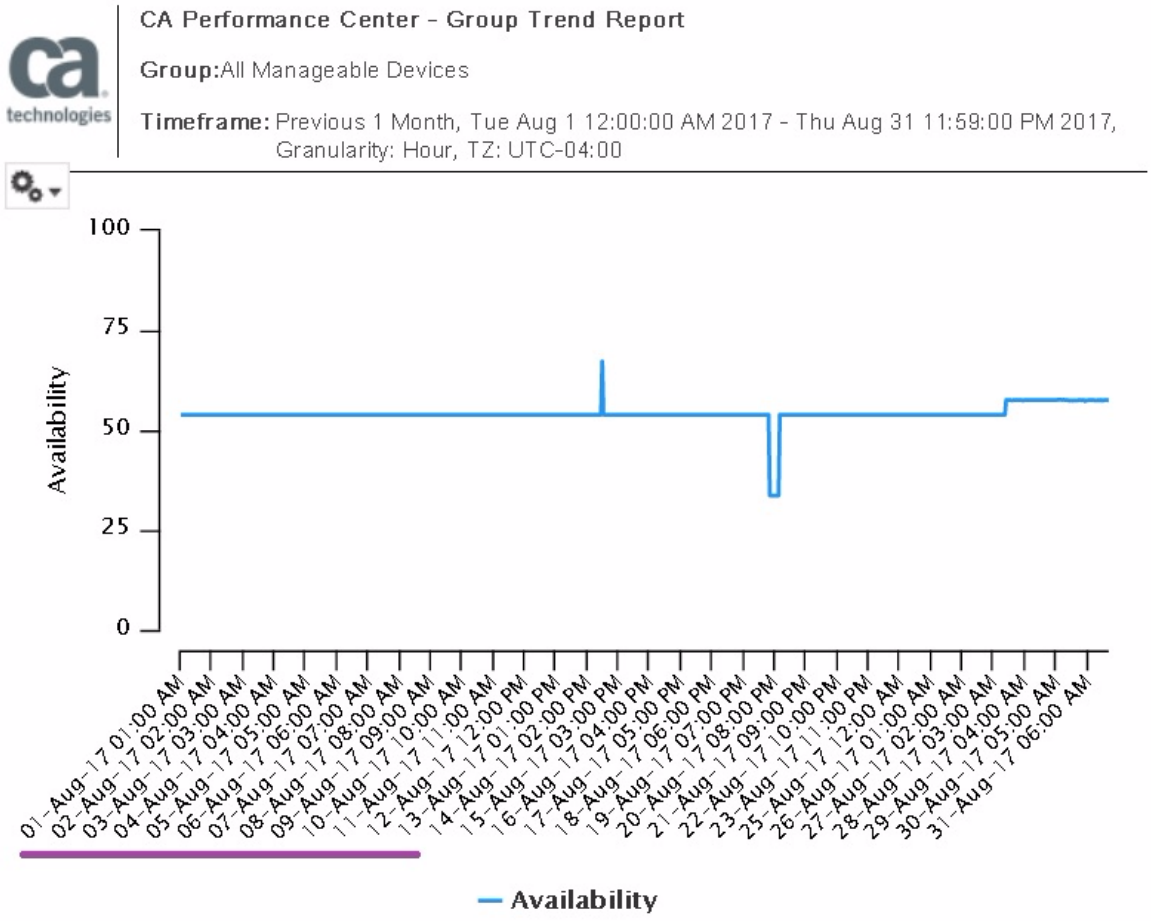
DX NetOps Performance Management uses the following default data retention settings:

- Polled data: 45 days
- Hourly rollup data: 90 days
- Daily rollup data: 365 days
- Weekly rollup data: 730 days

For more information, see Configure Data Retention Rates.
In the previous example, the report was configured to include polled data for August. However, because the report was run September 28, DX NetOps Performance Management only retained data from August 14 (September 28 - 45 days is August 14).

To see data for the entire month of August, change Time Granularity to Hourly. Because hourly data is retained for 90 days, DX NetOps Performance Management can display data for all of August.

Figure 67: Group_Trend_Report_2



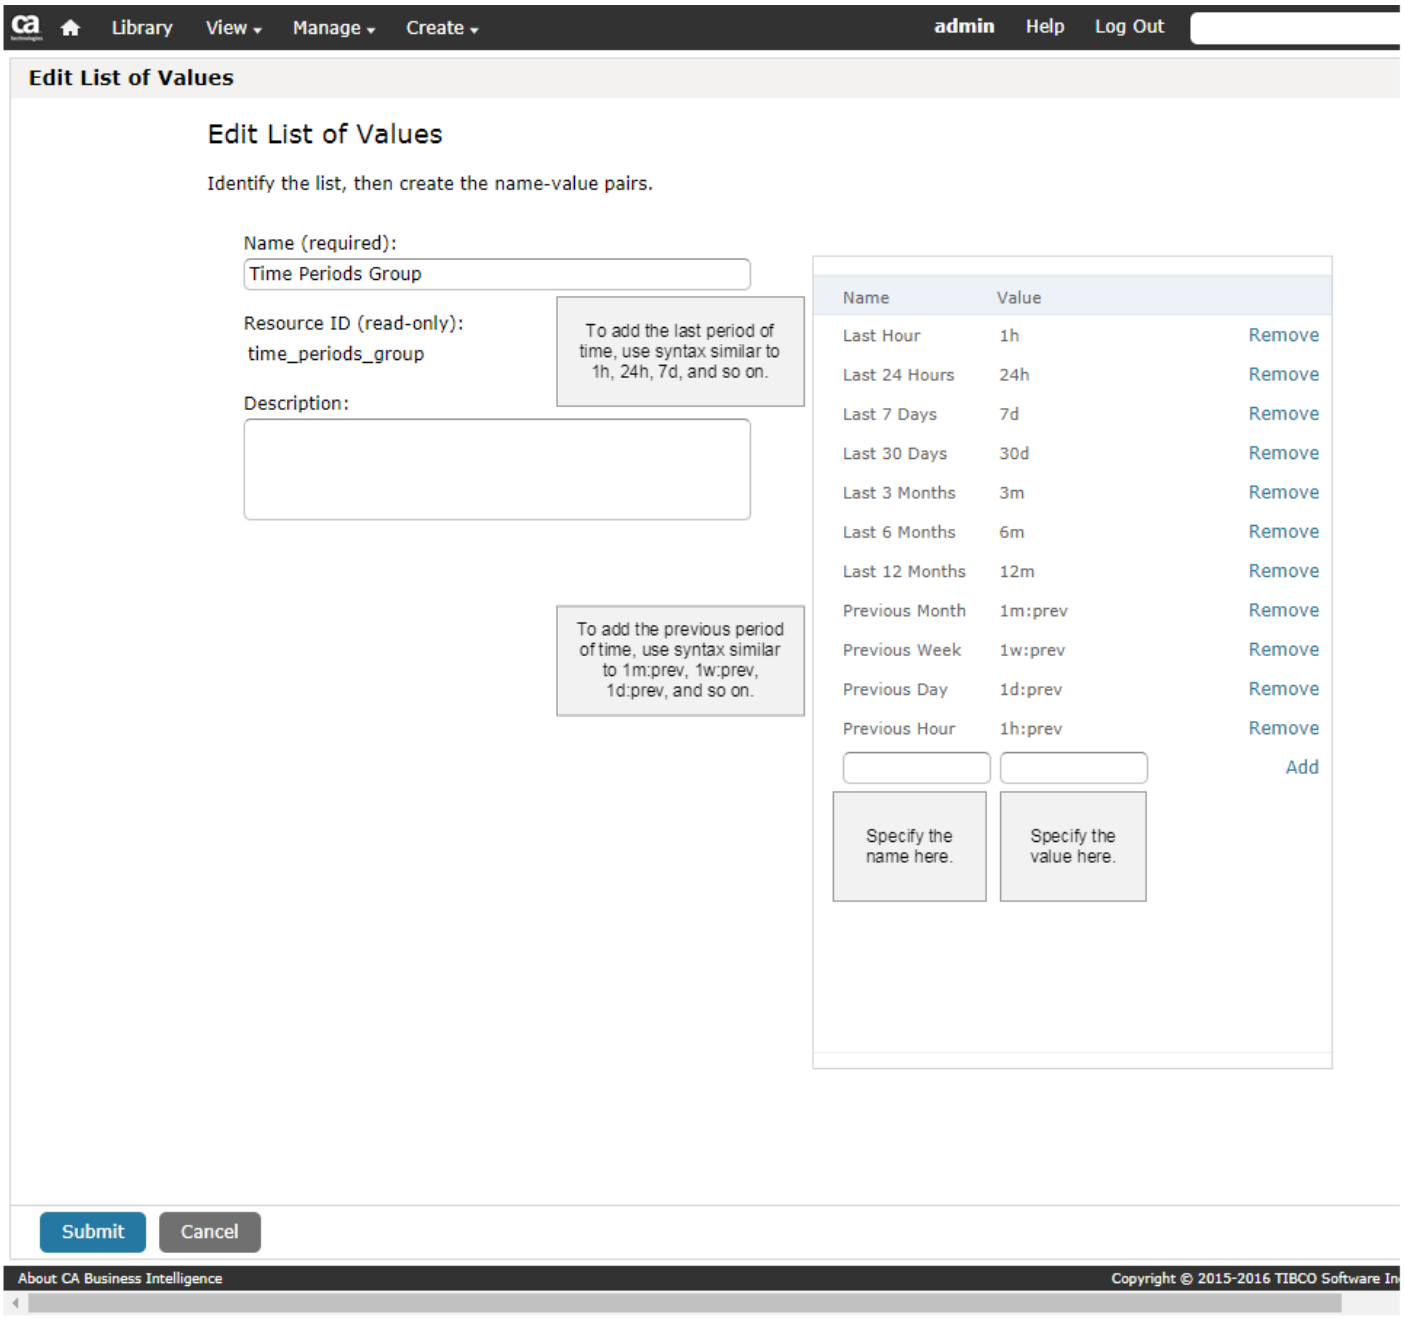
Configure a Custom Time Period

If the default time periods do not meet your needs, you can add a new Time Period .

Follow these steps:

1. Log in to the CABI Reports Server as a user with edit permissions.
2. Go to `Public/ca/Performance Management/inputcontrols/list of values`.
3. Edit the **Time Periods Group**.
4. Add any interval that the OpenAPI supports.
5. Specify the following information for the new time period:
   - **Name**
     Specify the name that appears in the Time Period options list.
   - **Value**
     Specify the custom timeframe.

Figure 68: List_of_Values



Troubleshoot the GAT Report

Report Timeout

Sometimes, the GAT report fails if you specify a long Time Period (month or more), *and* **As Polled** as the Time Granularity setting. The report can fail because of a timeout on the Data Aggregator. The default query timeout setting on the Data Aggregator is 30 seconds.

To resolve this issue, choose *one* of the following options:

- Set the Time Granularity to Hourly and rerun the GAT report.
- Increase the Data Aggregator timeout setting (defaultQueryTimeoutSecs - Default: 30)
  You can change the value of the defaultQueryTimoutSecs parameter during query execution (for current query only) or permanently in the following location:`/opt/IMDataAggregator/apache-karaf-<vers>/etc/com.ca.im.odata.beans.ODataLimiters.cfg`
  For more information, see Configure OpenAPI Defaults and Limits.

  NOTE

  In DX NetOps Performance Management tests, CA Technologies found that the appropriate Data Aggregator timeout setting for 10,000 interfaces is `defaultQueryTimeoutSecs=60` . However, you may need to increase the timeout setting if there are more items in the group the report is run against.

Situations to Watch Report

The Situations to Watch report predicts the health of your environment by providing the following information:

- When a given metric is expected to cross a specified threshold
- How quickly the metric will cross the threshold
- Anticipated future value based on a time period you choose (for example, 30, 60, and 90 days in the future)

You can use the Situations to Watch report to analyze resource allocation and prevent issues before they impact performance.

Configure the Situations to Watch Report

DX NetOps Performance Management includes a number of options that you can configure to see a custom view of metric thresholds.

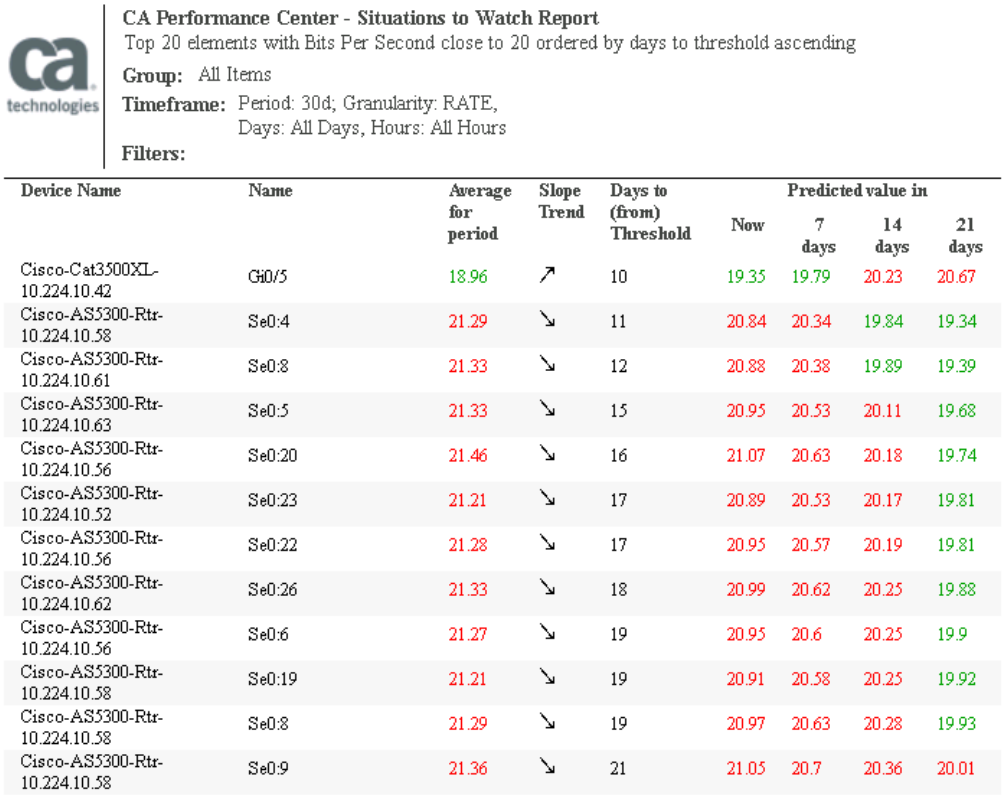
- **Time Period**: Specify the period time that DX NetOps Performance Management uses as the historical baseline when calculating a future metric value. For example, specify 30 days to use data from the previous month to determine the future behavior of the metric.
- **Time Granularity**: Specify how frequently DX NetOps Performance Managementcollects data for the report. You can select the following options:
  - As polled
  - Hour
  - Day
  - Week
- **Enable Business Hours**: Specify the days that you want DX NetOps Performance Management to use in the report. Specifying business days can limit data to high-traffic times.
- **Business Hour Start/End Time:** Specify the start and end of the business day to limit report data to that period of time.
- **Select Group Name**: Specify the group that contains the devices that you want to view in the report.
- **Metric Family**: Select the metric family that contains the metric for the report. The metric family determines the values in the Metric field.
- **Metric**: Select the metric for the report.
- **Threshold**: Specify the threshold for the report. For example, to report on when memory usage will meet or exceed 80%, specify 80.
- **Days to Threshold Filter/ Days to Threshold Value**: Specify the scope of the data in the report by adding a filter and value:

- Filter: Specify one of the following operators: <, =, >
- Value: Specify the number of day

For example, if you specify < 30, CA Advanced Authentication shows all inventory that will reach the threshold in less than 30 days.

- **Include Historical Situations**: When you select this option, CA Advanced Authentication displays items that have already exceeded the threshold. The number of days since the item exceeded the metric is displayed in parentheses. For example, (9) indicates that the item exceeded the threshold 9 days ago.
- **Show with Trend**: Displays an arrow in the Slope Trend column of the report. The arrow indicates whether the metric value is increasing or decreasing.

Figure 69: Sits_to_watch_report



CA Performance Center - Situations to Watch Report
Top 20 elements with Bits Per Second close to 20 ordered by days to threshold ascending
Group: All Items
Timeframe: Period: 30d; Granularity: RATE, Days: All Days, Hours: All Hours
Filters:

Device Name	Name	Average for period	Slope Trend	Days to (from) Threshold	Predicted value in			
					Now	7 days	14 days	21 days

Cisco-AS5300-Rtr-10.224.10.58	Se0:9	21.36	↘	21	21.05	20.7	20.36	20.01

- **Top All**: Includes all data.
- **Delta in Days:** Specify an increment in days that DX NetOps Performance Management uses to predict 3 future metric values. If you specify 30, DX NetOps Performance Management provides predicted metric values for 30, 60, and 90 days in the future.

SystemEDGE System Response Path Test Metrics

DX NetOps Performance Management discovers ESX hosts and virtual machines in the following ways:

- Through ICMP
- Through SNMP, if the servers have an SNMP agent deployed
- Through discovery of a server running SystemEDGE with the VCAIM

For more information, see Discovery and Polling in VMware Environments.

Response path tests help you see the overall status for devices that support service level agreements (SLA) using various protocols. This information lets you gain a broad sense of overall SLA performance for the enterprise or a specific device.

For example, as a network infrastructure manager, you can identify which protocols are experiencing the highest latency and slowest response times from the dashboard. You can then look at the device-level views to determine which devices are experiencing the problems. This information can help determine if increased activity, a device that is down, or something else caused an issue.

Response path test metrics are available specifically for SystemEDGE.

The SystemEDGE Response Path vendor certification includes the Service Availability Response Path metric family, which provides the following metrics:

- Attempts
- Avg. DNS Lookup Time
- Avg. Response Time
- Avg. TCP Connect Time
- Avg. Transaction Time
- Bytes Received Total
- Descriptions
- Failed Transactions
- Indexes
- Max. DNS Lookup Time
- Maximum Response
- Max. TCP Connect Time
- Min. Transaction Time
- Names
- Percent Failed Attempts
- Percent Successful Attempts
- Response/Limit
- Response Throughput
- Successful Attempts
- Successful Transactions
- Total Errors

Troubleshooting

Use the troubleshooting section to diagnose and resolve issues with DX NetOps Performance Management. Each troubleshooting page in this section contains one or more symptoms, and at least one solution to resolve the issue.

Insufficient Permissions During Installation

Symptom:

After you specify an installation path the following error appears:

```
Error: Insufficient permissions for installation path: Folder_PathPath must have
 executable permission for 'other'.Exiting the installer...
```

Solution:

Run the following command to ensure all child and parent directories have the necessary executable permission:

```
chmod 755 "Folder_Path"
```

Installation Stopped Abruptly

In CA Virtual Network Assurance 3.6.6, when the installation stops abruptly for any reason, and you start the installation again, the installer does not prompt you to install the product on a custom directory. Perform the following steps to resolve the issue and install the product on a custom directory.

Follow these steps:

1. On the server where the installation stopped, navigate to the `/etc` directory.
2. Delete the VNA.cfg file using the `rm -rf VNA.cfg` command.
3. Follow the steps in the Installing section and complete the installation.

Enable NetOps Portal Logging

If you encounter an issue with a specific view in the NetOps Portal user interface, you can easily enable logging on that view. You can use this method to provide the necessary details to CA Support.

Follow these steps:

1. Log in as a user who has the Generate URLs from Views role right.
2. Open the dashboard that contains the problematic view.
3. Click the **Edit** (gear) icon on the view, and select **Generate URL**.
   The Generate URL dialog opens.
4. Enable **Detailed View Logging**.
5. Click **Preview.**
6. Take a screenshot of the preview for CA Support.
7. Run CARE on the NetOps Portal host and the Data Aggregator host.
8. Provide the archive files from CARE and the screenshot to CA Support.

Enable Data Collector Logging

If you encounter missing data, detailed poll logging is available from the Data Collector debug tool. When enabled for an IP address, the tool generates logs on the Data Collector. Before you download the logs, you should wait at least two poll cycles (ten minutes) after enabling logging to collect sufficient data.

The logs record the following details of every poll for the specified IP address:

- The requests that are sent to the device
- The responses that are received from the device
- The delta processing the Data Collector performs on the responses
- The expression evaluation the Data Collector performs on the responses

You cannot enable detailed poll logging for more than one IP address at a time. If a second IP address is enabled, detailed poll logging for the previous IP address is disabled. The logs for the previous IP address are discarded.

Detailed poll logging stores a maximum of 60 MB of logged messages by default. If the limit is reached, the oldest entries are discarded to make room for the newer messages. You can configure this limit with the cache setting.

Logging can be filtered by Poll Group ID, or by Component Item ID. Filtering restricts the logging to a specific Vendor Certification or a specific component.

> **WARNING**
>
> Detailed poll logging is stored in the runtime memory of the Data Collector. If the Data Collector is shut down, the log is lost. If the Data Collector restarts, the log resets.

Follow these steps:

1. Go to the following location:
   DA_host:*port*/dcdebug/enabledebug.html
2. Specify the IP address of the polled device.
3. Select an IP domain.
4. (Optional) Specify Filtering and Cache settings.
5. Select **Enable Debug Logging**.
6. Click **Enable Debug Logging**.

Download Data Collector Logs

If you encounter missing data, you can use the Data Collector debug tool to download the relevant logs. Before you download the logs, you should wait at least two poll cycles (ten minutes) after enabling logging to collect sufficient data. You can use this method to provide the necessary details to CA Support. After you download the logs, you should disable detailed poll logging.

Follow these steps:

1. Go to the following location:
   DA_host:*port*/dcdebug/searchdebug.html
2. Specify the IP address of the polled device.
3. Select an IP domain.
4. Select **Download all logs for IP**.
5. Click **Download As Zip**.

Disable Data Collector Logging

After you download the Data Collector logs, you should disable detailed poll logging.

Follow these steps:

1. Go to the following location:
   DA_host:*port*/dcdebug/enabledebug.html
2. Specify the IP address of the polled device.
3. Select an IP domain.
4. Select **Disable Debug Logging**.
5. Click **Disable Debug Logging**.

SNMP Querying Tools

SNMP querying tools are included with DX NetOps Performance Management. The `sapwalk2` utility and the `sappoll` utility are available in the *DC_Install_Directory*`/scripts/` directory. The `sapwalk2` command line tool gathers an SNMP snapshot of network devices. Internal CA engineers can use this snapshot to reproduce issues and verify SNMP values on devices. The `sappoll` utility retrieves SNMP data for a timeframe.

CA Support finds the following `sapwalk2` command helpful:

```
sapwalk2 -i ip_address -v snmp_version -s starting_oid -c community_name -
xv bridge_table_oid -o output_file.walk
```

Example:

```
sapwalk2 -i 10.253.190.15 -v v2c -s 1.3.6.1 -c public -xv 1.3.6.1.2.1.17 -o
 10.253.190.15.walk
```

CA Support finds the following `sappoll` command helpful:

```
sappoll - i ip_address -v snmp_version -c community_name -p snmp_port -r retries -d
 timeout -f file_containing_oids -n number_of_polls -t poll_interval
```

Example:

```
sappoll -i 138.42.110.45 -v v2c -c xxxxx -p 161 -r 3 -d 3000 -f /tmp/OidList -n 5 -t 2
```

The file containing OIDs (for example, `/tmp/OidList`), should include the OIDs to poll in the following format:

```
I instance_oid
N node_oid
```

Example:

```
I 1.3.6.1.2.1.1.1
```

Enable the ActiveMQ Admin Console for the Data Aggregator or Data Collector

Generally, the ActiveMQ admin console should not be available on the network. However, if you absolutely need the console to address a problem, you can enable it for the Data Aggregator or Data Collector.

Follow these steps:

1. Go to one of the following files:
   - **Data Aggregator**
     DA_Install_Directory/broker/apache-activemq-*version*/conf/activemq.xml
   - **Data Collector**
     DC_Install_Directory/broker/apache-activemq-*version*/conf/activemq.xml
2. Uncomment
   `<import resource="jetty.xml"/>`
   .
3. (Optional) To update user access, edit the
   `jetty-realm.properties`
   .
4. (Optional) To encrypt the user passwords, run one of the following commands:
   - **Data Aggregator**
     DA_Install_Directory/broker/apache-activemq-*version*/lib/web run java -cp jetty-all-9.2.22.v20170606.jar org.eclipse.jetty.util.security.Password *passwordpassword*
   - **Data Collector**
     DC_Install_Directory/broker/apache-activemq-*version*/lib/web run java -cp jetty-all-9.2.22.v20170606.jar org.eclipse.jetty.util.security.Password *passwordpassword*
5. Shut down the ActiveMQ broker on each Data Collector:
   `service activemq stop`
6. Shut down the ActiveMQ broker on the Data Aggregator:
   `service activemq stop`
7. Start the ActiveMQ broker on the Data Aggregator:
   `service activemq start`
   If you do not, the Data Aggregator starts the broker automatically.
8. The Data Collectors automatically restart the ActiveMQ brokers. Use the following command to restart the brokers manually:

```
service activemq start
```

Access Denied to MySQL Utilities

Symptom:

Access is denied when you try to access a MySQL utility from the command line.

Example:

If you try to run `mysqldump` without a password, the following error returns:

```
mysqldump: Got error: 1045: Access denied for user 'root'@'localhost' (using password:
 NO) when trying to connect
```

Solution:

As a step toward enhanced security, the MySQL utilities require a MySQL password. In previous releases, if you were running the utilities as the root user, the password had a default. We strongly recommend you upgrade or at least change the default password with the `mysqladmin` utility.

Example:

To change the default 'root' password from the default ('*`default`*' in the following example) to your custom password ('*`newpassword`*' in the following example), use the following command:

```
mysqladmin -uroot -pdefault password newpassword
```

Automatic Rediscovery Does Not Run After Updating Vendor Group Priority

Symptom:

DX NetOps Performance Management did not run rediscovery after I updated the vendor certification priorities and updated the order of vendor certifications.

Solution:

Updating the order of vendor certifications and the PriorityGroup tag in the same REST operation can disrupt automatic rediscovery. Manually trigger rediscovery for the affected metric family.

Follow these steps:

1. Mouseover **Administration**, and click the Data Aggregator data source.
2. Click **Monitoring Configuration, Metric Families**.
3. Select the affected metric family.
4. Click **Update Metric Family**.
   Discovery runs for all devices in the metric family.

Browser Shows Error when Logging In

Symptom:

When I enter my password on the Login page, I am redirected to an error page in the web browser.

Solution:

This symptom does not indicate that you entered incorrect SAML credentials. Instead, the browser error (such as 401 or 500) indicates that Single Sign-On redirected the browser to the login URL, but the Identity Provider (IdP) server is down.

Follow these steps to correct the issue:

- Verify that the IdP server is running.
- Test the network connection between the CA NetOps Portal server and the IdP server.

Cannot Create a Vendor Certification

Symptom:

I cannot create a vendor certification and I receive an error message.

Solution:

Open the karaf log files in the Data Aggregator installation directory, and follow these steps:

1. Look for the MIB name string or the name of the metric family that you selected.
2. Review the stack trace of the exception to find the CertManagerException and the reason for the error. The reason for the error follows the exception.
   Example: The expression parser did not expect the token after ++, as shown:

```
Caused by: com.ca.im.dm.certmgr.interfaces.CertManagerException: Tech Cert: {http://
im.ca.com/
normalizer}NormalizedCPUInfo, Unable to compile expression: [Error: expected end of statement

[Near : {... stemID ++ extremeSystemBoardID ....}]
```

3. Fix the error based on the reason that is provided. Verify that the following requirements are met:
   - The expression group does not contain a mix of scalar and table entries.
   - Expressions contain valid syntax.
   - At least one expression is defined for a metric family variable.
   - At least two metric family variables are defined. Names and Indexes are required (except for scalar-only metrics).
   - The vendor certification variable used in the expression is from the chosen MIB table (valid in the user interface).

Cannot Remove a Custom Vendor Certification

Symptom:

I want to stop using a custom vendor certification. I cannot find a method to remove or deactivate the certification.

Solution:

Removing a custom vendor certification is not supported. Move the vendor certification to the bottom of the vendor certification priority list.

Cannot Find the Data Aggregator RIB Document

Symptom:

I cannot locate the Data Aggregator RIB document.

Solution:

Follow these steps:

1. Verify that Data Aggregator has been successfully added to CA NetOps Portal. For more information, see Manage Data Sources.
2. Verify that the RIB web service for Data Aggregator is running.
3. Verify that the RIB web service for Data Aggregator is publishing the RIB document:

a. Use the Data Source's RIB web service to request the list of available RIB documents.
Example:

```
http://da_host:8581/rib/doclist
```

4. If you know the document ID, check the document:

```
http://da_host:8581/rib/doc/docId
```

Example:

```
http://da_host:8581/rib/doc/CA.IM.DA.NormalizedPortInfo
```

'Cannot Find Valid Certification Path' Exception After Enabling SSL

Symptom:

After you enable SSL on CA NetOps Portal, CA Business Intelligence reports fail to open or start. Errors that resemble the following appear in the long stack trace:

```
2017-11-20 14:38:55,410 ERROR AsyncJasperPrintAccessor,pool-6-thread-1:321 - Error
 during report execution
net.sf.jasperreports.engine.JRException: Can't get response from capm
at com.ca.capm.jasper.datasource.util.CAPMConnector.getCAPMResponse(CAPMConnector.java:46)
...

Caused by: sun.security.validator.ValidatorException: PKIX path building failed:
 sun.security.provider.certpath.SunCertPathBuilderException: unable to find valid
 certification path to requested target
```

Solution:

For reporting to work in an SSL-Enabled NetOps Portal instance, you must add the appropriate certificates to the CA Business Intelligence trust store. The appropriate certificates are the root or intermediate certificates comprising the chain of trust for the NetOps Portal public certificate.

The NetOps Portal public certificate (capc_cert.cer), and the root and intermediate certificates must exist in the cacerts keystore.

For more information, see the section Add a Certificate for SSL-Enabled NetOps Portal in Install CA Business Intelligence Reports and Dashboards.

Cannot Remove a Metric Family

Symptom:

I want to stop using a custom metric family. I cannot find a method to remove the metric family from my instance of DX NetOps Performance Management.

Solution:

Removing a custom metric family is not supported. To stop using the custom metric family, remove it from all monitoring profiles. For more information, see Configure Monitoring Profiles.

Cannot View More than 5000 Device Components in Inventory List

Symptom:

I have more than 5000 devices registered in NetOps Portal. However, the list of device components in the inventory or search results shows only 5000 items.

Resolution:

By default, NetOps Portal limits the number of devices in the Inventory to 5000. You can manually change this default value.

Follow these steps:

1. Go to the following URL:

   ```
   http://PC_ADDRESS:8181/pc/center/admin/debug
   ```

   PC_Address The hostname of your NetOps Portal installation.
2. Log in as an administrative user.
3. Select **Global Attributes**.
4. Specify a value for the UniversalList.Limit attribute.
5. Click **Update**.
   The maximum number of registered devices that are visible in the inventory is equal to the value of UniversalList.Limit. You do not need to restart any services for the changes to take effect.

   WARNING

   Increasing the default device limit of 5000 can cause performance issues in NetOps Portal.

Data Aggregator Disk Space is Decreasing

Symptom: The available disk space on the Data Aggregator host is decreasing unexpectedly.

Solution: Sometimes, an error causes orphaned Rollup messages to build up in ActiveMQ. These message files are large. Verify the presence of the messages and purge them if necessary.

Follow these steps:

1. Navigate to the following directory on the Data Aggregator host:
   installation_directory/broker/apache-activemq-*vers*/data/kahhadb

2. Search for "not removing data file ":
   ```
   grep "not removing data file"  db-*.log | more
   ```

   Compare the return to the following example:
   ```
   2015-10-13 09:30:31,411 [eckpoint Worker] TRACE MessageDatabase                - not
   removing data file:
   ```

   This return indicates that the ActiveMQ broker has orphaned messages that are blocking the queue.

If the return in your system is similar, continue to the next step.

3. Navigate to the following URL to access the ActiveMQ broker:
   `http://DA_host:8161/admin/queues.jsp`
   ActiveMQ might require login with the Admin account.
   Default Username: `admin`
   Default Password: `admin`
4. Locate ActiveMQ.DLQ. If the pending message count is greater than 0, click **purge**.
   ActiveMQ clears the orphaned messages.

Data Aggregator Fails to Synchronize

Symptom:

When I try to synchronize Data Aggregator with NetOps Portal, I see a 'Synchronization failure' message in the Status column.

Solution:

Data Aggregator could not handle the data that is sent to it during synchronization. Review the Device Manager application log file, called DMService.log. This file appears in the CA/PerformanceCenter/DM/logs directory. The log entry shows a general SOAP exception if Data Aggregator is unable to handle data that was received from CA NetOps Portal during synchronization.

Look for an exception and stack trace within the following phases of synchronization:

- Pull
- Global Sync
- Bind (only executes when initially synchronizing with a data source)
- Push

Contact CA Technical Support with this information.

Data Aggregator or Data Collector Does Not Initialize

Symptom:

On certain systems, the Data Aggregator or Data Collector processes start successfully, but the application is never initialized. The status shows that the process is running. This problem typically occurs on systems with underpowered CPUs. This problem only occurs when the Data Aggregator or Data Collector are upgraded, or restarted after clearing out the karaf data directory.

Solution

To verify that this issue occurred, complete the following verification steps:

1. Look at the following log file: `apache-karaf-<vers>/data/log/karaf.log`
   This issue produces an error message in the log. The following message is an example of this error:

```
2016-01-12 02:32:46,303 | WARN  | Event Dispatcher | AetherBasedResolver

```

2. Confirm that the Data Aggregator or Data Collector features are not resolved in karaf
   a. Log in to the karaf console on the relevant host:
      - On the Data Aggregator:

        ```
        ssh -p8501 karaf@localhost
        ```

      - On the Data Collector:

        ```
        ssh -p8601 karaf@localhost
        ```

   b. List the features:

      ```
      features:list | grep data
      ```

      When this issue occurs, this list does not include the following features:
      - `data-aggregator`
      - `data-collection-manager`

If this issue occurs, apply the fix for the relevant service:

Data Aggregator

1. Identify the features repository URL to be added from the following file: `INSTALL_ROOT/apache-karaf-2.4.3/etc/org.apache.karaf.features.cfg`

   ```
   [root@sapv1 ~]# grep --color provision /opt/IMDataAggregator/apache-karaf-2.4.3/etc/
   org.apache.karaf.features.cfg
   featuresRepositories = mvn:org.apache.karaf.assemblies.features/standard/2.4.3/
   xml/features,mvn:org.apache.karaf.assemblies.features/spring/2.4.3/xml/
   features,mvn:org.apache.karaf.assemblies.features/enterprise/2.4.3/xml/
   features,mvn:com.ca.im/data-mgmt.provision/2.7.0-RELEASE-133/xml/features
   #featuresRepositories=mvn:com.ca.im/data-mgmt.provision/2.7.0-RELEASE-133/xml/
   features
   ```

   Select the content from this file according to the error message in the karaf.log file. The number after **RELEASE-** can be different.
2. Connect through karaf:

   ```
   ssh -p8501 karaf@localhost
   ```

   The password is **karaf**.
3. Manually add the features:
   –
   ```
   features:addurl mvn:com.ca.im/data-mgmt.provision/2.7.0-RELEASE-133/xml/features
   ```
   –
   ```
   features:install data-aggregator
   ```
4. Verify the following log does not include a repeat of the error message: `apache-karaf-2.4.3/data/log/karaf.log`
   During normal operation, the log shows the various bundles in the application initializing.
5. Verify that the Data Aggregator has initialized. For example, verify that the Data Aggregator REST page loads from the following URL:
   `da_host:8581/rest/`
6. Restart each data collector. Do not apply the Data Collector fix unless the error message also appears in the karaf log on the Data Collector.

Data Collector

1. Identify the features repository URL to be added from the following file: `INSTALL_ROOT/apache-karaf-2.4.3/etc/org.apache.karaf.features.cfg`

   ```
   [root@sapv1 ~]# grep --color provision /opt/IMDataCollector/apache-karaf-2.4.3/etc/
   org.apache.karaf.features.cfg
   featuresRepositories = mvn:org.apache.karaf.assemblies.features/standard/2.4.3/
   xml/features,mvn:org.apache.karaf.assemblies.features/spring/2.4.3/xml/
   features,mvn:org.apache.karaf.assemblies.features/enterprise/2.4.3/xml/
   features,mvn:com.ca.im/data-mgmt.provision/2.7.0-RELEASE-133/xml/features
   ```

```
#featuresRepositories=mvn:com.ca.im/data-mgmt.provision/2.7.0-RELEASE-133/xml/
features
```

Select the content from this file according to the error message in the karaf.log file. The number after **RELEASE-** can be different.

2. Connect through karaf:

```
ssh -p8601 karaf@localhost
```

The password is **karaf**.

3. Manually add the features:
   –
   ```
   features:addurl mvn:com.ca.im/data-mgmt.provision/2.7.0-RELEASE-133/xml/features
   ```
   –
   ```
   features:install data-collection-manager
   ```
4. Verify the following log does not include a repeat of the error message: `apache-karaf-2.4.3/data/log/karaf.log`
   During normal operation, the log shows the various bundles in the application initializing.
5. Verify that the Data Collector has initialized. For example, in NetOps Portal, go to **Administration**, **Data Collector List**, and verify that the status is **Collecting Data**.

Data Collector Dropped Polling Event Message

Symptom:

A "Data Collector Dropped Polling" event appeared in my events list.

Solution:

Clock drift can sometimes cause polling to stop on some components and devices. When this occurs, restart the Data Collector.

For more information, see Restart the Data Collector.

Data Collector Installs But Does Not Appear in the Data Collector List Menu

Symptom:

I installed Data Collector successfully, but Data Collector does not appear in the Data Collector List menu.

Solution:

Do the following steps:

1. Review the *DC_Install_Directory*`/apache-karaf-`*version*`/shutdown.log` file to ensure that the Data Collector was not shut down automatically. Data Collector is shut down automatically when you specify the Data Aggregator host, tenant, or IP domain incorrectly when you install Data Collector. The shutdown.log file provides error information as to why Data Collector was shut down. The Data Collector shuts down for one of the following reasons:
   – The Data Aggregator host information, tenant, or IP domain that was specified during the Data Collector installation were incorrect:

- If you specified the Data Aggregator host information incorrectly, uninstall and reinstall the Data Collector.
- If you specified the tenant incorrectly, uninstall and reinstall Data Collector.
- If you specified the IP domain incorrectly, uninstall and reinstall Data Collector.

– Contact with Data Aggregator could not be established.

2. Type the following command to ensure that an established connection to Data Aggregator exists:

```
netstat  - a | grep 61616
```

3. If a connection to Data Aggregator does not exist, do the following steps:
   a. View the *DC_Install_Directory*/broker/apache-karaf-*version*/conf/activemq.xml file on the Data Collector host. This file contains the hostname or IP address of the Data Aggregator host that you specified when you installed Data Collector.
   b. Search for the “networkConnector” section of the activemq.xml file. This section should contain a line as follows:

```
<networkConnector name="manager"

       uri="static:(tcp://test:61616)"

       duplex="true"

          suppressDuplicateTopicSubscriptions="false"/>
```

   Ensure that the Data Aggregator hostname that is specified in the "networkConnector" section is correct and resolves through DNS or /etc/hosts entries. Data Collector cannot communicate with Data Aggregator if you entered the Data Aggregator hostname incorrectly during the Data Collector installation.
   c. Type the following command help ensure that the connection opens successfully when you open a telnet connection to the Data Aggregator host on port 61616:

```
telnet dahostname 61616
```

   This command confirms that Data Aggregator is listening in on that port.
   d. If the telnet connection does not open successfully, the reasons could be as follows:
   - Data Aggregator is not running. Ensure that Data Aggregator is running. Open a console and type the following command:

```
service dadaemon status
```

NOTE

For RHEL 7.x and OL, service invokes systemctl . You can use systemctl instead.

   e. If Data Aggregator is not running, start Data Aggregator. Log on to the Data Aggregator host computer as the root user or a sudo user with access to a limited set of commands. Do one of the following steps:
   - Start the Data Aggregator services:

```
service dadaemon start
```

   - (Fault tolerant environment) Run one the following commands to enable the fault tolerant Data Aggregator so that it can start when necessary:
     - **RHEL 6.x:**

```
service dadaemon activate
```

- **RHEL 7.x, SLES, or OL:**

```
DA_Install_Directory/scripts/dadaemon activate
```

The request to initiate the connection is not making it from Data Collector to Data Aggregator successfully. Ensure that the port that is specified in the “networkConnector” section of the broxer.xml file is open for incoming connections on Data Aggregator. Be sure that there are no firewall rules preventing this connection.

Data Is Missing from Views

Symptom:

Some of the table columns in the interface views are empty. For example, interface and device names, interface speeds, and utilization data are missing from views.

Solution:

Some data sources do not support authentication passwords or privacy passwords that are below the minimum length.

SNMP profiles that use the SNMPv3 format let you enable authentication and privacy options. When you create a valid SNMPv3 profile, specify an authentication password that is eight characters or more in length. These profiles may not be successful in communicating with devices. In this case, SNMP data are missing for the affected interfaces.

Similarly, blank passwords are not supported for SNMP v3 profiles with MD5 or SHA as the Authentication Protocol.

Data Source Registration Fails

Symptom:

I attempt to add a new data source, but the registration fails. The following message appears: 'Create Data Source Failed: Data source communication failure.'

Solution 1:

This message indicates that the data source is unreachable. Do the following:

- Verify that the data source is running.
- Verify that the DNS hostname or IP address of the server where the data source database is installed is correct. You can edit the data source to view this information.
- Check intervening firewalls. Make sure they are configured to let CA NetOps Portal communications reach the data sources. For more information about the ports to open, see the *Installation Guide*.

Solution 2:

If the failure occurred with a CA Infrastructure Management Data Aggregator data source, verify that it is running. Access the following URL:

```
http://<host>:<port_number>/rest
```

where 'host' is the IP address of the server where the Data Aggregator is installed, and 'port_number' is the port used to access the RESTful web service, usually 8181.

The web service status indicates whether the Data Aggregator is running.

Solution 3:

Check the Device Manager application.log file. The file is written to the following directory:

```
CA\PerformanceCenter\PC\logs
```

The log entry references the URI used by CA NetOps Portal to communicate with the data source, along with a stack trace.

Data Source Synchronization Fails

Symptom:

When I try to perform a data source synchronization, the 'Synchronization failure' message appears.

Solution 1:

A synchronization failure might indicate that the data source is unreachable. Do the following:

- Verify that the data source is running.
- Verify that the DNS hostname or IP address of the server where the data source database is installed is correct on the Add Data Source page.

Solution 2:

A synchronization failure can indicate that the data source could not handle the data sent to it during synchronization.

First, check the Data Source Log for the data source. For more information, see View the Data Source Log.

If you still cannot determine the source of the problem, check the Device Manager application.log file. It is written to the following directory:

```
CA\PerformanceCenter\PC\logs
```

If the data source was unable to handle data received from CA NetOps Portal during synchronization, the log entry shows a general SOAP exception.

Solution 3:

CA NetOps Portal encountered an issue during the attempted synchronization.

Check the log files, as instructed above. Look for an exception and stack trace within the following phases of synchronization:

- Pull
- Global Sync
- Bind (only executes when initially synchronizing with a data source)
- Push

The log contains detailed information about the steps that are performed during each phase. This information can help pinpoint the cause for the synchronization failure.

Solution 4:

System times are not synchronized. Check the NTP server or the system time on each server (including data sources and the CA NetOps Portal server).

Data Source Test Fails

Symptom:

I test a data source during the registration process, but the test fails.

Solution 1:

Do the following:

- Verify the DNS hostname or IP address of the server where the database for the data source is installed.
- Try running the data source registration. The data source registration might succeed even if the test failed.
- Check the logs for registration failure information. For more information, see Data Source Registration Fails.

Solution 2:

If the failure occurred with a Data Aggregator data source, verify that it is running. Access the following URL:

```
http://<host>:<portnumber>/rest
```

> **NOTE**
> This URL does not open the correct page in Mozilla Firefox. Use another supported browser.

The web service status indicates whether the Data Aggregator is running.

Solution 3:

If the failure occurred with a data source other than a Data Aggregator, check the application log file (PC/logs/application.log) for a corresponding event. The log entry includes the URL that CA NetOps Portal uses to communicate with the data source, as well as a stack trace.

Discovery Does Not Start

Symptom:

I select discovery profiles and click Run to run a discovery, but discovery fails to start, or the Run button is disabled.

Solution:

Possible reasons for a discovery failure or for a disabled Run button include the following:

- The IP domain previously specified in the discovery profile has been deleted. Assign the discovery profile to an IP domain.
- No Data Collector has been installed for the IP domain that is specified in the selected discovery profile.

  > **NOTE**
  > For information about installing Data Collector hosts, see Installing.
- One or more Data Collector hosts are installed for the IP domain that is specified in the selected discovery profile. However, all of the Data Collector hosts that are installed for the IP domain are stopped. Start the Data Collector hosts.
- The tenant is deactivated. Activate the tenant.

ETL Failures

Symptom:

After you upgrade the Data Aggregator, ETL jobs start failing and new items are missing from your dashboards.

Solution:

Run the `etlHealth.sh` script. For releases 20.2.3 and higher, the script is included with the Data Repository installation. For earlier releases, contact Support. We recommend you run this script well in advance of the upgrade and again directly before the upgrade.

Follow these steps:

1. Log in to one of the Data Repository nodes as the root user.
2. Run the validation script:

   ```
   ./etlHealth.sh dauser dapassword
   ```

3. If the health check fails, follow the instructions in the prompt to collect the irep and the data collected by the `etlHealth.sh` script, and submit these details in a Support ticket.

Gaps Appear in Reports or Views

Symptom:

A view or report shows a gap in the value for a metric.

Solution:

By default, DX NetOps Performance Management shows gaps in the data for counter values for counter wraps, bad counter values, and missing data. This behavior protects the integrity of report data. For more information, see Configure Counter Behavior and Hide Gaps in Trend Views.

Gaps in Data Appear during Throttling

Symptom:

Certain devices are missing data in DX NetOps Performance Management. You notice a gap in polling or missed polls even though the device is running.

Solution:

The throttling of outgoing SNMP requests can cause gaps in data. Throttling occurs when some polls in a poll group have responded with REQUEST_TIMED_OUT in a single poll cycle. The device is assumed to be too busy to respond to polls for that poll group. Polling is attempted again in the next poll cycle.

To address this issue, verify that polling is being throttled. To prevent gaps in data, reduce the poll rate or configure a monitoring profile poll filter. For more information, see Poll Sensitive and Critical Devices Without a Performance Impact and Configure Monitoring Profiles.

To verify that polling is being throttled, use the following method that is most convenient:

- Select the **Details** tab for a device. Look for any events related to throttling. "Polling Stopped" appears in the event list when a throttling event occurs on the device that is missing data. For more information about these events, see Polling Stopped Event Message.
- Hover over **System Health**, and click **Data Aggregator Polling**:
  - Review the Device Polling Statistic chart, which shows a systemwide total of stopped polls. Investigate any spikes above zero.
  - Review the Stopped Polls by Device chart, which shows the devices with the most stopped polls. Investigate the top devices struggling to keep up with the polling load.
- Query the `NormalizedDevicePollingStatistics` metric family. Determine the number of polls that were stopped during the poll cycle. Also, determine the number of poll groups that were stopped.
- Review the Poll Summary log for `badPollRequestTimedOutCount` and `notSentPollRequestCount` .
- If you have Detailed Poll Logging from dcdebug, review the dcdebug Detailed Poll Log for the following string. If the value is above zero, then polls have been throttled.

```
DCMResponseVariable [name={http://im.ca.com/
normalizer}NormalizedDevicePollingStatistics.NumPollsStoppedDueToPriorTimeouts,
value=
```

Group Membership Is Not Updated During Synchronization

Symptom:

After synchronization, your group memberships are not updated completely.

Solution:

Your system may have many rule groups to evaluate each synchronization cycle. Each rule group is all the rules for a single group. DX NetOps Performance Management processes as many rule groups as possible within the configured time. By default, the processing time is 60 seconds. If processing takes longer than the configured time, DX NetOps Performance Management finishes processing the current rule group. During the next synchronization cycle, the oldest unprocessed rule groups are processed first.

To evaluate more rules groups during each cycle, increase the processing time.

Follow these steps:

1. Log in to the NetOps Portal host.
2. Set a new processing time:

```
mysql netqosportal -unetqos -ppassword -e "replace into general
 values('Rules.MaxTimeSeconds', 'time');"
```

Time defines the rule processing time in seconds.
Default: 60

TIP

Set the processing time to 120 seconds and evaluate the system performance.

DX NetOps Performance Management allocates the specified time to rules processing during synchronization.

Insecure Connection Message in Firefox

Symptom:

When logging in to NetOps Portal, the following warning message appears when you click inside the **Username** or **Password** field:

"This connection is not secure. Logins entered here could be compromised."

Solution:

Some versions of Firefox show this warning for any login screen that is not using HTTPS. NetOps Portal uses HTTP by default because it is hosted as an internal application behind corporate firewalls. For more security, Configure Performance Center to Use HTTPS. For more information about this feature, see the Firefox help.

Inventory is Empty After a Data Source is Registered

Symptom:

I installed a data source and registered it, but I do not see any managed items in the Inventory.

Solution 1:

Check to make sure that the data source is registered and has an active status. Do the following:

1. Log in as a user with administrative privileges.
2. Select **Administration**, **Data Sources**, and click **Data Sources**.
   The Manage Data Sources page opens.

Solution 2:

One of the following may have occurred:

- Data source registration failed. For more information, see Data Source Registration Fails.
- Data source synchronization failed. For more information, see Data Source Synchronization Fails.

Solution 3:

Check the permissions for the user account that you used to log in. If the user account has no assigned permission groups, you see no managed items.

Make sure that you have not logged in as a user associated with the Default Tenant, who sees no managed items.

Low Data Aggregator Disk Space

Symptom:

The Data Aggregator ran out of disk space.

Solution:

Move the Data Aggregator to a new location on the same host with more disk space.

Follow these steps:

1. Do one of the following steps:
   – Stop the ActiveMQ and Data Aggregator services:

     ```
     service activemq stop
     ```

     ```
     service dadaemon stop
     ```

     NOTE

     For RHEL 7.x or OL, `service` invokes `systemctl` . You can use `systemctl` instead.
   – (Fault tolerant environment) Run one the following commands to enable the fault tolerant Data Aggregator so that it can start when necessary:
     - **RHEL 6.x:**

       ```
       service dadaemon activate
       ```

     - **RHEL 7.x, SLES, or OL:**

       ```
       DA_Install_Directory/scripts/dadaemon activate
       ```

2. Uninstall the ActiveMQ service and the Data Aggregator service from the following Data Aggregator locations:

   ```
   Current_DA_Install_Dir/scripts/activemq uninstall
   ```

   ```
   Current_DA_Install_Dir/scripts/dadaemon uninstall
   ```

   – ***Current_DA_Install_Dir*** The installation directory for the DA**Default:** `/opt/IMDataAggregator`

3. Move the contents of the current directory to the new directory:

   ```
   cp -
   rfp Current_DA_Install_Dir
   New_DA_Install_Dir
   ```

4. Delete the current directory:

   ```
   rm -rf Current_DA_Install_Dir
   ```

5. Clean up the `apache-karaf-version/data` directory:

   ```
   rm -rf New_DA_Install_Dir/apache-karaf-version/data
   ```

6. Update the following files to point to the new directory:

   ```
   /etc/DA.cfg file
   /var/.com.zerog.registry.xml

   New_DA_Install_Dir/scripts/activemq

   New_DA_Install_Dir/scripts/dadaemon

   New_DA_Install_Dir/apache-karaf-version/bin/setenv

   New_DA_Install_Dir/apache-karaf-version/bin/restart
   ```

7. Install the ActiveMQ service and Data Aggregator service from the following locations:

   ```
   New_DA_Install_Dir/scripts/activemq install

   New_DA_Install_Dir/scripts/dadaemon install
   ```

8. Do one of the following steps:
   – Start the ActiveMQ and Data Aggregator services:

     ```
     service activemq start

     service dadaemon start
     ```

   – (Fault tolerant environment) Run one the following commands to enable the fault tolerant Data Aggregator so that it can start when necessary:
     • **RHEL 6.x:**

```
service dadaemon activate
```

- **RHEL 7.x, SLES, or OL:**

```
DA_Install_Directory/scripts/dadaemon activate
```

Metric Family is Incomplete

Symptom:

I successfully imported a custom metric family, but later found a defective metric definition. For example, the <Name> property has a maximum length of 32 characters. If this limit is exceeded, it can cause synchronization problems.

Solution:

Delete the custom metric family.

WARNING

This procedure is unsupported and is an emergency procedure only.

Follow these steps:

1. Locate the following directory:

```
/opt/IMDataAggregator/apache-karaf-<vers>/certifications/custom/deploy
```

2. Delete the XML files that were created and deployed for the metric family. They are named as follows:
   – im.ca.com-normalizer-<technology>.xml
   – im.ca.com-inventory-<technology>.xml
   If applicable, also delete the file that was created for the vendor certification:
   – im.ca.com-certifications-snmp-<vendor>.xml
3. Do one of the following steps:
   – Start the Data Aggregator service:

```
service dadaemon start
```

NOTE

For RHEL 7.x or OL, `service` invokes `systemctl` . You can use `systemctl` instead.

   – (Fault tolerant environment) Run one the following commands to enable the fault tolerant Data Aggregator so that it can start when necessary:
   - **RHEL 6.x:**

```
service dadaemon activate
```

   - **RHEL 7.x, SLES, or OL:**

```
DA_Install_Directory/scripts/dadaemon activate
```

After Data Aggregator restarts, verify that the previously imported metric family or vendor certification does not appear in NetOps Portal. All previously discovered components for this custom certification are also deleted.

4. Click **Administration**, **Data Sources**.
5. Select **Data Aggregator** and click the **Resync** button.
   The components for remaining metric families synchronize between Data Aggregator and NetOps Portal.
6. Edit and correct your custom metric family XML file.
7. Import your corrected metric family XML file.

Metric Family is Not Supported

Symptom:

I created a monitoring profile to poll metric families on a collection of devices. However, in the Polled Metric Families table, one of those metric families has a status of 'Unsupported.'

Solution:

To correct the problem, follow these steps:

1. Verify that the polled device responds to SNMP queries.
2. Navigate to the unsupported metric family.
3. Verify that a vendor certification supports the metric family. If no vendor certification is defined, create a custom vendor certification.
4. Verify that all key vendor certification attributes are supported on the device. If all key vendor certificate attributes are supported:
   a. Navigate back to the device
   b. Select the metric family for which you added a custom vendor certification
   c. Click Update Metric Family.
      Your device configuration is updated.

Metric Values Do Not Appear in Table in OpenAPI

Symptom:

I ran a query to generate a table with metric values. However, when I open the table, no metric values appear in the results.

Solution:

The OpenAPI does not currently support the aggregation of multiple data samples into a single value for a particular time range.

To preview the results of your query, select the appropriate output format, such as:

- HTML table with extra metrics
- JSON
- XML

MIB Fails to Compile

Symptom:

When I review the list of MIBs in the Select MIB page of the Create Vendor Certification wizard, I receive an error message that a MIB did not compile.

Solution:

If a MIB failed to compile, follow these steps:

1. Check the error message in the Select MIB page.
2. Perform one of these actions, depending on the error type:
   – Syntax error -- Using details in the error message, correct the syntax error in your MIB and import the corrected MIB.
   – Dependency error -- Upload the required MIB to resolve the dependency issue.

   When a new MIB is imported, any existing MIB that failed to compile is recompiled in addition to the new or modified MIB.

Multiple SNMP Devices Trigger Intrusions Alarms

Symptom:

I have many SNMP devices behind a more restricted firewall configuration (such as DMZ networks). For security reasons, the SNMP devices have different community strings. I defined an SNMP profile for each different community string, but now I am getting intrusion alarms and have been logged out of CA NetOps Portal.

Solution:

To find the correct SNMP profile for a device, CA NetOps Portal tries all of the SNMP profiles. This behavior can trigger intrusion alarms and can log you out of CA NetOps Portal.

To resolve this issue, follow this process:

1. Create a separate discovery profile for a critical SNMP device.
2. Assign the SNMP profile with the correct community string to the discovery profile.
3. Repeat steps one and two for each critical SNMP device.

When discovery is run, only the assigned SNMP profile is used.

No Charts or Images are Visible in IE with HTTPS

Symptom:

Some charts or images do not appear in NetOps Portal when I use Internet Explorer with HTTPS. A red X appears to indicate that the chart or image is broken.

Solution:

By default, the TLS setting needed for HTTPS is set to TLS 1.0 in IE. To view the broken charts or missing images, turn on TLS 1.1.

Follow these steps:

1. Click Tools at the top of the Internet Explorer browser, or click the gear icon at the top right.
2. Click Internet Options.
3. Click the Advanced tab, and select the TLS 1.1 checkbox.
4. Click Apply.
   The TLS settings are saved. Charts and images appear in CAPC.

'No Data to Display' Message in Views

Symptom:

Several views on the dashboard are empty. A message states, "No Data to Display".

Solution:

A graph or table view on a dashboard can show "No Data to Display" for the following reasons:

- The data source for the view has not been installed or has not been registered.
  Each view receives data from a single data source. Some view containers appear on dashboards even if the corresponding data source is not registered. They are always empty until the data source is registered.
  You can change display settings so that such views are never displayed in dashboards.
- The data source is registered, but it has been temporarily disabled.
  A disabled data source is not polled for data. An administrator can edit the data source to enable it. For more information, see Configure a Data Source.
- The view type requires editing before data can be displayed.
  Some types of view do not have default settings. For example, multiviews and multitrend views require customization before they display any data.
- No data is available for the selected time range. To test this theory, select a different time range.
- Not enough time has transpired since polling started on the devices that are selected for reporting.
  If the polling interval is fairly long, the first data point can take a little longer to appear. Polling rates are set in the data sources.
  A service is not running.
  If the device manager service is not running, the "no data" message may appear.
- The current group does not contain items of the required type for this view.
  The group of items whose data is reported on the dashboard is shown above the Time Period selector. Check the view: is this Server report trying to show data from a group of routers?
- The group is new or has recently been changed.
  Check group membership. A group rule might be misconfigured.
  If your user account has the required role right, edit the view to select another group context. Or click the Group Filter link above the Time Period selector and select another group context for the dashboard.
- The user account of the logged-in user does not have permission to view monitored items that have reported data. For more information, see How to Create a User Account.
- The data source has not properly synchronized with CA NetOps Portal. For more information, see Data Source Synchronization Fails.
- Components or managed items were not discovered.
  This problem is data source-specific, so consult the online Help for the data source. For a Data Aggregator data source, you can check inventory discovery history. On the Discovery Profiles List page, select the Discovery profile that you created for the initial discovery and click the History button.
- Metric families were not configured or enabled.
  A Data Aggregator data source automatically applies predefined (factory) monitoring profiles to the predefined collections, such as the All Routers collection. However, custom groups and custom collections are subject to misconfigured custom monitoring profiles.
- The database query timed out. Network connectivity issues between the NetOps Portal server and the data source can cause this problem.

No Output is Generated After Running the Device Pack Generator

Symptom:

I ran the Device Pack Generator but no output files were generated.

Solution:

To verify that validation of the devicePackConfig file is successful, execute the following command:

```
createIMDevicePack   <path_of_devicePackConfig.xml>   -v
```

If the validation is unsuccessful, review the error message in the console. To fix the problem, make the recommended changes in the devicePackConfig file and rerun the script using the -v option.

You can also verify that the directory information provided in <Path> is correct and that it contains the CSV files. Also verify that the header information provided matches the CSV files.

If the problem persists, contact CA Technologies Support.

No Performance Data for a Device Pack

Symptom:

I generated and deployed my device pack in NetOps Portal. I do not see any performance data for my device pack.

Solution:

Data becomes available after two performance polls.

Old Router Getting Created When Refresh Occurs

> **NOTE**
> This scenario is applicable for all CA Network Flow Analysis (9.3.3, 9.5.0, and 9.5.1) that function as expected.

CA Network Flow Analysis and Data Aggregator monitor the same router and a router refresh has occurred in the past (when CA Network Flow Analysis is upgraded to 10.0 and DX NetOps Performance Management to 3.7)

- You can see all of the pre-refresh CA Network Flow Analysis performance data on the old router in NetOps Portal. Additionally, you can see all DA-collected performance and all of the post-refresh CA Network Flow Analysis data on the new router in NetOps Portal.

Only NFA monitors the router and a router refresh has occurred in the past (when NFA is upgraded to 10.0 and PM to 3.7)

- You can see two routers with all of the pre-refresh CA Network Flow Analysis performance data on the OLD Router in NetOps Portal and all of the post-refresh CA Network Flow Analysis data on the new Router in NetOps Portal.

Old Router Not Getting Created When Refresh Occurs

This scenario is applicable for all CA Network Flow Analysis versions (9.3.6 and 9.3.8) that do not function as expected.

CA Network Flow Analysis and Data Aggregator monitor the same router and a router refresh has occurred in the past (when CA Network Flow Analysis is upgraded to 10.0 and DX NetOps Performance Management to 3.7)

- You can see only one router with one set of interfaces that have been incorrectly reconciled by NetOps Portal. The reason is that CA Network Flow Analysis has reported two interfaces with the same interface index (IfIndex) on the same device. In this scenario, the CA Network Flow Analysis devices are reconciled in a non-deterministic manner.

OpenAPI Query Results in Empty Table

Symptom:

After you run a query, the resulting Query URL shows an empty table.

Solution:

When selecting to show metric columns in a table format, select at least one configuration column, such as item name. Another solution is to select a format other than 'HTML table with export'.

Performance Center Cannot Contact Data Aggregator

Symptom:

I installed Data Aggregator successfully, but its status in the Manage Data Sources dialog is 'Unable to Contact'.

Solution:

Do the following steps:

1. Log on to the Data Aggregator host computer. Open a console and type the following command to verify that Data Aggregator is running:

   ```
   service dadaemon status
   ```

   NOTE

   For RHEL 7.x or OL, `service` invokes `systemctl` . You can use `systemctl` instead.
2. If Data Aggregator is running, a network issue is most likely preventing CA NetOps Portal from contacting Data Aggregator. Resolve all network problems.
3. If Data Aggregator is not running, start Data Aggregator. Log on to the Data Aggregator host computer as the root or sudo user with access to a limited set of commands. Do one of the following steps:
   – Start the Data Aggregator services:

     ```
     service dadaemon start
     ```

   – (Fault tolerant environment) Run one the following commands to enable the fault tolerant Data Aggregator so that it can start when necessary:
     - **RHEL 6.x:**

       ```
       service dadaemon activate
       ```

     - **RHEL 7.x, SLES, or OL:**

       ```
       DA_Install_Directory/scripts/dadaemon activate
       ```

Polling Does Not Complete for My Sensitive Device

Symptom:

Polling on my critical device cannot complete in a single polling cycle. The large amount of network traffic sometimes completely stops my device. How can I reliably poll this device to help ensure quality performance?

Solution:

Polling is vital for monitoring a device. However, excessive polling can cause a large amount of network traffic, which can degrade your ability to monitor a device successfully. If too much network traffic is overwhelming your sensitive device, you can try the following adjustments to reduce overall traffic to the device:

- Adjust your monitoring profile to remove unnecessary metric families from polling.
- Apply a filter in your monitoring profile to reduce the number of polled interfaces.
- Adjust your monitoring profile to poll less often (for example, change the SNMP Poll Rate to 15 minutes, instead of the default 5 minutes).
- Adjust the SNMP traffic threshold to lower the number of SNMP requests that are sent to the device at a time.
- Adjust the SNMP timeouts threshold to control how many polling timeouts cause polling to suspend for the current polling cycle.

Polling Has Stopped on Discovered Metric Family

Symptom:

I select a device from the Monitored Devices page and see that polling has stopped for a metric family that the device supports. I did not intend for polling to stop for that metric family.

Solution:

Follow this process to determine why polling has stopped and perform the appropriate steps to address the cause:

1. Verify that a monitoring profile is defined and is set to poll the desired metric family.
   If this requirement is not already met, create or edit a monitoring profile with the desired metric family defined in it.
2. Verify that the device is associated with the device collection.
   If the device is not associated with the device collection, add the device to the device collection.

   NOTE
   For information about adding a device to a device collection, see the *CA NetOps Portal Administrator Guide*.
3. Verify that the monitoring profile is associated with the device collection and the device.
   If the monitoring profile is not associated, create the relationship between the monitoring profile and the device collection.

After you complete one of these actions to restart polling, select the device on the Monitored Devices page to verify:

- The status of the metric family on the Polled Metric Families tab has changed.
- The status in the Interface Components table has changed to Active.

Polling resumes automatically on existing devices.

New devices can be discovered using one of the following methods:

- Select the polled metric family on the Monitored Devices page, and click Update Metric Family.
- Set the Change Detection rate in the monitoring profile for that metric family, with Automatic Discovery set to True.

Polling Safety Valve Event Message

Symptom:

A "Polling Safety Valve" event appeared in my events list.

Solution:

Clock drift can sometimes cause polling to stop on some components and devices. When this occurs, restart the Data Collector.

For more information, see Restart the Data Collector.

Polling Stopped Event Message

Symptom:

A "polling stopped" event appeared in my events list.

Solution:

By default, Data Aggregator controls SNMP polling, helping to ensure that too many poll requests do not overwhelm a device. One method for controlling poll traffic is the SNMP timeouts threshold. The default threshold value is 15. When 15 or more SNMP requests timeout for a polling group, polling is suspended for the remainder of the current polling cycle for that polling group. Other polling groups on the device continue to poll. An event is generated, informing you of the situation.

> **NOTE**
> Polling resumes at the beginning of each poll cycle. When no timeouts occur in a complete 5-minute poll cycle, a "clear" event is generated.

For more information, see Poll Sensitive and Critical Devices Without a Performance Impact and Gaps in Data Appear during Throttling.

PrimaryIPAddress ATTRIBUTE_VALUE_NOT_ALLOWED Error in Karaf Log

Symptom

The following error message appears in the karaf.log file:

```
ERROR | 0c98d87-thread-1 | date time | AbstractReconciler |
 iliation.impl.AbstractReconciler  495 | .im.aggregator.discovery |       |
 Got unexpected error for detect change only write for attr {http://im.ca.com/
inventory}Device.PrimaryIPAddress on item Item_ID#: ATTRIBUTE_VALUE_NOT_ALLOWED
```

Solution

This error is benign and occurs when the system detects a duplicate IP address. One possible cause is that the vCenter has a decommissioned VM and the IP address has been reused. Both VMs are created in the DX NetOps Performance Management environment.

QueryBuilder Certificate Warning

Symptom:

In an environment with a Data Aggregator that is configured to use HTTPS, a certificate warning appears when you try to run QueryBuilder.

Solution:

QueryBuilder requires Single Sign-On authentication. The QueryBuilder URL redirects to NetOps Portal Single Sign-On. The Single Sign-On URL uses the NetOps Portal host IP address instead of its host name. This scenario leads to a certificate warning because SSL certificates are generated for host names not IP addresses. Add the NetOps Portal IP address as a Subject Alternative Name (SAN) in the v3 certificate extension. For more information, see Set Up SSL Certificates for Performance Center.

Report on All Pages Times Out

Symptom:

When you run a report on All Pages, it times out. When you click the link for a timed out report, the PDF contains a "Query failed" error message.

Solution:

If you experience memory issues, ensure all your servers, especially the Data Repository, meet the minimum requirements and sizing guidelines. For information about the sizing requirements, see the DX NetOps Performance Management Sizing Tool. If a report on All Pages times out and the minimum requirements and sizing guidelines are met, reach out to CA Support.

Unable to Back Up Data Repository

Symptom:

When I run the vbr.py script to back up the Data Repository, the following message appears: "Another vbr instance is already running".

Solution:

A previous backup attempt failed (for example, password-less SSH was not set up correctly).

To back up the Data Repository, remove the /tmp/.initiator.mutex file from the computer where the Data Repository is installed. The next scheduled backup occurs normally.

Unable to Resolve Issue

If you cannot resolve an issue, use the CA Remote Engineer (CARE) tool. The CARE tool gathers data that a CA Support Engineer can use to help you troubleshoot a problem. CARE contains configuration files in its scripts directory for every product that CARE supports.

CARE is installed when you install DX NetOps Performance Management components:

Component	Installation Directory
CA NetOps Portal	`/opt/CA/PerformanceCenter/RemoteEngineer`
Data Aggregator	`/opt/IMDataAggregator/RemoteEngineer`
Data Collector	`/opt/IMDataCollector/RemoteEngineer`
Data Repository	The Data Repository installer extracts CARE to the following directory: `/opt/CA/IMDataRepository_vertica9/RemoteEngineer`

When prompted by a CA Support Engineer, take the following steps to run CARE to collect troubleshooting data.

Follow these steps:

1. At a command prompt, navigate to the relevant installation directory:

   ```
   cd Component_Install_Directory
   ```

   – ***Component_Install_Directory***
   Specify the directory where CARE is installed.
2. Enter the following command:

   ```
   ./re.sh
   ```

   The first time you run the command, a license agreement appears.

Unexpected Data Aggregator Shutdown

Symptom:

Data Aggregator shuts down unexpectedly.

Solution:

Data Aggregator shuts down if it loses contact with Data Repository. If contact with Data Repository is lost, an audit message is logged in the *DA_installation_directory*/apache-karaf-<*vers*>/shutdown.log file.

> **NOTE**
> The *DA_installation_directory*/apache-karaf-<*vers*>/shutdown_details.log logs heartbeat messages between Data Aggregator and Data Repository, as well as any Data Aggregator shutdowns for debugging purposes.

To resolve any connectivity or other Data Repository issues, perform the following steps:

1. Verify that the Data Repository process is running. Do the following actions:
   a. Log in to the database server you use for Data Repository as the database administrator user, not as the root user.
   b. Type the following command:

      ```
      /opt/vertica/bin/adminTools
      ```

      The Administration Tools dialog opens.
   c. Select (1) View Database Cluster State.
      The returning window should state: “ALL” for Host and “UP” for State.
2. If Data Repository is not running, attempt to start it by performing the following steps:
   a. Log in to the database server you use for Data Repository.
   b. Type the following commands:

      ```
      /opt/vertica/bin/adminTools
      ```

      The Administration Tools dialog opens.
   c. Select (3) Start Database.
   d. Press the Space bar next to the database name, select **OK**, and press Enter.
      You are prompted for the database password.
   e. Enter the database password and press Enter.
      The Data Repository database starts.

      > **NOTE**
      > If you see an error message stating that you cannot connect because of a username or password error, it is possible that a database password change is why Data Aggregator has disconnected from Data Repository.
   f. Select (E) Exit and press Enter.
      If Data Repository does not start, contact CA Technical Support.
3. If Data Repository is running, you have a network connection problem, such as a network latency issue. Address your network connectivity problem.
4. Once Data Aggregator is running again, set up an automatic recovery of the Data Aggregator process.

Vendor Certification Expression is Erroneous

Symptom:

The MVEL compiler may not give an evaluation exception (error) for bad expressions. This situation can happen for some syntax errors, including missing or open parentheses, and multiple asterisks.

The incorrect expression is compiled without an error condition until an expression evaluation is performed with the appropriate variables. Database columns that are the target for the intended expression are not populated.

Solution:

Turn on debug logging for the ExpressionEvaluator using the following steps:

1. Locate the IMDataAggregator/apache-karaf-<*vers*>/etc directory.
2. Open the org.ops4j.pax.logging.cfg file and create the following entry:

```
log4j.logger.com.ca.im.core.expressionevaluator=DEBUG
```

3. Do one of the following steps:
   – Start the Data Aggregator service:

```
service dadaemon start
```

NOTE

For RHEL 7.x or OL, `service` invokes `systemctl` . You can use `systemctl` instead.

   – (Fault tolerant environment) Run one the following commands to enable the fault tolerant Data Aggregator so that it can start when necessary:
   - **RHEL 6.x:**

```
service dadaemon activate
```

   - **RHEL 7.x, SLES, or OL:**

```
DA_Install_Directory/scripts/dadaemon activate
```

4. Search for evaluation exceptions in the karaf.log file in the IMDataAggregator/apache-karaf-<*vers*>/data/log directory.

Vertica Fails to Install in a Cluster Environment

Symptom:

Vertica fails to install in my cluster environment.

Solution:

Verify that passwordless SSH is set up for the Vertica Linux database administrator user between the nodes in the cluster. For more information, see Prepare to Install the Data Repository.

Vertica Fails to Start

Symptom:

The Data Repository does not restart after you stopped the database through Vertica admintools.

Solution:

A leap second occurred on 30 June 2015. The extra second causes Vertica to fail to start on certain versions of the Linux operating system.

To resolve this issue, restart each node before the first time you start the database.

This issue is fixed in the following Linux Kernel versions:

- RHEL 6.1 EUS kernel-2.6.32-131.30.2 or later
- RHEL 6.2 EUS kernel-2.6.32-220.25.1.el6 or later
- RHEL 6.3 kernel-2.6.32-279.5.2 or later

RHEL 6.4 and later already contain a fix for this issue.

Vertica Fails to Install due to 'iptables' Error

Symptom:

When you run the dr_install.sh script, Vertica fails to install due to the following 'iptables' error:

```
Prerequisites not fully met during local (OS) configuration for

verify-ipAddress.xml:

   WARN (N0010): https://my.vertica.com/docs/version/HTML/index.htm#cshid=N0010

        Linux iptables (firewall) has some non-trivial rules in tables: filter
```

Solution:

If you encounter this Vertica known issue, reach out to CA Support for a workaround.

View Shows Invalid RIB Query Syntax Error

Symptom

A view does not load, and the view shows the following error message:

Invalid RIB query syntax. See logs for details.

Solution

Percentile or Projection attributes are disabled. Verify that the attributes for Percentiles and Metric Projections are configured correctly in the metric family XML. Enable the calculation, or remove the reporting field from the view.

For more information, see Metric Family XML Structure.

APIs

DX NetOps Performance Management offers APIs that let you automate provisioning and configuration tasks or extract data from the DX NetOps Performance Management database. The most frequently repeated or time-consuming tasks are exposed to you by web services.

Some APIs consist of RESTful web services. The REST model lets you access a set of resources by a fixed set of operations. This model takes advantage of widely deployed HTTP features that are supported by common hardware, such as gateway devices.

The global administrator can use the RESTful web services to perform many administrative tasks.

The following categories of APIs are available:

- **NetOps Portal REST Web Services**
  Use these web services to automate tasks that are manually performed in NetOps Portal.
  For more information, see Performance Center REST Web Services.
- **Data Aggregator REST Web Services**
  Use these web services to manage administrative operations, such as retrieving data or managing relationships between profiles and tenants or groups.
  For more information, see Data Aggregator REST Web Services.
- **OpenAPI**The Open API is a flexible tool that lets users easily extract data from the DX NetOps Performance Management database. The OpenAPI enables integration between DX NetOps Performance Management data and external applications.
  For more information, see OpenAPI.

Set Up a REST Client

You must set up a REST client to interact with the available web services. We expect that users working with our web services are familiar with RESTful APIs and how to set up a REST client.

> **NOTE**
> Due to known limitations, we recommend setting up a REST client using a browser other than Firefox.

Performance Center REST Web Services

The CA NetOps Portal RESTful web services can programmatically perform the following tasks:

- Create and update user accounts
- Create containers for MSP customer sites ("tenants")
- Create and manage groups
- Import and export dashboards
- Manage data sources
- Create, edit, and delete SNMP profiles
- Create IP domain definitions, and associate them with tenants
- Provide lists of all configuration items, such as custom user accounts, roles, or groups, that are already in the system

Access NetOps Portal Web Services

API components are installed automatically with DX NetOps Performance Management. Access the web services from a web browser. The launch page includes a list of the available web services, endpoint addresses, and WADL and WSDL URLs. The full list of all available web services for NetOps Portal is available at the following URL:

```
http://PC_host:8181/pc/center
```

From this page, you can also access the WADL of each web service. If you use a testing utility to run web service calls, you receive feedback that is useful for debugging purposes. Using a testing utility is also a timesaver. You can supply username and password parameters as service endpoints for automatic authentication of all service calls.

Such utilities require a WSDL file that describes the service being tested. A WSDL file is an XML file that conforms to the Web Services Description Language. In the REST format, the simpler Web Application Description Language (WADL) is used instead. The CA NetOps Portal API launch page gives you access to a WADL file for each web service that you can use for testing. A link to the WSDL is provided for the SOAP web services.

Most web services provide their own documentation, including lists and descriptions of the available parameters and operations. The documentation is accessible in HTML format from the API launch page:

```
http://PC_host:8181/pc/center/rest
```

Connect a REST Client to NetOps Portal

You can connect any REST client to NetOps Portal.

Follow these steps:

1. Launch the REST client.
2. Type a URL for the CA NetOps Portal RESTful web services API in the URL field. Use the following format:

   ```
   http://PC_host:8181/pc/center/webservice/Web_Service_Name
   ```

   For example, to invoke the tenants web service, supply the following URL:

   ```
   http://PC_host:8181/pc/center/webservice/tenants/
   ```

3. Select **GET** for the **HTTP Method**.
4. Select **Basic Authentication** from the **Authentication** menu.
   The Basic Authorization dialog opens.
5. Type a valid username and password for a user account that has global administrator access, and click **OK**.
6. Select **Custom Header** from the **Headers** menu.
   The **Request Header** dialog opens.
7. Type `Content-Type` as the value for the **Name** parameter.
8. Type `application/xml` in the **Value** field, and click **OK**.
   The Headers section now shows the following updated values:
   Authorization: Basic YWRtaW46YWR...
   Content-Type: application/xml

Endpoints and the XML Schema

All endpoints act on a common set of data. The data can be represented in different data formats (for example, MIME types). The format depends on the endpoint that consumes or produces the data. An XML schema describes the data and other supported data formats, such as JSON.

This documentation describes the basic terms and parameters of the XML schema to create scripts for the NetOps Portal RESTful web services. Data can be grouped by namespace. A schema describes the types and elements of each namespace. *Types* define the structure of the data, while *elements* are instances of a type. For example, elements are produced or consumed by a REST endpoint, and the structure of each element is described by its type.

Use Performance Center Web Services

The following examples illustrate some standard procedures for interacting with the DX NetOps Performance Management RESTful web services. The procedures in these examples require Administrator access.

Basic REST Web Service Examples

The following is an example of a simple PUT operation that updates the description parameter of a tenant:

```
http://PC_host:8181/pc/center/webservice/tenants/tenantName/tenantName/
tenantDescription/NewDescription
```

Substitute the desired values for the italicized terms. Some parameters are required:

- **tenantName**
  The name of the tenant that you want to edit.
- **tenantDescription**
  The new description to identify this tenant.

The following is an example of a simple GET operation that returns a list of tenant IDs and names using the tenants web service:

```
http://PC_host:8181/pc /center/webservice/tenants/idNames
```

The following XML is returned:

```
<?xml version="1.0" encoding="UTF-8"?>
<idNames>
  <idName value="tenantAccountId" />
  <idName value="tenantItemId" />
  <idName value="tenantName" />
</idNames>
```

HTTP requests always return a response and a status code, even when successful. The response text is either the expected result or an error message to indicate a problem. The status code is 200 for a successful response, or a numeric error indicator. The following HTTP response code ranges are used:

- 200 - Command status is 'OK'.
- 400 - A user error has occurred. Errors in this range indicate a problem with the input text (400) or the user credentials (403) and can usually be easily corrected.
- 500 - A system error occurred. Errors in this range typically indicate a system fault. Such errors can require assistance from CA Technical Support to resolve them.

For more information about HTTP status codes, see the IETF website.

Create User Account Roles Using the Client

Best Practice: Create user account roles before creating user accounts.

The role is a parameter of the user account that grants the user access to certain administrative features and to perform selected tasks.

You can use the REST client that you have configured to invoke the NetOps Portal roles web service.

Follow these steps:

1. In the REST client interface, type the following URL in the URL field:
   ```
   http://PC_host:8181/pc/center/webservice/roles/
   ```
2. Select **Post** for the method.
3. Type the following text into the Body text field:
   ```
   <role>
     <name>{Name for the role}</name>
     <description>{Text to describe the role in the UI}</description>
     <enabled>{Whether the role is activated or disabled}</enabled>
   ```

```
</role>
```

4. Replace any values with the values that you want to use for the new role.
   For example, supply the following parameters:

```
<role>
  <name>Data Center Manager</name>
  <description>Manages data center operations and performs troubleshooting</description>
  <enabled>True</enabled>
</role>
```

5. Click **Send** to run the method.
6. Run the following GET method to get the role ID that has been automatically assigned to the new role:
   `http://PC_host:8181/pc/center/webservice/roles/idNames`
7. Click the Response Body (Highlight) tab to see the response.
   The values of the `roleId` and `roleName` properties are returned.

   NOTE
   You can substitute either the `roleID` value or the `roleName` value for the `{roleIdName}` property where it appears in the web services documentation interface.
8. (Optional) Verify that the new role has been created by taking the following steps:
   a. Log in to NetOps Portal as a global administrator.
   b. Click **Admin**, **Roles**.
   The Manage Roles page shows a list of roles. The new role appears in the list.

Create User Accounts Using the Client

Create user accounts using the REST client that you configured. Supply the role ID for the new role that you created in the previous procedure.

Follow these steps:

1. Enter a URL for the NetOps Portal RESTful web services API in the REST client. Use the following syntax to invoke the users web service:
   `http://PC_host:8181/pc/center/webservice/users/role/{roleIdName}/{roleIdValue}/`
   For `{roleIdName}` and *`{roleIdValue}`*, use the values that were returned when you ran the roles/idNames method in an earlier procedure.

   NOTE
   You can substitute either the `roleID` value or the `roleName` value for the `{roleIdName}` property where it appears in the web services documentation interface.

   If you are deploying multi-tenancy, NetOps Portal automatically associated the role that you created with the tenant with which your user account is associated.
   a. Select **Post** for the **HTTP Method**.
   b. Leave `'application/xml'` configured as the `'Body Content-type'`.
2. Type the following parameters in the Body text field:

```
<user>
   <name>{UserName}</name>
   <description>{UserDescription}</description>
   <enabled>{UserEnabled}</enabled>
   <removable>{UserRemovable}</removable>
   <timezone>{UserTimeZone}</timezone>
   <culture>{UserCulture}</culture>
</user>
```

   Replace any values with the values that you want to use for the new user account.

For example, supply the following parameters:

```
<user>
   <name>Jane Doe</name>
   <description>User associated with the John Doe Corporation tenant.</description>
   <enabled>true</enabled>
   <removable>true</removable>
   <timezone>CST6CDT</timezone>
   <culture>en-US</culture>
</user>
```

For more information about the basic user account parameters, see Use Web Services to Create Tenants Programmatically.

3. Run the method.
4. Repeat the preceding steps until you have created as many users as you require.

Dashboards Web Service

As an administrator, you can use the NetOps Portal API web services to perform dashboard management tasks.

Use the dashboards RESTful web service to create and manage dashboard pages to display data views:

- Create new dashboards
- Import and export dashboards
- Build the dashboards once and deploy them in an additional tenant. The import feature lets you deploy extra dashboards without manually recreating them.

To import a dashboard for a specific tenant, log in as the administrator for that tenant.

> **WARNING**
>
> Exporting a dashboard in XML format via the RESTful web service can result in a broken dashboard after you post the XML. To avoid this issue, create a dashboard by copying an existing one using the UI. For more information, see Manage Dashboards.

Issue the following call to see the parameters for the dashboards web service:

```
http://PC_host:8181/pc/center/rest/dashboards/documentation
```

Export a Dashboard

Perform a GET operation to export a dashboard to an XML file that is suitable for importing into another instance of CAPC.

To export a dashboard, the internally assigned page ID is required. Use the product user interface to find the ID:

1. Navigate to the dashboard to export.
2. In the browser window, find the page ID in the URL.
   Example:
   ```
   http://PC_host:8181/pc/desktop/page?pg=2000040
   ```
   The page ID is 2000040.
3. In a REST client, set the URL to the following:
   ```
   http://PC_host:8181/pc/center/webservice/dashboards/pageId
   ```
4. Perform a GET operation.

An error or success message appears in the response.

Import a Dashboard

You can import a dashboard from an XML file.

1. Browse to select the XML file that represents a dashboard that you have exported, or paste the exported text of the XML file into the Body field.
2. Update the dashboardMenu, menuItem, and dashboardTitle attributes in the XML body for the dashboard that you import:
   ```
   <dashboardMenu>MyCustomDashboard_DashboardMenuName</dashboardMenu>
   <menuItem>MyCustomDashboard_MenuItemName</menuItem>
   <dashboardTitle>MyCustomDashboard_DashboardTitleName</dashboardTitle>
   ```
   - **<dashboardMenu>**The title that appears at the top of the dashboard menu. Specify an existing top-level dashboard menu title for this attribute.**Examples:**Infrastructure Health, Capacity Planning
   - **<menuItem>**The title of the dashboard that appears in the dashboards menu. This property is unique to each tenant.
   - **<dashboardTitle>**The title of the dashboard that appears at the top of the dashboard page. This property is unique to each tenant.
3. (Optional) Test the import of a dashboard before you import it.
   Perform the following POST operation:
   ```
   http://PC_host:8181/pc/center/webservice/dashboards/test/
   ```
   The following message appears to indicate that the test was successful:
   ```
   <?xml version="1.0" encoding="UTF-8"?>
   <msg>Validation successful.</msg>
   ```
   Checking is performed for the unique menuItem and dashboardTitle attrributes.
4. Set the URL to the following:
   ```
   http://PC_host:8181/pc/center/webservice/dashboards/import
   ```
5. Perform a POST operation.
6. An error or success message appears in the response.
   The web service assigns a page ID to the imported dashboard.

Update a Dashboard

You can update a dashboard based on a page ID. Edit the XML to modify the dashboard:

1. Set the URL to the following:
   ```
   http://PC_host:8181/pc/center/webservice/dashboards/pageId
   ```
2. Paste the XML file that represents the dashboard into the Body field, and edit the XML as needed.
3. Perform a PUT operation.
   An error or success message appears in the response.

Data Sources Web Service

The API provides the data sources web service, which lets you perform the following tasks to manage data sources:

- Get item IDs from local IDs.
- Get local IDs from the item IDs.
- Manage the data source log file.
- Modify data source settings, such as the authentication method to use.
- Register new data sources.
- Remove data sources.
- Synchronize data sources.
- View the current registered data sources.
- Get the current NetOps Portal version.

Issue the following call to see the available operations and parameters for the data sources web service:
`http://PC_host:8181/pc/center/rest/datasources/documentation`

Data Source Parameters

The current values for the following data source settings are available from the GET command:

- **id**
  An internally assigned identifier for the data source
- **enabled**
  This value indicates whether the data source is enabled
  Default: true
- **name**
  The hostname of the data source
- **authtype**
  The type of authentication to use for this data source. One of the following values:
  - **NONE**
  - **BASIC**
- **type**
  One of the following data source type values:
  - **REPORTER**: CA Network Flow Analysis
  - **SUPER_AGENT**: CA Application Delivery Analysis
  - **VOIP_MONITOR**: CA Unified Communications Monitor
  - **ANOMALY_DETECTOR**: CA Anomaly Detector
  - **EVENT_MANAGER**: Event Manager
  - **SPECTRUM_IM**: CA Spectrum
  - **APM**: CA Application Performance Management
  - **DATA_AGGREGATOR**: The default DX NetOps Performance Management data source
  - **CATALYST_CONNECTOR**: The CA Catalyst Connector for CA NetOps Portal
  - **SERVICE_OPERATIONS_INSIGHT**: CA Service Operations Insight
  - **RESERVED_CUSTOMER_N**: An enum that has been reserved for the unspecified custom uses.
- **consoleSameAsDataSource**
  This parameter indicates whether the data source web console address is the same as the hostname. Use this parameter in cases where network address translation is deployed.
  Default: true
- **consoleAddress**
  The IP address where DX NetOps Performance Management contacts the data source console.

Data Sources Web Service Examples

The following examples demonstrate some of the operations for the data sources web service.

- **get item ids**
  This operation retrieves the NetOps Portal item ids given the data source local id. If an id is not found, it is omitted from the returned data.
  URL: `http://hostname:8181/pc/center/webservice/datasources/{idName}/{idValue}/itemids`
  Where:
  – **{idName}**
    One of the property name values that the get id names method of this web service returns.
    {idName} can be any of the following values:
    - **dataSourceId**
      Example: `http://PC_address:8181/pc/center/webservice/datasources/dataSourceId/3/itemids`
    - **dataSourceGUID**
      Example: `http://PC_address:8181/pc/center/webservice/datasources/dataSourceGUID/7b0ef6b1e9094d599821b2b07d78d83d/itemids`
    - **dataSourceConsoleName**
      Example: *http://PC_address:8181/pc/center/webservice/datasources/dataSourceConsoleName/Data%20Aggregator%40PC_DA.ca.com/itemids*
  – **{idValue}**
    A value for the property denoted by **idName**
  HTTP method = POST
  XSD for the provided XML: `http://hostname:8181/pc/center/rest/datasources/xsd`
  To translate an array of local ids into item ids, supply XML in the following format:

```
<LocalIDs>
     <LocalID ID="4514"/>
     <LocalID ID="4705"/>
     <LocalID ID="4501"/>
     <LocalID ID="4540"/>
     <LocalID ID="4511"/>
     <LocalID ID="4499"/>
</LocalIDs>
```

  The function returns an array of **ItemIDResult** objects.
  Example:

```
<ItemIDResults>
     <ItemIDResult ItemID="406" LocalID="4514"/>
     <ItemIDResult ItemID="407" LocalID="4705"/>
     <ItemIDResult ItemID="408" LocalID="4501"/>
     <ItemIDResult ItemID="409" LocalID="4540"/>
     <ItemIDResult ItemID="410" LocalID="4511"/>
     <ItemIDResult ItemID="411" LocalID="4499"/>
</ItemIDResults>
```

- **get local ids**
  This operation retrieves the data source local id given the NetOps Portal item ids. If an id is not found, it is omitted from the returned data.
  URL: `http://hostname:8181/pc/center/webservice/datasources/{idName}/{idValue}/localids`
  Where:
  – **{idName}**
    One of the property name values that the get id names method of this web service returns.

{**idName**} can be any of the following values:

- **dataSourceId**
  Example: *http://PC_address:8181/pc/center/webservice/datasources/dataSourceId/3/localids*
- **dataSourceGUID**
  Example: `http://PC_address:8181/pc/center/webservice/datasources/dataSourceGUID/7b0ef6b1e9094d599821b2b07d78d83d/localids`
- **dataSourceConsoleName**
  Example: `http://PC_address:8181/pc/center/webservice/datasources/dataSourceConsoleName/Data%20Aggregator%40PC_DA.ca.com/localids`

– **{idValue}**
A value for the property denoted by **idName**

HTTP method = POST
XSD for the provided XML: `http://hostname:8181/pc/center/rest/datasources/xsd`
To translate an array of the specified NetOps Portal item ids to local ids, supply XML in the following format:

```
<ItemIDs>
     <ItemID ID="412"/>
     <ItemID ID="413"/>
</ItemIDs
```

The function returns an array of **ItemIDResult** objects.
Example:

```
<ItemIDResults>
     <ItemIDResult ItemID="412" LocalID="4590"/>
     <ItemIDResult ItemID="413" LocalID="4760"/>
</ItemIDResults>
```

Devices Web Service

The API provides the devices web service to let you view the devices that belong to a tenant. You can also retrieve a list of interfaces from a device (a router or switch) in the inventory of managed items.

All devices are associated with a tenant. If you are not deploying multi-tenancy, devices are associated with the Default Tenant. Run the getlist method to the root /devices/ to retrieve a list of devices that are associated with your tenant.

Issue the following call to see the parameters for the devices web service:

`http://PC_host:8181/pc/center/webservice/devices`

Issue the following call to see a list of supported operations:

`http://PC_host:8181/pc/center/rest/devices/documentation`

Available GET Methods

- **get list**
  Gets a list of devices that belong to the tenant of the logged-in user.

```
http://PC_host:8181/pc/center/webservice/devices
```

- **get interfaces**
  Gets a list of all interfaces that belong to a specified device.

  ```
  http://PC_host:8181/pc/center/webservice/devices/idName/idValue/interfaces
  ```

The following URL lets you retrieve a list of internally assigned identifiers that can be used in other methods to identify devices:

```
http://PC_host:8181/pc/center/webservice/devices/idNames
```

Or you can retrieve a list that is filtered by tenant and by device subtype as follows:

```
http://PC_host:8181/pc/center/webservice/devices/subtype/tenant/tenantIdName/
tenantIdValue
```

The subtype further describes the device. For example, the server, switch, and router subtypes identify devices, while an interface can have subtype "physical" or "virtual".

NOTE

: A GET to the following URL for the groups web service returns a list of group members that includes their subtype:

```
http://PC_host:8181/pc/center/webservice/groups/idName/idValue/items
```

Set the Alias Name for a Device

You can set an alias name for a single monitored device. The alias name appears in the inventory list of devices and in the inventory list of interfaces.

NOTE

An alias that is set using REST web services takes precedence over the alias that you can set by importing a CSV file.

To set an alias name for a single monitored device, run a PUT to the following URL:

```
http://PC_host:8181/pc/center/webservice/devices/deviceItemId/device_id/
aliasName/alias_name
```

- ***device_id***
  Is the device item identification number for the monitored device for which you are setting an alias name.
- ***alias_name***
  Is the alias name for the monitored device.

Example:

Run a PUT to the following URL to set 'Alias name for 96.24' as the alias name for a device with a device item ID of 119:

```
http://PC_host:8181/pc/center/webservice/devices/deviceItemId/119/aliasName/Alias name
 for 96.24
```

> **NOTE**
> To set the aliases for multiple device items, use the `update_alias_name.sh` script.

Set Interface Name Aliases

As an administrator, you can set aliases for interface component names per device item. An interface alias is a name that the administrator configures and applies to the associated interface component in NetOps Portal. Users see the interface aliases in their dashboards and views depending on the role rights you assign.

> **NOTE**
> An alias that is set using REST web services takes precedence over the alias that you can set by importing a CSV file.

The following URL shows the syntax:

```
http://PC_host:8181/pc/center/webservice/devices
```

Follow these steps:

1. Determine which interfaces you want to set an alias for:
   a. To return a list of all of the interfaces on a device item, enter the following URL in the REST client:

      ```
      http://PC_host:8181/pc/center/webservice/devices/deviceItemId/device_id/interfaces
      ```

      - ***device_id***
        Is the device item identification number for the monitored device that interface components are associated with.

   b. Select **GET** for the **"HTTP" Method**.
   c. Determine which interfaces you want to set an alias for.
2. Enter one of the following URLs in the REST client:

   ```
   http://PC_host:8181/pc/center/webservice/devices/deviceItemId/device_id/
   setInterfaceNameAlias
   ```

   ```
   http://PC_host:8181/pc/center/webservice/devices/domainItemId/domain_id/device_IP/
   setInterfaceNameAlias
   ```

   – ***domain_id***
     Is the domain identification number for the domain that interface components are associated with.
3. Select **PUT** for the **"HTTP" Method**.

4. To set the interface name aliases, enter the following information in the Body tab of the HTTP Request pane:

```
<interfaces>

     <interface>

          <itemId>interface_item_id</itemId>

          <nameAlias>alias_for_interface</nameAlias>

     </interface>

     ...

</interfaces>
```

Example:

To set 'Et0 - alias' and 'Se0 - alias' as the interface name alias for two interfaces, enter the following information in the Body tab of the HTTP Request pane:

```
<interfaces>

     <interface>

          <itemId>164</itemId>

          <nameAlias>Et0 - alias</nameAlias>

     </interface>

     <interface>

          <itemId>165</itemId>

          <nameAlias>Se0 - alias</nameAlias>

     </interface>

</interfaces>
```

NOTE
To set the aliases for interface component names across multiple device items, use the `update_alias_name.sh` script.

Set Component Name Aliases

As an administrator, you can set aliases for component names per device item. A component alias is a name that the administrator configures and applies to the associated component in NetOps Portal. Users see the component aliases in their dashboards and views depending on the role rights you assign.

> **NOTE**
>
> An alias that is set using REST web services takes precedence over the alias that you can set by importing a CSV file.

The following URL shows the syntax:

```
http://PC_host:8181/pc/center/webservice/devices
```

Follow these steps:

1. Determine which components you want to set an alias for:
   a. To return a list of all the components on a device item, use one of the following URLs in the REST client:
      - `http://PC_host:8181/pc/center/webservice/devices/deviceItemId/device_id/components`
        - ***device_id***
          The device item identification number for the parent device of the components
      - `http://PC_host:8181/pc/center/webservice/devices/domainItemId/domain_id/device_IP/components`
        - ***domain_id***
          The domain identification number for the IP domain that the device is in.
   b. Select GET for the **"HTTP" Method**.
      All components on the device are returned. Determine which components you want to set an alias for.
2. Enter one of the following URLs in the REST client:
   - `http://PC_host:8181/pc/center/webservice/devices/deviceItemId/device_id/setComponentNameAlias`
   - `http://PC_host:8181/pc/center/webservice/devices/domainItemId/domain_id/device_IP/setComponentNameAlias`
3. Select PUT for the "HTTP" Method.
4. To set the component name aliases, use the following information in the Body tab of the HTTP Request pane:

```
<deviceComponents>

    <deviceComponent>

        <itemId>component_ item_ id</itemId>

        <nameAlias>alias_for_component</nameAlias>

    </deviceComponent>

    ...

</deviceComponents>
```

NOTE

To set the aliases for for component names across multiple device items, use the `update_alias_name.sh` script.

Update the Device Life Cycle State

Life cycle states define the monitoring behavior for devices. Lifecycle management enables you to define the usage state of SNMP and ICMP devices. Components inherit the life cycle state of the associated device.

NOTE

Lifecycle management does not apply to devices from DX NetOps Mediation Manager.

You can manage the device life cycle state using the NetOps Portal API or the Manage Device Life Cycle user interface in NetOps Portal. To use the Manage Device Life Cycle user interface, see Manage Device Life Cycles.

TIP

In environments where DX NetOps Spectrum manages the life cycle state, use the DX NetOps Spectrum REST API to change the life cycle state for devices instead of this REST API. For more information, see the CA Spectrum documentation.

To define when a device is active, retired, or in maintenance, change the life cycle state.

To update the device life cycle state for a single monitored device, run a PUT to the following URL:

```
http://PC_host:8181/pc/center/webservice/devices/{idName}/{idValue}/
lifeCycleState/{newState}
```

- ***{idName}***
  Specify one of the property name values that the `get id names` method of this web service returns.
- ***{idValue}***
  Specify a value for the property that is denoted by ***idName*** .
- ***{newState}***
  Specify in ALL CAPS one of the following new life cycle states:
  - **ACTIVE**
    Specifies the normal operating status of a device.
  - **RETIRED**
    Specifies that the device is no longer in use and that no monitoring occurs. This state disables polling, threshold monitoring, notifications, and change detection. The system does not update the SNMP Profile or change the hostname.

    NOTE

    Any virtual device (Virtual Machine or ESX), discovered with systemEdge is not polled for its vCenter statistics when the device lifecycle state is Retired.
  - **MAINTENANCE**
    Specifies that the device is temporarily under maintenance. The behavior of this state is configurable.

Domains Web Service

The API provides the domains web service to let you view, create, and modify IP domain definitions.

Managed items are associated with IP domains by the data sources during data collection. Consult the documentation for each registered data source to determine the steps to take to associate items with domains.

Domains Web Service Example Syntax

Issue the following call to see the parameters for the domains web service:

```
http://PC_host:8181/pc/center/webservice/domains
```

Issue the following call to see a list of supported operations:

```
http://PC_host:8181/pc/center/rest/domains/documentation
```

Available GET Methods

- **get list**
  Gets a list of all of the IP domains that belong to the tenant for the logged-in user.
  Run the `getList` method to the root `/domains/` to retrieve a list of all IP domain IDs for the tenant of the currently logged-in administrator:
  – If you are logged in as a global administrator, you see a list of domain IDs for the Default Tenant only.
  – If you are logged in as a tenant administrator, you see a list of domain IDs for your tenant.
- **get**
  Retrieves information about a specified IP domain.

  ```
  http://PC_host:8181/pc/center/webservice/domains/idName/idValue
  ```

  NOTE
  The global administrator sees only the IP domains that fall within the Default Tenant. A tenant administrator sees only the IP domains within that tenant.
- **get domain for group**
  Gets the IP domain associated with a specified group.

  ```
  http://PC_host:8181/pc/center/webservice/domains/group/groupIdName/groupIdValue
  ```

- **get id names**
  Retrieves a list of identifiers that can be used to identify IP domains in other web service operations.

  ```
  http://PC_host:8181/pc/center/webservice/domains/idNames
  ```

- **get list**
  Gets all of the IP domains that belong to the tenant for the logged-in user.

  ```
  http://PC_host:8181/pc/center/webservice/domains
  ```

- **get list by tenant**
  Retrieves the list of all of the IP domains that are associated with the specified tenant ID:

  ```
  http://PC_host:8181/pc/center/webservice/domains/tenantItemId/tenantId
  ```

- **get list with translation**

Gets all of the IP domains that belong to the tenant for the logged-in user. Any localized text is translated to the specified language.

```
http://PC_host:8181/pc/center/webservice/domains/cultureId
```

Available POST Method

- **create**
  Creates an IP domain.

```
http://PC_host:8181/pc/center/webservice/domains
```

Available PUT Method

- **update**
  Updates a specified IP domain.

```
http://PC_host:8181/pc/center/webservice/domains/idName/idValue
```

Available DELETE Method

- **delete**
  Deletes an IP domain definition.

```
http://PC_host:8181/pc/center/webservice/domains/{idName}/{idValue}
```

Basic IP Domain Parameters

The current values for the following domain parameters are available from the GET command:

- **cultureID**
  Specifies a language (locale). Supply a language identifier from the following list:
  - en-US (English, United States)
  - ja-JP (Japanese)
  - zh-CN (Simplified Chinese)
  - fr-FR (French, France)
- **dnsProxyAddress**
  Is the IP address of the DNS proxy server.
- **domainItemID**
  Is an internal (database) identifier for a tenant definition.
- **groupItemID**
  Is an internal (database) identifier for the group definition associated with a domain.
- **itemDesc**
  Describes this domain namespace, such as naming the enterprise that owns it.
- **itemName**
  Identifies the domain.

tenantIDIs an internal (database) identifier for a tenant definition. Identifies the tenant associated with this domain.

- **primaryDNSAddress**
  Is the IP address of the primary name server for this domain.
- **primaryDNSPort**
  Is the port number that the primary name server uses.
- **secondaryDNSAddress**
  (Optional) Is the IP address of the secondary name server for this domain.
- **secondaryDNSPort**
  (Optional) Is the port number that the secondary name server uses.
- **isDNSProxyEnabled**
  Indicates whether the proxy address is enabled for this IP domain.
- **deviceAlias**
  Indicates the alias to use for a managed item. A device alias is a user-configured name that is applied to the associated managed item in CA NetOps Portal.
- **deviceAliasList**
  Identifies a CSV or TXT file of alternate interface descriptions. A comma-separated list of values that include the device IP address, interface name, interface description, and alternate interface description (alias) mappings.
- **interfaceDescriptionOverride**
  Indicates the alternate description to use for an interface. Overrides the interface descriptions that appear in CA NetOps Portal by default.

Groups Web Service

The NetOps Portal API provides web services to let you perform common group management tasks.

Use the groups RESTful web service to create and manage groups of monitored items. You can create new groups and can add items to them manually. You can also write rules to create and populate groups that are based on item attributes.

Looking Up the ID of a Group

For most of the NetOps Portal API calls, you need the numeric groupItemId for a group. You can use any of the following three methods to look up these IDs.

1. **groupItemId Lookup Service**
   This service lets you look up the ID of a single group path using a simple HTTP GET.
   To look up the ID of "All Groups/Inventory", use the *groupItemId* parameter. The syntax is as follows:

   ```
   http://PC_host:8181/pc/center/webservice/groups/groupPath/All%20Groups%2FInventory/groupItemId
   ```

   It is not mandatory to specify the entire path. For example, you can find the "`All Groups/Tenants/Acme/Groups/Sites/Boston`" group by searching for "`groupPath/Acme%2FGroups%2FSites%2FBoston/groupItemId`".

   NOTE

   When specifying the group path, use URL text encoding. Spaces must be replaced with %20 and the groups should be separated by %2F.

   The xml that is returned is as follows:

   ```
   <groupItemId>
       <groupItemId>5</groupItemId>
   </groupItemId>
   ```

NOTE
The search might match more than one group, but returns only one group.

2. **Bulk Group Find Service**
   This service lets you look up the ID of several groups with a single HTTP POST. The syntax is as follows:
   ```
   http://PC_host:8181/pc/center/webservice/groups/find
   ```
   The XML to POST is as follows:
   ```
   <groups>
   <group Path='/All Groups/Tenants/Acme/Groups/Sites/San Francisco'/>
   <group Path='/All Groups/Tenants/Acme/Groups/Sites/Austin'/>
   <group Path='/All Groups/Tenants/Acme/Groups/Sites/Boston'/>
   </groups>
   ```
   You can look up for any number of groups. For each group path that is found, the corresponding group ID and the group Name are returned. If a path does not match a group, no ID is returned.
   The XML that is returned for the above POST is as follows:
   ```
   <?xml version="1.0"
   encoding="UTF-8"?>
   <groups>
        <group ID="10503"Name="San Francisco" Path="/All Groups/Tenants/Acme/Groups/Sites/San Francisco"/>
        <group Path="/All Groups/Tenants/Acme/Groups/Sites/Austin"/>
        <group ID="10505"Name="Boston" Path="/All Groups/Tenants/Acme/Groups/Sites/Boston"/>
           </groups>
   ```

   NOTE

   The 'Austin' group does not exist, so no group ID is returned for this group.
3. **Groups Web Service**
   This service lists all child groups of the specified group. This call takes several minutes to return a large group hierarchy. This method is the slowest as it returns more data.
   To look up the ID of "All Groups/Inventory", the syntax is as follows:
   ```
   http://PC_host:8181/pc/center/webservice/groups/groupPath/All%20Groups%2FInventory
   ```

   NOTE

   When specifying the group path, use URL text encoding. Spaces must be replaced with %20 and the groups should be separated by %2F.

Syntax for Site Group Management

To get a list of all groups under All Groups, use the groupPath parameter or the groupItemId parameter.

Issue the following call to use the groupPath parameter to identify the default group:

```
http://PC_host:8181/pc/center/webservice/groups/groupPath/All%20Groups
```

NOTE
When using some REST clients, the ‘All Groups’ syntax is required rather than ‘All%20Groups’. But in general, blank spaces are not valid in URLs.

Issue the following call to get the identifier (siteId) for a site group:

```
http://PC_host:8181/pc/center/webservice/groups/groupItemId/siteId
```

The following XML shows an example of the return for the site ID:

```
<GroupTree siteId="118" inheritDefault="true" path="Austin, TX">
```

To get a list of all subgroups under a group that you specify, you have two options:

- Use the `groupPath` parameter.
- Use the `groupItemId` parameter.

Issue the following call to use the `groupPath` parameter to identify the group whose subgroups are listed in the XML that is returned:

```
http://PC_host:8181/pc/center/webservice/groups/groupPath/All%20Groups%2FInventory
```

Issue the following call to use the `groupItemId` parameter to identify the group whose subgroups are listed in the XML that is returned:

NOTE
The `groupItemId` of the default 'Inventory' group is 5.

```
http://PC_host:8181/pc/center/webservice/groups/groupItemId/5
```

The XML that is returned includes the syntax of any group rules that are applied to that group. Test with various rules that you create in the user interface, and examining the syntax that is generated.

Site Groups and Rules

Group rules support multiple comparisons, in addition to regular expressions. For example, use the following syntax in the XML to post a group rule that adds devices whose name begins with the word 'Cisco':

```
<Match>
   <Compare readOnly="true" using="MEMBER_OF">
       <Property name="ItemID" type="device"/>
           <Value reference="/All Groups">1</Value>
   </Compare>
   <Compare readOnly="false" using="STARTS_WITH">
      <Property name="AlternateName" type="device"/>
           <Value>Cisco*</Value>
   </Compare>
</Match>
```

For group path syntax, forward-slash characters are appropriate for the XML documents that you post. This example assumes that you already have a group structure of “All Groups\Texas\Austin”:

```
<GroupTree inheritDefault="true" path="/All Groups/Texas/Austin">
    <Group desc="" inherit="true" location="" name="CA Officetype="custom group">
        <Group desc="" inherit="true" location="" name="Austin Lab" type="custom group"/>
    </Group>
    <Group desc="" inherit="true" location="" name="Austin Data Center" type="custom group"/>
</GroupTree>
```

In the URL for the web service request, use a backslash character for a group path. Do not use forward slashes in the URL.

Groups Web Service Example Syntax

Issue the following call to see the parameters for the groups web service:

```
http://PC_host:8181/pc/center/webservice/groups/idNames
```

Issue the following call to see a list of supported operations:

```
http://PC_host:8181/pc/center/rest/groups/documentation
```

To get a list of all groups under the highest-level group in the Groups tree (the default, 'All Groups') you can use the groupPath parameter or the groupItemId parameter.

Issue the following call to use the groupPath parameter to identify the default group:

```
http://PC_host:8181/pc/center/webservice/groups/groupPath/All%20Groups
```

> **NOTE**
> When using some REST clients, the ‘All Groups’ syntax is required rather than ‘All%20Groups’. But in general, blank spaces are not valid in URLs.

Issue the following call to use the groupItemId parameter to identify the default group (whose groupItemId value is 1):

```
http://PC_host:8181/pc/center/webservice/groups/groupItemId/1
```

Subgroup Syntax

To get a list of all subgroups under a group that you specify, you have two options:

- Use the `groupPath` parameter.
- Use the `groupItemId` parameter.

Issue the following call to use the groupPath parameter to identify the group whose subgroups are listed in the XML that is returned:

```
http://PC_host:8181/pc/center/webservice/groups/groupPath/All%20Groups%2FInventory
```

Issue the following call to use the groupItemId parameter to identify the group whose subgroups are listed in the XML that is returned:

> **NOTE**
> The `groupItemId` of the default 'Inventory' group is 5.

```
http://PC_host:8181/pc/center/webservice/groups/groupItemId/5
```

The XML that is returned includes the syntax of any group rules that are applied to that group. Test with various rules that you create in the user interface, and examining the syntax that is generated.

Site Group Syntax

To create a site group, use the following XML syntax in a POST command:

```
<GroupTree path="/All Groups">
```

```
    <Group name="group_name" desc="group_description"
    inherit="true" type="site" location="North America"
    bHourID="99990" timeZone="EST"/>
 </GroupTree>
```

- **inherit**
  Indicates whether the group includes child items of group members. For example, if this attribute is set to true, device interfaces are added to a group if the device is added to the group.
- **type**
  Indicates the type of group. The following values are supported.
  Values:
  – **user group** (default)
    A group that a user has created.
  – **site**
    A user-created group that represents a physical site.
- **bHourID**
  (Optional) The internally assigned identifier of the business-hour definition that you want to associate with this site group.
- **timeZone**
  (Optional) The time zone to associate with this site group. Time zones can only be associated with site groups, not with user groups.

Group Rules

Group rules support multiple comparisons, in addition to regular expressions. For example, you want a group rule that adds devices in the Routers group whose name begins with 'Cisco'. The group ID of the Router group is 31. Use the following syntax in the XML:

```
<Match>
   <Compare readOnly="true" using="MEMBER_OF">
       <Property name="ItemID" type="device"/>
           <Value reference="/All Groups/Inventory/All Items/Routers">31</Value>
   </Compare>
   <Compare readOnly="false" using="STARTS_WITH">
      <Property name="AlternateName" type="device"/>
           <Value>Cisco*</Value>
   </Compare>
</Match>
```

NOTE

Scope group rules as narrowly as possible. Do not scope group rules to All Groups.

AllowDeletes

Group deletion requires the `allowDeletes` parameter to be set to 'true'. When the `allowDeletes` parameter is set to 'true' for a group, groups under the `GroupTree path` are retained, unless they are excluded from the XML body. Groups under the `GroupTree path` that are excluded from the XML body are deleted. When the `allowDeletes` parameter is set to 'false' for a group, groups under the `GroupTree path` are retained regardless of whether they are included in the XML body.

Apply and set this parameter to 'true' for a container group when you want to delete a subgroup. For example, the following XML deletes any unlisted groups under Austin:

```
<GroupTree inheritDefault="true" path="/All Groups/Texas/Austin" allowDeletes=”true”>
```

```
    <Group desc="" inherit="true" location="" name="CA Office" type="user group">
        <Group desc="" inherit="true" location="" name="Austin Lab" type="user group"/>
    </Group>
    <Group desc="" inherit="true" location="" name="Austin Data Center" type="user
group"/>
</GroupTree>
```

The following XML deletes any unlisted groups under Texas. For example, this XML would delete the Austin subgroup from the previous example.

```
<GroupTree path="/All Groups/Texas">
    <Group name="USA" desc="Group to represent the entire
    United States" allowDeletes="true" type="user group"/>
</GroupTree>
```

For group path syntax, forward-slash characters are appropriate for the XML documents that you post.

In the URL for the web service request, use a backslash character for a group path. Do not use forward slashes in the URL.

Roles Web Service

The API provides the roles web service to let you view, create, and modify user account roles.

The *role* is a parameter assigned to a user account that controls user access to product features and dashboard pages. Based on user job functions, the role grants administrative access to product configuration using *role rights*. Roles let users access data and product features that they require to perform their duties and restrict access to features that they do not require. To assign custom or factory roles to user accounts, use the users RESTful web service.

Basic Role Parameters

The current values for the following user account role settings are available from the GET command:

- **accessRights**
  Are the role rights that are allocated to this role. Multiple role rights are available for allocation, and some are data source-specific. To get a list of all available role rights, the **categoryId** is required. The categoryId with value 1 corresponds to both CA NetOps Portal and Data Aggregator.
- **culture**
  Specifies a language (locale). Supply a language identifier from the following list:
  - en-US (English, United States)
  - ja-JP (Japanese)
  - zh-CN (Simplified Chinese)
  - fr-FR (French, France)
- **description**
  (Optional) Describes the role to help you identify it.
- **enabled**
  Determines whether the role is enabled for use (activated). Values are true or false.
- **name**
  Is a name for the role. The name is limited to 50 characters.
- **selections**

Provides sets of access rights that you can selectively grant to this role, organized into categories.

- **userCount**
  Is the number of users who have this role assigned to their user account.
- **userID**
  Is an internally assigned value for the role.

Roles Web Service Example Syntax

Issue the following call to see the available operations and parameters for the roles web service:

```
http://PC_host:8181/pc/center/rest/roles/documentation
```

Available GET Methods

- **get access rights**
  Retrieves a list of the role rights that are assigned to a specified role. Use the following syntax:
  ```
  http://PC_host:8181/pc/center/webservice/roles/idName/idValue/rights/cultureId
  ```

- **get access rights by category**
  Retrieves a list of all available role rights for a specified category. The category is either CA NetOps Portal or a data source. A categoryId of 1 applies to both CA NetOps Portal and Data Aggregator.
  ```
  http://PC_host:8181/pc/center/webservice/roles/rights/categoryid/cultureId
  ```

- **get category**
  Retrieves an XML document that includes the categoryId:
  ```
  http://PC_host:8181/pc/center/webservice/roles/rights/categories/en-US
  ```

- **get by tenant**
  Retrieves a list of all roles that are associated with the tenant for the logged-in user. Use the following syntax:
  ```
  http://PC_host:8181/pc/center/webservice/roles/idName/idValue/rights/tenant/
  tenantIdName/tenantIdValue/cultureId
  ```

- **get categoryId**
  Retrieves XML that shows the available category IDs.
  ```
  http://PC_host:8181/pc/center/webservice/roles/rights/categories/cultureId
  ```

  A value of 1 corresponds to CA NetOps Portal and Data Aggregator. Role rights in that category only apply to a Data Aggregator data source.
- **get id names**
  Retrieves a list of identifiers that can be used to identify roles in other web service methods. Use the following syntax:
  ```
  http://PC_host:8181/pc/center/webservice/roles/idNames
  ```

Available PUT Methods

- **copy**
  Copies a role. This method creates a copy of a specified role and associates it with the tenant for the logged-in user. Use the following syntax:
  ```
  http://PC_host:8181/pc/center/webservice/roles/idName/idValue/copy/roleName/
  description/enabled/cultureId
  ```

- **update**
  Modifies a specified role. The role name and tenant ID are required elements of the role parameters.
  `http://PC_host:8181/pc center/webservice/roles/idName/idValue/cultureId`

Available POST Methods

- **create**
  Creates a role. The new role is associated with the tenant for the logged-in user:
  `http://PC_host:8181/pc/center/webservice/roles/`

- **create for tenant**
  Creates a role and assigns it to the specified tenant.
  `http://PC_host:8181/pc/center/webservice/roles/tenant/tenantIdName/tenantIdValue`

Create a Role

Use the roles web service to create user account roles.

Issue the following call to see the parameters for the roles web service:

`http://PC_host:8181/pc/center/webservice/roles`

Follow these steps:

1. Enter a URL for the CA NetOps Portal RESTful web services API in the REST client. Use the following format:
   `http://PC_host:8181/pc /center/webservice/roles`
2. Select **POST** for **"HTTP" Method**.
3. Provide a valid Username and Password for a user account that has global administrator access to NetOps Portal.
4. Select **'application/xml**' as the **'Body Content-type'** in the Body settings.
5. Paste XML in the Body field that resembles the following example:

```
<role>
  <name>TestRoleName</name>
  <description>Test Role Description</description>
  <enabled>true</enabled>
  <accessRights>
  <accessRight>
  <accessRightName>ViewToS</accessRightName>
  <categoryId>1</categoryId>
  <enabled>true</enabled>
  </accessRight>
  </accessRights>
</role>
```

   - **accessRights**
     Correspond to role rights.
   - **accessRightName**
     The name of the role right. For example, the administerGroups role right lets the user with this role manage a limited section of the Groups tree.
   - **categoryId**

Identifies the category of role rights, such as CA NetOps Portal role rights or data-source-specific role rights.

6. Run the method.

Users Web Service

The API provides a users web service to manage user accounts. You can perform the following tasks:

- Retrieve a current list of user accounts.
- Create user accounts.
- Modify user accounts.
- Delete user accounts.

The following topics provide information about related parameters:

Basic User Account Parameters

The following is a list of the parameters for the users web service:

NOTE
You can get the parameters and available operations for the users web service by issuing the following call:
`http://PC_host:8181/pc/center/rest/users/documentation`

- **userID**
  Internally-assigned value for the user account.
- **name**
  Login name for the user account. The name is limited to 50 characters.
- **description**
  (Optional) Describes the user account to help you identify it.
- **enabled**
  Determines whether the user account is enabled for use (activated).
- **removable**
  Determines whether you can delete the user account (remove it from the database).
  Values: true or false.

  NOTE
  You can delete all user accounts except the **admin** and **user** predefined user accounts.
- **timezone (tz)**
  Corresponds to the time zone in which the user views report data.
  Default: UTC (Coordinated Universal Time).
- **userLevel**
  Identifies the product privilege assigned to the user account.
- **role**
  Specifies the role assigned to the user account.
- **permissionId**
  Specifies the ID for the **My Assigned Groups** for the user account.
- **tenantId**
  The internal (database) identifier for the tenant with which the user account is associated.
- **culture**
  Specifies the language (locale) code for the user.
  Options:

- en-US (English, United States)
- ja-JP (Japanese)
- zh-CN (Simplified Chinese)
- zh-TW (Traditional Chinese)
- fr-FR (French, France)

Example:

Issue the following GET call to see the current values for the `culture` parameter for users that are associated with the same tenant as the account that is used to run this command:
`http://PC_host:8181/pc/center/webservice/users/cultureId`
For *`cultureId`*, supply the language code for the language in which you would like to view the output, such as `en-US`.

Users Web Service Example Syntax

The following HTTP methods are available with the users web service:

Available GET Methods

NOTE
You cannot retrieve password information using the GET method.

- **get groups owned by user**
  Retrieves a list of groups for the specified user. The groups that are returned are groups that are owned by the specified user, meaning that this user can modify or delete these groups:
  `http://PC_host:8181/pc/center/webservice/users/idName/idValue/groupsOwnedByUser`
- **get groups**
  Retrieves a list of groups to which the specified user has view access. The groups that are returned are groups that are within the permission set of the specified user. The user cannot modify or delete these groups:
  `http://PC_host:8181/pc/center/webservice/users/idName/idValue/groups`
- **get administered groups**
  Retrieves a list of all administered groups associated with a specified user account:
  `http://PC_host:8181/pc/center/webservice/users/idName/idValue/administeredGroups`
- **get id names**
  Retrieves a list of identifiers that can be used to identify users in other web service methods:
- **idValue**
  The value for the identifying category. For example, if *`idName`* is `userID`, provide the user ID. If *`idName`* is `userName`, provide the login name for the user acount.
- **get authentication types**
  Returns a list of identifiers that can be used to assign authentication types to users:
  `http://PC_host:8181/pc/center/webservice/users/authenticationTypes`

Available PUT Methods

NOTE
You can update the password of a specified user account using the PUT method. The password is sent in cleartext to avoid publicizing the encryption key for the web service to use. As a result, to protect the password privacy, use this method for changing the password only on NetOps Portal host.

- **update role**
  Updates the role assignment of a specified user account:
  `http://PC_host:8181/pc/center/webservice/users/idName/idValue/role/roleIdName/roleIdValue`
- **update time zone**

Updates the time zone of a specified user account:
`http://PC_host:8181/pc/center/webservice/users/idName/idValue/timeZone/newTimeZone`

- **set groups**
  Updates the permission groups that have been granted to a specified user account:
  `http://PC_host:8181/pc/center/webservice/users/idName/idValue/groups`
  To set groups, supply XML in the following format:

```
<group>
  <group ID="5245"/>
  <group ID="5246"/>
  <group ID="5247"/>
...
</group>
```

- **add groups**
  Adds the specified groups:
  `http://PC_host:8181/pc/center/webservice/users/idName/idValue/addGroups`
  To add groups, supply XML in the following format:

```
<group>
  <group ID="5245"/>
  <group ID="5246"/>
  <group ID="5247"/>
...
</group>
```

- **remove groups**
  Removes the specified groups:
  `http://PC_host:8181/pc/center/webservice/users/idName/idValue/removeGroups`
  To remove groups, supply XML in the following format:

```
<group>
  <group ID="5245"/>
  <group ID="5246"/>
  <group ID="5247"/>
...
</group>
```

- **set administered groups**
  Updates the branches of the groups tree to which the specified user has administrative access:
  `http://PC_host:8181/pc/center/webservice/users/idName/idValue/administeredGroups`
  The following example XML sets administered groups to a user account:

```
<group>
  <group ID="5245"/>
  <group ID="5246"/>
  <group ID="5247"/>
...
 </group>
```

- **set default group**
  Updates the default group for the specified user:
  `http://PC_host:8181/pc/center/webservice/users/idName/idValue/defaultGroup/groupId`
  Example:
  `http://PC.broadcom.net:8181/pc/center/webservice/users/userId/7/defaultGroup/11`
- **add administered groups**
  Adds the specified groups to a user account:
  `http://PC_host:8181/pc/center/webservice/users/idName/idValue/addAdministeredGroups`
  The following example XML adds administered groups to a user account:

```
<group>
  <group ID="5245"/>
  <group ID="5246"/>
  <group ID="5247"/>
...
 </group>
```

- **remove administered groups**
  Removes the specified groups from a user account:
  `http://PC_host:8181/pc/center/webservice/users/idName/idValue/removeAdministeredGroups`
  The following example XML removes administered groups from a user account:

```
<group>
  <group ID="5245"/>
  <group ID="5246"/>
  <group ID="5247"/>
...
 </group>
```

- **update product privilege per datasource**
  Updates the product privilege of a specified user account to enable access to the user interface of a specific data source:
  `http://PC_host:8181/pc/center/webservice/users/idName/idValue/ds/dsId/productPrivilege/newProductPrivilege`
- **dsId**
  The data source identifier. For a list of available data source identifiers, see Basic Datasource Parameters.

Available POST Methods

- **create**
  Creates a user account. This user is associated with the tenant for the logged-in user. The parameters include a role assignment:
  `http://PC_host:8181/pc/center/webservice/users/role/roleIdName/roleIdValue`
- **create in tenant**
  Creates a user account in the specified tenant, with the specified role assignment:
  `http://PC_host:8181/pc/center/webservice/users/tenant/tenantIdName/tenantIdValue/role/roleIdName/roleIdValue`
- **clear administered groups**
  Clears administered groups with a special ID that indicates no groups are selected:
  `http://PC_host:8181/pc/center/webservice/users/idName/idValue/administeredGroups`
  The following example XML clears administered groups:

```
<group>
  <group ID="2"/>
 </group>
```

Create a User Account

Use any REST client to create and configure a user account using the users web service. User accounts are associated with a tenant automatically. If you are deploying multi-tenancy, this user is assigned to the tenant of the authenticated user account that was used to make the REST service call. If you are not deploying multi-tenancy, this association is transparent to you; new user accounts are associated with the default tenant.

Follow these steps:

1. Set up a REST client with a connection to the NetOps Portal host.
2. Enter a URL for the NetOps Portal RESTful web services API in the REST client. Use the following format:

`http://PC_host:8181/pc/center/webservice/users/role/roleIdName/roleIdValue/`

- **roleIdName**
  Use the values that are specified at the following URL:
  `http://PC_host:8181/pc/center/webservice/roles/idNames`
  Examples:
  - `roleName`
  - `roleId`
- **roleIdValue**
  This value depends on the `roleIdName` that you selected. For example, if `roleName` is used, substitute a valid role name for `roleIdValue`.

  NOTE
  This role must be available within the tenant.

3. Select **POST** for HTTP Method.
4. Provide a valid **Username** and **Password** for a user account that has host or tenant administrator access to NetOps Portal.

   NOTE
   The password is automatically set to be the same as the user name.
5. Select **application/xml** as the **Body Content-type** in the Body settings.
6. Add the following parameters within the **Body** text section:

```
<user>
   <name>{UserName}</name>
   <description>{UserDescription}</description>
   <enabled>{UserEnabled}</enabled>
   <removable>{UserRemovable}</removable>
   <timezone>{UserTimeZone}</timezone>
   <culture>{UserCulture}</culture>
    <administeredGroups>
      <group ID="{groupID}"/>
      <group ID="{groupID}"/>
   </administeredGroups>
</user>
```

7. Replace values with the values that you want to use for this user account.
   For example, supply the following parameters:

```
<user>
   <name>Jane Doe</name>
   <description>User associated with the John Doe Corporation tenant.</description>
   <enabled>true</enabled>
   <removable>true</removable>
   <timezone>CST6CDT</timezone>
   <culture>en-US</culture>
   <administeredGroups>
      <group ID="105"/>
      <group ID="367"/>
   </administeredGroups>
</user>
```

   NOTE
   The `administeredGroups` tag is optional. To create a user without administered groups, exclude the tag.
8. Run the method.
9. Repeat the preceding steps until you have created as many users as you require.

User Account Product Privilege Settings

Use NetOps Portal to determine the product privilege of a specified user account. The *product privilege* is a type of permission set associated with a user account. The product privilege grants user access to features in selected data sources and does not apply to NetOps Portal functionality.

User accounts have one of the following product privilege assignments:

- **NONE**
  Indicates that this user does note have access to a specified data source.
- **ADMINISTRATOR**
  Indicates that this user has the administrator product privilege for the indicated data source and can perform administrative tasks.
- **POWER_USER**
  Indicates that this user has the power user product privilege for the indicated data source and can perform some administrative tasks associated with user accounts and dashboards.
- **USER**
  Indicates that this user has the user product privilege for the indicated data source and has no access to administrative features.

Tenants Web Service

The API provides the tenants web service to let you view, create, and modify tenant definitions.

The basic tenant definition contains a few parameters to identify the tenant. All of the infrastructure -- devices, networks, servers -- and all monitoring parameters for a customer's monitored systems must be associated with the tenant definition. Each tenant must contain at least one IP domain, plus as many of the following definitions as required to manage the associated enterprise infrastructure and applications:

- User accounts
- Roles
- Custom and system groups
- Custom reports
- Custom menus

To associate definitions and monitoring parameters with an existing tenant definition, log in as the tenant administrator and use the required web services to create the required definitions. The definitions are then associated with the tenant definition and available to users logged in with this tenant's user accounts.

A use case document is available on the CA NetOps Portal Documentation Bookshelf to help you use the tenants and users web services.

Tenants Web Service Parameters

Issue the following call to see the available parameters and operations for the tenants web service:

```
http://PC_host:8181/pc/center/rest/tenants/documentation
```

Parameters

- **tenantDescription**
  (Optional) Describes the tenant.
- **idName**

Is a name for the tenant.

- **status**
  Is the status of this tenant. Select one of the following values:
  – Activated: Enables tenant user accounts for use.
  – Disabled: Prevents any actions by user accounts that are associated with this tenant.
- **removable**
  States whether the item can be deleted (removed from the database).
  Values: true or false.
- **theme**
  Specifies the format -- the theme that controls the appearance of the page in the browser window -- to use for this tenant. All operators whose user account is associated with this tenant see this same theme. Two themes are available: CA-Blue and CA-Gray.
  Default: CA-Blue.
- **defaultCulture**
  Specifies a language (locale). Supply a language identifier from the following list:
  – en-US (English, United States)
  – ja-JP (Japanese)
  – zh-CN (Simplified Chinese)
  – fr-FR (French, France)
- **accountId**
  Identifies this tenant; usually corresponds to the MSP account number. If a value is supplied as input, it must be unique across all defined tenants.
- **tenantID**
  Is an internal (database) identifier for a tenant definition.

Tenants Web Service Example Syntax

The tenants web service lets you get a current list of tenant definitions, create new tenant definitions, and modify those definitions by changing their parameters.

A use case document is available on the CA NetOps Portal Documentation Bookshelf to help you use the tenants web service.

Operations

The following basic operations are supported by the tenants web service:

- **GET**
  Returns a list of tenant definitions sorted by name. Available on the /tenantID endpoint. Use the following syntax:

  ```
  http://PC_host:8181/pc/center/webservice/tenants/
  ```

- **POST**
  Creates a custom tenant. Use the following syntax:

  ```
  http://PC_host:8181/pc /center/webservice/tenants/
  ```

- **PUT**
  Updates an existing tenant definition. Use the following syntax:

  ```
  http://PC_host:8181/pc/center/webservice/tenants/
  ```

Create a Tenant

Use any REST client to create and configure a tenant using the tenants web service.

Follow these steps:

1. Set up a REST client with a connection to the NetOps Portal server.
2. Enter a URL for the NetOps Portal RESTful web services API in the REST client. Use the following format:

   ```
   http://PC_host:8181/pc/center/webservice/tenants/
   ```

3. Select **POST** for **"HTTP" Method**.
4. Provide a valid Username and Password for a user account that has global administrator access to NetOps Portal.
5. Select **'application/xml'** as the **'Body Content-type'** in the Body settings.
6. Add the following XML within the "Body" text section:

   ```
   <tenant>
     <tenantName>Name of tenant</tenantName>
     <tenantDesc>Description of the tenant</tenantDesc>
     <accountIdentifier>unique string for this tenant</accountIdentifier>
     <status>{activated or disabled}</status>
     <removable>{true or false}</removable>
     <theme>{CA-Blue or CA-Gray}</theme>
     <defaultCulture>culture</defaultCulture>
   </tenant>
   ```

7. Replace any values with the values that you want to use for the new tenant.
   For example, supply the following parameters:

   ```
   <tenant>
     <tenantName>John Doe</tenantName>
     <tenantDesc>John Doe Corporation tenant</tenantDesc>
     <accountIdentifier>JD1234</accountIdentifier>
     <status>Enabled</status>
     <removable>false</removable>
     <theme>CA-Blue</theme>
     <defaultCulture>en-US</defaultCulture>
   </tenant>
   ```

8. Run the method.
9. Repeat the preceding steps until you have created as many tenants as you require.

Supporting Web Services

The API provides the consoleinfo web service and the event web service. These web services supply configuration items and identifying data to the administrative web services.

Consoleinfo Web Service

You can retrieve information about NetOps Portal console configuration using the consoleinfo web service that the API provides. You can pass this information into other web service methods, such as time zone information that is required to create business hour definitions.

Consoleinfo Web Service Example Syntax

Issue the following call to see the parameters for the consoleinfo web service:

`http://PC_host:8181/pc/center/rest/consoleinfo/documentation`

Available GET Methods

- **get all time zones**
  Gets a list of all of the time zones that are available for use in business hour definitions:
  `http://PC_host:8181/pc/center/webservice/consoleinfo/allTimezones/cultureID`

  – **cultureId**
    Specifies a language (locale). Supply a language identifier from the following list:
    - en-US (English, United States)
    - ja-JP (Japanese)
    - zh-CN (Simplified Chinese)
    - fr-FR (French, France)
- **get installed language packs**
  Gets a list of language packs that are installed on the server:
  `http://PC_host:8181/pc/center/webservice/consoleinfo/languagepacks/cultureID`

- **get time zones assigned to sites**
  Retrieves a list of all of the time zones that are assigned to site groups to which the logged-in user has access:
  `http://PC_host:8181/pc/center/webservice/consoleinfo/timezonesAssignedToSites`

Event Web Service

You can retrieve a list of events that have been raised in your environment using the event web service.

Perform a GET to the following URL to see a list of events for the specified managed item:

`http://PC_host:8181/pc/eventId/item/itemId`

- **eventId**
  Event ID of the event to retrieve properties for.
- **itemId**
  Item ID of the item that the event is on.

For more information, see Devices Web Service.

Use Web Services to Create Tenants Programmatically

NetOps Portal offers a set of APIs that let you automate provisioning and configuration tasks. The most frequently repeated or time-consuming tasks are exposed to you with web services. Some of these APIs consist of web services that conform to the Representational State Transfer (REST) model.

This use case illustrates a procedure that an administrator can deploy to create multiple tenant definitions using the CA NetOps Portal RESTful web services. Because each tenant has its own user accounts to provide access to CA NetOps Portal, we also describe user account creation within tenants. In this use case, we describe the steps to take when using a REST client, a generic web services user interface application. The examples in this use case contain URIs that are constructed using the default server port, 8181.

Create Tenants Programmatically

The global administrator can use the CA NetOps Portal RESTful web services to create tenants with specific parameters. The basic tenant definition contains a few parameters to identify the MSP customer and let other operators access managed items and configuration for the customer. An administrator account is a required component of the tenant definition so that the customer can perform some tenant setup.

You can associate monitored devices and product settings with the tenant definition in separate steps. Each tenant must contain at least one IP domain. You and the tenant administrator can then configure other product settings that are required to manage the enterprise infrastructure and applications for that customer.

Create Tenants Using Web Services

Use any REST client to create and configure a tenant using the tenants web service.

Follow these steps:

1. Set up a REST client with a connection to the NetOps Portal server.
2. Enter a URL for the NetOps Portal RESTful web services API in the REST client. Use the following format:
   `http://PC_host:8181/pc/center/webservice/tenants/`
3. Select **POST** for **"HTTP" Method**.
4. Provide a valid Username and Password for a user account that has global administrator access to NetOps Portal.
5. Select **'application/xml'** as the **'Body Content-type'** in the Body settings.
6. Add the following XML within the "Body" text section:

```
<tenant>
  <tenantName>Name of tenant</tenantName>
  <tenantDesc>Description of the tenant</tenantDesc>
  <accountIdentifier>unique string for this tenant</accountIdentifier>
  <status>{activated or disabled}</status>
  <removable>{true or false}</removable>
  <theme>{CA-Blue or CA-Gray}</theme>
  <defaultCulture>culture</defaultCulture>
</tenant>
```

7. Replace any values with the values that you want to use for the new tenant.
   For example, supply the following parameters:

```
<tenant>
  <tenantName>John Doe</tenantName>
  <tenantDesc>John Doe Corporation tenant</tenantDesc>
  <accountIdentifier>JD1234</accountIdentifier>
  <status>Enabled</status>
  <removable>false</removable>
  <theme>CA-Blue</theme>
  <defaultCulture>en-US</defaultCulture>
</tenant>
```

   For more information about tenant parameters, see Tenants Service Example Syntax.
8. Run the method.
9. Repeat the preceding steps until you have created as many tenants as you require.

Create Users Using Web Services

Use any REST client to create and configure a user account using the users web service.

Every user account is automatically associated with a tenant. If you are deploying multi-tenancy, the new user is assigned to the tenant of the authenticated user account that was used to make the REST service call. If you are not deploying multi-tenancy, this association is transparent to you; new user accounts are associated with the Default Tenant.

Follow these steps:

1. Set up a REST client with a connection to the NetOps Portal server.
2. Enter a URL for the NetOps Portal RESTful web services API in the REST client. Use the following format:
   `http://PC_host:8181/pc/center/webservice/users/role/{roleIdName}/roleIdValue/`

   – ***{roleIdName}***
   Use values that are specified in `http://PC_host:8181/pc/center/webservice/roles/idName` s.
   Examples: '`roleName` ' and '`roleId` '.
   – ***roleIdValue***
   This value depends on the *`roleIdName`* that you selected. For example, if `'roleName'` is used, substitute a valid role name for *`roleIdValue`* .
   This role must be available within the tenant.
3. Select **POST** for **"HTTP" Method**.
4. Provide a valid Username and Password for a user account that has host or tenant administrator access to NetOps Portal.
5. Select **'application/xml'** as the **'Body Content-type'** in the Body settings.
6. Add the following parameters within the "Body" text section:

```
<user>
   <name>{UserName}</name>
   <description>{UserDescription}</description>
   <enabled>{UserEnabled}</enabled>
   <removable>{UserRemovable}</removable>
   <timezone>{UserTimeZone}</timezone>
   <culture>{UserCulture}</culture>
    <administeredGroups>
      <group ID="{GroupID}"/>
      <group ID="{GroupID}"/>
   </administeredGroups>
</user>
```

7. Replace any values with the values that you want to use for the new user account.
   For example, supply the following parameters:

```
<user>
   <name>Jane Doe</name>
   <description>User associated with the John Doe Corporation tenant.</description>
   <enabled>true</enabled>
   <removable>true</removable>
   <timezone>CST6CDT</timezone>
   <culture>en-US</culture>
    <administeredGroups>
      <group ID="105"/>
      <group ID="367"/>
   </administeredGroups>
</user>
```

   For more information about user parameters, see Users Web Service.

   NOTE

   The `administeredGroups` tag is optional. To create a user without administered groups, exclude the tag.

8. Run the method.
9. Repeat the preceding steps until you have created as many users as you require.

Basic User Account Parameters

The current values for the following user account settings are available from a GET operation:

`http://PC_host:8181/pc /center/webservice/users/cultureId.`

> **NOTE**
> This URL returns information about users associated with the same tenant as the account that is used to execute this command.

For *cultureId*, supply the language code for the language in which you would like to view the output, such as 'en-US'.

- **userID**
  Is an internally assigned value for the user account.
- **name**
  Is a login name for the user account. The name is limited to 50 characters.
- **description**
  (Optional) Describes the user account to help you identify it.
- **enabled**
  Determines whether the user account is enabled for use (activated).
- **removable**
  States whether the item can be deleted (removed from the database).
  Values: true or false.

  > **NOTE**
  > You cannot delete the two predefined user accounts (**admin** and **user**).

- **timezone (tz)**
  Corresponds to the time zone in which the user will view report data.
  Default: UTC (Coordinated Universal Time).
- userLevel
  Identifies the product privilege assigned to this user account.
- **role**
  Specifies the role assigned to the user account.
- **tenantId**
  Is an internal (database) identifier for the tenant with which the user account is associated.
- **culture**
  Specifies a language (locale). Supply a language identifier from the following list:
  - en-US (English, United States)
  - ja-JP (Japanese)
  - zh-CN (Simplified Chinese)
  - fr-FR (French, France)

  > **NOTE**
  >
  > : The GET method does not return password information. When you create a new user account, the password is automatically set to be the same as the user name.
  >
  > A separate PUT method lets you update the password of a specified user account. The password is sent in cleartext to avoid publicizing the encryption key for the web service to use. As a result, the method for changing the password must only be used on the server where CA NetOps Portal is installed to protect the password privacy.

User Account Product Privilege Settings

Use the CA NetOps Portal user interface to determine the product privilege of a specified user account. The *product privilege* is a type of permission set associated with a user account. The product privilege grants user access to features in selected data sources and does not apply to CA NetOps Portal functionality.

A user account has one of the following product privilege assignments:

- **NONE**
  Indicates that this user has no access to a specified data source.
- **ADMINISTRATOR**
  Indicates that this user has the administrator product privilege for the indicated data source and can perform administrative tasks.
- **POWER_USER**
  Indicates that this user has the power user product privilege for the indicated data source and can perform some administrative tasks associated with user accounts and dashboards.
- **USER**
  Indicates that this user has the user product privilege for the indicated data source and has no access to administrative features.

Use Web Services to Manage Groups

NetOps Portal offers a set of APIs that let you automate provisioning and configuration tasks. The most frequently repeated or time-consuming tasks are exposed to you with web services. Some of these APIs consist of web services that conform to the Representational State Transfer (REST) model.

This use case illustrates procedures that an administrator can deploy to create and manage groups or collections using the NetOps Portal REST web services. You can add and delete multiple groups or subgroups. You can add items to groups and create group rules to populate groups. You can also export and import group definitions.

In this use case, we describe the steps to take when using a REST client, a generic web services user interface application. The examples in this use case contain URIs that are constructed using the default server port, 8181.

Create Groups Programmatically

The global administrator can use the CA NetOps Portal REST web services to create and populate groups. Groups are always associated with a tenant definition. If you are not deploying multi-tenancy, groups are associated with the Default Tenant. Otherwise, group management tasks only apply to the current tenant.

The web service offers two methods of identifying groups:

- Using the full *group path*, which identifies the group as a subgroup of the default first-level or root group ('All Groups'). The group itself is a node on the *Groups tree*, which extends hierarchically from the root group.
- Using the *group ID*, an internally assigned numeric value that identifies a node. No identifier is assigned to the *path* to a group.
  Use this method to identify groups if they are nested within multiple containers to avoid typing the full group path.

You can create rules to add monitored devices to groups automatically. You can also add subgroups to your groups.

Get Identifying Information for a Group

You can use the group path or the group ID for a group to identify that group when you want to update it. The group path shows the position of a group within the Groups tree. The group ID is typically a better way to retrieve group information and to manage a group than using the group path, which can be lengthy.

Follow these steps:

1. Set up a REST client with a connection to the CA NetOps Portal server.
2. Use the following format for the URL in the REST client:
   `http://PC_host:8181/pc/center/webservice/groups/idName/idValue`

   – **IdName**
   A supported value for specifying a group. Possible values can be retrieved by performing a GET operation on the following URL:
   `http://PC_host:8181/pc/center/webservice/groups/idNames`

   Specify one of the following parameters for the **idName**:
   - **groupItemId** - The internally assigned ID of the group.
   - **groupPath** - The path of the group, with each group delimited by encoded front slashes (%2F).

   – **idValue**
   The value that is used to specify a group, based on the nature of the ID name. Dependent on the value of the **idName** field, as follows:
   groupItemId - The ID of the group is expected.
   groupPath - The path of the group, with each group delimited by encoded front slashes (%2F) is expected.

   Example: To view the details and rule definitions of a given group, issue a GET request to the parent of that group. The following call retrieves the details and rule definitions for the groups under a specific group that is named **ParentGroup** under **All Groups**:
   `http://PC_host:8181/pc/center/webservice/groups/groupPath/All%20Groups%2fParentGroup`

3. Select **GET** for the **HTTP method**.
4. Provide a valid Username and Password in the request header for a user account that has global administrator access to NetOps Portal.
5. Run the method.
   The XML that is returned contains the group item identifier.
   You can also use this method to get the full group path.

In the following example, the XML that is returned includes information about the system group named Inventory:

```
<?xml version="1.0" encoding="UTF-8"?>
<GroupTree id="5" inheritDefault="true" path="Inventory">
  <Group desc="This group contains groups for the various item types
  that are associated with all data sources." id="12" inherit="false"
  location="" name="All Items" type="automatic group">
    <Group desc="Includes networks from all Application Delivery
     Analysis data sources." id="40" inherit="true" location=""
     name="Application Delivery Analysis Networks" type="automatic
     group" />
    <Group desc="This group contains all the applications reported by
     each data source." id="41" inherit="true" location="" name=
     "Applications" type="automatic group" />
    <Group desc="This group contains all the device components reported
     by each data source." id="113" inherit="true" name="Device
     Components" type="automatic group" />
    <Group desc="This group contains all the VMware ESX hosts reported
     by each data source." id="35" inherit="true" location="" name="ESX
     Hosts" type="automatic group" />
    <Group desc="Includes interfaces from all data sources." id="50"
```

```
     inherit="true" location="" name="Interfaces" type="automatic group" />
    <Group desc="This group contains all the pingable devices reported
     by each data source." id="114" inherit="true" name="Pingable
     Devices" type="automatic group" />
    <Group desc="Includes routers from all data sources." id="31"
     inherit="true" location="" name="Routers" type="automatic group" />
    <Group desc="Includes servers from all data sources." id="32"
     inherit="true" location="" name="Servers" type="automatic group" />
    <Group desc="Includes switches from all data sources." id="33"
     inherit="true" location="" name="Switches" type="automatic group" />
    <Group desc="This group contains all the virtual machines reported
     by each data source." id="34" inherit="true" location=""
     name="Virtual Machines" type="automatic group" />
    <Group desc="This group contains all the voice interfaces reported
     by each data source." id="51" inherit="true" location="" name=
     "Voice Interfaces" type="automatic group" />
    <Group desc="This group contains all the voip locations reported
     by each data source." id="52" inherit="true" location="" name=
     "VoIP Locations" type="automatic group" />
  </Group>
  <Group desc="Includes every data source that has reported
  configuration information to the performance center." id="4"
  inherit="false" location="" name="Data Sources" type="automatic
  group">
    <Group desc="Contains configuration information reported to the
     performance center by Data Aggregator" id="115" inherit="true"
     name="da" type="system group" />
    <Group desc="Contains configuration information reported to the
     performance center by Event Manager" id="100" inherit="true"
     name="EventManager@servername.domain.com" type="system group">
      <Group desc="Devices created by event manager" id="101" inherit=
      "true" name="Devices" type="system group" />
    </Group>
  </Group>
```

The above results show that the group ID for the Inventory group is 5:

```
<GroupTree id="5" inheritDefault="true" path="Inventory">
```

You can use this value to get the complete group path. Enter the following URL:

```
http://PC_host:8181/pc/center/webservice/groups/groupItemId/5
```

From this result, you can see that the complete path to the Inventory group is "/All Groups/Inventory". All subgroups of the Inventory system group are also returned.

You can then use the values that are returned for the group name parameter to construct a group path for a subgroup, as in the following example:

```
/All%20Groups/Inventory/Device%20Components
```

The URL to get the group ID from the group path would resemble the following example:

```
http://PC_host:8181/pc/center/webservice/groups/groupPath/All%20Groups%2FInventory
%2FDevice%20Components
```

NOTE

When specifying a group path in the URL, use the percent encoded value for front slashes (%2F, as shown above) to delimit each group in the path. This requirement comes from the fact that non-encoded front slashes are reserved as the delimiting character for path segments in the URL syntax.

Get a List of Group Members

Use the groups web service to get a list of subgroups and items that are direct members of a specified group. The XML that is returned displays information about the specified group as the parent element, and separates groups and items into their own separate elements.

The list that is returned does not include items that were added to the group as children of a managed item that was directly added to the group. For example, if a router is a direct member of a group, the list does not include the interfaces that belong to that router.

To get a list of members for a group whose name or ID you know, enter the following base URL:

`http://PC_host:8181/pc/center/webservice/groups/idName/idValue/items`

- **idName**
  A supported ID name for specifying a group. Possible values can be retrieved by performing a GET operation on the following URL:
  `http://PC_host:8181/pc/center/webservice/groups/idNames.`
  Use one of the following parameters for the **idName**:
  - **groupItemId** - The internally assigned ID of the group.
  - **groupPath** - The path of the group, with each group delimited by encoded front slashes (%2F).
  - **idValue**
    The value that is used to specify a group, based on the nature of the ID name. Dependent on the value of the **idName** field, as follows:
    - **groupItemId** - The ID of the group is expected.
    - **groupPath** - The path of the group, with each group delimited by encoded front slashes (%2F) is expected.

Follow these steps:

1. Set up a REST client with a connection to the NetOps Portal server.
2. Use the following format for the URL in the REST client:
   `http://PC_host:8181/pc/center/webservice/groups/idName/idValue/items`
3. Select **GET** for the **HTTP** method.
4. Provide a valid Username and Password in the request header for a user account that has global administrator access to NetOps Portal.
5. Run the method.
   The XML that is returned lists subgroups and managed items that are members of the group. It resembles the following:

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<group id="787" name="Test Group" description="" type="group" subType="user">
  <groups>
    <group id="788" name="Test Child Group 1" description="" type="group" subType="user"/>
    <group id="789" name="Test Child Group 2" description="" type="group" subType="user"/>
  </groups>
  <itemTypes>
```

```
    <itemType type="Devices">
      <items>
        <item id="121" name="Austin Switch" description="Cisco IOS Software, Switch 192.168.1.1"
type="device" subType="switches" addedBy="BY_USER"/>
        <item id="124" name="Austin Router" description="Cisco IOS Software, Router 192.168.0.1"
type="device" subType="router" addedBy="BY_USER"/>
        <item id="127" name="Austin Server" description="Linux" type="device" subType="server"
addedBy="BY_USER"/>
      </items>
    </itemType>
    <itemType type="Interfaces">
      <items>
        <item id="417" name="eth0/1/0:7" description="Ethernet0/1/0:7" type="interface" subType="physical"
addedBy="BY_USER"/>
        <item id="418" name="eth0/1/0:8" description="Ethernet0/1/0:8" type="interface" subType="physical"
addedBy="BY_USER"/>
        <item id="420" name="eth0/1/0:9" description="Ethernet0/1/0:9" type="interface" subType="physical"
addedBy="BY_USER"/>
      </items>
    </itemType>
  </itemTypes>
</group>
```

Get a List of Groups that You Own

You can only modify or delete groups that you own. If you created a group, you are the owner of that group. The global administrator is the owner of all groups in the Groups tree. In addition, the global administrator or tenant administrator can edit your user account to give you ownership of a "branch" of the Groups tree.

Use the Users web service to get a list of the groups of which you are the owner. Consult the following descriptions to use the Users web service:

Issue the following call to see the parameters and available operations for the users web service:

`http://PC_host:8181/pc/center/rest/users/documentation`

Available GET Methods

- **get groups owned by user**
  Retrieves a list of groups for the specified user. The groups that are returned are groups that are owned by the specified user, meaning that this user can modify or delete these groups:
  `http://PC_host:8181/pc/center/webservice/users/idName/idValue/groupsOwnedByUser`

- **get groups**
  Retrieves a list of groups to which the specified user has view access. The groups that are returned are groups that are within the permission set of the specified user. The user cannot modify or delete these groups:
  `http://PC_host:8181/pc/center/webservice/users/idName/idValue/groups`

- **get id names**
  Retrieves a list of identifiers that can be used to identify users in other web service methods.
  `http://PC_host:8181/pc/center/webservice/users/idNames`

  - **idValue**
    Is the value for the identifying category. For example, if ***idName*** is **userID**, provide the user ID. If ***idName*** is **userName**, provide the user name.
- **get authentication types**
  Returns a list of identifiers that can be used to assign authentication types to users.
  `http://PC_host:8181/pc/center/webservice/users/authenticationTypes`

Available PUT Methods

- **update role**
  Updates the role assignment of a specified user account.
  `http://PC_host:8181/pc/center/webservice/users/idName/idValue/role/roleIdName/roleIdValue`

- **update time zone**
  Updates the time zone of a specified user account.
  `http://PC_host:8181/pc/center/webservice/users/idName/idValue/timeZone/newTimeZone`

- **set groups**
  Updates the permission groups that have been granted to a specified user account.
  `http://PC_host:8181/pc/center/webservice/users/idName/idValue/groups`

- **set administered groups**
  Updates the groups of a specified user account.
  `http://PC_host:8181/pc/center/webservice/users/idName/idValue/administeredGroup`

  To add administered groups to a user account, supply XML in the following format (for example):

```
<groups>
  <group ID="5245"/>
  <group ID="5246"/>
  <group ID="5247"/>
...
 </groups>
```

- **update product privilege per datasource**
  Updates the product privilege of a specified user account to enable access to the user interface of a specific datasource.
  `http://PC_host:8181/pc/center/webservice/users/idName/idValue/ds/dsId/productPrivilege/newProductPrivilege`

  - **dsId**
    The data source identifier. For a list of available data source identifiers, see Basic Datasource Parameters. For more information about product privileges, see User Account Product Privilege Settings.

Available POST Methods

- **create**
  Creates a new user account. The new user is associated with the tenant for the logged-in user. The parameters include a role assignment.
  `http://PC_host:8181/pc/center/webservice/users/role/roleIdName/roleIdValue`

- **create in tenant**
  Creates a new user account in the specified tenant, with the specified role assignment.
  `http://PC_host:8181/pc/center/webservice/users/tenant/tenantIdName/tenantIdValue/role/roleIdName/roleIdValue`

Create Groups Using Web Services

Use any REST client to create and configure a group associated with the Default Tenant using the groups web service. The steps to create groups within a custom tenant are slightly different. You can supply the group ID or the group path as parameters.

The basic URL to create a group is as follows:

`http://PC_host:8181/pc/center/webservice/groups/useIds/allowDeletes/items`

- **useIds**
  Indicates that the **groupItemId** parameter is used to identify the group. Indicates whether or not the supplied id attribute of a group should be used to identify it. A value of 'false' ensures that the groups web service does not try to use the IDs of the groups to create any new groups. Because they are internally assigned, the IDs are a less reliable way to identify groups that have been exported and reimported.
- **allowDeletes**
  Enables deletion of the group that you are creating. Lets the groups web service update any rules that are defined in any existing groups that are overwritten by this XML document.

Example:

`http://PC_host:8181/pc/center/webservice/groups/groupPath/All%20Groups%2FAustin`

Follow these steps:

1. Set up a REST client with a connection to the NetOps Portal server.
2. Use the following format for the URL in the REST client:
   `http://PC_host:8181/pc/center/webservice/groups/false/false`
3. Select **POST** for **"HTTP" Method**.
4. Provide a valid Username and Password in the request header for a user account that has global administrator access to NetOps Portal.
5. Select **'application/xml'** as the **'Body Content-type'**.
6. Add the following XML within the "Body" text section, replacing the values with the values that you want to use for the new group:

```
<GroupTree path="/All Groups">
    <Group name="Group Name" desc="Description of the group"
    inherit="true" type="user group"/>
</GroupTree>
```

   - **inherit**
     Indicates whether the group includes child items of group members. For example, if the "inherit" attribute is set to true, device interfaces are group members if the device has been added to the group.
   - **type**

Indicates the type of group. The following values are supported.
Values:

- **user group** (default)
  A group that a user has created.
- **site**
  A user-created group that represents a physical site.

For example, supply the following XML:

```
<GroupTree path="/All Groups">
    <Group name="USA" desc="Group to represent the entire
    United States" inherit="true" type="user group"/>
</GroupTree>
```

7. Run the method.
   A new group, 'USA,' is created under the default 'All Groups' group in the Groups tree.
8. Repeat the preceding steps to create a site group. Supply the following XML for a site group:

```
<Group name="USA-Site" desc="Site group to represent the
entire United States" inherit="true" type="site group"
location="North America"/>
```

9. Repeat these steps until you have created as many groups and site groups as you require.
10. Use a similar procedure to create subgroups. Add the following XML within the "Body" text section:

```
<GroupTree path="/All Groups/USA">
    <Group name="Raleigh" desc="This is the group for
    managed items in Raleigh, NC" inherit="true"
    type="user group"/>
</GroupTree>
```

11. Run the method.
    In this example, a new group, "Raleigh," is added as a subgroup of the "All Groups\USA" group.

Create Groups in a Custom Tenant

The procedure for creating groups within a custom tenant definition is slightly different from the procedure to create groups in the Default Tenant.

Supply the group ID or the group path that you retrieved in a previous procedure as parameters. But create the group in the "`/All Groups/Tenants/` " path.

Here is an example of how to add groups to a non default tenant. In the user interface, the result looks like the following image:

Follow these steps:

1. Set up a REST client with a connection to the NetOps Portal server.
2. Use the following format for the URL in the REST client:

   `http://PC_host:8181/pc/center/webservice/groups/false/false`

3. Select **POST** for **"HTTP" Method**.
4. Provide a valid Username and Password in the request header for a user account that has global administrator access to NetOps Portal.
5. Select **'application/xml'** as the **'Body Content-type'**.
6. Add the following XML within the "Body" text section, replacing the values with the values that you want to use for the new group:

```
<GroupTree path="/All Groups/Tenants/MyCustomTenant/Groups">
    <Group name="North Carolina" desc="NC in the Southeast Region" inherit="true" type="user group"/>
```

```
</GroupTree>
```

7. Run the method.
   A new group, 'North Carolina,' is created under the custom tenant, MyCustomTenant. Only the global administrator and the administrator for the custom tenant can manage this group, and only MyCustomTenant users can see this group.

Add Items to Groups

Add individual managed items to groups using the groups web service. The item ID for each item is required.

Start by using the devices web service to get a list of managed items in the database and their IDs. The get id names method returns a list of identifiers that can be used in other methods to identify devices. A submethod, get interfaces, returns a list of device interfaces. You can filter the results by item subtype.

Checking is performed to avoid item duplication and make sure the group is valid. If any of these steps fail, then the service will exit out with an error:

- The group exists.
- The user who authenticated with the web service has access permissions to the group.
- The group can have items added to it. You can add items of the following subtypes to groups: user, site, service provider-defined items.

Each item that is specified in the list is also validated according to the following criteria:

- The list of items to add does not contain duplicate IDs. Nor does the list contain the IDs of any items that are already members of the target group.
- An item that corresponds to the specified ID exists.
- The item is NOT a group. If a user wants to add a group to an existing group, there are other services for that.
- The user has access to (permission to view) that item.

The XML that is returned shows the results of the validation. They include a report of the items that were added and the items that were not added.

Follow these steps:

1. Set up a REST client with a connection to the NetOps Portal server.
2. Use the following format for the URL in the REST client:
   `http://PC_host:8181/pc/center/webservice/devices/idNames`
3. In the XML that is returned, locate the device IDs for the devices to add to the target group.
4. Now type the following URL into the REST client:
   `http://PC_host:8181/pc/center/webservice/groups/idName/idValue/items`

   Example:
   `http://PC_host:8181/pc/center/webservice/groups/groupPath/All%20Groups%2FmyGroup/items`

   – **idName**
   A supported ID name for specifying a group. Possible values can be retrieved by performing a GET operation on the following URL:
   `http://PC_host:8181/pc/center/webservice/groups/idNames`
   Use one of the following parameters for the **idName**:

- **groupItemId** - The internally assigned ID of the group.
- **groupPath** - The path of the group, with each group delimited by encoded front slashes (%2F).

– **idValue**
The value that is used to specify a group, based on the nature of the ID name. Dependent on the value of the **idName** field, as follows:
groupItemId - The ID of the group is expected.
groupPath - The path of the group, with each group delimited by encoded front slashes (%2F) is expected.

5. Select **POST** for the **HTTP method**.
6. Provide a valid Username and Password in the request header for a user account that has global administrator access to NetOps Portal.
7. Select **'application/xml'** as the **'Body Content-type'**.
8. Add the following XML within the "Body" text section:

```
<items>
  <item id="value"/>
</items>
```

For example, enter something like the following to add a single router with managed item ID 684 to the group named "Austin":

```
<items>
  <item id="684"/>
</items>
```

You can also submit a list of managed items to add to a single group.

9. For example, add XML like the following to add five items:

```
<items>
  <item id="123"/>
  <item id="234"/>
  <item id="345"/>
  <item id="456"/>
  <item id="567"/>
</items>
```

The items that you specified in your list are added to the group.

10. Use the product user interface to verify group membership.

Add Group Rules

Add rules to groups that determine the managed items to include. As items are discovered, they are automatically added to the groups whose rules apply to those items.

The same URL that is used to create groups is used to add group rules. The body of the XML in the POST is modified to include rules. The web service adds XML to the group definition to create the rules.

Follow these steps:

1. Set up a REST client with a connection to the NetOps Portal server.
2. Use the following format for the URL in the REST client:

```
http://PC_host:8181/pc/center/webservice/groups/idName/idValue/groupItemId
```

3. Select **POST** for the **HTTP method**.
4. Provide a valid Username and Password in the request header for a user account that has global administrator access to NetOps Portal.
5. Select **'application/xml'** as the **'Body Content-type'**.
6. Add the following XML within the "Body" text section, replacing the values with the values that you want to use for the group rule:

```
<GroupTree path="/All Groups/USA">
   <Group name="Austin" desc="The group for items in Austin, TX">
      <Rules allowDeletes="true" saveRules="true">
         <Rule add="device" name="Add Devices">
            <Match>
               <Compare readOnly="true" using="MEMBER_OF">
                  <Property name="ItemID" type="device"/>
                     <Value reference="/All Groups">1</Value>
               </Compare>
               <Compare readOnly="false" using="EQUALS">
                  <Property name="AlternateName" type="device"/>
                     <Value>Cisco-3345</Value>
               </Compare>
            </Match>
         </Rule>
      </Rules>
   </Group>
</GroupTree>
```

This example creates a rule that adds a device named 'Cisco-3345' to the group named "Austin".

7. Run the method.
8. Repeat the preceding steps until you have created as many rules as you require.

We recommend using the Manage Groups page to create a few rules before you use the groups web service to create them. You can view the syntax for a rule that you have applied by taking the steps in Get Identifying Information for a Group. The XML that is returned includes group rules.

Remove Items from Groups

You can remove individual items from a group using the rules feature of the groups web service. You must first use the Manage Groups page in the CA NetOps Portal user interface to view current group membership. Then apply a new rule to the group that specifies the **allowDeletes** property. When you post the rule, it deletes items that are already in the group but that do not meet the criteria that the rule specifies.

Follow these steps:

1. Set up a REST client with a connection to the NetOps Portal server.
2. Use the following format for the URL in the REST client:

   `http://PC_host:8181/pc/center/webservice/groups/false/true`

   NOTE
   Specifying 'true' for the final property lets you delete items from the group.
3. Select **POST** for the **HTTP method**.
4. Provide a valid Username and Password in the request header for a user account that has global administrator access to NetOps Portal.
5. Select **'application/xml'** as the **'Body Content-type'**.
6. Add the following XML within the "Body" text section, replacing the values with the values that you want to use for the group rule:

```
<GroupTree path="/All Groups/USA">
   <Group name="Austin" desc="The group for items in Austin, TX">
      <Rules allowDeletes="true" saveRules="true">
         <Rule add="device" name="Add Devices">
            <Match>
```

```
                <Compare readOnly="true" using="MEMBER_OF">
                   <Property name="ItemID" type="device"/>
                      <Value reference="/All Groups">1</Value>
                </Compare>
                <Compare readOnly="false" using="EQUALS">
                   <Property name="subType" type="device"/>
                      <Value>server</Value>
                </Compare>
                <Compare readOnly="false" using="NOT_EQUALS">
                   <Property name="subType" type="device"/>
                      <Value>VM</Value>
                </Compare>
             </Match>
          </Rule>
       </Rules>
    </Group>
 </GroupTree>
```

This example creates a rule that adds devices with subtype 'server' but removes devices with subtype 'VM' (virtual machine) from the group named "Austin".

7. Run the method.
8. Use the Manage Groups page in the CA NetOps Portal user interface to verify group membership.

Delete Groups

The groups web service does not offer a DELETE method to delete a user group or a custom collection based on the group ID. Deletion of groups is possible using the update method. You perform another POST of the entire XML for a group with the group elements that need to be deleted removed from the XML. Their absence, and the **allowDeletes** parameter, removes them.

Set **allowDeletes** on a group that is one level higher in the tree to ‘true’ to ensure that a subgroup is deleted if no entry for that group is included in the XML. This attribute is inherited by all subgroups. It is not applied to the parent group itself.

You can only delete user groups. System groups and out-of-the-box collections cannot be deleted. To delete groups that you defined in My User Groups, use the user interface.

WARNING
The user groups that you delete can only be restored by recreating them.

You can supply the group ID or the group path that you retrieved in a previous procedure as parameters.

The basic URL to create a group that allows deletion is as follows:

```
http://PC_host:8181/pc/center/webservice/groups/useIds/allowDeletes
```

Example:

In Create Groups Using Web Services, the example XML created a group named 'Raleigh' that was a subgroup of a group named 'USA'. The full XML for this task would be as follows:

```
<GroupTree path="/All Groups">
    <Group name="USA" desc="Group to represent the entire United
    States" inherit="true" type="user group">
       <Group name="Raleigh" desc="This is the group for managed items
       in Raleigh, NC" inherit="true" type="user group"/>
    </Group>
</GroupTree>
```

The XML had to be posted to the following URL to enable future deletion of these groups:

```
http://PC_host:8181/pc/center/webservice/groups/false/true/
```

Now delete the Raleigh subgroup.

Follow these steps:

1. Set up a REST client with a connection to the NetOps Portal server.
2. Enter a URL for the NetOps Portal REST web services API in the REST client. Use the following format:
   `http://PC_host:8181/pc/center/webservice/groups/false/true/`
3. Select **POST** for **"HTTP" Method**.
4. Provide a valid Username and Password in the request header for a user account that has global administrator access to NetOps Portal.
5. Select **'application/xml'** as the **'Body Content-type'**.
6. Add the following XML within the "Body" text section. Replace the values with values to identify the groups that contain the groups to be deleted:
   ```
   <GroupTree path="/All Groups">
       <Group name="USA" desc="Group to represent the entire United
       States" allowDeletes="true" type="user group"/>
   </GroupTree>
   ```
7. Run the method.
   The web service updates the XML for the specified group (All Groups\USA) to remove the Raleigh subgroup. The Raleigh group is thus deleted from the Groups tree.

Import Group Definitions

Use any REST client to import a list of group definitions using the groups web service. To import group definitions into a new database, you must first retrieve, and then export, all of your existing definitions.

You can supply the group ID or the group path that you retrieved in a previous procedure as parameters.

The basic URL to retrieve group definitions is as follows:

```
http://PC_host:8181/pc/center/webservice/groups/groupPath/All%20Groups
```

That method uses the group path name to identify the root group. You can also retrieve the "All Groups" structure by group item ID:

```
http://PC_host:8181/pc/center/webservice/groups/groupItemId/1
```

Prepare to export all of the groups that you have defined in NetOps Portal by performing a retrieval of the "All Groups" group. Retrieving this root group calls up the entire tree in the XML that is returned.

Follow these steps:

1. Set up a REST client with a connection to the NetOps Portal server.
2. Use the following format for the URL in the REST client:
   `http://PC_host:8181/pc/center/webservice/groups/groupItemId/1`
3. Select **GET** for **"HTTP" Method**.
4. Provide a valid Username and Password in the request header for a user account that has global administrator access to NetOps Portal.

5. Select **'application/xml'** as the **'Body Content-type'**.
6. Run the method.
   The XML document that is returned defines your entire group structure.
   You are now ready to import the group definitions into another NetOps Portal database.
7. Open a connection to the NetOps Portal server from a REST client.
8. Select **POST** for **"HTTP" Method**.
9. Use the following format for the URL:
   `http://PC_host:8181//pc/center/webservice/groups/false/true`

   The 'false' and 'true' values refer to the following parameters:
   - **useIds**
     Indicates whether the supplied *id* attribute of a group is used to identify it. Ensures that the groups web service does not try to use the IDs of the groups to create any new groups. Because they are internally assigned, the IDs are a less reliable way to identify groups that have been exported and reimported.
   - **allowDeletes**
     Enables deletion of the group that you are creating. Lets the groups web service update any rules that are defined in any existing groups that are overwritten by this XML document.
10. Run the method.
    The groups that you exported are added as subgroups of the "All Groups" root group.
11. Use the user interface to verify the structure of the imported groups (Admin, Group Settings, Groups).

Use Web Services to Manage Business Hours

This use case illustrates procedures that an administrator can deploy to create and manage business hours definitions to filter views using the NetOps Portal RESTful web services. NetOps Portal administrators can enhance reporting by creating sets of business hours definitions. Business hours help product operators prioritize their troubleshooting workload by highlighting events that occur during business-critical time periods.

Use the groups web service to create site groups, and use the business hours web service to manage business hours definitions. If you add business hours first, you can then associate them with site groups during site-group creation.

You can add and delete multiple business hours definitions and assign them to site groups.

In this use case, we describe the steps to take when using a REST client, a generic web services user interface application. The examples in this use case contain URIs that are constructed using the default server port, 8181.

Create Site Groups Using Web Services

Use any REST client to create and configure a site group that is associated with the Default Tenant using the groups web service. With the groups web service, you can create rules and apply them to site groups so that items are added automatically. The steps to create groups within a custom tenant are slightly different. You can supply the group ID or the group path as parameters.

The basic URL to create a group is as follows:

`http://PC_host:8181/pc/center/webservice/groups/useIds/allowDeletes`

`useIdsIndicates` that the `groupItemId` parameter is used to identify the group. Indicates whether the supplied id attribute of a group should be used to identify it. A value of `false` ensures that the groups web service does not try to use the IDs of the groups to create any new groups. Because they are internally assigned, the IDs are a less reliable way to identify groups that have been exported and reimported. In this example, the XML does not contain a group ID, so the value is 'false'.

- **allowDeletes**

Enables deletion of the group that you are creating. The groups web service can update the rules that are defined in the existing groups that are overwritten by this XML document.

Example:

```
http://PC_host:8181/pc/center/webservice/groups/false/true
```

Follow these steps:

1. Set up a REST client with a connection to the NetOps Portal server.
2. Use the following format for the URL in the REST client:
   ```
   http://PC_host:8181/pc/center/webservice/groups/false/true
   ```
3. Select **POST** for **"HTTP" Method**.
4. Provide a valid Username and Password in the request header for a user account that has global administrator access to NetOps Portal.
5. Select **'application/xml'** as the **'Body Content-type'**.
6. Add the following XML within the "Body" text section, replacing the values with the values that you want to use for the new site group:
   ```
   <GroupTree path="/All Groups">
      <Group name="East Coast USA" desc="This is a site group"
      inherit="true" type="site group" location="North America"
      bHourID="99990" timeZone="EST"/>
   </GroupTree>
   ```
   - **inherit**
     Indicates whether the group includes child items of group members. For example, if the "inherit" attribute is set to true, device interfaces are group members if the device has been added to the group.
   - **type**
     Indicates the type of group. Accepts the following values:
     - **custom group**: A group that a user has created.
     - **site group**: A user-created group that represents a physical site.
     - **system group**: A predefined group that cannot be modified or deleted.
     - **automatic group**: A predefined group of items from a data source other than Data Aggregator that cannot be modified or deleted.
   - **bHourID**
     The internally assigned identifier of the business-hour definition that you created previously.
   - **timeZone**
     The time zone to associate with this site group.

   For example, supply the following XML:
   ```
   <Group name="East Coast" desc="Site group to represent the
       entire United States" inherit="true" type="site group" location="North
       America" bHourID="99990" timeZone="EST"/>
   ```
7. Run the method.
   The USA site group is created under the default All Groups group in the Groups tree.
8. Repeat the preceding steps until you have created as many site groups as you require.
9. Use a similar procedure to create subgroups. Add the following XML within the "Body" text section:
   ```
   <GroupTree path="/All Groups/USA">
       <Group name="Raleigh" desc="This is the group for
       managed items in Raleigh, NC" inherit="true"
       type="custom group"/>
   </GroupTree>
   ```
10. Run the method.
    In this example, a new group, "Raleigh," is added as a subgroup of the "All Groups\USA" group.

Manage Time Zone Associations

You can manage associations of time zones with site groups using web services.

Assign a time zone to a site group using the following URL in a PUT operation:

```
http://PC_host:8181/pc/center/webservice/businesshours/assign/timezone/site/siteGroupId
```

Use the following syntax in a PUT operation to remove the assignment:

```
unassign/timezone/site/siteGroupId
```

Use the following syntax to get a list of time zones that are assigned to site groups:

```
http://PC_host:8181/pc/center/webservice/businesshours/timezonesAssignedToSites
```

Remove a time zone association by running the same method with the `unassign/timezone` syntax.

Follow these steps:

1. Using the REST client with a connection to the NetOps Portal server, enter a URL for the NetOps Portal RESTful web services API in the REST client. Use the following format:
   ```
   http://PC_host:8181/pc/center/webservice/businesshours/assign/timezone/site/siteGroupId
   ```
2. Select **PUT** for **"HTTP" Method**.
3. Provide a valid Username and Password for a user account that has administrator access to NetOps Portal.
4. Select **'application/xml'** as the **'Body Content-type'** in the Body settings.
5. Add the following XML within the "Body" text section:
   ```
   <GroupTree path="/All Groups">
       <Group name="East Coast USA" desc="This is a site group"
      inherit="true" type="site group" location="North America"
      bHourID="99990" timeZone="EST"/>
   </GroupTree>
   ```
   - **bHourID**
     The internally assigned identifier of the business-hour definition that you created previously.
   - **timeZone**
     The time zone to associate with this site group.
6. Run the method.
   If it does not already exist, the USA site group is created under the default All Groups group in the Groups tree. The Eastern Standard timezone (EST) is assigned to this site group.
7. Repeat the preceding steps until you have associated time zones with all site groups to which you plan to apply business hours.

Create a Business Hours Definition

You can create business hours definitions using the business hours web service and any REST client. For this procedure, you can log in as a global administrator or as a tenant administrator. The global administrator creates the business hours definitions within the Default Tenant, while the tenant administrator creates the definition within that tenant.

The steps to create business hours within a custom tenant are slightly different. You can supply the tenant ID as a parameter.

Business hours definitions comprise a starting hour and an ending hour. The `startHour` and `endHour` parameters in the XML must be the same for all days to avoid an error in any POST or PUT operation.

For systems with multiple tenants, specify the tenant in the URL. To get a list of tenant IDs, perform a GET to the following URL:

```
http://PC_host:8181/pc/center/webservice/tenants/idNames
```

NOTE
You can also modify business hours within a custom tenant by performing a PUT operation to the following URL:
`/businesshours/tenantId/tenant Id/id/id`
where `id` is the ID of the business-hour definition.

Follow these steps:

1. Using the REST client with a connection to the NetOps Portal server, enter a URL for the NetOps Portal RESTful web services API in the REST client. Use the following format:
   - **Default Tenant:**
     `http://PC_host:8181/pc/center/webservice/businesshours/`
   - **Specific Tenant**
     `http://PC_host:8181/pc/center/webservice/businesshours/tenantId/tenant_ID`
2. Select **POST** for **"HTTP" Method**.
3. Provide a valid Username and Password for a user account that has global administrator or tenant administrator access to NetOps Portal.
4. Select **'application/xml'** as the **'Body Content-type'** in the Body settings.
5. Add the following XML within the "Body" text section:

```
<BusinessHour>
       <Name>Bakery</Name>
       <Description>HEB Bakery</Description>
       <Monday>
<HourRange startHour="5" endHour="12"/>
</Monday>
       <Tuesday>
<HourRange startHour="5" endHour="12"/>
</Tuesday>
       <Wednesday>
<HourRange startHour="5" endHour="12"/>
</Wednesday>
       <Thursday>
<HourRange startHour="5" endHour="12"/>
</Thursday>
       <Friday>
<HourRange startHour="5" endHour="12"/>
</Friday>
       <Saturday/>
       </Sunday>
</BusinessHour>
```

   In this example, a business-hour definition named HEB Bakery is created. The business hours start at 5 a.m. and end at noon. Saturday and Sunday are excluded.
6. Run the method.
7. Repeat the preceding steps until you have created as many business hours definitions as you require.

Manage Business Hours Associations

To apply a business hours filter, associate a business hours definition with a site group.

Use the following URL in a PUT operation to assign business hours to a site group:

`http://PC_host:8181/pc/center/webservice/businesshours/assign/businesshour/businessHourId/site/siteGroupId`

NOTE
NetOps Portal validates the site group for an associated time zone by performing a verification. If the site group does not have a time zone assignment, an error message appears.

Use the following syntax in a PUT operation to remove the assignment:

```
unassign/businesshour/site/siteGroupId
```

Follow these steps:

1. Using the REST client with a connection to the NetOps Portal server, enter a URL for the NetOps Portal RESTful web services API in the REST client. Use the following format:
   ```
   http://PC_host:8181/pc/center/webservice/businesshours/assign/businesshour/businessHourId/site/siteGroupId
   ```
   – **businessHourId**
   The internally assigned identifier of the business-hour definition that you created previously.
2. Select **PUT** for **"HTTP" Method**.
3. Provide a valid Username and Password for a user account that has administrator access to NetOps Portal.
4. Select 'application/xml' as the 'Body Content-type' in the Body settings.
5. Add the following XML within the "Body" text section:
   ```
   <GroupTree path="/All Groups">
       <Group name="East Coast USA" desc="This is a site group"
      inherit="true" type="site group" location="North America"
      bHourID="99990" timeZone="EST"/>
   </GroupTree>
   ```
6. Run the method.
   If it does not already exist, the USA site group is created under the default All Groups group in the Groups tree. The business-hour definition with ID 99990 is assigned to this site group.
7. Repeat the preceding steps until you have associated time zones with all site groups to which you plan to apply business hours.

You can remove a business hour association by running the same method with the `unassignbusinesshour` syntax.

Query the RIB to Return a View with Business-Hour Filtering

You can return data for a specific metric by entering queries into a web browser by querying the Report Information Base (RIB). This example presents a NetOps Portal RIB query that returns Top Discards data from a data aggregator data source.

Precede the NetOps Portal RIB queries with the following URL:

```
http://PC_host:8481/dm/rib/query/
```

You can append URL parameters to specify property values:

```
http://PC_host:8481/dm/rib/query/ribquery/?property1=value1&property2=value2
```

The following RIB query returns Top Discards data from a data aggregator data source:

```
http://<server IP address>:port/dm/rib/query/
SELECT .PollItem.ID, .PollItem.DevDisplayName, .Item.DisplayName, .Discards.Sum, .DiscardsIn.Sum, .DiscardsOut.Sum
 FROM CA.IM.DA.MF.NormalizedPortInfo.IFSTATS WHERE .Group.GroupID = 1039 AND .EndTime(300) > 1366208760
 AND .EndTime(300) <= 1366212360 GROUPBY .PollItem.ID, .Item.DisplayName, .PollItem.DevDisplayName
 ORDERBY .Discards.Sum DESC LIMIT 10
```

TIP
If necessary, you can escape the RIB query and parameters in your web browser, for example:

```
http://PC_host:port/dm/rib/query/SELECT%20.PollItem.ID,
%20.PollItem.DevDisplayName,%20.Item.DisplayName,
%20.Discards.Sum,%20.DiscardsIn.Sum,%20.DiscardsOut.Sum%20FROM
%20CA.IM.DA.MF.NormalizedPortInfo.IFSTATS%20WHERE%20.Group.GroupID%20=
%201039%20AND%20.EndTime(300)%20%3E%201366208760%20AND%20.EndTime(300)%20%3C=
%201366212360%20GROUPBY%20.PollItem.ID,%20.Item.DisplayName,
%20.PollItem.DevDisplayName%20ORDERBY%20.Discards.Sum%20DESC%20LIMIT%2010
```

Add the following URL parameters to return Top Discards data for a set of business hours in a specific time zone. NetOps Portal administrators configure sets of business hours.

NOTE
Some queries support only data filtering by time zone and business hours.

- **RIB.TimeZone**
  Is the string identifier of the time zone used to filter data results.
- **RIB.BusinessHours**
  Is the NetOps Portal ID of the business hour definition used to filter data results. Include this parameter in the `propertiesToTranslate` value to ensure that the ID is translated. IDs that are not translated are submitted unchanged to each applicable data source.
- **propertiesToTranslate**
  Is a list of parameter names whose values contain a NetOps Portal ID to translate to a local data source ID.

Example 1

To return data filtered by time zone, add the time zone parameter (shown in bold text) to the URL. In the following example, the data is filtered to include only data for items in sites configured for the America/New_York time zone:

```
http://pchost:8481/dm/rib/query/
SELECT .PollItem.ID, .PollItem.DevDisplayName, .Item.DisplayName, .Discards.Sum, .DiscardsIn.Sum, .DiscardsOut.Sum
 FROM CA.IM.DA.MF.NormalizedPortInfo.IFSTATS WHERE .Group.GroupID = 1039 AND .EndTime(300) > 1366208760
 AND .EndTime(300) <= 1366212360 GROUPBY .PollItem.ID, .Item.DisplayName, .PollItem.DevDisplayName
 ORDERBY .Discards.Sum DESC LIMIT 10?RIB.TimeZone=America/New_York
```

Example 2

To return data filtered by time zone and business hours, add the time zone and business hours parameters (shown in bold text) to the URL. In the following example, the data is filtered to include only data for items in sites configured for the America/New_York time zone and business hours matching the NetOps Portal definition for ID 6434:

```
http://pchost:8481/dm/rib/query/
SELECT .PollItem.ID, .PollItem.DevDisplayName, .Item.DisplayName, .Discards.Sum, .DiscardsIn.Sum, .DiscardsOut.Sum
 FROM CA.IM.DA.MF.NormalizedPortInfo.IFSTATS WHERE .Group.GroupID = 1039 AND .EndTime(300) > 1366208760
 AND .EndTime(300) <= 1366212360 GROUPBY .PollItem.ID, .Item.DisplayName, .PollItem.DevDisplayName
 ORDERBY .Discards.Sum DESC LIMIT 10?RIB.TimeZone=America/
New_York&RIB.BusinessHours=6434&propertiesToTranslate=RIB.BusinessHours
```

Troubleshooting

Errors are returned if valid syntax invokes a definition that is not itself valid. For example, you attempt to create a site group. The syntax includes the businessHourId for an invalid business-hour definition. In such a case, the HTTP Response XML includes an error message similar to the following text:

```
<Group bHourID="99990" desc="This is a site group" inherit="true" location="North America" name="East Coast
 USA" result="Error with validating business hour ID: Business hour definition with an ID of '99990' not
 found!" timeZone="EST" type="site group"/>
```

Business hours definitions comprise a starting hour and an ending hour. The `startHour` and `endHour` parameters in the XML must be the same for all of the days that are included in the definition. Otherwise, you see an error in POST or PUT operations.

Use Web Services to Manage Maintenance Indicators

An administrator can use web services to create maintenance indicators. Maintenance indicators represent times when maintenance is occurring. After you schedule maintenance indicators, views indicate maintenance with shading.

Maintenance indicators apply to all the devices and components in a site group. When the associated site group is selected in the context, maintenance indicators appear in applicable views as you navigate between dashboards. The subtitle of each view indicates whether maintenance indicators apply to the view.

Subgroups do not directly inherit maintenance indicators from the site groups. Associate the maintenance indicators with each relevant subgroup. However, when rendering views, these filters apply to all items based on the selected site group. The filters of the selected site group apply to all items in that group and in any subgroups. When you change the selected site group to a subgroup, the filters of the parent group are no longer applicable.

Reference groups inherit associated maintenance indicators from the original site group.

Maintenance Indicators Web Service Operations

Issue the following call to see the available operations for the maintenance indicators web service:

```
http://PC_host:8181/pc/center/rest/maintenanceindicators/documentation
```

Operations

- ***PC_host*:8181**
  Specify the NetOps Portal IP address. 8181 is the required port.
- **get list**
  Get a list of all maintenance indicators definitions for the authenticated user.
  URL: `http://PC_host:8181/pc/center/webservice/maintenanceindicators/`
  HTTP method: `GET`
  XSD for the returned XML: `http://PC_host:8181/pc/center/rest/maintenanceindicators/xsd`
- **add**
  Create a maintenance indicators definition from the provided XML.
  URL: `http://PC_host:8181/pc/center/webservice/maintenanceindicators/tenantId/{tenantId}`
  – ***{tenantId}***
  Specify the ID for the desired tenant.
  HTTP method: `POST`
  XSD for the provided XML: `http://PC_host:8181/pc/center/rest/maintenanceindicators/xsd`
  XSD for the returned XML: `http://PC_host:8181/pc/center/rest/maintenanceindicators/xsd`
- **delete**
  Delete the maintenance indicators definition using the specified ID.
  URL: `http://PC_host:8181/pc/center/webservice/maintenanceindicators/id/{maintenanceIndicatorId}`
  – ***{maintenanceIndicatorId}***

Specify the ID for the desired maintenance indicator.

HTTP method: `DELETE`
Return type is a string.

- **get**
  Get a specific maintenance indicators definition.
  URL: `http://PC_host:8181/pc/center/webservice/maintenanceindicators/id/{maintenanceIndicatorId}`
  HTTP method: `GET`
  XSD for the returned XML: *http://PC_host:8181/pc/center/rest/maintenanceindicators/xsd*
- **get id names**
  Return a list of identifiers that can be used in other methods to identify certain objects. For this web service, an empty list is returned.
  URL: *http://PC_host:8181/pc/center/webservice/maintenanceindicators/idNames*
  HTTP method: `GET`
- **get list for tenant**
  Get a list of all maintenance indicators definitions for the specified tenant.
  URL: `http://PC_host:8181/pc/center/webservice/maintenanceindicators/tenantId/{tenantId}`
  – ***{tenantId}***
  Specify the ID for the desired tenant.
  HTTP method: `GET`
  XSD for the returned XML: `http://PC_host:8181/pc/center/rest/maintenanceindicators/xsd`
- **update**
  Update the specified maintenance indicators definition from the provided XML.
  URL: `http://PC_host:8181/pc/center/webservice/maintenanceindicators/tenantId/{tenantId}/id/{maintenanceIndicatorId}`
  HTTP method: `PUT`
  XSD for the provided XML: `http://PC_host:8181/pc/center/rest/maintenanceindicators/xsd`
  XSD for the returned XML: `http://PC_host:8181/pc/center/rest/maintenanceindicators/xsd`

Create Maintenance Indicators Using Web Services

Use any REST client to create and configure maintenance indicators using the maintenance indicators web service.

Follow these steps:

1. Set up a REST client with a connection to the NetOps Portal server.
2. Use the following format for the URL in the REST client:
   http://PC_host :8181/pc/center/webservice/maintenanceindicators/tenantId/8

   NOTE

   8 is the ID for the Default Tenant.
3. Select
   `POST`
   for the **'HTTP' Method**.
4. Provide a valid Username and Password for a user account that has global administrator access to NetOps Portal.
5. Select **'application/xml'** as the **'Body Content-type'**.
6. Add the following XML within the "Body" text section:

```
<MaintenanceIndicator>
   <Name>Maintenance Indicator Name</Name>
   <Description> Maintenance Indicator Description</Description>
   <MaintenanceYear>Year</MaintenanceYear>
```

```
    <MaintenanceMonth>Month</MaintenanceMonth>
    <MaintenanceDay>Day</MaintenanceDay>
    <StartHour>StartHour</StartHour>
    <EndHour>EndHour</EndHour>
    <SelectedSites>
       <SelectedSite>SiteID</SelectedSite>
       <SelectedSite>SiteID</SelectedSite>
    </SelectedSites>
 </MaintenanceIndicator>
```

- **Name**
  Specify a name for this maintenance indicators definition.
- **Description**
  Specify a description for this maintenance indicators definition.
- **MaintenanceYea**r
  Specify a four-digit year for when the related maintenance takes place.
- **MaintenanceMonth**
  Specify a month (1 - 12) for when the related maintenance takes place.
- **MaintenanceDay**
  Specify a day (1 - 31) for when the related maintenance takes place.
- **StartHour**
  Specify an hour (0 - 23) for when the related maintenance takes place.
- **EndHour**
  Specify an hour (1 - 24) for when the related maintenance takes place.
- **SelectedSites**
  (Optional) Specify one or more tags containing the site IDs to assign this maintenance indicators definition to. To create a definition without sites that are assigned, omit this parameter

7. Replace any values with the values that you want to use for the new maintenance indicators.
   For example, supply the following parameters, where 3569 is the site ID for the **Framingham** site:

```
 <MaintenanceIndicator>
    <Name>Framingham router maintenance</Name>
    <Description>Upgrade of the network for framingham</Description>
    <MaintenanceYear>2016</MaintenanceYear>
    <MaintenanceMonth>8</MaintenanceMonth>
    <MaintenanceDay>5</MaintenanceDay>
    <StartHour>19</StartHour>
    <EndHour>22</EndHour>

    <SelectedSites>
       <SelectedSite>510</SelectedSite>
       <SelectedSite>511</SelectedSite>
    </SelectedSites>

 </MaintenanceIndicator>
```

8. Run the method.
9. Repeat the preceding steps until you have created as many maintenance indicators as you require.

Use Web Services to Manage Alarm Attributes

An administrator can use web services to create alarm attributes. You can create them for a specific tenant or for all tenants (global).

> **NOTE**
>
> You can create the same attribute at the tenant level and the global level. The tenant level attribute applies to the tenant user and the global level attribute applies only to all other tenant users.
>
> **WARNING**
>
> Do not use these web services to manage external attributes, which directly correspond to specific MIB variables in DX NetOps Spectrum.

For more information, see Alarms View.

Alarm Attributes Web Service Operations

Issue the following call to see the available operations for the alarm attributes web service:

```
http://PC_host:8181/pc/center/rest/alarmattributes/documentation
```

Operations

- ***PC_host*:8181**
- Specifies the NetOps Portal host name. 8181 is the required port.
- **delete**
  Delete the attribute using the specified ID.
  URL: `http://PC_host:8181/pc/center/webservice/alarmattributes/tenantId/{tenantId}/attributeId/{attributeId}`
  – ***{tenantId}***
    The id for the desired tenant
  – ***{attributeId}***
    The hexadecimal id of the alarm attribute
  HTTP method: `DELETE`
  Return type is a string.
- **delete global**
  Delete the global attribute using the specified ID.
  URL: `http://PC_host:8181/pc/center/webservice/alarmattributes/global/attributeId/{attributeId}`
  – ***{attributeId}***
    The hexadecimal id of the alarm attribute
  HTTP method: `DELETE`
  Return type is a string.
- **get id names**
  Return an empty list. In other web services, it can potentially return a list of identifiers that can be used in other methods to identify certain objects.
  URL: `http://PC_host:8181/pc/center/webservice/alarmattributes/idNames`

HTTP method: `GET`

- **get list for tenant**
  Get a list of all attribute definitions for the specified tenant.
  URL: `http://PC_host:8181/pc/center/webservice/alarmattributes/tenantId/{tenantId}`
  – ***{tenantId}***
  The id for the desired tenant
  HTTP method: `GET`
  XSD for the returned XML: `http://PC_host:8181/pc/center/rest/alarmattributes/xsd`
- **add or update**
  Add or update an attribute for the specified tenant.
  URL: `http://PC_host:8181/pc/center/webservice/alarmattributes/tenantId/{tenantId}`
  – ***{tenantId}***
  The id for the desired tenant
  HTTP method = `POST`
  XSD for the provided XML: `http://PC_host:8181/pc/center/rest/alarmattributes/xsd`
  XSD for the returned XML: `http://PC_host:8181/pc/center/rest/alarmattributes/xsd`
- **get global list**
  Get a list of all global attribute definitions.
  URL: `http://PC_host:8181/pc/center/webservice/alarmattributes/global`
  HTTP method: `GET`
  XSD for the returned XML: `http://PC_host:8181/pc/center/rest/alarmattributes/xsd`
- **add or update global**
  Add or update a global attribute.
  URL: `http://PC_host:8181/pc/center/webservice/alarmattributes/global`
  HTTP method = `POST`
  XSD for the provided XML: `http://PC_host:8181/pc/center/rest/alarmattributes/xsd`
  XSD for the returned XML: `http://PC_host:8181/pc/center/rest/alarmattributes/xsd`

Create Alarm Attributes Using Web Services

Use any REST client to create and configure alarm attributes using the alarm attributes web service.

Follow these steps:

1. Set up a REST client with a connection to the NetOps Portal server.
2. Use the following format for the URL in the REST client:
   `http://PC_host :8181/pc/center/webservice/alarmattributes/tenantId/8`

   NOTE

   8 is the ID for the Default Tenant.
3. Select
   `POST`
   for the **'HTTP' Method**.
4. Provide a valid Username and Password for a user account that has global administrator access to NetOps Portal.
5. Select **'application/xml'** as the **'Body Content-type'**.
6. Add the following XML within the "Body" text section:

```
<AlarmAttribute>
    <AttributeID>HEX_ID</AttributeID>
    <Name>Attribute_Name</Name>
    <Description>Attribute_Description</Description>
    <Type>Value_Type</Type>
```

```
    <AddAsFilter>true</AddAsFilter>
   <AddAsColumn>true</AddAsColumn>
</AlarmAttribute>
```

- **AttributeID**
  Specify the hexadecimal ID of the alarm attribute.
- **Name**
  Specify a name for this alarm attribute.
- **Description**
  Specify a description for this alarm attribute.
- **Type**
  Specify one of the following allowable types:
  - **STRING**
    A String field, for example, the Device Name
  - **BOOLEAN**
    A Boolean value, for example, Acknowledged
  - **ADDRESS_RANGE**
    An IP address field, for example, the IP Address
  - **INTEGER**
    A numeric value, for example, Number of Occurrences
  - **HEX**
    A hexadecimal value, for example, Cause Code
  - **OCTET_STRING**
    A string value that is treated as a numeric value
- **AddAsFilter**
  Specify whether to add the attribute to the filter list.
  Default: true
- **AddAsColumn**
  Specify whether to add the attribute as a column in an Alarm view. The column is hidden by default.
  Default: true

7. Replace any values with the values that you want to use for the new alarm attribute.
   Example:

```
<AlarmAttribute>
    <AttributeID>0x129e7</AttributeID>
    <Name>Topology Model Name</Name>
    <Description>The Topology Model Name String</Description>
    <Type>STRING</Type>
    <AddAsFilter>true</AddAsFilter>
   <AddAsColumn>true</AddAsColumn>
</AlarmAttribute>
```

8. Run the method.
9. Repeat the preceding steps until you have created as many alarm attributes as you require.

Data Aggregator REST WebServices

Data Aggregator REST web services manage administrative operations, such as retrieving data or managing relationships between profiles and tenants or groups. Use any REST client tool or use an HTTP tool that can send requests and can receive responses. Some REST web services cannot be scoped to tenant domains.

These REST services include two types:

- **Data-Driven**
  Read and modify Data Aggregator configuration information, such as Monitoring Profiles and Groups.
- **Generic**
  Manage metric families and limited SNMP vendor certification support. Generic REST web services are self-filtering and do not use an argument within the URL to manage relationships.

Basic Data Aggregator REST Operations

Each endpoints maps to types of items, such as groups, monitoring profiles, tenants, and device certifications. Use specific endpoints to return a list of results, or create, update, or delete an item.

> **NOTE**
>
> Individual metric family items and SNMP vendor certification items are specified using name instead of ID.
>
> **WARNING**
> Set the Context-type files to **application/xml** when you perform operations using Data Aggregator REST web services.

Basic operations:

- **GET http://.../*endpoint***
  Returns a list of all items of the specified type. The getlist.xsd schema defines the format for the return data.
- **GET http://.../*endpoint*/[*id* | *name*]**
  Returns the details for a single item with the specified ID or certification name. The XSD schema defines the format for the return data.
- **POST http://.../*endpoint***
  Creates an object of the specified type with specified facets. The XSD schema defines the format for the return data.

  > **NOTE**
  > With POST operations, you can create objects with the same name but different IDs. This convention is allowed because it is often valid when the objects are scoped to different tenants.
- **PUT http://.../*endpoint*/[*id* | *name*]**
  Updates the attributes of the specified item. The update.xsd schema defines the format and expected fields.

  > **NOTE**
  > With PUT operations, you can create objects with the same name but different IDs. This convention is allowed because it is often valid when the objects are scoped to different tenants.
- **DELETE http://.../*endpoint*/[*id* | *name*]**
  Deletes the item that is specified using the ID or certification name.

Generic REST Web Services

Use generic REST web services to manage metric families and for limited SNMP vendor certification support. Generic REST web services are self-filtering and do not use an argument within the URL to manage relationships.

The following URL displays details about every user-facing, generic web service in the system:
`http://DA_host:8581/genericWS`

This URL includes detailed information about generic web services, including XSDs, URIs, supported HTTP methods, attributes, and relationships.

To view detailed documentation about a specific endpoint, access the following URL: `http://DA_host:8581/genericWS/endpoint/documentation`

Manage Relationships with Generic REST Web Services

Generic REST web services do not use an argument within the URL to manage relationships. Instead, generic REST web services rely on the basic operations alone to manage relationships. The endpoints filter on themselves to expose the information. These methods are used for managing relationships between the metric families and SNMP vendor certifications.

Relationships for generic REST web services are viewed, created, and deleted using the following methods:

- GET
- PUT
- DELETE

All methods use the following URL:
`http://DA_host:8581/genericWS/endpoint/name/endpoint`

Example: List Metric Families Related to an SNMP Vendor Certification

To return a list of metric families for a specified SNMP vendor certification, use the GET operation at the following URL:
`http://DA_host:8581/genericWS/certifications/snmp/name/metricfamilies`

Data-Driven REST Web Services

As an administrator, use data-driven REST web services for most Data Aggregator web services, such as monitoring profiles and groups.

The following URL display details about every user-facing, data-driven web service in the system:
`http://DA_host:8581/rest`

This URL includes detailed information about endpoints, and data-driven web services, including XSDs, URIs, supported HTTP methods, attributes, and relationships.

To view detailed documentation about a specific endpoint, access the following URL:
`http://DA_host:8581/rest/endpoint/documentation`

View XSD Schemas for Data-Driven REST Web Services

Do the following steps before performing an HTTP request:

- Verify the XML schema definition (XSD) for the endpoint.
- Review the format of the return or upload XML that the service provides.

Each item of content that is placed in an XML document must adhere to the description of the endpoint.

The XSD files for each operation contain tags that describe the attributes and the purpose of the metric families. To obtain the XSD for an endpoint, use the following paths with the data-driven web services URL:
`http://DA_host:8581/rest/endpoint/XSD/operation.xsd`

- ***operation***
  Specifies the type of operation to execute.
  Values:
  – **get**

The XSD for a single item get
- **getlist**
  The XSD for a list of the endpoint items
- **filterselect**
  The XSD for advanced filter criteria and return XML format to be specified using GET Tunneling
- **create**
  The XSD that any input XML must match when trying to create
- **update**
  The XSD that any input XML must match when trying to update

> **NOTE**
> Not all operations are supported for each endpoint. If an operation is not supported, the web service fails and returns a '403 Forbidden' message.

Filter on Attributes in the XSD Schema for Data-Driven REST Web Services

You can filter on attributes such as the item name, description, and other such attributes. For example, filter monitoring profiles by the metric families they contain. You can use this information to determine whether to add or remove metric families to or from a monitoring profile.

Follow these steps:

1. Enter the following URL in a web browser:
   `http://DA_host:8581/rest/`
   A list shows the available data-driven web services.
2. Click a web service.
   The documentation page for that web service opens.
3. Click the URL under the "filtered get list" method.
   The XSD schema opens.
4. Look for the elements that include the following property:
   `substitutionGroup="AttributeFilterTypeSubstitution`
   Use this information to determine which attribute you want to filter on.
5. Open a REST client editor or HTTP tool that sends requests and gets responses, and set the Content-type to **application/xml**.
6. Enter the following filter criteria:
   - URL: `http://DA_host:port/rest/endpoint/filtered/`
   - HTTP method = POST
     This method must define the filter criteria.
   - Basic filter select criteria on the Body tab in the HTTP Request pane:

```
<FilterSelect xmlns:xsi="http://www.w3.org/2001/XMLSchema-
instance" xsi:noNamespaceSchemaLocation="filter.xsd">

       <Filter>

                  <elementName type="CONTAINS">filter-criteria</elementName>

       </Filter>

</FilterSelect>
```

- ***filter-criteria***

Specifies the actual value of the attribute.

- ***elementName***
  Specifies the element name (attribute) to filter on.

  NOTE
  You can specify selection criteria also, such as poll rates only. This method is also known as Get Tunneling. For more information, see the following example.

Results are returned in the Body tab of the HTTP Response pane.

Example: Return a List of Monitoring Profiles that Contain a Metric Family Using Filter and Selection Criteria (Get Tunneling).

To return the monitoring profiles that contain a metric family using poll rate as the selection criteria, use the following method:

- **Method:** POST
- **URL**: `http://DA_host:8581/rest/monitoringprofiles/filtered/`
- **Body:**

```
<FilterSelect xmlns:xsi="http://www.w3.org/2001/XMLSchema-
instance" xsi:noNamespaceSchemaLocation="filter.xsd">

               <Filter>

                     <MonitoringProfile.FacetTypes type="CONTAINS">{http://
im.ca.com/normalizer}NormalizedPortInfo</MonitoringProfile.FacetTypes>

               </Filter>

               <Select use="exclude"  isa="exclude">

                  <MonitoringProfile use="exclude">

                      <PollRate use="include"/>

                  </MonitoringProfile>

               </Select>

</FilterSelect>
```

Example: Return a List of Monitoring Profiles that Contain an Item **Using Filter and Selection Criteria**.

To return the monitoring profiles that contain an item using the name as the selection criteria, use the following method:

- **Method:** POST
- **URL**: `http://DA_host:8581/rest/monitoringprofiles/filtered/`
- **Body:**

```
<FilterSelect xmlns:xsi="http://www.w3.org/2001/XMLSchema-
instance" xsi:noNamespaceSchemaLocation="filter.xsd">
```

```
                <Filter>

                      <MonitoringProfile.FacetTypes type="CONTAINS">{http://
im.ca.com/normalizer}NormalizedPortInfo</MonitoringProfile.FacetTypes>

                </Filter>

                <Select use="exclude"  isa="exclude">

                   <Item use="exclude">

                      <Name use="include"/>

                   </Item>

                </Select>

</FilterSelect>
```

Manage Basic Relationships with Data-Driven REST Web Services

To create or delete relationships, use the PUT or DELETE operation at the following URL:
`http://DA_host:8581/rest/endpoint/id/relatesto/endpoint/id`

To view nested relationships, use the following URL:
`http://DA_host:8581/rest/endpoint/id/relatesto/endpoint/endpoint`

Example

To see all associated groups and devices for a specific monitoring profile ID 781, use a GET call at the following URL:
`http://DA_host:8581/rest/monitoringprofile/781/relatesto/groups/devices`

The response URL lists all the related groups and devices for the specified monitoring profile ID with the attributes in the current getlist.xsd file.

Limit Data-Driven Scope to Tenant Domains

You can limit the data-driven scope of your operations to a specific tenant domain for some of the Data Aggregator features, rather than accessing information in the entire global repository.

Use the following basic method to access information for an endpoint with a specific tenant domain:

```
GET http://DA_host:port/rest/tenant/id/endpoint
```

You can use some, but not all, web services with tenant domains.

Change When Same Day, Same Hour Baseline Averages Are Calculated

After a limited amount of data has been collected, the baseline average is calculated for the same hour for every preceding day of the week.

When more data is available, a switchover in the calculation method occurs automatically and Data Aggregator establishes "normal" by averaging hourly samples across available preceding same days of the week.

By default, this automatic switchover occurs when at least 3 same day of the week, same hour data samples are available for the past 12 weeks. You can change when this automatic switchover occurs.

Consider the following information about changing when same day of the week, same hour baseline averages are calculated:

- You have the option of changing both attributes, or just one of the attributes.
- Both attribute values must be a numeric value that is greater than or equal to 1.
- No upper limit is enforced. However, the retention policy of the hourly roll ups defines the upper limit. By default, the hourly retention rate is 90 days (which is approximately 12 weeks of data). If you increase the maximum number of preceding weeks, increase the hourly roll-up retention rate also.
- The MinimumNumberOfRequiredDataPoints attribute value must be less than or equal to the MaximumNumberOfWeeks value.

Follow these steps:

1. Enter the following information in a web browser:
   `http://DA_host:port/rest/sdshbaselineconfig`
   – ***DA_host*:*port***
   Specifies the Data Aggregator host name and the port number.
   Default port: 8581
   The sdshbaselineconfig webservice endpoint URL opens.
2. Review the current values for the minimum required number of data points and the maximum number of preceding weeks.
3. Open a REST client editor or HTTP tool that sends requests and gets responses and set the Content-type to application/xml.
4. Enter the following criteria:
   – HTTP method = PUT
   – Enter the minimum required number of data points within the maximum number of preceding weeks (to trigger the switchover in the baseline calculation method) that you want to change on the Body tab in the HTTP Request pane. For example:

```
<SdshBaselineConfiguration version="1.0.0">

 <SDSHSettings>

  <MinimumNumberOfRequiredDataPoints>5</MinimumNumberOfRequiredDataPoints>

  <MaximumNumberOfWeeks>10</MaximumNumberOfWeeks>

  </SDSHSettings>

</SdshBaselineConfiguration>
```

   In this example, the minimum number of data points to be available for baseline average calculation has been changed to 5. The number of preceding weeks to look for these data points has been changed to 10.

Manage Polling Behavior for Components

You can use this Data Aggregator REST web service to disable or enable polling on other components. This feature allows for more granular polling control than monitoring profile filters alone.

You can also disable or enable polling on specific interfaces from the UI. For more information, see Configure Monitoring Profiles.

By default, polling is enabled for all new components. You can use a Data Aggregator REST web service to disable polling for all new components associated with specific metric families. For more information, see Manage Default Polling Behavior.

Follow these steps:

1. Set up a REST client with a connection to the Data Aggregator server.
2. Query the following REST URL to find the `pollable` item ID:
   `http://DA_host:8581/rest/pollable`
3. Use the following format for the URL in the REST client:
   `http://DA_host:8581/rest/pollable/itemID`
   - ***itemID***
     Specify the `pollable` item ID.
4. Select
   `PUT`
   for the **'HTTP' Method**.
5. Provide a valid Username and Password for a user account that has global administrator access to the Data Aggregator.
6. Select **'application/xml'** as the **'Body Content-type'**.
7. Add the following XML within the "Body" text section:

```
<Pollable version="1.1.1">

   <IsPollEnabled>false</IsPollEnabled>

</Pollable>
```

   - **<IsPollEnabled>**
     To disable polling, specify false. To enable polling, specify true.
8. Run the method.

Manage Default Polling Behavior

By default, polling is enabled for all new components. You can use this Data Aggregator REST web service to disable polling for all new components of specific metric families.

You can disable or enable polling on specific interfaces through the UI. For more information, see Manage Interface Polling Behavior.

You can also use a Data Aggregator REST web service to disable or enable polling on other components. For more information, see Manage Polling Behavior for Components.

This feature allows for more granular polling control than monitoring profile filters alone. For more information, see Configure Monitoring Profiles.

Disable Polling for New Components

You can disable polling for all new components of specific metric families.

Follow these steps:

1. Set up a REST client with a connection to the Data Aggregator server.
2. Query the following REST URL to find the `DiscoveryDefaultConfig` item ID:
   `http://DA_host:8581/rest/discoverydefaultconfig`
3. Use the following format for the URL in the REST client:
   `http://DA_host:8581/rest/discoverydefaultconfig/itemID`
   – ***itemID***
   Specify the `DiscoveryDefaultConfig` item ID.
4. Select
   `PUT`
   for the **'HTTP' Method**.
5. Provide a valid Username and Password for a user account that has global administrator access to the Data Aggregator.
6. Select **'application/xml'** as the **'Body Content-type'**.
7. Add the following XML within the "Body" text section:

```
<DiscoveryDefaultConfig version="1.0.0">
  <DisablePollingOfNewComponentsList>
     <DisablePollingOfNewComponents>{http://im.ca.com/
normalizer}Metric_Family_Name</DisablePollingOfNewComponents>
  </DisablePollingOfNewComponentsList>
</DiscoveryDefaultConfig>
```

   – ***Metric_Family_Name***
   Specify the metric family that is associated with the components for which you want to disable polling.
8. Edit the XML to include the metric families that are associated with the components for which you want to disable polling.
   Example:

```
<DiscoveryDefaultConfig  version="1.0.0">
   <DisablePollingOfNewComponentsList>
     <DisablePollingOfNewComponents>{http://im.ca.com/
normalizer}NormalizedPortInfo</DisablePollingOfNewComponents>
     <DisablePollingOfNewComponents>{http://im.ca.com/normalizer}NormalizedCPUInfo</
DisablePollingOfNewComponents>
   </DisablePollingOfNewComponentsList>
</DiscoveryDefaultConfig>
```

9. Run the method.

Re-enable Polling for New Components

If you want to re-enable polling for new components of a specific metric family, simply reput the XML excluding the metric family.

Follow these steps:

1. Set up a REST client with a connection to the Data Aggregator server.
2. Query the following REST URL to find the `DiscoveryDefaultConfig` item ID:

http://DA_host:8581/rest/discoverydefaultconfig

3. Use the following format for the URL in the REST client:
   http://DA_host:8581/rest/discoverydefaultconfig/itemID
   – ***itemID***
     Specify the `DiscoveryDefaultConfig` item ID.
4. Select
   `PUT`
   for the **'HTTP' Method**.
5. Provide a valid Username and Password for a user account that has global administrator access to the Data Aggregator.
6. Select **'application/xml'** as the **'Body Content-type'**.
7. Add the following XML within the "Body" text section:

```
<DiscoveryDefaultConfig version="1.0.0">
  <DisablePollingOfNewComponentsList>
     <DisablePollingOfNewComponents>{http://im.ca.com/
normalizer}Metric_Family_Name</DisablePollingOfNewComponents>
  </DisablePollingOfNewComponentsList>
</DiscoveryDefaultConfig>
```

   – ***Metric_Family_Name***
     Specify the metric family that is associated with the components for which you want to disable polling.
8. Edit the XML to exclude the metric families that are associated with the components for which you to re-enable polling.
   Example: You want to re-enable polling for new components of the `NormalizedCPUInfo` metric family.

```
<DiscoveryDefaultConfig  version="1.0.0">
   <DisablePollingOfNewComponentsList>
     <DisablePollingOfNewComponents>{http://im.ca.com/
normalizer}NormalizedPortInfo</DisablePollingOfNewComponents>
   </DisablePollingOfNewComponentsList>
</DiscoveryDefaultConfig>
```

9. Run the method.

Manage Filtered Components

You can control whether filtered components are created with the `DoNotCreateFilteredItems` attribute.

Follow these steps:

1. Set up a REST client with a connection to the Data Aggregator server.
2. Query the following REST URL to find the `DiscoveryDefaultConfig` item ID:
   http://DA_host:8581/rest/discoverydefaultconfig
3. Use the following format for the URL in the REST client:
   http://DA_host:8581/rest/discoverydefaultconfig/itemID
   – ***itemID***
     Specify the `DiscoveryDefaultConfig` item ID.
4. Select
   `PUT`
   for the **'HTTP' Method**.
5. Provide a valid Username and Password for a user account that has global administrator access to the Data Aggregator.

6. Select **'application/xml'** as the **'Body Content-type'**.
7. Add the following XML within the "Body" text section:

```
<DiscoveryDefaultConfig version="1.0.0">
  <DoNotCreateFilteredItems>true</DoNotCreateFilteredItems>
</DiscoveryDefaultConfig>
```

   – ***DoNotCreateFilteredItems***
   Specify whether true or false. True does not create filtered items. False creates filtered items.
8. Run the method.

Poll Sensitive and Critical Devices Without a Performance Impact

Critical devices are sensitive to too many polls, which can lead to performance problems. To throttle the SNMP poll requests and avoid overwhelming your sensitive devices, configure the SNMP polling controls.

By default, SNMP polling is controlled in three ways:

- **SNMP traffic threshold**
  No more than 15 SNMP requests can be sent to a device at a time. Poll and discovery SNMP requests over 15 are queued and sent to a device when possible during the polling cycle. Up to 600 requests can be queued.
- **SNMP timeouts threshold**
  When 15 or more SNMP requests timeout, polling is suspended for the remainder of the current polling cycle. An event is generated, informing you of the situation.
  Polling resumes at the beginning of each poll cycle. When the timeouts do not exceed the 15 threshold, a "clear" event is generated.
- **SNMP PDU Segmentation**
  SNMP packets can be limited to contain a maximum number of varbinds by splitting a larger SNMP request into multiple smaller requests and reassembling the responses.

These thresholds are designed to prevent overwhelming a device with too many poll requests or PDUs that are too large. You can override these SNMP polling thresholds defaults by modifying the following parameters:

- **TimeoutFailSafeThrottleDefault**Specifies the default maximum number of timeouts that trigger the fail-safe throttle**.**
- **MaxOutstandingRequestsDefault**Specifies the default maximum number of outstanding requests.
- **MaxRequestSizeDefault**Specifies the default maximum number of varbind that a single SNMP request may contain.

These thresholds can also be modified per device so that a specific device can be assigned individual threshold values.

For example, your older router is exceptionally sensitive to polling. But, this router is critical and must be polled as frequently as possible. You already adjusted your monitoring profile to remove unnecessary metric families from polling. You also applied a filter in your monitoring profile to reduce the number of polled interfaces. However, polling still causes this router to crash. Therefore, your only option is to adjust the default SNMP polling parameters for your sensitive router.

You can add any of the following parameters to the policy for individual IPs or IP ranges in an IPRange section within the IPRangeList:

- **TimeoutFailSafeThrottle**The maximum number of timeouts that are applied on the devices within this IP range
- **MaxOutstandingRequests**
  The maximum number of outstanding requests that are sent to the devices within the indicated IP range
- **MaxRequestSize**
  Limits the number of varbinds in an outgoing SNMP request
  If the number of varbinds in the SNMP request exceeds the value of `MaxRequestSize` , the outgoing request is split into two or more smaller requests.
  Some IP ranges are not covered in the IPRange sections. For global settings, use the `MaxRequestSizeDefault` parameter to set the varbind limit.

NOTE

If `MaxRequestSize` is 0, the original request is sent regardless of its size.

For related troubleshooting information, see Gaps in Data Appear during Throttling and Polling Stopped Event Message.

Follow these steps:

1. Find the ID for your IP Domain (that contains your sensitive router) by opening:
   `http://DA_host:port/rest/ipdomains`

   – ***DA_host*:*port***
   Specifies the Data Aggregator hostname and the port number where you are accessing the REST web services from.
2. Locate your IP Domain ID in the following SNMP throttle policy list, and note the corresponding policy ID:
   `http://DA_host:port/rest/snmpthrottlepolicies`

3. Determine the number of varbinds that you want to include in a single outgoing SNMP request. Some devices ignore requests that are too large without sending an error. As a result, the SNMP poller cannot reach the device. Use the `MaxRequestSize` value to allow the Data Collector to monitor these devices.
   Example
   If the interface SNMP request has 27 varbinds and *MaxRequestSizeDefault* is set to 15, the outgoing request is split into two smaller requests. One request contains 14 varbinds, and the other contains 13 varbinds.
   Example: The following example from an SNMP throttle policy shows that the policy ID is "601" for IP Domain "2" with no limit on the number of varbinds:

```
<SnmpThrottlePolicy version="1.0.0">
    <ID>601</ID>
    <MaxOutstandingRequestsDefault>15</MaxOutstandingRequestsDefault>
    <QueueLength>600</QueueLength>
    <TimeoutFailSafeThrottleDefault>15</TimeoutFailSafeThrottleDefault>
    <MaxRequestSizeDefault>0</MaxRequestSizeDefault>
     <IPDomainID>2</IPDomainID>
    </SnmpThrottlePolicy>
```

4. Open a REST client editor or HTTP tool that sends requests and gets responses, and set the Content-type to application/xml.
5. Open and edit the SNMP throttle policy for your IP Domain by entering the following criteria:
   – URL: `http://DA_host:port/rest/snmpthrottlepolicies/policyID`
   • ***policyID***
   Specifies a unique identification number that is assigned to the SNMP throttle policy for the IP Domain that contains your sensitive device.
   Example: `http://DA_host:port/rest/snmpthrottlepolicies/601`
   – HTTP method = PUT
   – Adjust the following values for your IP Range on the Body tab in the HTTP Request pane:
   • **<MaxOutstandingRequests>**
   SNMP traffic threshold
   • **<TimeoutFailSafeThrottle>**
   SNMP timeouts threshold

NOTE
Both values are required for every IP Range entry. You can disable either parameter by setting the value to "0."

– Remove the following lines:
  - `<ID>`
  - `<IPDomainID>`

Results are returned in the Body tab of the HTTP Response pane.
Example: In this example, the thresholds are lowered to "10" for device 10.231.41.7 only. For this device, the number of varbinds is limited to 50. The default thresholds and other IP Range thresholds continue using the default value of "15." For devices 10.231.41.1-10.231.41.255, SNMP requests are limited to 30 varbinds.

```
<SnmpThrottlePolicy version="1.0.0">
    <IPRangeList>
      <IPRange>
            <IPRangeText>10.231.41.7</IPRangeText>
            <MaxOutstandingRequests>10</MaxOutstandingRequests>
            <TimeoutFailSafeThrottle>10</TimeoutFailSafeThrottle>
            <MaxRequestSize>50</MaxRequestSize>
      </IPRange>
      <IPRange>
            <IPRangeText>10.231.41.1-10.231.41.255</IPRangeText>
            <MaxOutstandingRequests>15</MaxOutstandingRequests>
            <TimeoutFailSafeThrottle>15</TimeoutFailSafeThrottle>
            <MaxRequestSize>30</MaxRequestSize>
      </IPRange>
    </IPRangeList>
        <MaxRequestSizeDefault>0</MaxRequestSizeDefault>
        <MaxOutstandingRequestsDefault>15</MaxOutstandingRequestsDefault>
        <QueueLength>600</QueueLength>
        <TimeoutFailSafeThrottleDefault>15</TimeoutFailSafeThrottleDefault>
</SnmpThrottlePolicy>
```

NOTE
You can adjust the thresholds for a single device or a range of devices. The IP Range definition and the IP Range order determine which threshold applies. The IP Ranges are listed in priority order. That is, the first IP Range that applies to a device determines the threshold value to apply.

6. Always include the `MaxOutstandingRequestsDefault`, `MaxRequestSizeDefault`, `TimeoutFailSafeThrottleDefault`, and `QueueLength` parameters in the update/POST XML at the root level. Include the parameters even if the values do not differ from the default.
   Example:
   This PUT command generates the policy that follows.

```
Update XML: PUT on URL DA-HOST:8581/rest/snmpthrottlepolicies/21
   <SnmpThrottlePolicy version="1.0.0">
   <IPRangeList>
     <IPRange>
       <IPRangeText>130.119.103.8</IPRangeText>
       <MaxOutstandingRequests>10</MaxOutstandingRequests>
       <TimeoutFailSafeThrottle>10</TimeoutFailSafeThrottle>
```

```
        <MaxRequestSize>20</MaxRequestSize>
      </IPRange>
    </IPRangeList>
    <MaxRequestSizeDefault>0</MaxRequestSizeDefault>
    <MaxOutstandingRequestsDefault>15</MaxOutstandingRequestsDefault>
    <TimeoutFailSafeThrottleDefault>15</TimeoutFailSafeThrottleDefault>
    <QueueLength>600</QueueLength>
    </SnmpThrottlePolicy>
```

This command generates the following policy:

```
<SnmpThrottlePolicy version="1.0.0">
<ID>21</ID>
<QueueLength>600</QueueLength>
<TimeoutFailSafeThrottleDefault>15</TimeoutFailSafeThrottleDefault>
<IPDomainID>2</IPDomainID>
<IPRangeList>
<IPRange>
<IPRangeText>130.119.103.8</IPRangeText>
<MaxOutstandingRequests>10</MaxOutstandingRequests>
<TimeoutFailSafeThrottle>10</TimeoutFailSafeThrottle>
<MaxRequestSize>20</MaxRequestSize>
</IPRange>
</IPRangeList>
<MaxRequestSize>0</MaxRequestSize>
<MaxOutstandingRequestsDefault>15</MaxOutstandingRequestsDefault>
</SnmpThrottlePolicy>
```

Schedule Data Purges

You schedule how often Data Repository purges all data that is older than the specified retention periods. You can modify the start hour, start minute, and you can modify the start second. By default, the Data Aggregator purges data every day at 2:00:00 AM.

Follow these steps:

1. Enter the following information in a web browser:

   `http://DA_host:port/rest/globalretentionscheduledefinition`

   – ***DA_host*:*port***
   Specifies the Data Aggregator hostname and the port number where you are accessing the REST web services from.

   The `globalretentionscheduledefinition` webservice endpoint URL.
2. Take note of the ID that is assigned to the `globalretentionscheduledefinition` .
3. Look for the elements that have `StartMinute, StartHour,` and `StartSecond` . Use this information to determine whether you want to modify the start hour, start minute, or start second when old data is purged.

4. Open a REST client editor or HTTP tool that sends requests and gets responses and set the Content-type to application/xml.
5. Enter the following criteria:
   – URL: `http://DA_host:port/rest/globalretentionscheduledefinition/ID`
     - ***ID***
       Is a unique identification number that is assigned to the `globalretentionscheduledefinition`.
   – HTTP method = PUT
   – Enter the time values that you want to change in the Body tab of the HTTP Request pane.
     For example:

```
<GlobalRetentionScheduleDefinition version="1.0.0">

  <StartMinute>28</StartMinute>

  <StartHour>17</StartHour>

  <Enabled>true</Enabled>

  <Status>Scheduled to run everyday at 17:28:00</Status>

</GlobalRetentionScheduleDefinition>
```

WARNING
Be sure that there is no white space at the beginning of each of these lines, otherwise the PUT operation fails.

In this example, the start hour has been changed to 17 and the start minute has been changed to 28.

NOTE
To disable the purge job, set <Enabled> to false. To reenable the purge job, set <Enabled> to true.

Results are returned in the Body tab of the HTTP Response pane.
For example:

```
<GlobalRetentionScheduleDefinitionList>

<GlobalRetentionScheduleDefinition version="1.0.0">

  <ID>9</ID>

  <StartMinute>28</StartMinute>

  <StartHour>17</StartHour>

  <Enabled>true</Enabled>

  <JobStatus>Has never run</JobStatus>

  <Status>Scheduled to run everyday at 17:28:00</Status>

  <StartSecond>0</StartSecond>
```

```
<Item version="1.0.0">

  <CreateTime>Thu Dec 15 15:52:20 EST 2011</CreateTime>

  <Name>Global Retention Schedule Definition</Name>

  </Item>

  </GlobalRetentionScheduleDefinition>

  </GlobalRetentionScheduleDefinitionList>
```

In this example, data that is older than the specified retention periods will be purged every day at 17:28:00.

Schedule Rollup Processing and Baseline Calculations

Administrators can schedule rollup processing and baseline calculations. Changing the time when these operations run lets administrators schedule these intensive operations to occur during off-hours. When these operations occur during off-hours, users who generate reports will not be impacted during business hours.

By default, rollup processing and baseline calculations are run at the bottom of the hour, every hour of the day.

Follow these steps:

1. Enter the following URL in a web browser:
   `http://DA_host:port/rest/rollups/config`
   – ***DA_host*:*port***
   Specifies the Data Aggregator host name and the port number.
   Default port: 8581
2. Take note of the ID that is assigned to the configuration item.
3. Open a REST client editor or HTTP tool that sends requests and gets responses. Enter the following criteria:
   – URL: `http://DA_host:port/rest/rollups/config/ID`
   • ***DA_host*:*port***
   Specifies the Data Aggregator host name and the port number.
   Default port: 8581
   • **ID**
   Is a unique identification number that is assigned to the configuration item. You noted this number in the previous step.
   – HTTP method: PUT
   – Enter the hour of the day when you want rollup processing to begin and end in the Body tab of the HTTP Request pane.

   By default, the following results are returned:

```
<RollupsConfigurationList>

     <RollupsConfiguration version="1.0.0">

          <ID>8</ID>

          <StartHour>0</StartHour>
```

```
            <EndHour>23</EndHour>

        </RollupsConfiguration>

    </RollupsConfigurationList>
```

- **StartHour**
  Defines the hour of the day (in your local timezone) in 24-hour time format when rollup processing will begin.
- **EndHour**
  Defines the hour of the day (in your local timezone) in 24-hour time format when rollup processing should end. No new rollups will be kicked off after the end-hour, but any rollups that are in-progress will be allowed to complete.

  NOTE
  For more details on these attributes, see http://*DA_host*:*port*/rest/rollups/config/documentation.

Example: In this example, you change the schedule so that rollup processing and baseline calculations run only from 20:00 to 7:00.

```
<RollupsConfigurationList>

    <RollupsConfiguration version="1.0.0">

      <ID>8</ID>

      <StartHour>20</StartHour>

      <EndHour>6</EndHour>

    </RollupsConfiguration>

</RollupsConfigurationList>
```

The <EndHour> is inclusive. In this example, that means if you specify 6 as the EndHour, rollup processing and baseline calculations will be initated in at the bottom of the hour during the 06:00 hour, but they will not be initiated at the 07:00 hour. Any calculations that are in progress will be allowed to complete.

WARNING
Any modifications to the default schedule can result in a larger delay in data showing up in reports pertaining to the corresponding resolution. For example, if hourly rollups are delayed, then a reporting showing hourly resolution data will not be current until the hourly rollup has been performed.

OpenAPI

The OpenAPI is a flexible tool that lets users easily extract data from the DX NetOps Performance Management database. The OpenAPI enables integration between DX NetOps Performance Management data and external applications.

The OpenAPI is a public API that uses the QueryBuilder GUI. The QueryBuilder is a guided URL builder that lets you create custom Query URLs to extract and explore performance data. The URLs return customized data in the specified format. You can view the data in a browser or process the data in a custom web application.

The OpenAPI uses the OData 2.0 industry standard. The documentation for this standard is found at the OData 2.0 web page.

When new metrics families are added to the system, the metrics are automatically added to the OpenAPI schema.

Access the OpenAPI

All users who have NetOps Portal credentials can use QueryBuilder and the OpenAPI. To log in to the OpenAPI QueryBuilder, use your NetOps Portal credentials. The OpenAPI uses Single Sign-On (SSO) for credential authentication.

> **NOTE**
>
> If the PC hostname is overridden, the Web Service Host must be updated using the Single Sign-On Configuration Tool. Otherwise, QueryBuilder cannot access SSO to log in users. If you override the PC hostname, update the Web Service Host property in the Single Sign-On Configuration Tool. For more information, see Update Performance Center Website Settings.

To access the QueryBuilder, go to the following URL: `http://DA_host:8581/odataquery`

In a fault tolerant environment, specify the proxy server as the *DA_host*.

> **NOTE**
>
> You **cannot** run OpenAPI queries outside the QueryBuilder as a user with Security Assertion Markup Language (SAML) 2.0 authentication. SAML authentication works in the QueryBuilder UI. LDAP authentication and NetOps Portal authentication support direct OpenAPI queries.

The schema XML description provides detailed information about the items and relationships in your system. To review the schema XML description and metadata, go to the following URL:
`http://DA_host:8581/odata/api/$metadata`

Use the OpenAPI QueryBuilder

The OpenAPI QueryBuilder creates query URLs that export configuration and polled data.

To access the QueryBuilder, go to the following URL: `http://DA_host:8581/odataquery`

In a fault tolerant environment, specify the proxy server as the *DA_host*.

Create an OpenAPI Query

To extract customized data sets from the data source, use the QueryBuilder to generate OpenAPI queries.

> **WARNING**
> Queries that return large sets of results can negatively affect your system. Refine your queries to return only the results that are relevant to your needs.

> **NOTE**
>
> The address bar of the Web browser updates to show the selected tokens in the Query Expression field. To continue editing the query, copy and save this URL

Follow these steps:

1. Click the Query Expression field to start a query.
2. Select the **for** option that represents what you want in the data set.
3. Add the **select**, **expand metrics**, and **expand** tokens to define the output data.
4. Add more tokens to refine the results.
   QueryBuilder creates the OData URL.

- To run the query in the QueryBuilder browser window, click **Run**.
- To run the query from a Web browser, REST tool, or custom application, copy the OData URL.

OpenAPI Controls

The OpenAPI QueryBuilder uses tokens that represent logical elements in the OpenAPI query syntax. Tokens appear when you click the Query Expression field. A token lets you select the type of attribute, filter, metric family, metric, or time range for the query. Selecting a token updates the Query URL.

Use tokens to create and export Query URLs:

- **for**
  This token determines the type of item that the query retrieves data about. This token appears only once in each query. Most options for this token include selections that set up an automatic filter. For example, when you select **interface** in the token, you can select **within Groups that...** This option adds a filter token with the group filter selected as the first criterion.

  NOTE

  If a newly added metric family does not appear in the QueryBuilder, refresh the Web browser.
- **select**
  This token determines the item properties to include in the data set.
  Property order is not supported in the results.
- **expand metrics**
  This token determines the performance metrics to include in the data set.
  Property order is not supported in the results.
- **filter**
  This token adds custom filters that are based on logical functions using the AND and OR operations. Select whether the filter is case-sensitive for all logical functions.
  When OData evaluates a filter expression, the 'Any' operator is used to determine whether the Boolean expression is True or False for a collection of items. The following examples return True:
  - `odata/api/devices?$select=ID,Name&$filter=((startswith(Name, 'cisco') eq true))`
  - `odata/api/cpus?$top=10&$filter=cpumfs/im_Utilization gt 80 where cpumfs/im_Utilization is the collection [60,65,81,68,61]`

  NOTE

  In large systems, some queries might time out if the filters are applied inefficiently. OpenAPI evaluates filter expressions in the order they appear in the query. Use the filter that limits the data more first. For example, if you want all groups where interface utilization is great than 50 percent in North America, place the North America filter first.
- **filter metrics**
  This token adds custom filters that are based on the selected metrics.
- **time range**
  This token limits the time range of the results for performance metrics and sets the granularity of the data.

  NOTE

  If the time granularity is set to Day and the Time Zone is set to any value other than the default, the Start Time and End Time fields are disabled.
- **expand**
  This token adds data that is related to the base item to the returned data set. For example, if you selected data for interface, use expend to get data about the related devices.
  In the expand token, select which columns to add to the data set. For example, for device, you might select name, primary IP address, and location.

Each expanded attribute appears in the HTML table in the same format as a metric column. For example, if to display interface information for a specific device, you can use the following query:

```
select=device/Name&$expand=device
```

- **group/aggregate**
  This token defines grouping and aggregation for the returned data set. For example, aggregate CPU utilization to the device level, and average the utilization for the last hour.

  NOTE

  The OpenAPI QueryBuilder currently supports only the '`groupby` ' and '`aggregate` ' OData transformations. If the starting entity is metric family, then the `groupby` transformation can be applied to `ID` , `DeviceItemID` , and `Timestamp` . If the starting entity if a config entity and aggregation is for metric family data, the `groupby` transformation can be applied to `ID` and `DeviceItemID` . The `groupby` transformation can now be done on the group level using group ID. The `aggregate` transformation can now include up to 5 expressions.
- **sort**
  This token controls the sorting of the query output.
  The OpenAPI does not support sorting on properties of a related entity. For example, the following query is supported:

  ```
  /cpus?$orderby=Name
  ```

  The following query is **not** supported:

  ```
  /cpus?$orderby=device/Name
  ```

  The OpenAPI supports sorting only on the properties of the target entity of your query.

  ```
  http://hostname:8581/odata/api/TargetEntity
  ```

  For example, sorting of metric columns works best when the target entity of your query is the metric family.
- **limit (top)**
  This token specifies the maximum number of rows or expanded rows in the query output.
  - **Maximum number of rows**
    The number of rows in the Results table
  - **Maximum number of expanded rows**
    The number of rows in the Expand window
    This number only applies to the number of rows when the Expand token is used.

    NOTE

    To modify the default values or the maximum number of rows, see Configure OpenAPI Defaults and Limits.
  - **Skip**
    The number of leading rows to omit from the query output
- **format**
  This token determines the format of the returned data set. The OpenAPI supports the following formats:
  - **HTML Table**
    If the query does not include this token, HTML Table is the default format.

    NOTE

    The HTML table format is supported only in the OpenAPI QueryBuilder. Direct OpenAPI queries support JSON, XML, Atom, and CSV.
  - **JSON**

NOTE

The JSON format removes the metadata from the resulting data set. Doing so reduces the network transfer time, the payload size up to 50-75 percent, and the client processing time. To add metadata to JSON output manually, use the following HTTP header:

```
Accept: application/json;odata=verbose
```

You can also add metadata to JSON output. To do so, add the $format query option as the following text to the OData URL:

```
$format=application/json;odata=verbose
```

- **XML**
- **Atom**
- **CSV**
  To specify CSV as a format manually, append the following text to the end of the OData URL:
  ```
  $format=text/csv
  ```

- **custom parameter**
  This token adds custom parameters in OData syntax to the OpenAPI query.

Find Metric Family Names for QueryBuilder

The metric family names in the OpenAPI are shortened versions of the internal metric family names. The OpenAPI metric family names remove the prefix 'Normalized' and the suffix 'Info'. The capitalization is removed and the suffix 'mf' is added to the string. For example, the internal name of the Interface metric family is 'NormalizedPortInfo'. The OpenAPI metric family name is 'portmf'.

To see the internal metric family name, look up the name in NetOps Portal.

Follow these steps:

1. Select **Administration**, and click the Data Aggregator data source.
2. Expand **Monitoring Configuration**, and click **Metric Families**.
3. Hover over one of the column headings, and click the down arrow.
4. Expand the Columns menu, and select **Internal Name**.
   The **Internal Name** column appears on the page.
5. Search for the metric family, and record the internal name.

Best Practices for OpenAPI Performance

The OpenAPI enables quick and flexible extraction of data from the database. For queries that produce large results, use the following best practices to improve performance:

- When you apply multiple filters to a query, ensure that all filters rules against the same object are adjacent. Splitting these filters reduces the efficiency of the query.
- Avoid filtering by strings. For example, to filter on a group, look up the group ID instead of filtering on the group name.
- Combine group expressions. Using an OR operator between a group expression and another expression is unsupported. For example, the following expression returns an error:

```
odata/api/interfaces?&$select=ID,Description&$filter=(groups/Name eq 'Manageable
Devices')  or (substringof('Gigabit',Description) eq true)
```

- Aggregation functions against large data sets take a long time.
- OpenAPI is not a bulk data export tool. Use OpenAPI to extract only the data that you need.
- Use the top and skip values to apply paging for large data sets.
- Use the largest granularity that is relevant for your data set. For example, if you want data that is aggregated by sum, the hourly or daily values provide the same information as rate data.

OpenAPI QueryBuilder Examples

The following examples highlight the flexibility of the OpenAPI. Use these examples as a model to create your own OpenAPI queries:

Export Inventory and Configuration Details

The following examples show how to extract lists of items from inventory with specific configuration details.

Get a List of All Devices with Cisco in the Name

You want to get a list of Cisco devices and IP addresses of those devices. For these devices, you know that the device name includes "Cisco".

To get this list, use the following tokens to build the query:

- **for: device**
- **select: ID, Name, PrimaryIPAddress**
- **filter: name contains cisco**

OpenAPI URL: `http://da_host:8581/odata/api/devices?$select=ID,Name,PrimaryIPAddress&$filter=((groups/Name eq 'cisco'))`

Get a List of Devices and Location Information

You want a list of Cisco devices and the location information (location, latitude, longitude, location description, and elevation) for those devices.

> **TIP**
>
> The **Location** attribute is tied to the MIB **sysLocation** value. The **Latitude**, **Longitude**, **LocationDesc**, and **Elevation** attributes are user-defined values. An administrator must set these values on the Data Aggregator. If these values are not set, they return a null result.

To get this list, use the following tokens to build the query:

- **for: device**
- **select: ID, Name, PrimaryIPAddress, Location, Latitude, Longitude, LocationDesc, Elevation**
- **filter: name contains cisco**

OpenAPI URL: `http://da_host:8581/odata/api/devices?$select=ID,Name,PrimaryIPAddress,Location,Latitude,Longitude,LocationDesc,Elevation&$filter=((groups/Name eq 'cisco'))`

Get a List of Devices and Components If the Device IP Address Begins with 10.251

You want a list of all devices where the IP address begins with 10.251. You also want a list of the components for those devices.

TIP

The **expand** token lets you get items that are related to the main entity of the query.

To get this list, use the following tokens to build the query:

- **for: device**
- **select: ID, Name, PrimaryIPAddress**
- **filter: PrimaryIPAddress starts with 10.251**
- **expand: components, DisplayName**

OpenAPI URL: `http://da_host :8581/odata/api/devices?$expand=components&$select=ID,Name,PrimaryIPAddress,components/DisplayName&$filter=((startswith(PrimaryIPAddress, '10.251') eq true))`

Get a List of Devices and Components in the Boston Group

You want a list of all devices in the Boston group. You also want a list of the components for those devices.

TIP

When you selected a group filter, OpenAPI always includes subgroups of the selected group.

To get this list, use the following tokens to build the query:

- **for: device**
- **select: ID, Name, PrimaryIPAddress**
- **filter: groups/Name equal Boston**
- **expand: components, DisplayName**

OpenAPI URL: `http://da_host:8581/odata/api/devices?$expand=components&$select=ID,Name,PrimaryIPAddress,components/DisplayName&$filter=((groups/Name eq 'Boston'))`

Get a List of Metric Families and Vendor Certifications for a Specific Device

You want to know which metric families and vendor certifications are used to monitor specific devices. From this list, you can derive the available metrics for a device. The name of the device is MyDevice-123.

To get this list, use the following tokens to build the query:

- **for: device**
- **filter: DisplayName equal MyDevice-123**
- **select: ID, Name**
- **expand: metricfamilyhistory, MetricFamilyID, VendorCertDisplayName**

OpenAPI URL: `http://da_host:8581/odata/api/devices?$expand=metricfamilyhistories&$select=ID,Name,metricfamilyhistories/MetricFamilyID,metricfamilyhistories/VendorCertDisplayName&$filter=((DisplayName eq 'MyDevice-123'))`

Get a List of Supported Metric Families

You want to know which metrics are available for reporting. From a list of metric families, you can determine which metric families are supported by which monitored devices.

To get this list, use the following tokens to build the query:

- **for: metricfamilyhistory**
- **select: Status**
- expand: device/ID, device/Name, metricfamilydef/ID, metricfamilydef/DisplayName, metricfamilydef/DisplayDescription, **metricdefs/ID, metricdefs/DisplayName, metricdefs/DisplayDecsription,**
- **filter: Status/Status equal SUPPORTED**

OpenAPI URL:

```
http://da_host:8581/odata/api/metricfamilyhistories?$expand=metricfamilydef,metricdefs,device&
$select=device/ID,device/Name,Status,metricfamilydef/ID,metricfamilydef/DisplayName,metricfamilydef/
DisplayDescription,metricdefs/ID,metricdefs/DisplayName,metricdefs/DisplayDescription&$filter=((Status eq
'SUPPORTED'))
```

Export Inventory and Monitoring Data

The following examples show how to extract monitoring data for items with specific configuration details or monitoring status.

List the Interfaces in the North America Group That Are Not Being Polled

You want to know which interfaces in the North America group are not currently being monitored.

To get this list, use the following tokens to build the query:

- **for: interface**
- **select: ID, Name**
- **filter: groups/Name equal North America and IsPolled False**

OpenAPI URL: `http://da_host:8581/odata/api/interfaces?$select=ID,Name&$filter=((groups/Name eq 'North America') and (IsPolled eq false))`

Get the Polling Statistics for Devices in a Group for the Last 24 Hours

You want to know the success and failure rate of devices in the Boston group for the last 24 hours. The database does not store the number of unsuccessful polls. To derive this value, use the **group aggregate** token to subtract the number of successful polls from the number of polls sent.

> **TIP**
>
> Time selections are absolute. When you select the time for the query, that time is fixed. To create a query with a flexible time, use a script to replace the time and data in the query.

To get this data, use the following tokens to build the query:

- **for: device**
- **select: Name**
- **expand metrics: devicepollingstatisticsmfs: im_NumSuccessfulPolls**
- **group aggregate:**
  - **Group By: devicepollingstatisticsmfs, ID**
  - Add an Aggregation Function: **Sum Of** `im_NumPollsSent sub im_NumSuccessfulPolls`
- **filter: groups/Name equal Boston**
- **time range: Last24Hours**

OpenAPI URL:

```
http://da_host :8581
```

```
/odata/api/devices?$apply=groupby(devicepollingstatisticsmfs/ID,
 aggregate(devicepollingstatisticsmfs(im_NumPollsSent sub im_NumSuccessfulPolls
 with sum as Value)))&period=1d&resolution=RATE&$expand=devicepollingstatisticsmfs&
$select=Name,devicepollingstatisticsmfs/im_NumSuccessfulPolls&$filter=((groups/Name eq 'Boston'))
```

Get a List of Devices with More Than 25 Percent Polling Failures in the Last 30 Days

You want to identify devices that respond inconsistently to poll requests. For this query, use the aggregation function to calculate the poll failure rate, then set a limit against that value.

> **TIP**
>
> The **group aggregate** token enables you to derive values from metrics in the system. In the results, the aggregated data is reported as "Value". You can use Value as a filter criteria for the filter metrics token.

To get this data, use the following tokens to build the query:

- **for: device**
- **select: Name**
- **group aggregate:**
  - **Group By: devicepollingstatisticsmfs, ID**
  - Add an Aggregation Function: **Sum Of** `((im_NumPollsSent sub im_NumSuccessfulPolls) div im_NumPollsSent) mul 100`
- **filter metrics: devicepollingstatisticsmfs/Value greater 25**
- **time range: Last30Days**

OpenAPI URL:

```
 http://da_host :8581
/odata/api/devices?$apply=groupby(devicepollingstatisticsmfs/ID,
 aggregate(devicepollingstatisticsmfs(((im_NumPollsSent sub im_NumSuccessfulPolls) div im_NumPollsSent) mul
 100 with sum as Value)))&period=1m&resolution=RATE&$select=Name&$filter=((devicepollingstatisticsmfs/Value gt
 25))
```

Export Device Status

The following examples show how to extract details regarding device statuses.

Get a List of All Devices from the Last 24 Hours with Management Issues

You want to identify recent devices with management issues.

To get this data, use the following tokens to build the query:

- **for: device**
- **select: ID, Name**
- **group aggregate:**
  - **Group By: availabilitymfs, DeviceItemID**
  - Add an Aggregation Function: **Count Distinct Of** `(Timestamp)`
- **filter metrics: availabilitymfs/Value less 1**
- **time range: Last24Hours/As polled**
- **limit(top): top=2000, skip=0, expandtop=0**

OpenAPI URL: *http://da_host* :8581/odata/api/devices?$apply=groupby(availabilitymfs/DeviceItemID, aggregate(availabilitymfs(Timestamp with countdistinct as

```
Value)))&resolution=RATE&period=1d&$top=2000&$skip=0&top=0&$select=ID,Name&
$filter=((availabilitymfs/Value lt 1))
```

Get a List of All Devices from the Last 24 Hours with Reachability Issues

You want to identify recent devices with reachability issues.

To get this data, use the following tokens to build the query:

- **for: device**
- **select: ID, Name**
- **group aggregate:**
  - **Group By: reachabilitymfs, DeviceItemID**
  - Add an Aggregation Function: **Count Distinct Of** `(Timestamp)`
- **filter metrics: reachabilitymfs/Value less 1**
- **time range: Last24Hours/As polled**
- **limit(top): top=2000, skip=0, expandtop=0**

OpenAPI URL: http://*da_host*
:
```
8581/odata/api/devices?$apply=groupby(reachabilitymfs/DeviceItemID,
aggregate(reachabilitymfs(Timestamp with countdistinct as
Value)))&resolution=RATE&period=1d&$top=2000&$skip=0&top=0&$select=ID,Name&
$filter=((reachabilitymfs/Value lt 1))
```

Get a List of All Devices from the Last 24 Hours that are Up without a Single CPU Polled

You want to identify devices that need CPU metric polling restarted.

To get this data, use the following tokens to build the query:

- **for: device**
- **select: ID, Name**
- **group aggregate:**
  - **Group By: cpumfs, DeviceItemID**
  - Add an Aggregation Function: **Count Distinct Of** `(Timestamp)`
- **filter metrics: cpumfs/Value less 1**
- **time range: Last24Hours/As polled**
- **limit(top): top=2000, skip=0, expandtop=0**

OpenAPI URL: http://*da_host*
:
```
8581//odata/api/devices?$apply=groupby(cpumfs/DeviceItemID, aggregate(cpumfs(Timestamp
with countdistinct as Value)))&resolution=RATE&period=1d&$top=2000&$skip=0&top=0&
$select=ID,Name&$filter=((cpumfs/Value lt 1))
```

Get a List of All Devices from the Last 24 Hours that are Up without a Single Interface Polled

You want to identify that the devices that need Interface metric polling restarted.

To get this data, use the following tokens to build the query:

- **for: device**
- **select: ID, Name**
- **group aggregate:**

  - **Group By: portmfs, DeviceItemID**
  - Add an Aggregation Function: **Count Distinct Of** `(Timestamp)`
- **filter metrics: portmfs/Value less 1**
- **time range: Last24Hours/As polled**
- **limit(top): top=2000, skip=0, expandtop=0**

OpenAPI URL: http://*da_host*
:
```
8581/odata/api/devices?$apply=groupby(portmfs/DeviceItemID, aggregate(portmfs(Timestamp
with countdistinct as Value)))&resolution=RATE&period=1d&$top=2000&$skip=0&top=0&
$select=ID,Name&$filter=((portmfs/Value lt 1))
```

Extract Inventory and Time-Series Data

The following examples show how to extract trend and time-series data for items with specific configuration details.

Export As-Polled Bits-In and Bits-Out for Interfaces in a Group

You want to extract key interface monitoring data from the Boston group to use in a new visualization. You want to extract one week of as polled data.

> **TIP**
>
> To get the as polled data for a week, set the maximum number of expanded rows to the correct value. For this example, the poll interval is 5 minutes, so 2016 data point is one week of data.

To get this data, use the following tokens to build the query:

- **for: interface**
- **select: name**
- **expand metrics: portmfs: im_BitsIn, im_BitsOut**
- **filter: groups/Name equal Boston**
- **time range: Last7Days/As polled**
- **limit: Maximum number of expanded rows: 2016**

OpenAPI URL:
```
   http://da_host :8581
/odata/api/interfaces?period=1w&resolution=RATE&$top=50&$skip=0&top=2016&$expand=portmfs&$select=Name,portmfs/
im_BitsIn,portmfs/im_BitsOut&$filter=((groups/Name eq 'Boston'))
```

Get Total Hourly Bits-In and Bits-Out for Interfaces Associated to Devices by IP Address Substring

You want to extract key throughput information for interfaces where the parent device IP address begins with 10.251. You want the hourly throughput totals for the month.

> **TIP**
>
> For 30 days of hourly data, set the maximum number of expanded rows to 720

To get this data, use the following tokens to build the query:

- **for: interface**
- **select: name**
- **expand metrics: portmfs: im_BitsIn, im_BitsOut**
- **filter: device/PrimaryIPAddress starts with 10.251**
- **time range: Last30Days/Hour**
- **limit: Maximum number of expanded rows: 720**

OpenAPI URL:

```
   http://da_host :8581
/odata/api/interfaces?period=1m&resolution=HOUR&$top=50&$skip=0&top=720&$expand=portmfs&$select=Name,portmfs/
im_BitsIn,portmfs/im_BitsOut&$filter=((startswith(PrimaryIPAddress, '10.251') eq true))
```

Get Total Daily Bits-In & Bits-Out for Interfaces That Have Less Than 1-GB Daily Throughput for the Last 30 Days

You want to identify which interfaces are underutilized.

> **TIP**
>
> Because bits in and bits out aggregate by sum, daily resolution provides the same value and the query runs faster.

To get this data, use the following tokens to build the query:

- **for: interface**
- **select: name**
- **expand metrics: portmfs: im_BitsIn, im_BitsOut**
- **filter metrics: portmfs/im_Bits less 1000000000**
- **time rang: Last30Days/Day**

OpenAPI URL:

```
   http://da_host :8581
/odata/api/interfaces?period=1m&resolution=DAY&$expand=portmfs&$select=Name,portmfs/im_BitsIn,portmfs/
im_BitsOut&$filter=((portmfs/im_Bits lt 1000000000))
```

Extract Inventory and Aggregated Values

The following examples show how to extract aggregated data for items with specific configuration details.

> **TIP**
>
> The **group aggregate** token applies customizable run-time analytics to the data set.
>
> **NOTE**
>
> You cannot mix percentile aggregations with other aggregation types.

Show Me the 95th Percentile Utilization Value for Each Interface in a Group for the Last Seven Days

You want the 95th percentile of utilization for each interface in the Boston group.

To get this data, use the following tokens to build the query:

- **for: interface**
- **select: name**
- **expand metrics: portmfs: im_Utilization**
- **group aggregate:**

  - **Group By: portmfs, ID**
  - Add an Aggregation Function: **Percentile95** `im_Utilization`
- **filter: groups/Name equal Boston**
- **time range: Last7Days/As polled**

OpenAPI URL:

```
http://da_host :8581/odata/api/interfaces?$apply=groupby(portmfs/ID, aggregate(portmfs(im_Utilization with
percentile95 as Value)))&resolution=RATE&period=1w&$expand=portmfs&$select=Name,portmfs/ID&$filter=((groups/
Name eq 'Boston'))
```

Show Me the Average CPU Utilization for Each Device in a Group for the Last 30 Days

You want to the average CPU utilization for routers in the Boston group

To get this data, use the following tokens to build the query:

- **for: device**
- **select: name**
- **group aggregate:**
  - **Group By: cpumfs, ID**
  - Add an Aggregation Function: **AverageOf** `im_Utilization`
- **filter: groups/Name equal Boston**
- **time range: Last30Days/As polled**

OpenAPI URL:

```
http://da_host :8581
/odata/api/devices?$apply=groupby(cpumfs/ID, aggregate(cpumfs(im_Utilization with average as
Value)))&period=1m&resolution=RATE&$select=Name&$filter=((groups/Name eq 'Boston'))
```

Show Me the Interfaces in a Group That Have Averaged Less Than 40 Percent Hourly Utilization

You want to see which interfaces in your network were underutilized during the last quarter.

To get this data, use the following tokens to build the query:

- **for: interface**
- **select: name**
- **expand metrics: portmfs: im_utilization**
- **group/aggregate**
  - **Group By: portmfs, ID**
  - Add an Aggregation Function: **AverageOf** `im_utilization`
- **filter metrics: portmfs/Value less 40**
- **time range: Last3Months/Hour**

OpenAPI URL:

```
http://da_host :8581
/odata/api/interfaces?$apply=groupby(portmfs/ID, aggregate(portmfs(im_Utilization with average as
Value)))&period=3m&resolution=HOUR&$expand=portmfs&$select=Name,portmfs/im_Utilization&$filter=((portmfs/
Value lt 40))
```

Show Me the Devices with Average CPU and Memory Utilization More Than 75 Percent Based on IP Address Substring

You want to see devices in the subnet starting with 10.251 that have high CPU and memory utilization.

To get this data, use the following tokens to build the query:

- **for: device**
- **select: Name**
- **expand metrics: cpumfs: im_MemoryUtilization, im_Utilization**
- **filter metrics: cpumfs/im_MemoryUtilization greater 75 OR cpumfs/im_Utilization greater 75**
- **filter: PrimaryIPAddress starts with 10.251**

OpenAPI URL:

```
   http://da_host :8581
/odata/api/devices?$expand=cpumfs&$select=Name,cpumfs/im_MemoryUtilization,cpumfs/im_Utilization&
$filter=((cpumfs/im_MemoryUtilization gt 75) or (cpumfs/im_Utilization gt 75)) and
 ((startswith(PrimaryIPAddress, '10.251') eq true))
```

Extract Metrics Aggregated at the Group Level

The following examples show how to extract metrics aggregated at the group level. Use these queries to understand capacity that is related to the logical groupings of resources. For example, by customers, geography, services, or other.

> **NOTE**
>
> In large systems, some queries might time out if the filters are applied inefficiently. OpenAPI evaluates filter expressions in the order they appear in the query. Use the filter that limits the data more first. For example, if you want all groups where interface utilization is greater than 50 percent in North America, place the North America filter first.

Show Me the Top Ten Interfaces in Group ID 10 with the Highest Bandwidth Utilization

You want to see the top ten interfaces in Group ID 10 with the highest bandwidth utilization.

To get this data, use the following tokens to build the query:

- **for: portmf**
- **select: ID, im_utilization**
- **expand: interface/Name**
- **filter: groups/ID equal 10**
- **sort: im_Utilization (DESC)**
- **limit(top): top=10, skip=0, expandtop=10**

OpenAPI URL: `http://da_host:8581 /odata/api/portmfs?$orderby=im_Utilization desc&$top=10&$skip=0&top=10&$expand=interface&$select=ID,im_Utilization,interface/Name&$filter=((groups/ID eq 10))`

Show Me the Average Interface Utilization of Each Interface in Group ID 10

You want to know the average interface utilization of each interface in Group ID 10.

> **NOTE**
>
> The following query works best for a small group because paging on aggregated values is unsupported.

To get this data, use the following tokens to build the query:

- **for: group**
- **group/aggregate: groupby(portmfs/ID, aggregate(portmfs(im_utilization with average as Value)))**
- **expand: interfaces/ID, interfaces/Name**
- **select: ID, Name, Description**

NOTE
Note: Value is selected by default on the server side.

- **filter: ID equal 10**

OpenAPI URL: `http://da_host:8581 /odata/api/groups?$apply=groupby(portmfs/ID, aggregate(portmfs(im_Utilization with average as Value)))&$expand=interfaces&$select=ID,Name,Description,interfaces/ID,interfaces/Name&$filter=((ID eq 10))`

Show Me the Average Interface Utilization for All Interfaces Within Group ID 10 and Group ID 11

You want to know the average interface utilization for all interfaces within Group ID 10 and Group ID 11.

NOTE

The following query works best for small groups because paging on aggregated values is unsupported.

To get this data, use the following tokens to build the query:

- **for: group**
- **group/aggregate: groupby(portmfs/ID, aggregate(portms(im_Utilization with average as Value)))**
- **select: ID, Name**

NOTE
is selected by default on the server side.

- **filter: (ID equal 10) or (ID equal 11)**

OpenAPI URL: `http://da_host:8581 /odata/api/groups?$apply=groupby(portmfs/ID, aggregate(portmfs(im_Utilization with average as Value)))&$select=ID,Name&$filter=((ID eq 10) or (ID eq 11))`

Show Me the Maximum Interface Utilization Value for Each Child Group Within the Boston Group

You want to know the maximum interface utilization value for each child group within the Boston group.

To get this data, use the following tokens to build the query:

- **for: group**
- **group/aggregate: groupby(portmfs/ID, aggregate(portms(im_Utilization with max as Value)))**
- **select: ID, Name**

NOTE
is selected by default on the server side.

- **filter (GroupPathLocation contains Boston)**

OpenAPI URL: `http://da_host:8581 /odata/api/groups?$apply=groupby(portmfs/ID, aggregate(portmfs(im_Utilization with max as Value)))&$select=ID,Name&$filter=((substringof('Boston:', GroupPathLocation) eq true))`

Show Me the 95th Percentile of Interface Utilization for Each Group That Has the Word "Boston" in the Description

You want to know the 95th percentile of interface utilization for each group with the word "Boston" in the Description.

To get this data, use the following tokens to build the query:

- **for: group**
- **group/aggregate: groupby(portmfs/ID, aggregate(portms(im_Utilization with percentile95 as Value)))**
- **select: ID, Name**

NOTE
is selected by default on the server side.

- **filter (Name contains Boston)**

OpenAPI URL: `http://da_host:8581 /odata/api/groups?$apply=groupby(ID, aggregate(portmfs(im_Utilization with percentile95 as Value)))&$select=ID,Name& $filter=((substringof('Boston',Name) eq true))`

Show Me the Top Five Group IDs with the Highest Group Interface Utilization for All Child Groups in the Boston Group

You want to see the top five groups with the highest group interface utilization for all child groups in the Boston group.

To get this data, use the following tokens to build the query:

- **for: portmf**
- **group/aggregate: groupby(groups/ID,aggregate(im_Utilization with average as Value))**
- **filter: (groups/GroupPathLocation contains Boston) and (Value greater than or equal 0)**
- **select: ID, Value**
- **sort: Ordering, Value (DESC)**

OpenAPI URL:

```
http://da_host:8581
/odata/api/portmfs?$apply=groupby(groups/ID, aggregate(im_Utilization with average as Value))&$orderby=Value
desc&$select=ID,Value&$filter=((substringof('Boston:',groups/GroupPathLocation) eq true) and (Value ge 0))
```

Extract Metrics within Specified Business Hours

The following examples show how to extract metrics within specified business hours. For more information see, Advanced OpenAPI Query Examples.

Show Me Data for Monday through Friday 9:00 AM to 5:00 PM Eastern Standard Time (EST)

You want to see data within your business hours, which are Monday through Friday 9:00 AM to 5:00 PM EST.

- **for: group**
- **group/aggregate: groupby(portmfs/ID, aggregate(portms(im_Utilization with average as Value)))**
- **time range: Last 7 Days/As polled/-05/Mon,Tue,Wed,Thu,Fri 9:00-17:00**
- **select: ID, Name**

OpenAPI URL: `http://da_host:8581/odata/api/groups?$apply=groupby(portmfs/ID, aggregate(portmfs(im_Utilization with average as Value)))&resolution=RATE&period=1w&bh=Mon-Fri 9:00-17:00&tz=-05&$select=ID,Name`

Show Me Data for Monday, Tuesday, and Friday 9:00 AM to 12:00 PM and 1:00 PM to 6:00 PM

You want to see data within your business hours, which are Monday, Tuesday, and Friday 9:00 AM to 12:00 PM and 1:00 PM to 6:00 PM.

- **for: group**
- **group/aggregate: groupby(portmfs/ID, aggregate(portms(im_Utilization with average as Value)))**
- **time range: Last 7 Days/As polled/Mon,Tue,Fri 9:00-12:00 13:00-18:00**
- **select: ID, Name**

OpenAPI URL:

http://da_host:8581/odata/api/groups?$apply=groupby(portmfs/ID, aggregate(portmfs(im_Utilization with average as Value)))&resolution=RATE&period=1w&bh=Mon-Tue 9:00-12:00 13:00-18:00,Fri 9:00-12:00 13:00-18:00&$select=ID,Name

Show Me Data for Monday through Friday 8:00 PM to 4:00 AM

You want to see data within your business hours, which are Monday through Friday 8:00 PM to 4:00 AM.

- **for: group**
- **group/aggregate: groupby(portmfs/ID, aggregate(portms(im_Utilization with average as Value)))**
- **time range: Last 7 Days/As polled/Mon,Tue,Wed,Thur,Fri 20:00-4:00**
- **select: ID, Name**

OpenAPI URL: *http://da_host:8581/*odata/api/groups?$apply=groupby(portmfs/ID, aggregate(portmfs(im_Utilization with average as Value)))&resolution=RATE&period=1w&bh=Mon-Fri 20:00-4:00&$select=ID,Name

Show Me Data for Monday through Friday 9:00 AM to 5:00 PM in January

You want to see data for January within your business hours, which are Monday through Friday 9:00 AM to 5:00 PM.

- **for: group**
- **group/aggregate: groupby(portmfs/ID, aggregate(portms(im_Utilization with average as Value)))**
- **time range: 2017-01-02T09:00~2017-01-31T17:00/As polled/Mon,Tue,Wed,Thu,Fri 9:00-17:00**
- **select: ID, Name**

OpenAPI URL: *http://da_host:8581/odata/api/groups?$apply=groupby(portmfs/ID, aggregate(portmfs(im_Utilization with average as Value)))&resolution=RATE&starttime=1483365600&endtime=1485900000&bh=Mon-Fri 9:00-17:00&$select=ID,Name*

Extract SD-WAN Data

The following examples show how to extract SD-WAN data.

Show Me All Tunnels and Attributes in a Group

You want to see data for your SD-WAN tunnels.

- **for: sdntunnel**
- **filter: groups/Name contains Site 1**

OpenAPI URL: http://*da_host*:8581/odata/api/sdntunnels?$filter=((substringof('Site 1', groups/Name) eq true))

Show Me the Latency, Loss, and Jitter Values for All Tunnels in a Group

You want to see the latency, loss, and jitter values for your SD-WAN tunnels.

- **for: sdntunnel**
- **filter: groups/Name contains Site 1**
- **expand metrics: sdntunnelmfs(im_Jitter,im_Latency,im_PacketLossPercentage)**

OpenAPI URL: *http://da_host:8581/odata/api/sdntunnels?$expand=sdntunnelmfs&$select=sdntunnelmfs/std_im_Jitter,sdntunnelmfs/std_im_Latency,sdntunnelmfs/std_im_PacketLossPercentage&$filter=((substringof('Site 1', groups/Name) eq true))*

Show Me the System Metrics for the Source and Destination Devices for All Tunnels in a Group

You want to see the system metrics for your source and destination devices.

- **for: sdntunnel**
- **filter: groups/Name contains Site 1**
- **expand metrics: sdntunnelmfs(std_im_Jitter,std_im_Latency,std_im_PacketLossPercentage)**

OpenAPI URL: *http://da_host:8581/odata/api/sdntunnels?$expand=sdntunnelmfs&$select=sdntunnelmfs/std_im_Jitter,sdntunnelmfs/std_im_Latency,sdntunnelmfs/std_im_PacketLossPercentage&$filter=((substringof('Site 1', groups/Name) eq true))*

Show Me the Virtual Interface Metrics for the Source and Destination Interfaces in a Group

You want to see the virtual interface metrics for your source and destination interfaces.

- **for: sdnvirtualinterface**
- **filter: groups/Name contains Site 1**
- **expand metrics: stdvitualinterface(std_im_BitsIn,std_im_BitsOut)**

OpenAPI URL: *http://da_host:8581/*odata/api/adnvirtualinterfaces?$expand=virtualinterfacemfs&$select=virtualinterfacemfs/std_im_BitsIn,virtualinterfacemfs/std_im_BitsOut&$filter=((substringof('Site 1', groups/Name) eq true))

Advanced OpenAPI Query Examples

To take further advantage of the flexibility of the OpenAPI, use advanced OpenAPI queries. You can use advanced OpenAPI queries to build your own OpenAPI applications.

The OpenAPI service declares its structure in the Metadata Document, so that you can view the following details:

- The requests that can be executed
- The structure of the results
- How the service can be navigated

You can invoke the Metadata Document using the following URI:

http://*da_host*:8581/odata/api/$metadata

Special Aggregation Functions

Special aggregation functions can be used to:

- Calculate projection values
- Determine the projected time to a threshold
- Get the properties of the linear data model such as the slope and intercept that are used for these calculations

The following special aggregation functions are available for these calculations:

- **intercept**
  Where the projection line crosses the Y-axis
- **slope**
  The steepness of the projection line
- **projection**
  A line predicting the future performance of a metric
- **datasetcount**

The number of data points that are used to calculate the linear data model

- **timetothreshold**
  The number of seconds required for the projection line to cross a threshold
  This value is calculated from the end of the time interval that is defined by the `starttime` and `endtime` parameters

  NOTE

  Note: If `starttime` and `endtime` are unspecified, the default time interval is used.

Threshold Projection Parameters

To extract projections and threshold projections, include the following parameters in advanced OpenAPI queries:

- **prjoffset**
  The amount of time in seconds to calculate out the projection
- **threshold**
  The threshold value for the query

Extract Projections and Threshold Projections

Projections predict future performance. Threshold projections indicate when a metric is predicted to cross a threshold. Use this functionality to manage the capacity of your infrastructure and reprovision or acquire hardware as needed.

The following examples show how to extract projections and threshold projections.

Show Me the Projection for a Single Metric

You want to see the projected CPU utilization for the next 24 hours starting from Wednesday, Aug 10, 2016 at 14:05:00 GMT.

To get this data, use the following OpenAPI URL:

```
http://da_host
:8581
/odata/api/cpumfs?apply=groupby(ID,aggregate(im_Utilization with projection as Value))&
$select=ID,Value&starttime=1470837900&endtime=1470927900&resolution=DAY&prjoffset=86400
```

Show Me the Threshold Projection for a Single Metric

You want to see when CPU utilization is predicted to cross 40 percent. The default resolution for calculating the data is as polled. The threshold projection is returned in seconds.

To get this data, use the following OpenAPI URL:

```
http://da_host
:8581
/odata/api/cpumfs?$apply=groupby(ID,aggregate(im_Utilization with timetothreshold as Value))&
$select=ID,Value&threshold=40
```

Show Me the Threshold Projection for a Specified Resolution

You want to see when the CPU utilization is predicted to cross 40 percent. Your desired resolution for calculating the data is daily. The threshold projection is returned in seconds.

To get this data, use the following OpenAPI URL:

```
http://da_host
:8581
/odata/api/cpumfs?$apply=groupby(ID,aggregate(im_Utilization with timetothreshold as Value))&
$select=ID,Value&resolution=DAY&threshold=40
```

Show Me Multiple Projections from a Single Query

You want to see the projected throughout (bits per second) and discard rate for both inbound and outbound traffic in 60 days. You want to use hourly data from the past three months.

To get this data, use the following OpenAPI URL:

```
http://da_host:8581/odata/api/portmfs?apply=groupby(ID,aggregate((im_BitsPerSecondIn
with projection as im_BitsPerSecondIn),(im_BitsPerSecondOut with
projection as im_BitsPerSecondOut),(im_DiscardsIn with projection as
im_DiscardsIn),(im_DiscardsOut with projection as im_DiscardsOut)))&
$select=ID,Value&starttime=1463320821&endtime=1471269621&resolution=HOUR&prjoffset=5184000
```

Business Hours Parameters

To extract data based on business hour time ranges, include the following parameters in advanced OpenAPI queries:

- **duration**
  Machine-based time interval in time units (**s** second, **h** hour, **d** day, **w** week)
  Machine-based time models a quantity or amount of time in terms of seconds. Machine-based time can be accessed using other duration-based units, such as hours, days, and weeks. In addition, the days unit is treated as exactly equal to 24 hours, thus ignoring daylight savings effects. Use this parameter when you want to ignore daylight savings effects. You can use with `starttime` and `endtime` parameters to specify the start point or endpoint of the duration.
  Example: `duration=1w`
- **period**
  Human-based time interval in time units (**s** second, **h** hour, **d** day, **w** week, **m** month, **y** year)
  Human-based time models a quantity or amount of time in terms of years, months, and days. Human-based time includes daylight savings and other effects. Use this parameter when you want to account for daylight savings effects. You can use with `starttime` and `endtime` parameters to specify the start point or endpoint of the period.
  Example: `period=1w`
- **tz**
  Time zone offset from Greenwich Mean Time (GMT) applied to the start and end times of the query and any specified business hours. If no `tz` parameter is used, the default time zone of the server is used.
  Example: `period=20d&tz=-4:00`

  NOTE

  If you use a daily or weekly resolution in your query, the `tz` parameter is ignored.
- **bh**
  Business hours
  Examples:
  ```
  bh=Mon-Fri
  bh=Mon,Tue,Fri
  bh=Mon 8:30am-5:30pm
  bh=Mon 8:30-17:30
  bh=Mon 8:30-12:30 13:30-17:30
  ```

You can use `starttime` and `endtime` parameters with the business hours parameters as shown in the following examples:

- `starttime=1493145475&endtime=1493145775&bh=Mon-Fri 8:30am-5:30pm`
- `starttime=2017-03-15T18:00:00&period=20d&bh=Mon-Fri 8:30am-5:30pm&tz=-8:00`
- `endtime=2017-04-15T18:00:00&period=20d&bh=Mon-Fri 8:30am-5:30pm&tz=-8:00`
- `startime=2017-03-15T18:00:00&period=20d&bh=Mon-Fri 8:30am-5:30pm&tz=-8:00`
- `starttime=2017-03-15T18:00:00&endtime=2017:04:15T18:00:00&bh=Mon-Fri 8:30am-5:30pm`

Custom Functions

The following custom functions are available:

- **getSchemaVersion**
  See the schema version information.
  Example: *http://da_host:8581/odata/api/getSchemaVersion*
- **getDataCollectors**
  See a list of your Data Collectors and their details including hostname, IP address, and status.**Example:** *http://da_host:8581/odata/api/getDataCollectors*
- **getGroupMetricFamilies**
  See a list of metric families by group.**Example:** *http://da_host:8581/odata/api/getGroupMetricFamilies?&ID=GroupID$format=json&timeout=30*
  - **GroupID**
    Specify the Group ID from the Data Aggregator.
- **getDataAggregators-**
  See a list of Data Aggregators and their details including hostname, IP address, and status.**Example:** *http://da_host:8581/odata/api/getDataAggregators*
- **getResultLimiters**
  See a list of result limiters.**Example:** *http://da_host:8581/odata/api/getResultLimiters*

Configure OpenAPI Defaults and Limits

To perform operations that heavily affect the system during off-hours, override the QueryBuilder properties. You can override several parameters in the QueryBuilder. The default parameter values that are defined in the OData limiters configuration file protect the system from OpenAPI queries that negatively affect the overall system performance. These parameters either limit the returned set of results, or define the timeout threshold for potentially large operations. You can customize and override the default parameter values, which vary according to the scale and capability of the system.

Override an OpenAPI Parameter

To override a parameter, append the following code to the OpenAPI URL:

```
&<Override_parameter>=<override_value>
```

For example, to override the number of rows that are returned for a device query, use the following URL:

```
http://da_host:8581/odata/api/devices?$expand=cpumfs&$select=Name,PrimaryIPAddress,cpumfs/
im_MemoryUtilization,cpumfs/im_Utilization
&$top=200
```

The following parameters can be overridden:

Parameter	Default Value	Override	Description
`defaultTopLimit`	50	$top	Number of rows to return
`defaultExpandTopLimit`	100	top	Custom parameter for number of expanded rows to return
`defaultQueryTimeoutSecs`	30 (sec)	timeout	Custom parameter for overall time query can execute before timeout exception

Configure Web Service Parameter

The OpenAPI web service parameters limit concurrent use and limit the processing time for requests beyond that limit.

To override a web service parameter, edit the value in the following configuration file:
/opt/IMDataAggregator/apache-karaf-<vers>/etc/com.ca.im.odata.filters.OpenAPIRequestLimiterFilter.cfg

You can override the following web service parameters.

- **maxRequests**Number of simultaneous OpenAPI requests. Other requests are suspended until one of the current queries finishes.**Default:** 4
- **suspendMs**The length of time, in milliseconds, that each additional request is suspended when the OpenAPI reaches the maximum number of simultaneous requests. For example, specifying 20000 suspends the request for 20 seconds, after which time the request is rejected. A rejected request generates the 503 Unavailable error, and the OpenAPI does not run the query again automatically.**Default:** -1 (Use the value of defaultQueryTimeoutSecs)
- **waitMS**The length of time, in milliseconds, to wait before trying to accept a new request. This parameter is used when the **maxRequests** limit is reached. We recommend setting this parameter to the same value as `defaultQueryTimeoutSecs` in the following file:/opt/IMDataAggregator/apache-karaf-<*vers*>/etc/com.ca.im.odata.beans.ODataLimiters.cfg

Configure Maximum Results

To modify the defaults or increase the limit, configure the values for the number of rows that OpenAPI queries return.

Follow these steps:

1. Log on to the Data Aggregator host.
2. Locate and edit the following file:
   `/opt/IMDataAggregator/apache-karaf-<vers>/etc/com.ca.im.odata.beans.ODataLimiters.cfg`
3. Modify the file to set the limits and defaults. The following example shows the default values for this file. The bold attributes control the limits and defaults:

```
defaultTopLimit=50

defaultExpandTopLimit=100

maxTopLimit=20000
```

```
maxSubQueryLimit=2000000

defaultRateTimeIntervalSecs=3600

defaultHourlyTimeIntervalHours=168

defaultDailyTimeIntervalDays=30

defaultWeeklyTimeIntervalWeeks=52

defaultQueryTimeoutSecs=30

maxQueryTimeoutSecs=120
```

- **defaultTopLimit**
  Defines the default value for the maximum number of rows in the output.
  Default: 50
- **defaultExpandTopLimit**Defines the default value for the maximum number of expanded rows in the output.
  Default: 100
- **maxTopLimit**Defines the limit for the value in the maximum number of rows in the output.
  Default: 20000
- **maxSubQueryLimit**
  Defines the maximum number of expanded rows that an OpenAPI query can return. In QueryBuilder, the limit for the maximum number of expanded rows is calculated by dividing this value by the specified value for the maximum number of rows.
  Default: 2000000
- **defaultRateTimeIntervalSecs**
  Defines the default value for the query time interval when the resolution equals rate. If the time interval is unspecified, the query time is for 3,600 seconds (one day).
  Default: 3600
- **defaultHourlyTimeIntervalHours**
  Defines the default value for the query time interval when the resolution equals hour. If the time interval is unspecified, the query time is for 168 hours (7 days).
  Default: 168
- **defaultDailyTimeIntervalDays**
  Defines the default value for the query time interval when the resolution equals day. If the time interval is unspecified, the query time is for 30 days.
  Default: 30
- **defaultWeeklyTimeIntervalWeeks**
  Defines the default value for the query time interval when the resolution equals week. If the time interval is unspecified, the query time is for 52 weeks.
  Default: 52
- **defaultQueryTimeoutSecs**
  Defines the standard timeout for all queries.

Default: 30

- **maxQueryTimeoutSecs**
  Defines the maximum timeout, which can be specified in the URL with the `timeout` parameter.
  Default: 120

4. Save the changes.
   The new values apply when you load or reload QueryBuilder in the browser.

OpenAPI Apps

OpenAPI apps use the flexibility of OpenAPI queries to deliver and present data in a highly customizable way. OpenAPI apps allow custom content to be served to OpenAPI app views on dashboards and context pages. You can build your own apps or you can select from various available apps. You can then deploy and display these apps in NetOps Portal.

The following video demonstrates how to download, deploy, and add OpenAPI apps to NetOps Portal:

OpenAPI App Development

OpenAPI apps are made up of HTML, JavaScript, CSS, and metadata contained in a zip file. Generally, apps use NetOps Portal web services and OpenAPI.

The following process guides you through the OpenAPI app development and testing process:

1. If one exists, find a similar OpenAPI app to use as the basis for your new app.
2. Set up a local folder to house the files for the app. Use a single directory that contains all the required directories and files for the app.
3. Create the appConfig.properties file. This properties file is required for deployment in NetOps Portal and for the App View. See the following documentation for information about the contents of this file.

   NOTE

   The appConfig.properties file must reside in the top-level single directory referenced in the previous step.
4. Use OpenAPI QueryBuilder to create sample odata queries for your app. Save the output from these queries as to a static file. Start developing your code with the static data.
   After development, static data is useful for debugging to ensure that your parsing code works correctly.
5. Build a demo page. Ensure that the page can load the static data. Also, ensure it can save the data to a variable attached to the window object. To enable browser debugging tools, add the debugger statement in the JavaScript code.
   The demo page lets you use a browser debugging tool. Use the tool to look at the data that came over, and verify that part of the app worked.
6. Start parsing parameters.
   Include the URL you used to get the original data, and use a parameter to switch into debug mode. Use parameters from the URL to the build OpenAPI query. Use the console.log function to log any URL to the console, such as console.log("url: " + url).
7. Pick the JavaScript libraries that you want to use for your app.
   Look at existing apps for examples and copy the libraries into your app folder. Remove unnecessary files.
8. Start writing the app.
   - If the data includes multiple items, start with one item first.
   - At this stage, do not focus on the app appearance. However, *do* include CSS classes in the resulting HTML to make it easier.
   - Put all your labels in a single place in your code, in case you localize the app.
9. When you have something working, deploy the app to your NetOps Portal test system. Verify that it works on a remote server. If you refactor your code to get it to work remotely, there is less code to refactor at this stage.

10. Zip the app folder, including the properties file and deploy the app through the UI.
11. To test the app in the UI, create a dashboard, and add two App Views to the dashboard.
    Edit one of the App Views, and select your app from the drop-down list. If the app does not appear in the drop-down list, something in the appConfig.properties file is incorrect.
    Once the app appears in the first view, edit the other App View and add the same app. This test ensures that the app can support multiple instances on a single page.
12. Continue to work locally, and periodically redeploy the app to the test system.
    If you update the URL in the metadata, edit the App View. Reselect the app to get the updated URL.
13. Use a more restricted user account on Performance Create to verify that the app still works correctly.
    If your app is context or time range aware, change the associated controls and verify that your app responds correctly.
14. If appropriate, use the redirector to add context page links to your app. The redirector makes the app feel like a native part of the system.
15. When the app is complete, consider contributing your app to the GitHub repository for others.
    Before you add the app to the repository, remove any personal information.

appConfig.properties

Use the following format for the appConfig.properties file:

```
   appName=App Name
description=Optional app description
url=Required_URL_parameters
height=height in pixels  supportedContext=context_code
```

- **appName**A unique name for the app
- (Optional) **description**
  A description that appears in the App View when you select the app
- **url**
  The app URL and URL parameters
  For information about URL parameters in NetOps Portal, see Browser Views.
- (Optional) **height** The height of the app view in pixels **Default:** 250
- (Optional) **supportedContext**
  The context where the app appears in the app view. You can use this parameter to restrict the available apps to specific contexts. For example, if you specify only value **i**, the app is available only in app views on interface context pages and the app is unavailable at the dashboard level.
  Values:
  - **d**
    Device
  - **i**
    Interface
  - **s**
    Server
  - **r**
    Router
  - **g**
    Group
  - **nc**
    None, appears in all contexts

  Default: nc
  To designate multiple contexts, separate the values with a comma.

Example:

```
  appName=Percentile Trend App
description=This is a Percentile Trend App
url=index.html?
id={ItemIdDA}&startTime={TimeStartUTC}&endTime={TimeEndUTC}&metric=im_UtilizationIn
height=750 supportedContext=i,d
```

App Development Best Practices

Use the following best practices for developing OpenAPI apps:

- Do not use externally sourced JavaScript libraries. If you need libraries for your app, include the library in the app folder. Also include any files that describe the license terms of the library.
- Do no use any NetOps Portal JavaScript, CSS, or images. When these entities are updated, that app could break.
- Test the app to verify that it works at scale and with different configurations. Many apps depend on system resources, such as web services. Verify that the app is not generating unnecessary load.
- Build test modes into the app to help debug problems. Add an optional parameter that switches the app from using a web service API to a canned set of data included in the app.
- If you distribute the app to other users, verify that no private information is included. Sanitize the static data files that are included for debugging.
- Use relative paths and never include the full URL. If the system is behind a firewall, or changes DNS names, using full URLs breaks the app. Using relative paths helps the transition between working locally and then deploying the app.
- Verify that the app works in an iframe. Both the Browser View and App View use iframes to isolate the apps from the rest of the page.
- The OpenAPI uses Data Aggregator item IDs. NetOps Portal IDs are not recognized. Use the Data Sources web services to convert between the Data Aggregator item ID and the NetOps Portal ID. For more information, see Data Sources Web Service.
- To access OpenAPI data, the request must come from an app on the NetOps Portal host. The app deployment places the app folder on the NetOps Portal host.
- For direct oData queries in the apps, use the relative path for the NetOps Portal system to use the OpenAPI proxy: `/pc/odata/api/...`

Download an App

Various apps are available on GitHub. These applications are supported through GitHub open-source collaboration:

```
Copyright (c) 2018 CA Technologies
The MIT License
Permission is hereby granted, free of charge, to any person obtaining a copy of this
software and associated documentation files (the "Software"), to deal in the Software
without restriction, including without limitation the rights to use, copy, modify,
merge, publish, distribute, sublicense, and/or sell copies of the Software, and to
permit persons to whom the Software is furnished to do so, subject to the following
conditions:
The above copyright notice and this permission notice shall be included in all copies
or substantial portions of the Software.
THE SOFTWARE IS PROVIDED "AS IS", WITHOUT WARRANTY OF ANY KIND, EXPRESS OR
IMPLIED, INCLUDING BUT NOT LIMITED TO THE WARRANTIES OF MERCHANTABILITY,
FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT. IN NO EVENT SHALL THE
```

```
AUTHORS OR COPYRIGHT HOLDERS BE LIABLE FOR ANY CLAIM, DAMAGES OR OTHER
LIABILITY, WHETHER IN AN ACTION OF CONTRACT, TORT OR OTHERWISE, ARISING FROM,
OUT OF OR IN CONNECTION WITH THE SOFTWARE OR THE USE OR OTHER DEALINGS IN
THE SOFTWARE.
```

Follow the steps:

1. Go to https://github.com/CA-PM.
   A list of available apps with descriptions appear.
2. Click the app that you want.
   The contents of the app, a sample visualization, and readme instructions appear.
3. Click **Clone or download** and **Download ZIP**.
4. Save the files to your preferred directory.

Deploy an App

To deploy OpenAPI apps, load the app through NetOps Portal. You can deploy apps while the system is running. App deployment does not require a restart. For successful deployment, the app must meet the following requirements:

- The app files are contained in a single folder.
- The folder includes the appConfig.properties file.
- The app folder is zipped in a ZIP file.
- The maximum ZIP filesize is 100 MB.

This procedure requires the Administrator role.

Follow the steps:

1. Hover over **Administration**, and click **Configuration Settings: App Deployment**.
2. Click **Browse**, and select a zipped app.
3. Click **Add**.
   The app is copied to the user app directory. Use the App Viewer to show the app in NetOps Portal.

Display an App in NetOps Portal

Use the app view in NetOps Portal to display an app.

> **NOTE**
>
> PDF and CSV printing and emailing options are unsupported for app views.

Follow the steps:

1. Add or edit a dashboard or page for the intended item context.
2. Add an app view for the app.
3. Select the app for the view.
4. Update the parameters and height as desired.
5. Click **Save**.

Audit OpenAPI Usage

To track the performance of the OpenAPI QueryBuilder, see the usage statistics. To view the usage statistics of the OpenAPI QueryBuilder, review the OpenAPI log file or create an OpenAPI query. Auditing OpenAPI usage helps to diagnose system performance issues.

OpenAPI Usage Log File

The log file provides detailed information about each query that is executed, and whether the query succeeded or failed. Each entry for a single query in the log file documents the start and end of the request. The log file is located in the following directory:
`/opt/IMDataAggregator/apache-karaf-<vers>/data/log/odata-services.impl.log`

The following query details are documented in the log file:

- Host that made the API call
- Tenant
- User
- URL
- Length of time of the request

Example

The following entry is an example of a successful query request:

```
INFO  | qtp1695827227-67 | 2015-06-01 12:17:55,207 | ODataRequestProcessor |
 odata.impl.ODataRequestProcessor  910 || Start request (Thread id 67): host:
 '10.42.200.100' tenant: 'Default Tenant' user: 'admin' url: 'http://da.ca.com:8581/
odata/api/components?$expand=device&$select=ID,Name,device/ID,device/Name&$format=json&
$top=20000' - Run budget 30000 ms (30 seconds).

INFO  | qtp1695827227-67 | 2015-06-01 12:17:55,482 | ODataRequestProcessor |
 odata.impl.ODataRequestProcessor  948 || Done request (Thread id 67): host:
 '10.42.200.100' tenant: 'Default Tenant' user: 'admin' url: 'http://da.ca.com:8581/
odata/api/components?$expand=device&$select=ID,Name,device/ID,device/Name&$format=json&
$top=20000' - Execution time 273 ms.
```

The following entry is an example of a failed query request:

```
INFO  | p1695827227-1474 | 2015-06-01 12:33:30,892 | ODataRequestProcessor |
 odata.impl.ODataRequestProcessor  910 || Start request (Thread id 1474): host:
 '10.42.200.100' tenant: 'Default Tenant' user: 'admin' url: 'http://da.ca.com:8581/
odata/api/components?$expand=device&$select=ID,Name,device/ID,device/Name&$format=json&
$top=500000' - Run budget 30000 ms (30 seconds).

ERROR | p1695827227-1474 | 2015-06-01 12:33:30,894 | ODataRequestProcessor |
 odata.impl.ODataRequestProcessor 1047 || Failed to complete request (Thread id
 1474): host: '10.42.200.100' tenant: 'Default Tenant' user: 'admin' url: 'http://
da.ca.com:8581/odata/api/components?$expand=device&$select=ID,Name,device/ID,device/
Name&$format=json&$top=500000' - Execution time 0 ms. Error: The top value must be in
 the range (0 .. 20000).
```

Track OpenAPI Usage

Run an OpenAPI query to track the overall OpenAPI usage. This query can show you the number of queries during a specific time period or the average processing time. The following statistics are available:

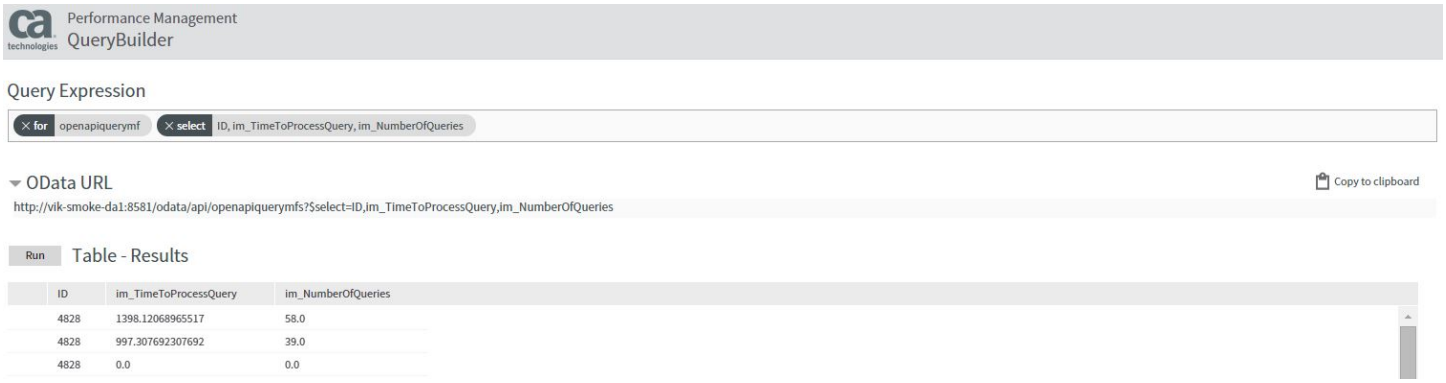
- **Number of Queries**
  The number of queries that occurred since the last read
- **Number of Successful Queries**
  The number of successful queries that occurred since the last read
- **Number of Failed Queries**
  The number of failed queries that occurred since the last read
- **Time to Process Queries**
  The average time to process queries

  NOTE

  This data is collected every 5 minutes.

Follow these steps:

1. Select **Click to start query** in the Query Expression field.
2. Select **metric family, openapiquerymf** from the Query Expression field.
3. Select **select** from the Query expression field.
4. Select the statistics that you want to view. For example, select the following metrics:
   – ID
   – im_TimeToProcessQuery
   – im_NumberOfQueries
5. Click **Run**.
   The OpenAPI usage statistics appear, as shown in the following example:



Product Accessibility Features

CA Technologies is committed to making sure that all customers, regardless of ability, can successfully use its products and supporting documentation to accomplish vital business tasks. This section outlines the accessibility features of DX NetOps Performance Management.

NOTE
If you use a screen reader, we recommend using a browser other than Internet Explorer to access our product. For more information about known screen reader limitations, see Known Limitations.

Product Enhancements

DX NetOps Performance Management offers accessibility enhancements in the following areas:

- Display
- Sound
- Keyboard
- Mouse

> **NOTE**
>
> The following information applies to Windows-based and Macintosh-based applications. Java applications run on many host operating systems, some of which already have assistive technologies available to them. For these existing assistive technologies to provide access to programs written in JPL, they need a bridge between themselves in their native environments and the Java Accessibility support that is available from within the Java virtual machine (or Java VM). This bridge has one end in the Java VM and the other on the native platform, so it will be slightly different for each platform it bridges to. Sun is currently developing both the JPL and the Win32 sides of this bridge.

Display

To increase visibility on your computer display, you can adjust the following options:

- **Font style, color, and size of items**

Defines font color, size, and other visual combinations.

- **Screen resolution**

Defines the pixel count to enlarge objects on the screen.

- **Cursor width and blink rate**

Defines the cursor width or blink rate, which makes the cursor easier to find or minimize its blinking.

- **Icon size**

Defines the size of icons. You can make icons larger for visibility or smaller for increased screen space.

- **High contrast schemes**

Defines color combinations. You can select colors that are easier to see.

Sound

Use sound as a visual alternative or to make computer sounds easier to hear or distinguish by adjusting the following options:

- **Volume**

Sets the computer sound up or down.

- **Text-to-Speech**

Sets the computer's hear command options and text read aloud.

- **Warnings**

Defines visual warnings.

- **Notices**

Defines the aural or visual cues when accessibility features are turned on or off.

- **Schemes**

Associates computer sounds with specific system events.

- **Captions**

Displays captions for speech and sounds.

Keyboard

You can make the following keyboard adjustments:

- **Repeat Rate**

Defines how quickly a character repeats when a key is struck.

- **Tones**

Defines tones when pressing certain keys.

- **Sticky Keys**

Defines the modifier key, such as Shift, Ctrl, Alt, or the Windows Logo key, for shortcut key combinations. Sticky keys remain active until another key is pressed.

Mouse

You can use the following options to make your mouse faster and easier to use:

- **Click Speed**

Defines how fast to click the mouse button to make a selection.

- **Click Lock**

Sets the mouse to highlight or drag without holding down the mouse button.

- **Reverse Action**

Sets the reverse function controlled by the left and right mouse keys.

- **Blink Rate**

Defines how fast the cursor blinks or if it blinks at all.

- **Pointer Options**

Let you do the following:

- – Hide the pointer while typing
  – Show the location of the pointer
  – Set the speed that the pointer moves on the screen
  – Choose the pointer's size and color for increased visibility
  – Move the pointer to a default location in a dialog box

Keyboard Shortcuts

The following table lists the keyboard shortcuts that *DX NetOps Performance Management* supports:

Keyboard	Description
Ctrl+X	Cut
Ctrl+C	Copy

Ctrl+K	Find Next
Ctrl+F	Find and Replace
Ctrl+V	Paste
Ctrl+S	Save
Ctrl+Shift+S	Save All
Ctrl+D	Delete Line
Ctrl+Right	Next Word
Ctrl+Down	Scroll Line Down
End	Line End

Keyboard Navigation

Keyboard	Description
Tab	• Advance the focus to the next field or control in the page.
Shift+Tab	• Move the focus to the previous field or control in the page.
Enter	• Activate the control that has focus (for example, click a button).
Shift+Enter	• Make a selection in a menu or tree.
Space	• Change selection of a checkbox that has focus.
Down Arrow	• Move the focus into a menu or into a tree. • Move the focus to the next item in a menu, tree, radio-button group, or chart.
Up Arrow	• Move the focus to the previous item in a menu, tree, or radio-button group, or chart.
Left Arrow	• Open a closed item in a menu or tree. • Move to the next element of a radio button group and select it.
Right Arrow	• Close an open item in a menu or tree. • Move to the previous element of a radio button group and select it.
Esc	• Close an open menu or dialog box.
Ctrl+Left Arrow	• When the focus is on a grid column header, make the column narrower.
Ctrl+Right Arrow	• When the focus is on a grid column header, make the column wider.
Ctrl+Up Arrow	• When the focus is on a grid column header, move the column to the left.
Ctrl+Down Arrow	• When the focus is on a grid column header, move the column to the right.

Product References and Abbreviations

List only CA product names with a shortened version (such as "CA Service Operations Insight (CA SOI)") and abbreviations/acronyms (such as "virtual machine (VM)") that you use in your wiki space. Sort the list alphabetically. Place this page at the bottom of your TOC so that it appears just above the Announcements & News link.

This documentation references the following products and abbreviations:

- CA Application Delivery Analysis (CA ADA)
- CA eHealth®
- CA Mediation Manager (CAMM)
- CA Network Flow Analysis
- DX NetOps Performance Management (CA PM)
- CA Single Sign-On
- CA Spectrum®
- CA Unified Communications Monitor (CA UCM)
- CA Virtual Network Assurance (CA VNA)

Documentation Legal Notice

Modern Network Monitoring

DX NetOps Virtual Network Assurance enables existing infrastructure management solutions to monitor software-defined networking (SDN) and network functions virtualization (NFV).

This section contains everything you need for modern network monitoring from getting started to troubleshooting information.

Getting Started

DX NetOps Virtual Network Assurance enables existing infrastructure management solutions to monitor software-defined networking (SDN) and network functions virtualization (NFV).

Key Features

DX NetOps Virtual Network Assurance reduces the challenge and risk of SDN/NFV deployments by providing extended visibility and sustained reliability for self-service, automated networks. DX NetOps Virtual Network Assurance provides the following functionality as part of the CA performance monitoring solution:

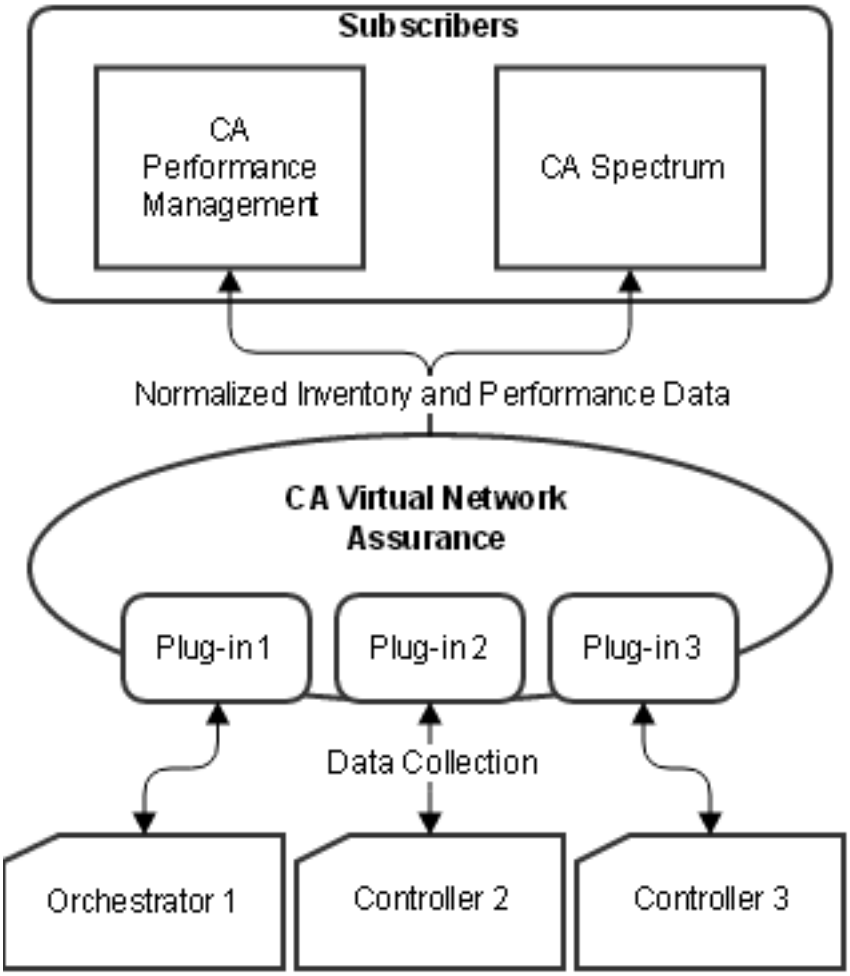
- **SDN/NFV Stack Correlation**
  Shows and monitors all the physical and virtual layers of the stack that supports virtual network functions (VNFs).
- **Service Chain Visibility**
  Provides insight into the building blocks that form service chains.
- **Multi-vendor Protocol and Platform Coverage**
  Supports for SDN controllers, orchestrators, OpenStack, and vendor agents including on-demand certification.
- **Integrated Metrics**
  Enables SDN/NFV monitoring and analytics with traditional SNMP monitoring and analytics.

Architecture

DX NetOps Virtual Network Assurance collects data from SDN/NFV controllers and orchestrators and provides that data to subscribers. Each orchestrator or controller requires a plug-in to configure the connection. DX NetOps Virtual Network Assurance normalizes the collected data and sends updates to subscribers that consume the data.

The following diagram shows this relationship:

Figure 70: Data Collection with CA Virtual Network Assurance



SDN/NFV Assurance in the Application Economy

The following video explains the necessity of SDN/NFV in the application economy:

Release Notes

This release includes the following new features and enhancements:

For the complete CA Performance Management and CA Virtual Network Assurance fixed issues list, see the CA Performance Management documentation.

New Features in the Current Release

New Plug-ins

The following plug-ins are newly supported:

- 128T SD-WAN
- Broadcom BroadView
- Broadcom Mirror on Drop (20.2.3 and Higher Only)
- Silver Peak

Poll Time Configuration

The default timeout value for a poll in the engine of any plug-in is 30 minutes. If a poll requires more than the default value, you can configure the `sdn_poll_timeout_minutes` parameter in the `/etc/VNA.cfg` file. The unit for the parameter value is minutes. After you update this parameter, you must restartDX NetOps Virtual Network Assurance.

Enhancements in Current Release

Cisco Meraki Plug-In (20.2.2 and Higher Only)

You can now configure whether to enable REST API or SYSLOG events along with a notification poll rate and delta time.

The following performance metrics are now available for Access Points:

- Authentication Failures
- Association Failures
- Successful Authentications
- Successful Associations
- Successful DHCP
- Successful DNS
- Successful Connections

For more information, see Cisco Meraki.

Secure Authentication for the VNA Console (20.2.4 or higher only)

The VNA console is now secured with authentication and requires credentials to log in. You can set credentials during a fresh DX NetOps Virtual Network Assurance installation or upgrade. The default user name is "admin".

VMware vSphere Plug-In (20.2.2 and Higher Only)

You can now configure whether to enable performance metrics for DVS ports.

For more information, see VMware vSphere.

Cisco ACI Plug-In

You can now configure either a whitelist or blacklist filter, but not both at the same time. Use the new `filterType` configuration option to configure blacklist or whitelist filters. If this option is unspecified, the filter defaults to a whitelist filter.

You can now configure whether fault or event subscription is enabled.

The Cisco ACI plug-in now includes a new configuration parameter for historical events. You can also configure faults and filters.

You can now configure an `INVENTORY_ENABLE_ENDPOINTS` parameter. If the property is set to No or false, DX NetOps Virtual Network Assurance does not poll for endpoint inventory. If the property is set to Yes or true, DX NetOps Virtual Network Assurance polls for endpoints inventory.

During the upgrade from DX NetOps Virtual Network Assurance 3.7.x to 20.2, the installer prompts the new configuration parameter with the default value (Yes).

For more information, see Cisco ACI.

Cisco Meraki Plug-In

You can now specify whether to enable SSID or policy polling. For more information, see Cisco Meraki.

Nuage Plug-In

You can now specify a notification poll rate, notification delta time, and a time zone. For more information, see Nuage.

Versa SD-WAN Plug-in

You can now configure the number of threads required to run the Inventory poll, the Performance and Availability poll, and the Notification poll.

Tunnels between branches and between branches and controllers are now supported.

You can now specify the out of band management IP address for appliances in multiple ways.

If the default out of band management IP address does not work for you, and if the appliance IP addresses are also the out of band management IP address for the appliances in your environment, then setting the `SET_APPLIANCE_IP_AS_OOBM_IP` flag to "true" forces the Versa plug-in to set the appliance IP address as the out of band management IP address for the discovered appliances.

Otherwise, use the `OOBM_INTERFACE_NAME` parameter to specify a name for the interface that is used as the management interface for your appliances (for example, "eth-0/0").

You can now configure whether to use the `ip-address` field value of the Versa device as the out of band management IP address of the device. For more information, see Versa SD-WAN.

Viptela Plug-in

The Viptela plug-in now collects the following metrics for tunnels:

- Time in Up State
- Time in Down State
- Time in Unknown State
- Pct Time in Up State
- Pct Time in Down State
- Pct Time in Unknown State
- Bytes In (Gauge)
- Bytes Out (Gauge
- Packets In (Gauge)
- Packets Out (Gauge)

This release supports Viptela 19.x.

For more information, see Viptela.

VMware vSphere

You can now specify the number of threads required to run the performance poll. For more information, see VMware vSphere.

DX NetOps Virtual Network Assurance Aggregation Server

Full synchronization fails when partial updates are high in volume. As a result, alarms are missing in DX NetOps Spectrum. This release introduces enhancements to the DX NetOps Virtual Network Assurance Aggregation server. You can now use a new configuration option to specify the queue size. The new configuration parameter is `sdn_client_queue_size` in `/etc/VNA.cfg`.

Example:

```
ca.root=/opt/CA
vna_db_name=vna_lvnqa004994
container_install=0
sdn_client_queue_size=1000
mysql_host=localhost
mysql_port=3306
```

Third-Party Software Acknowledgements

All third-party software has been used in accordance with the terms and conditions for use, reproduction, and distribution as defined by the applicable license agreements. The following file contains the license agreements: TPSAs

The file contains the following license agreements:

- aws-java-sdk 1.11.429
- bc-fips 1.0.1
- Camel 2.16.1
- cdi-api.2.0
- cglib.3.2.12
- cglib-nodep 3.2.12
- commons-beanutils 1.9.3
- Commons Cli 1.4
- Commons Collections 4.4.0
- Commons Logging 1.2
- Commons net 3.6
- commons-compress 1.18
- Commons IO 2.6
- Commons Lang 2.6
- Commons Lang 3.3.9
- dom4j 1.6.1
- Ganymed SSH-2 Build 262
- gpars 1.2.1
- Groovy 2.5.7
- Guava 28.0-jre
- Hibernate Validator 6.0.17.Final
- hibernate_core 5.3.10.Final
- HttpComponent 4.5.9
- jackson-databind 2.9.9.1
- javaee-pi.8.0.1
- Jaxen 1.1 B8
- Jaxrs-api 3.0.12
- JBoss RESTEasy 3.8.0 Final
- jgrapht 1.3.1
- Joda-time 2.10.3
- json-lib 2.4
- json-path 2.4.0
- kryo 4.0.2
- kryo-seriallizers 0.45
- liquibase 3.8.0
- mvel 2.4.0 Final
- MySQL 8.0.12
- ovsdb 1.2.1
- Saxon-B 9.1.0.8
- ServingXML 1.1.2
- slf4j 1.7.26
- swagger-core 1.5.22
- Syslog4j 0.9.46
- trimou 2.5.0 Final
- TrueZIP 6.6
- Tyrus 1.15
- VMware VI (vSphere) Java API 5.5
- WildFly 17.0.1.
- xercesImpl 2.6.2
- xml-apis 1.0.b.2
- xnio-nio 3.6.5 Final
- yamlbeans 1.13

Plug-in Compatibility

DX NetOps Virtual Network Assurance collects performance data for virtual networks. To enable data collection, configure the plug-in for each technology in your environment

The following table contains the supported plug-ins:

Table 2: Supported Plug-ins

Technology	Versions
128T SD-WAN	• 128T SD-WAN 4.1.1 SNMP support is not available in 4.1.1.
Amazon Web Services (AWS)	• Cloud
Broadcom BroadView	• SONiC BUZZNIK
Cisco ACI	• Cisco ACI 4.2.4 • Cisco ACI 4.0 • Cisco ACI 3.2 • Cisco ACI 2.0
Cisco Meraki	• Cloud
Nuage	• Nuage 4.0.0 R3
OpenContrail	• 2.20 • 2.21
OpenDaylight	• Nitrogen
OpenStack	• Juno • Kilo • Liberty • Mitaka • Newton • Ocata • Pike
Open vSwitch	• 2.8.2
Silver Peak	• Unity Orchestrator 8.6.1.40151
Versa SD_WAN	• Versa SD-WAN 16.1R2 **Note:** Only the Versa SD-WAN 16.1R2 version supports out-of-band IP management for the branches that this plugin discovers. Without this IP management, DX NetOps Spectrum cannot automatically poll the branches using SNMP. • Versa SD-WAN 16.1R1
Viptela	• Viptela 20.1.1 • Viptela 19.x. • Viptela 18.4 • Viptela 18.3 • Viptela 17.2.0 • Viptela 17.1.0
VMware vSphere	• VMware vSphere 6.0. • VMware vSphere 6.5.

Installing

Ensure someone with the appropriate level of familiarity with your network deploys and configures DX NetOps Virtual Network Assurance.

Contents:

DX NetOps Virtual Network Assurance Compatibility

DX NetOps Virtual Network Assurance is compatible with the following product versions:

- DX NetOps Performance Management 20.2
  For DX NetOps Performance Management installation information, see the DX NetOps Performance Management documentation.
- DX NetOps Spectrum 10.4.2
  For DX NetOps Spectrum installation information, see the DX NetOps Spectrum documentation.
- Network Flow Analysis 10.0.4
  For Network Flow Analysis installation information, see Network Flow Analysis documentation.

For more information about supported releases, see the DX NetOps Interoperability.

Verify the Requirements of Your Technologies

Verify the requirements of each technology in your virtual network environment:

> **TIP**
>
> We recommend, but do not require, a single DX NetOps Virtual Network Assurance (CA VNA) per data center or technology grouping in your virtual network environment. For example, you can have OpenStack, Open vSwitch, and Cisco ACI on the same instance of VNA.
>
> You can have multiple plug-ins of the same technology type on a single instance of CA VNA.

- 128T SD-WAN
- Amazon Web Services (AWS)
- Broadcom BroadView
- Cisco ACI
- Cisco Meraki
- Nuage
- OpenContrail
- OpenDaylight
- OpenStack
- Open vSwitch
- Poll Rate Configuration
- Silver Peak
- Versa SD-WAN
- Viptela
- VMware vSphere

Ensure that you install the product as the root user.

Prepare to Install DX NetOps Virtual Network Assurance

Before you install DX NetOps Virtual Network Assurance, verify that your system meets the requirements.

Follow these steps:

1. Verify that the DX NetOps Virtual Network Assurance host meets the system requirements:
   - **Memory:** 12 GB
   - **CPU:** 4vCPU
   - **Disk:** 20 GB
   - **Operating System:** RHEL/CentOS 6.5 through 7.x
   - **Packages:** `libaio`
2. **(Scaled-Environment Only)** Verify that the DX NetOps Virtual Network Assurance host meets the heap size requirements:
   - **Heap Memory:** 16 GB
   - **CPU:** 8vCPU
   - **Disk:** SSD recommended 120 GB
3. Install Oracle or any OpenJDK 64-bit Java 8 as the default JDK.

   NOTE

   DX NetOps Virtual Network Assurance does not run on IBM SDK Java and any JRE. Only JDKs are supported.

   IMPORTANT
   Use the `alternatives` tools to select the default JDK version of Java to use.
   For more information, see the Red Hat documentation.
   Alternatively, create a link in `/usr/bin/java` to the Java 8 JDK Java executable.
4. Verify that the system hostname resolves to an IP address in `/etc/hosts` .
5. Verify that the following ports are open on the DX NetOps Virtual Network Assurance host:
   - Verify any ports that are required for communication to the orchestrators and controllers.
   - Port 8080 is required for communication between DX NetOps Virtual Network Assurance and other CA products.
   - Port 9990 is the Wildfly management port.
6. Wildfly is installed as part of DX NetOps Virtual Network Assurance. Verify that no other versions of Wildfly are installed on the host system. Do not install DX NetOps Virtual Network Assurance on a system with another application that uses Wildfly.

Install DX NetOps Virtual Network Assurance

To set up your system, install DX NetOps Spectrum. The script creates the wildfly user and the mysql user.

Follow these steps:

1. Copy the installation files to the host server.
2. Open a command line and run the following command:
   `./CA_VNA-`*`version`*`-Linux.txe`

   NOTE

   To avoid prompts and use the default values, add the following parameter to the install command: `--no-prompt`
3. Accept the EULA.
4. Follow the instructions in the console.
   The prompts have the following default values:
   - Installation directory = /opt/CA
     You can install CA VNA on a custom directory.
   - Default user domain = Default Domain

For more information about user domains, see Manage Domain Groups.
- Wildfly admin password = admin
- Wildfly JMS password = app
- Configure APM = N
- MySQL server port = 3306
- MySQL root user password = admin

5. (Optional) To configure a CA Application Performance Management (CA APM) agent during installation, provide the CA APM host and port.
   To configure the agent after installation, see Monitor CA Virtual Network Assurance Broker Performance.
   The script installs DX NetOps Virtual Network Assurance.

Install Logs

After successful installation, you can find the installation log `CA_Virtual_Network_Assurance_install_dd_mm_yyyy_hh_mm_ss.log` in the `$CA_VNA_ROOT/VNA/logs` directory.

In case the installation fails or you stop the installation abruptly , the logs are saved to the directory where you have the CA VNA installer. You can find the log with name

```
CA_Virtual_Network_Assurance_install_dd_mm_yyyy_hh_mm_ss.log
```

Configure the Limit on the Number of Open Files

Configure the limit on the number of open files. Verify that the `wildfly` user has a limit of at least 65536 on the number of open files. Set this value permanently.

Follow these steps:

1. Log in as the `wildfly` user on the VNA host.
2. Change the `ulimit` for the open files limit to at least 65536:
   ```
   ulimit -n ulimit_number
   ```
   Example:
   ```
   ulimit -n 65536
   ```
3. Open the following file:
   `/etc/security/limits.conf`
4. Add the following lines:
   ```
   # Added by VNA
   * soft nofile 65536
   # Added by VNA
   * hard nofile 65536
   ```

   NOTE

   Restart VNA for these changes to take effect. If you are upgrading, the upgrade process automatically restarts VNA.
5. Verify that the number of open files is set properly:
   ```
   ulimit -n
   ```
   The command returns the limit that you specified earlier.

Configure the Plug-ins

CA Virtual Network Assurance collects performance data for virtual networks. To enable data collection, configure the plug-in for each technology in your environment. For more information, see Building.

Uninstall

To remove DX NetOps Virtual Network Assurance from your system, run the uninstaller.

Follow these steps:

1. Log in to the DX NetOps Virtual Network Assurance host as 'root', or use the 'sudo' account that you configured for the installation.
2. Uninstall DX NetOps Virtual Network Assurance using the following command:

```
/opt/CA/VNA/tools/bin/uninstall_vna.sh
```

3. Confirm the uninstall.

Upgrading

If you have DX NetOps Performance Management, to upgrade DX NetOps Virtual Network Assurance, use the following upgrade path. If you have DX NetOps Spectrum, see the documentation.

> **NOTE**
> If you have the Cisco ACI plug-in configured, when you upgrade to 3.7.8 and higher, all the previously set values for fault-codes, fault-types, and fault-severities are cleared. All the faults are whitelisted and saved in the database. To prevent this, stop the Wildfly service within 5 minutes of the upgrade and configure the filters as needed.

Verify the Prerequisites

Verify the following prerequisites before you upgrade DX NetOps Virtual Network Assurance:

- Verify whether the numactl package is installed on the DX NetOps Virtual Network Assurance host:

  ```
  rpm -qa | grep ^numactl
  ```

  If the required package is missing, install the package:

  > **NOTE**
  >
  > If you are not the root user, use the sudo prefix.

  ```
  yum -y install numactl
  ```

- Before you upgrade, back up the database. For more information, see Back Up and Restore CA Virtual Network Assurance.

Review Plug-in Configurations

During the DX NetOps Virtual Network Assurance upgrade, your plug-in inventory and configurations are maintained. You can query the following REST URL to review your plug-in configurations. For more information, see Building.

Follow these steps:

1. Query the following REST URL to find the engine ID:
   `http://VNA_host:8080/vna/rest/v1/admin/engines`
2. Query the following REST URL for your plug-in configuration:
   `http://VNA_host:8080/vna/rest/v1/admin/engines/Engine_ID/config`
3. Review the response.
   Example:

   ```
   {
   ```

```
    "AVAILABILITY_DELTA_TIME": "300",
    "AVAILABILITY_POLL_RATE": "0 */5 *",
    "DOMAIN_ID": "1",
    "INVENTORY_DELTA_TIME": "600",
    "INVENTORY_POLL_RATE": "0 */10 *",
    "PERFORMANCE_DELTA_TIME": "300",
    "PERFORMANCE_POLL_RATE": "0 */5 *",
    "PROTOCOL": "https",
    "VCENTER_IP": "10.241.16.37",
    "VCENTER_PASSWORD": "****",
    "VCENTER_USER_NAME": "vnaUser@vsphere.local"
}
```

NOTE

Passwords in the response is always encrypted.

Upgrade DX NetOps Virtual Network Assurance to a Custom Directory

From CA VNA 3.6.6, you can move existing CA VNA instance to a custom directory.

NOTE

Do not delete CA VNA server from Spectrum OneClick admin page or CA PC.

Migrate CA VNA and MySQL Data

When you upgrade to current version of CA VNA, you back up the CA VNA and MySQL data. You can import them post upgrade to the new installation location.

Follow these steps:

1. On the CA VNA server, copy the latest CA VNA 3.6.6 and higher version.
2. Stop WildFly using one of the following commands:

   ```
   service wildfly stop or systemctl stop wildfly
   ```

   Back up the Current CA VNA
3. To back up your current CA VNA instance, execute the following commands:

   ```
   mkdir -p /<backup_directory>/db
   mkdir -p /<backup_directory>/collector
   mkdir -p /<backup_directory>/data

   /opt/CA/VNA/tools/bin/db_backup.sh /<backup_directory>/db/vna_backup
   cp -r /opt/CA/VNA/data/* /<backup_directory>/data/
   cp -r /opt/CA/VNA/collector/* /<backup_directory>/collector/
   ```
4. Uninstall CA VNA using the `/opt/CA/VNA/tools/bin/uninstall_vna.sh` command.

Install CA VNA in new Location and Restore the Data

This section describes the steps to install the CA VNA on a custom directory and restore the old data from the `/opt/CA/VNA` .

Follow these steps:

1. Install CA VNA 3.6.6 or higher from the copied installer.

2. Enter a custom installation path.
   Follow the installation wizard and complete the installation.
3. After the installation, note the owner of `<new_vna_directory>/data` and `<new_vna_directory>/collector` directories.
   By default `wildfly` is the owner.
4. Note the owner & group of `<new_vna_directory>/data/ID_CACHE>dat` file.
   By default `wildfly:wildfly` is the owner and group name.
5. (Optional) For an Aggregator VNA, note the owner and group of `<new_vna_directory>/REMOTE_ID_CACHE.dat` file.
   By default `wildfly:wildfly` is the owner and group name.
6. Restore the database using the `/<new_install_directory>/VNA/tools/bin/db_restore.sh /<backup_directory>/db/vna_backup` command.
7. Stop the existing CA VNA instance using the, `service wildfly stop` or
   ```
   systemctl stop wildfly
   ```
   command.
8. Restore the files using the following commands:
   ```
   cp -r /<backup_directory>/data/* /root/CA/VNA/data/
   cp -r /<backup_directory>/collector/* /root/CA/VNA/collector/
   ```
9. Use
   ```
   chown
   ```
   command to restore the owner and group of restored data files.
10. Start CA VNA using the `service wildfly start` command.
11. Log in to CA VNA Swagger UI: http://*VNA_host*:8080/vna
12. Update the existing plug-in.

Upgrade DX NetOps Virtual Network Assurance on Existing Directory

Follow these steps:

1. In Performance Center, hover over **Administration**, and click **Monitored Items Management: VNA Gateways**.
2. Select the active VNA Gateway, and click **Edit**.
3. Set **Administrative Status** to **Down**, and click **Save**.
4. Upgrade DX NetOps Performance Management.
5. Install the new DX NetOps Virtual Network Assurance version. For more information, see Installing.
   The plug-in inventory and configurations are maintained.
6. Complete prompts for all new plug-in parameters.
7. Wait for a single polling cycle to complete.
8. In Performance Center, for the VNA Gateway, set **Administrative Status** to **Up**.

> **NOTE**
>
> You can find the installation log `CA_Virtual_Network_Assurance_install_dd_mm_yyyy_hh_mm_ss.log` in the `/opt/CA/VNA/logs` directory.

Building

DX NetOps Virtual Network Assurance collects performance data for virtual networks. To enable data collection, configure the plug-in for each technology in your environment.

The following video shows an example of plug-in configuration with the Cisco ACI plug-in:

Configure a Plug-in

For each technology in your environment, configure an instance of the plug-in. Ensure that the technology is set up correctly to enable data collection. For more information, see the relevant page for the specific plug-in.

Follow these steps:

1. Navigate to the DX NetOps Virtual Network Assurance API:
   `http://gateway_host:8080/vna/`
2. Expand **Admin**.
3. Select the following GET call, specify the **pluginName**, and click **Try it out!**
   `/v1/admin/plugins/{pluginName}/template`

   TIP

   To list all installed plug-ins, use the following GET call:

   `/v1/admin/plugins`
4. Copy the content of the template and complete the configuration details. For examples of the configuration JSON template, see the documentation for each plug-in.

   WARNING

   In the configuration JSON template, use the IP address to identify the technology. *Do not* use the hostname.
5. POST the configuration JSON template to the following endpoint:
   `/v1/admin/plugins/{pluginName}`

   NOTE

   To update the configuration an existing plug-in, PUT the updates to the following endpoint:

   `/v1/admin/plugins/{pluginName}`
6. Specify the **pluginName**, and write a meaningful description in **configDesc**. After you post the configuration JSON template, you cannot view the configuration details. The description is required to identify the configuration.
7. Update the required details in the JSON template, and click **Try it out!**
   DX NetOps Virtual Network Assurance uses the configuration details to connect to the technology and begin collecting performance and inventory data.

Verify Plug-in Status

To verify the status of a plug-in, change the engine status.

Follow these steps:

1. Get the **configId** value of the plug-in. Select the following GET call, specify the **pluginName**, and click **Try it out!**
   `/v1/admin/plugins/{pluginName}/configs`
2. From the response body, copy the **configId** value for the plug-in. To identify the plug-in, use the **configDesc**.
3. Select the following GET call, specify the **configId** value as the **engineid**, and click **Try it out!**
   `/v1/admin/engines/{engineid}`

   If the plug-in is operating correctly, the response body is **RUNNING**.

Upload a New Plug-in

For plug-ins that are delivered outside the release, upload the plug-in to the gateway before you configure the plug-in. The procedure requires CURL.

Follow these steps:

1. Download the new plug-in from CA Technologies and copy the plug-in to a system that has access to the gateway.
2. Upload the plug-in to the gateway:

   ```
   curl -X POST http://gateway_host:8080/vna/rest/v1/admin/plugins -H "Context-Type:
    application/octet-stream" -T new-plugin.jar
   ```

   – **new_plugin** is the name of the plug-in JAR file.

   The plug-in is uploaded to the gateway. To collect data, configure the plug-in.

   NOTE

   To revert a plug-in to an earlier version, add the following parameter to the URL:

   ```
   ?forceDowngrade=true
   ```

128T SD-WAN

Inventory and performance metrics from 128T SD-WAN support SD-WAN monitoring.

The plug-in collects inventory for the following items:

- Sites

  NOTE
  Sites from 128T SD-WAN map to the Site Groups in Performance Center. If desired, you can manage your site groups in Performance Center to update a site name.

- Routers

  NOTE
  Router inventory items are supported only for DX NetOps Performance Management
- Interfaces (Device Interfaces/Network Interfaces associated to Router)
- Tunnels (Connectivity between two Network Interfaces associated to Routers)
- Application/SLA Paths (SLA Class/Profile associated with Tunnels)
- Alarms (Related to Router)

  NOTE
  DX NetOps Spectrum consumes these alarms.

The plug-in collects the following performance metrics:

Table 3:

Item Types	VNA Metric Families and Metrics
Devices	• CPU – Utilization • Memory – Memory Utilization
Interfaces	• Interface – Incoming Packets – Outgoing Packets
Tunnels	• Network Interface – Jitter – Latency – Packet loss

Item Types	VNA Metric Families and Metrics
Application/SLA Paths	• Network Interface – Percentage of Jitter SLA Threshold – Percentage of Packet Loss SLA Threshold – Percentage of Latency SLA Threshold

Supported Releases

DX NetOps Virtual Network Assurance supports the following releases of Versa SD-WAN:

- 128T SD-WAN 4.1.1

  NOTE
  SNMP support is not available in 4.1.1.

Requirements

- The Conductor port must be open to the DX NetOps Virtual Network Assurance host.

Plug-in Configuration Example

The following JSON example shows the Versa SD-WAN plug-in configuration:

```
{
   "PLUGIN_CONFIG": {
        "CONDUCTOR_HOST": "54.177.55.140",
        "CONDUCTOR_HOST_PORT": 443,
        "CONDUCTOR_HOST_USER_NAME": "admin",
        "CONDUCTOR_HOST_USER_PASSWORD": "128Tadmin",
        "PROTOCOL": "https",
        "INVENTORY_POLL_RATE": "0 */10 *",
        "INVENTORY_DELTA_TIME": 600,
        "PERFORMANCE_POLL_RATE": "0 */5 *",
        "PERFORMANCE_DELTA_TIME": 300,
        "NOTIFICATION_POLL_RATE": "0 */1 *",
        "NOTIFICATION_DELTA_TIME": 60,
        "DOMAIN_ID": 0
        }
   }
```

- **CONDUCTOR_HOST**
  The IP address of the 128T Conductor
- **CONDUCTOR_HOST_PORT**
  The 128T Conductor port Default: 443
- **CONDUCTOR_HOST_USER_NAME**
  The 128T Conductor user name
- **CONDUCTOR_HOST_USER_PASSWORD**
  The password for the 128T Conductor user
- **PROTOCOL**
  The HTTP security scheme for 128T SD-WAN Default: https
- **INVENTORY_POLL_RATE**
  How often the product collects inventory data
- **INVENTORY_DELTA_TIME**

The time difference between inventory polls (in seconds)
- **PERFORMANCE_POLL_RATE**
  How often the product collects performance data
- **PERFORMANCE_DELTA_TIME**
  Difference between polls (in seconds) for performance data requests
- **NOTIFICATION _POLL_RATE**
  How often the product collects notification data
- **NOTIFICATION _DELTA_TIME**
  Difference between polls (in seconds) for notification data requests
- **DOMAIN_ID**
  CA Virtual Network Assurance assigns inventory from this plug-in to the specified domain.

Amazon Web Services (AWS)

Amazon Web Services (AWS) is a cloud computing platform. The AWS provides a combination of Infrastructure as a Service (IaaS), Platform as a Service (PaaS) and packaged Software as a Service (SaaS) offerings.

The plug-in collects inventory for the following items:

- Regions
- Availability Zones
- Amazon EC2 (VM)
- Virtual Private Cloud (Virtual Network)
- Subnets
- NAT Gateways
- Customer Gateways
- Internet Gateways
- VPN Gateways
- Tunnels

AWS Performance Metrics

The plug-in collects the following performance metrics:

Item Types	VNA Metric Families and Metrics	CA PM Metric Family	Metric Name/ Description
EC2	CPU Utilization	Virtual Machine Aggregate Metrics	CPU Utilization
	Aggregated Network Incoming Bytes	Virtual Machine Aggregate Metrics	Aggregated Bits In Of Interfaces
	Aggregated Network Outgoing Bytes	Virtual Machine Aggregate Metrics	Aggregated Bits Out Of Interfaces
	Aggregated Network Bytes	Virtual Machine Aggregate Metrics	Aggregated Bits Of Interfaces
	Aggregated Network Bytes Per Second	Virtual Machine Aggregate Metrics	Aggregated Bits Per Second Of Interfaces
	Aggregated Network Incoming Bytes Per Second	Virtual Machine Aggregate Metrics	Aggregated Bits In Per Second Of Interfaces

	Aggregated Network Outgoing Bytes Per Second	Virtual Machine Aggregate Metrics	Aggregated Bits Out Per Second Of Interfaces
	Aggregated Network Incoming Packets	Virtual Machine Aggregate Metrics	Aggregated Packets In Of Interfaces
	Aggregated Network Outgoing Packets	Virtual Machine Aggregate Metrics	Aggregated Packets Out Of Interfaces
	Aggregated Network Packets	Virtual Machine Aggregate Metrics	Aggregated Packets Of Interfaces
	Aggregated Network Incoming Packets Per Second	Virtual Machine Aggregate Metrics	Aggregated Packets In Per Second Of Interfaces
	Aggregated Network Outgoing Packets Per Second	Virtual Machine Aggregate Metrics	Aggregated Packets Out Per Second Of Interfaces
	Aggregated Network Packets	Virtual Machine Aggregate Metrics	Aggregated Packets Per Second Of Interfaces
	Disk Capacity	Virtual Disk	Capacity
	Disk IOPS	Virtual Disk	I/O per second
	Disk Read Bytes	Virtual Disk	Bytes Read Per Sec
	Disk Write Bytes	Virtual Disk	Bytes Written Per Sec
Tunnels	Tunnel State	SDN Tunnel	Availability
	Tunnel Data In	SDN Tunnel	Bytes In
	Tunnel Data Out	SDN Tunnel	Bytes Out

The plug-in collects the following threshold notifications:

VPN Connections	• Tunnel State • Tunnel Data In • Tunnel Data Out

The plug-in collects the flow data from VPC logs from AWS Console with the following header:

```
<version> <account-id> <interface-id> <srcaddr> <dstaddr> <srcport> <dstport> <protocol>
 <packets> <bytes> <start> <end> <action> <log-status>
```

The plug-in uses `aws-java-sdk` to pull data, which uses the HTTP protocol.

The following table contains the HTTP counts for each poll type:

NOTE

The following counts may vary depending on the environment. You can get more details for HTTP count from the `server.log` by turning the root logger of WildFly to debug.

Poll Type	HTTP Count
Inventory	35
Performance	39
Flow	17
Notification	17

NOTE

More Information:

For more information about flow log header, refer https://docs.aws.amazon.com/vpc/latest/userguide/flow-logs.html

Plug-in Configuration Example

The following JSON example shows the AWS plug-in configuration:

```
{
"PLUGIN_CONFIG": {
"AWS_ACCESS_KEY": "xxxxxxxxxxx",
"AWS_SECRET_KEY": "JWUSJJSJSUIWKSOW",
"PROTOCOL": "https",
"INVENTORY_POLL_RATE": "0 */10 *",
"INVENTORY_DELTA_TIME": 600,
"NOTIFICATION_POLL_RATE": "0 */5 *",
"NOTIFICATION_DELTA_TIME": 300,
"PERFORMANCE_POLL_RATE": "0 */5 *",
"PERFORMANCE_DELTA_TIME": 300,
"FLOW_POLL_RATE": "0 */10 *",
"FLOW_DELTA_TIME": 600,
"DOMAIN_ID": 0
}
}
```

AWS_ACCESS_KEY
Access keys to sign programmatic requests to AWS
AWS_SECRET_KEY
Secret keys to sign programmatic requests to AWS (Access key and Secret access key that is used together to authenticate requests to AWS)
PROTOCOL
The communication protocol with the AWS
INVENTORY_POLL_RATE
How often the product collects inventory data
INVENTORY_DELTA_TIME
Difference between polls (in seconds)
NOTIFICATION_POLL_RATE
How often the product collects notifications from the AWS
NOTIFICATION_DELTA_TIME
Difference between notification polls (in seconds)
PERFORMANCE_POLL_RATE
How often the product collects performance data
PERFORMANCE_DELTA_TIME
The time difference between performance polls (in seconds)
FLOW_POLL_RATE
How often the product collects flow data
FLOW_DELTA_TIME
The time difference between flow polls (in seconds)
DOMAIN_ID
CA Virtual Network Assurance assigns inventory from this plug-in to the specified domain.

Broadcom BroadView

The BroadView™ Instrumentation Agent unlocks the potential of Broadcom® switch silicon by augmenting CPU functionality to deliver advanced network analytics. The BroadView™ Instrumentation Agent communicates with the underlying Broadcom switch silicon. It collects various telemetry and visibility information, runs algorithms on the data, packages the information appropriately, and provides it to registered clients. Similarly, the agent configures the silicon based on the configuration requests from the client.

With the proliferation of Software-Defined Networking (SDN), multi-tenant networks, and server virtualization—aided by cloud deployments for applications and storage—network complexity is growing exponentially. Troubleshooting such networks has become an increasingly daunting task. Network operators need increased visibility into the network and deeper telemetry data in order to remain in control of the network and to ensure optimal network resource utilization. BroadView™ Instrumentation software provides this critical visibility and telemetry information.

The Buffer Statistics and Tracking (BST) feature of the the BroadView™ Agent, lets you monitor buffers Utilization and detect MicroBurst (Congestion) of Broadcom devices.

For more information, see the following BroadView™ documentation:

- BroadView™ Instrumentation Agent Guide
- SONiC Command Line Interface Guide

The BView BST plug-in collects inventory for the following items:

- Devices (Switches)
- Interface Buffers
- Device Buffers
- Alarms (Trigger Reports) raised on the Agent

The plug-in collects the following performance metrics:

> **NOTE**
> All metrics represent the corresponding buffer utilization. SONiC BUZZNIK supports only a subset of the following metrics.

Table 4:

Item Types	VNA Metric Families and Metrics
Devices (Switches)	• Device – data • Ingress service pool – um-share-buffer-count • Egress service poll. – um-share-buffer-count – mc-share-buffer-count – mc-share-queue-entries • Egress Unicast Queue Group – uc-buffer-count • Egress CPU Queue – cpu-buffer-count
Interfaces	• Ingress port priority group – um-share-buffer-count – um-headroom-buffer-count • Ingress port service pool – um-share-buffer-count • Egress Unicast Queue – uc-buffer-count • Egress Multicast Queue – mc-buffer-count – mc-queue-entries • Egress port service pool – uc-share-buffer-count – mc-share-queue-entries – mc-share-buffer-count – um-share-buffer-count

SONIiC BUZZNIK supports only the following metrics:

NOTE
All metrics represent the corresponding buffer utilization.

Table 5:

Item Types	VNA Metric Families and Metrics
Interfaces	• Ingress port priority group – um-share-buffer-count • Egress Unicast Queue • uc-buffer-count • Egress Multicast Queue • mc-buffer-count
Devices (Switches)	• Egress CPU queue – cpu-buffer-count

Notifications

The BView Agent allows you to configure a threshold for any of the monitored buffers.

For more information, see the `configure-bst-thresholds` API in the BroadView™ Instrumentation Agent Guide.

When any of the configured thresholds is triggered because the buffer usage crosses the configured threshold, the BView BST sends an asynchronous notification (BView Trigger Report) to DX NetOps Virtual Network Assurance.

The BView Agent keeps sending Trigger Reports to DX NetOps Virtual Network Assurance every `trigger-rate-limit-interval` seconds while the metric value remains above the threshold.

For more information, see the `configure-bst-feature` API in the BroadView™ Instrumentation Agent Guide.

Alarms Clearance

The plug-in raises an DX NetOps Virtual Network Assurance alarm when the first Trigger Report for a specific BST entity is received.

The plug-in checks every `ALARM_CLEAR_INTERVAL_SEC` seconds whether the time between *now* and the *last Trigger Report recieved timestamp* for the same BST entity is more than the `ALARM_CLEAR_INTERVAL_SEC` . If the time more than the `ALARM_CLEAR_INTERVAL_SEC` , the DX NetOps Virtual Network Assurance alarm lears.

> **NOTE**
> The BView Agent `trigger-rate-limit-interval` setting should be less than VNA plugin setting ALARM_CLEAR_INTERVAL_SEC. By default this is true

Supported Releases

DX NetOps Virtual Network Assurance supports the following releases of SONiC:

- SONiC BUZZNIK

Requirements

- The network device must support the BView BST feature. Configured the device to a working state.
- The network device must have an SNMP agent installed.
- For consistency, we recommend that each SONiC BView container have the same *trigger-rate-limit-interval* value set by the *configure-bst-feature* API.

Configure the SONiC BView BST Container

Use the BView configuration API to configure the container

Follow these steps:

1. Configure the BView SONiC container to send Periodic and Trigger Reports to the DX NetOps Virtual Network Assurance host (IP and Port).
   a. Log into the managed item with SSH.
   b. Run the following command:
      ```
      sudo su
      ```
   c. Run the following command to set the BST Data Collector IP Adress and Port:
      ```
      config broadview collector IP_Address  Port
      ```
      Example:
      ```
      config broadview collector 10.74.112.112 9070
      ```
2. Configure the following BView BST parameters with the `configure-bst-feature` REST API call:
   a. Set up a REST client with a connection to the managed item.

b. Specify the following URL:
`http://IP_Address:Port/broadview/bst/configure-bst-feature`

c. POST the JSON for defining the BView BST parameters.
Example:

```
{
    "jsonrpc":"2.0",
    "method":"get-bst-feature",
    "asic-id":"0",
    "params": {
    "bst-enable": 1,
    "send-async-reports": 1,
    "collective-interval": 60,
    "stat-units-in-cells": 0,
    "trigger-rate-limit": 1,
    "send-snapshot-on-trigger": 0,
    "trigger-rate-limit-interval": 30,
    "async-full-reports": 1,
    "stats-in-percentage": 1,
    }
     "id": 1,
}
```

3. Configure the following BST thesholds for the required realms or ports with the `configure-bst-thresholds` REST API call:

NOTE
To get a list of ports, priority groups, or queues, run the following command:
`get-bst-threshold`

a. Set up a REST client with a connection to the managed item.

b. Specify the following URL:
`http://DeviceIP:Port/broadview/bst/configure-bst-thresholds`

c. POST the JSON for defining the BView BST parameters.
Example:

```
{
    "jsonrpc":"2.0",
    "method":"get-bst-thresholds",
    "asic-id":"0",
    "params": {
    "include-ingress-port-priority-group": 1,
    "include-ingress-port-service-pool": 0,
    "include-ingress-service-pool": 0,
    "include-egress-port-service-pool": 0,
    "include-egress-service-pool": 0,
    "include-egress-us-queue": 1,
    "include-egress-us-queue-group": 0,
    "include-egress-mc-queue": 1,
    "include-egress-cpu-queue": 1,
    "include-egress-rqe-queue": 0,
    "include-device": 0,
    }
     "id": 1,
}
```

NOTE
We recommend that you use sniffer to make sure the BView Heartbeat messages and Periodic Reports are from the managed item to the BView Collector.

Plug-in Configuration Example

The following JSON example shows the BView BST plug-in configuration:

```
{
   "PLUGIN_CONFIG": {
        "PROTOCOL": "http",
        "SOCKET_PORT": 9070,
        "SEVERITY_INFO": "[]",
        "SEVERITY_WARN": "[device]",
        "SEVERITY_MINOR": "[ingress-port-service-pool]",
        "SEVERITY_MAJOR": "[ingress-port-priority-group, egress-cpu-queue]",
        "SEVERITY_CRITICAL": "[egress-service-pool, ingress-service-pool, egress-service-pool]",
        "WORKER_THREAD_COUNT": 32,
        "BVIEW_CONFIG_REQUEST_INTERVAL_MIN": 30,
        "ALARM_CLEAR_INTERVAL_SEC": 60,
        "SWITCH_INITIALIZATION_TIMEOUT_SEC": 300,
        "DOMAIN_ID": 0
        }
   }
```

- **PROTOCOL**
  The communication protocol with the Broadview Agent.
  Values: "http" only
- **SOCKET_PORT**
  The plug-in listens to this port.
- **SEVERITY_INFO**
  Comma separated list of realms. Alarms for the listed realms have the INFO severity.
- **SEVERITY_WARN**
  Comma separated list of realms. Alarms for the listed realms have the WARN severity.
- **SEVERITY_MINOR**
  Comma separated list of realms. Alarms for the listed realms have the MINOR severity.
- **SEVERITY_MAJOR**
  Comma separated list of realms. Alarms for the listed realms have the MAJOR severity.
- **SEVERITY_CRITICAL**
  Comma separated list of realms. Alarms for the listed realms have the CRITICAL severity.
- **WORKER_THREAD_COUNT**
  Number of workers (threads) that Netty uses to process incoming messages. This parameter is usually the number of cores * 2.
- **BVIEW_CONFIG_REQUEST_INTERVAL_MIN**
  How often the plug-in updates the threshold cache and updates the BView BST configuration.
- **ALARM_CLEAR_INTERVAL_SEC**
  How often the plug-in checks alarms cache and clears expired alarms.
- **SWITCH_INITIALIZATION_TIMEOUT_SEC**
  Time required to process and add to the database inventory data before consuming Trigger and Periodic reports.
- **DOMAIN_ID**

CA Virtual Network Assurance assigns inventory from this plug-in to the specified domain.

Troubleshoot Plug-in Issues

Issues with the BView BST plug-in are logged in the following locations:

- `/opt/CA/VNA/wildfly/standalone/log/gateway.log`
- `/opt/CA/VNA/wildfly/standalone/log/oc.log .`

You can adjust the log levels. For more information, see Troubleshooting.

Follow these steps:

1. Ensure the MoD Container on the switch is functioning correctly:
   a. Log in to the switch and run the following command:
      ```
      docker ps|grep tam
      ```
      The switch should appear up.
      Example:
      ```
      6389a19196e9    docker-tam:latest    "/usr/bin/supervisord"   3 days ago   Up 2 days   tam
      ```
   b. BView Periodic Reports
   c. If configured, BView Trigger Reports (depends on traffic load)
2. Check the log files.
3. Reproduce packets drops with any Drop Reason supported by MoD.
4. Use the DX NetOps Virtual Network Assurance client to confirm that the MoD DX NetOps Virtual Network Assurance notifications are available at the DX NetOps Virtual Network Assurance Gateway.
5. Check the DX NetOps Spectrum and DX NetOps Performance Management logs.

Broadcom Mirror on Drop

The BroadView Packet Drop Monitor (PDM) feature helps network administrators understand the packet drop pattern on Broadcom silicon, such as the BCM56870 (Trident 3). The PDM feature allows users to look for drops within specific patterns of flows. The PDM feature also reports the dropped packets to a specified collector. The Broadcom Mirror on Drop plug-in serves as Mirror on Drop (MoD) alarms collector. You can view MoD alarms in the NetOps Portal alarms view and DX NetOps Spectrum.

The Broadcom Mirror on Drop plug-in provides the following drop reasons:

- **L3_DEST_MISS**
  Missing L3 route/host entry
- **UNKNOWN_VLAN**
  Vlan of packet unknown
- **MARTIAN_ADDR**
  Packet with source IP=0.0.0.0
- **DOS_ATTACK**
  Packet with Source IP=Destination IP
- **L3_MTU_FAIL**
  MTU > configured MTU
- **L3_ADDR_BIND_FAIL**
  L3 Packet with incorrect SMAC
- **INVALID_TPID**
  Packet with an invalid TPID
  (Tag Protocol Identifier)
- **L3_HEADER_ERROR**

Error in L3 header
- **TTL1**
  Packet with TTL=1
- **TTL**
  Packet with TTL=0
- **PARITY_ERROR**
  Parity error detected

Supported Releases

DX NetOps Virtual Network Assurance supports the following releases of SONiC:

- SONiC BUZZNIK

Requirements

- Configure the MoD feature on the switch. In general, this includes specifying flows (five-tuple) of interest and related details. For exmample, specify the interface for drop detection, and so on.
  For more information, see the Broadview Packet Drop Monitor section of the official StrataXGS-MOD-AN100 documentation.

  NOTE
  Since MoD/PDM is a premium feature, the documentation is unavailable for some customers. To get it, contact Support and request access to a document with the "StrataXGS-MOD-AN100" DocSafe ID.

Plug-in Configuration Example

The following JSON example shows the Broadcom Mirror on Drop plug-in configuration:

```
{
   "PLUGIN_CONFIG": {
        "BVIEW_AGENT_PROTOCOL": "http",
        "BVIEW_AGENT_PORT": 8361,
        "MOD_COLLECTOR_PORT": 7777,
        "SONIC_REST_PROTOCOL": "https",
        "SONIC_REST_PORT": 443,
        "SONIC_REST_USER": "restapi",
        "SONIC_REST_PASSWORD": "restapi",
        "WORKER_THREAD_COUNT": 32,
        "INVENTORY_UPDATE_INTERVAL_MIN": 1440,
        "ALARM_CLEAR_INTERVAL_MIN": 10080,
        "DISABLE_CLEAR_EVENTS_PROCESSING": 0,
        "SWITCH_INITIALIZATION_TIMEOUT_SEC": 300,
        "DOMAIN_ID": 0
        }
   }
```

- **BVIEW_AGENT_PROTOCOL**
  The communication protocol with the Broadview Agent.
  Values: "http" only
- **BVIEW_AGENT_PORT**
  The communication port with the BroadView Agent.
- **MOD_COLLECTOR_PORT**
  The UDP port to which MoD alarms are sent from the switch.
- **SONIC_REST_PROTOCOL**

The communication protocol with the SONiC REST API.
Values: "http" or "https"

- **SONIC_REST_USER**
  Username for SONiC REST API authentication.
- **SONIC_REST_PASSWORD**
  Password for SONiC REST API authentication.
- **SONIC_REST_PORT**
  The communication port with the SONiC REST API.
- **WORKER_THREAD_COUNT**
  Number of workers (threads) that the plug-in uses to process incoming messages and data. This parameter is usually the number of cores * 2.
- **INVENTORY_UPDATE_INTERVAL_MIN**
  How often the plug-in updates the inventory cache with interface and flow information.
- **ALARM_CLEAR_INTERVAL_SEC**
  How often the plug-in checks alarms cache and clears expired alarms.
- **DISABLE_CLEAR_EVENTS_PROCESSING**
  If set to 1, disables `DROP_STOP` MoD packet processing for the plug-in. As a result, MoD alarms remain Active until the scheduled cleanup task in DX NetOps Virtual Network Assurance, or you manually change them in DX NetOps Spectrum.
- **SWITCH_INITIALIZATION_TIMEOUT_SEC**
  Time required to process and add to the database inventory data before consuming Trigger and Periodic reports.
- **DOMAIN_ID**
  CA Virtual Network Assurance assigns inventory from this plug-in to the specified domain.

Mod Alarms

The Broadcom Mirror on Drop plug-in regularly checks whether the time between now and the timestampt of the last MoD Event received for the same MoD Flow entity is more than the configured `ALARM_CLEAR_INTERVAL_MIN` value. If the time is more, then the VNA alarm is cleared. The check interval is calculated as `ALARM_CLEAR_INTERVAL_MIN / 10`, but cannot be less than 1 minute and more than 60 minutes.

> **IMPORTANT**
> If `DISABLE_CLEAR_EVENTS_PROCESSING=1` , the plug-in does not process `DROP_STOP` events from the switch. As a result, a lot of MoD alarms for short-living flows might occur. In this case, you can clear MoD alarms only with alarm clear tasks in DX NetOps Virtual Network Assurance, or manually in DX NetOps Spectrum.

If a you condifure the MoD feature and specify an interface name during the MoD Session creating, MoD alarms are raised on the appropriate interface in DX NetOps. Otherwise, MoD alarms are raised on a device item.

Troubleshoot Plug-in Issues

Issues with the Broadcom Mirror on Drop plug-in are logged in the following locations:

- `/opt/CA/VNA/wildfly/standalone/log/gateway.log`
- `/opt/CA/VNA/wildfly/standalone/log/oc.log`.

Follow these steps:

1. To verify that the BView Container on your the switch is working, use a sniffer and verify that the following messages are being sent:
   - BView Heartbeat messages
   - BView Periodic Reports
   - If configured, BView Trigger Reports (depends on traffic load)

2. Check the log files.
3. Use the DX NetOps Virtual Network Assurance client to confirm that the BView BST DX NetOps Virtual Network Assurance notifications are available at the DX NetOps Virtual Network Assurance Gateway.
4. Check the DX NetOps Spectrum and DX NetOps Performance Management logs.

Cisco ACI

Cisco Application Centric Infrastructure (ACI) is an orchestrator that applies the SDN policy model across networks, servers, storage, security, and services.

The plug-in collects inventory for the following items:

- ACI interfaces
- ACI tenants
- ACI virtual routing and forwarding (VRF)
- APIC controller
- APIC interfaces
- Applications profiles
- Bridge domains
- Contracts
- End points
- End point groups (EPG)
- L2/L3 EPGs
- Subnets
- Switches (leafs and spines)

Cisco ACI collects the following performance metrics:

Table 6:

Item Type	VNA Metric Families and Metrics
Fabric	• Health Score – Health Score – Critical Count – Major Count – Minor Count – Warning Count
Tenant	• Health Score – Health Score – Critical Count – Major Count – Minor Count – Warning Count
Pod	• Health Score – Health Score – Critical Count – Major Count – Minor Count – Warning Count

Item Type	VNA Metric Families and Metrics
Interface	• Interface – Incoming Bytes – Outgoing Bytes – Incoming Packets – Outgoing Packets • Health Score – Health Score – Critical Count – Major Count – Minor Count – Warning Count
Controller	• Disk – Disk Usage – Disk Available – Disk Capacity
Switch Policy	• Cam – Policy Capacity – Policy Usage
Application Profile	• Health Score – Health Score – Critical Count – Major Count – Minor Count – Warning Count
Bridge Domain	• Health Score – Health Score – Critical Count – Major Count – Minor Count – Warning Count
Contracts	• Health Score – Health Score – Critical Count – Major Count – Minor Count – Warning Count
End Point & End Point Group	• Health Score – Health Score – Critical Count – Major Count – Minor Count – Warning Count
VRF	• Health Score – Health Score – Critical Count – Major Count – Minor Count – Warning Count

Supported Releases

DX NetOps Virtual Network Assurance (VNA) supports the following releases of Cisco ACI:

- Cisco ACI 4.2.4
- Cisco ACI 4.0
- Cisco ACI 3.2
- Cisco ACI 2.0

Requirements

- Add the DX NetOps Virtual Network Assurance host IP address to the list of IPs in the Client Group Policies.
- For the DX NetOps Performance Management Data Collector that polls switches through SNMP, add the host IP address to the list of IPs in the Client Group Policies.
- The service account requires read-only access. We recommend, but do not require, the service account have access to all tenants.

  NOTE

  If you grant access to only a single tenant, then you must deploy multiple plug-ins for visibility into the other tenants (one per tenant).

  You can have multiple plug-ins of the same technology type on a single instance of VNA.
- We only require the service account have access to a single APIC. Other APIC controllers are identified through an inventory request.

  NOTE

  The plugin does not use the controllers that are discovered through the inventory request.

Plug-in Configuration Example

The following JSON example shows the Cisco ACI plug-in configuration:

```
{
"PLUGIN_CONFIG": {
     "APIC_HOST_IP": "10.241.17.185",
     "APIC_HOST_aaaUser_NAME": "api",
     "APIC_HOST_aaaUser_PASSWORD": "apiReadOn1y",
     "APIC_MAX_PAGE_SIZE": 15,
     "PROTOCOL": "https",
     "INVENTORY_ENABLE_ENDPOINTS": "Yes",
     "INVENTORY_POLL_RATE": "0 */10 *",
     "INVENTORY_DELTA_TIME": 600,
     "PERFORMANCE_POLL_RATE": "0 */5 *",
     "PERFORMANCE_DELTA_TIME": 300,
     "AVAILABILITY_POLL_RATE": "0 */5 *",
     "AVAILABILITY_DELTA_TIME": 300,
     "FAULT_SUBSCRIPTION_ENABLED": true,
     "EVENT_SUBSCRIPTION_ENABLED": true,
     "HISTORICAL_EVENT_DAYS": 1,
     "DOMAIN_ID": 0
     }
}
```

- **APIC_HOST_IP**

The IP address of the APIC controller host
- **APIC_HOST_aaaUser_NAME**
  The APIC controller user name
- **APIC_HOST_aaaUser_PASSWORD**
  The APIC controller password
- **APIC_MAX_PAGE_SIZE**
  The number of response objects per page
- **PROTOCOL**
  The communication protocol with the APIC controller
  Values: http or https (case-sensitive)
- **INVENTORY_ENABLE_ENDPOINTS**
  Whether to poll the endpoint inventory.
  Values: true, false, Yes, No
  Default: Yes
- **INVENTORY_POLL_RATE**
  How often the product collects inventory data
- **INVENTORY_DELTA_TIME**
  Difference between polls (in seconds)
- **PERFORMANCE_POLL_RATE**
  How often the product collects performance data
- **PERFORMANCE_DELTA_TIME**
  Difference between polls (in seconds) for performance data requests
- **AVAILABILITY_POLL_RATE**
  How often the product polls the availability of the controller
- **AVAILABILITY_DELTA_TIME**
  Difference between polls (in seconds) for availability data requests
- **FAULT_SUBSCRIPTION_ENABLED**
  Whether fault subscription is enabled.
- **EVENT_SUBSCRIPTION_ENABLED**
  Whether event subscription is enabled.
- **HISTORICAL_EVENT_DAYS**
  The number of days to retrieve historical events.
  Default: 1
  Maximum: 30
- **DOMAIN_ID**
  DX NetOps Virtual Network Assurance assigns inventory from this plug-in to the specified domain.

Configure Faults

The ACI plug-in collects faults based on certain patterns. Configure faults to add, delete, or update fault patterns. You can add new patterns in any order. For assistance, contact Support.

Follow these steps:

1. Stop the wildfly service:
   ```
   service wildfly stop
   ```
2. Edit the fault configuration file:
   VNA_install_directory/plugins/ACI Plugin/config/aci-fault-config.xml
   Example:
   ```
   <fault-patterns> <regex>.*fv-\[(.+?)].*</regex> <regex>.*ra-\[(.+?)].*</regex>
   <regex>.*client-\[(.+?)].*</regex> <regex>.*rtd-\[(uni\/.+?)\/</regex> <regex>.*jobs-
   ```

```
\[(uni\/.+?)\/</regex> <regex>(.+?)\/sys</regex> <regex>(.+?)\/local</regex>
<regex>(uni\/.+?)\/</regex> </fault-patterns> >
```

3. Start the wildfly service:
   ```
   service wildfly start
   ```

Configure Filters

You can configure blacklisting filters based on fault codes and severities. You can configure whitelisting filters as well. You can configure multiple fault code separated by a comma. DX NetOps Virtual Network Assurance filters new alarms generated after you configure the filter. The filter does not apply to pre-existing alarms. If the customer wants to apply the filter on existing alarms in the spectrum, the existing engine needs to be deleted from VNA and deploy a new engine after configuring the filter.

Follow these steps:

1. Stop the wildfly service:
   ```
   service wildfly stop
   ```
2. Edit the fault configuration file: *VNA_install_directory*/plugins/ACI Plugin/config/aci-fault-config.xml

   Examples:

   NOTE
   When you upgrade to 3.7.8 and higher, all the previously set values for fault-codes, fault-types, and fault-severities are cleared. All the faults are whitelisted and saved in the database. To prevent this, stop the Wildfly service within 5 minutes of the upgrade and configure the filters as needed.

   ```
   <filter enabled="true" filterType="whitelist"
        <fault-types>configuration,operational</fault-types>
        <fault-codes>F2603,F2631,F2632,F2633,F2634</fault-codes>
        <fault-severities>minor,warning</fault-severities>
   </filter>
   ```

   - **faultTypes**
     Values:
     - **whitelist**
       Shows only the alarms that match all the configured filter values.
     - **blacklist**
       Excludes only the alarms that match all the configured filter values.
   - **<fault-types>**
     Values: config, generic, equipment, connectivity, environmental, management, network, operational
   - **<fault-severities>**
     Values: critical, major, minor, warning, info, cleared
3. Start the wildfly service:
   ```
   service wildfly start
   ```

Cisco Meraki

Cisco Meraki includes cloud-controlled WiFi and SD-WAN solutions centrally managed from the web. This plug-in allows you to monitor MR WiFi Access Point devices and MX Security and SD-WAN appliances.The plug-in collects inventory for the following components:

- Organization
- Network
- Access Point
- SSID
- L3FirewallRules for SSIDs and Routers
- L7FirewallRules for Routers
- CellularFirewallRules for Routers
- VPNFirewallRules for Routers
- Meraki Controller
- Routers
- Uplink Interfaces

NOTE
The relationship between an access point and an SSID is discovered only when traffic has flowed from the access point on the SSID at least once in the past 7 days. If no traffic flowed from an access point on any SSID in the past 7 days, CA Virtual Network Assurance does not record the relationship.

The plug-in collects the following performance metrics:

Item Type	VNA Metric Families and Metrics
Access Point	Normalized Mobile WLAN AP Info • Bytes • Bytes In • Bytes Out • Client • Authentication Failures (20.2.2 and higher only) • Association Failures (20.2.2 and higher only) • Successful Authentications (20.2.2 and higher only) • Successful Associations (20.2.2 and higher only) • Successful DHCP (20.2.2 and higher only) • Successful DNS (20.2.2 and higher only) • Successful Connections (20.2.2 and higher only)
Meraki Controller	Normalized Wireless Controller Info • Active Access Points • Clients Associated
Router	• Device Utilization
Tunnel	• Latency • Packet Loss Percentage

Enable Tunnel Metric Collections

To enable tunnel metric collections, add the tunnels to the Uplink statistics. For more information, see the Cisco Meraki documentation.

Follow these steps:

1. Go to the Cisco Meraki Dashboard, Security & SD-WAN, Configure, SD-WAN & traffic shaping, Uplink configuration, and Uplink statistics.
2. Add the IPv4 public addresses of the WAN Interfaces for the other routers that have tunnels with this router.

Requirements

- Access to the Cisco Meraki Dashboard API must be enabled.
- An API key must be generated on your profile.

For more information, see the Cisco Meraki documentation.

Plug-in Configuration Example

The following JSON example shows the Cisco Meraki plug-in configuration:

```
{
"PLUGIN_CONFIG": {
    "MERAKI_DASHBOARD_HOST": "api.meraki.com",
    "MERAKI_API_KEY": "xxx3xxxxxe9xx",
    "PROTOCOL": "https",
    "DELAY_BETWEEN_REST_CALLS_IN_MS": 400,
    "MAX_RETRIES": 3,
    "RETRY_DELAY_IN_MS": 500,
    "SYSLOG_PORT": 1542,
    "INVENTORY_POLL_RATE": "0 */10 *",
    "INVENTORY_DELTA_TIME": 600,
    "PERFORMANCE_POLL_RATE": "0 */10 *",
    "PERFORMANCE_DELTA_TIME": 600,
    "BLACKLISTED_EVENT_TYPES":"[]",
    "POLL_SSIDS":"true",
    "POLL_POLICIES":"true",
    "POLL_CLIENTS":"true",
    "NETWORK_ID_LIST":"[]",
    "DOMAIN_ID": 0
    }
}
```

20.2.2 and Higher Only

```
{
"PLUGIN_CONFIG": {
    "MERAKI_DASHBOARD_HOST": "api.meraki.com",
    "MERAKI_API_KEY": "xxx3xxxxxe9xx",
    "PROTOCOL": "https",
    "DELAY_BETWEEN_REST_CALLS_IN_MS": 400,
    "MAX_RETRIES": 3,
    "RETRY_DELAY_IN_MS": 500,
    "SYSLOG_PORT": 1542,
    "INVENTORY_POLL_RATE": "0 */10 *",
    "INVENTORY_DELTA_TIME": 600,
    "PERFORMANCE_POLL_RATE": "0 */10 *",
    "PERFORMANCE_DELTA_TIME": 600,
    "NOTIFICATION_POLL_RATE": "0 */1 *",
    "NOTIFICATION_DELTA_TIME": 60
    "ENABLE_REST_API_EVENTS":"false",
    "ENABLE_SYSLOG_EVENTS":"false",
    "BLACKLISTED_EVENT_TYPES":"[]",
    "POLL_SSIDS":"true",
    "POLL_POLICIES":"true",
```

```
    "POLL_CLIENTS":"true",
    "NETWORK_ID_LIST":"[]",
    "DOMAIN_ID": 0
    }
}
```

- **MERAKI_DASHBOARD_HOST**
  The address host of the Meraki dashboard
- **MERAKI_USER_NAME**
  The Meraki dashboard user name
- **MERAKI_API_KEY**
  The API key of the Meraki dashboard
- **PROTOCOL**
  The communication protocol with the Meraki dashboard
  Values: http or https (case-sensitive)
- **DELAY_BETWEEN_REST_CALLS_IN_MS**
  Shows the delay between consecutive rest calls in milliseconds. The plug-in can make the maximum five REST calls to the Meraki Controller in a second.
- **MAX_RETRIES**
  The maximum retry attempts for a REST call by the plug-in in a poll when the Meraki Dashboard API returns the HTTP response code 429: 'Too Many Requests'.
- **RETRY_DELAY_IN_MS**
  The time delay in milliseconds that the plug-in waits before reattempting a REST call when the Meraki Dashboard API returns the HTTP response code 429: 'Too Many Requests'.
- **SYSLOG_PORT**
  The port to which the CA VNA syslog listens to
- **INVENTORY_POLL_RATE**
  How often the product collects inventory data
- **INVENTORY_DELTA_TIME**
  Difference between polls (in seconds)
- **PERFORMANCE_POLL_RATE**
  How often the product collects performance data
- **PERFORMANCE_DELTA_TIME**
  Difference between polls (in seconds) for performance data requests
- **NOTIFICATION_POLL_RATE** (20.2.2 and Higher Only)
  How often the product collects event notifications data through the REST API
- **NOTIFICATION_DELTA_TIME** (20.2.2 and Higher Only)
  Difference between polls (in seconds) for event notification data requests through the REST API
- **ENABLE_REST_API_EVENT** (20.2.2 and Higher Only)
  Whether to enable event notifications polling through the REST API
  Values: true or false

  NOTE
  You cannot enable this parameter at the same time as the `ENABLE_SYSLOG_EVENTS` parameter.
- **ENABLE_SYSLOG_EVENTS** (20.2.2 and Higher Only)
  Whether to enable event notifications polling through SYSLOG
  Values: true or false

  NOTE
  You cannot enable this parameter at the same time as the `ENABLE_REST_API_EVENT` parameter.
- **BLACKLISTED_EVENT_TYPES**
  Comma separated list of event types that are filtered out

Example: `"BLACKLISTED_EVENT_TYPES":"[vpn_connectivity_change,ids_alerts]",`
The following Access Point event types are supported:
- `association`
- `disassociation`
- `wpa_auth`
- `wpa_deauth`
- `8021x_eap_failure`
- `8021x_deauth`
- `8021x_eap_success`
- `splash_auth`
- `device_packet_flood`
- `device_packet_flood`
- `rogue_ssid_detected`
- `ssid_spoofing_detected`

For more information, see the Meraki MR Access Point.
The following Router event types are supported:
- `vpn_connectivity_change`
- `uplink_connectivity_change`
- `client_dhcp_lease`
- `ids_alerts`
- `ids_alerted`
- `security_filtering_file_scanned`
- `security_filtering_disposition_change`

For more information, see the Meraki MX Security Appliance.

- **POLL_SSIDS**
  Whether to enable SSID polling
  Values: true or false
- **POLL_POLICIES**
  Whether to enable policy polling
  Values: true or false
  NOTE
  If SSID polling is disabled, we recommend that you specify false.
- **POLL_CLIENTS**
  Whether to enable performance polling of access points and Meraki Controller metrics
  Values: true or false
- **NETWORK_ID_LIST**
  Network IDs to poll
  NOTE
  If empty, all available networks are polled.
- **DOMAIN_ID**
  DX NetOps Virtual Network Assurance assigns inventory from this plug-in to the specified domain

Configure Dashboard

To enable CA VNA to listen to syslog messages from the Access Points and Routers, add the following configuration for each of the networks. See the steps to configure dashboard in the Cisco documentation on Syslog Server Overview and Configuration.

- Enter the VNA IP as the Server IP.
- Enter the Syslog Port from the plug-in configuration as the Port.
- For Access Points, add the `Wireless event log` and the `Air Marshal events` as the Roles.
- For Routers, add the `Security events` and the `Appliance event log` as Roles.

Nuage

Nuage is an SDN solution optimized for data center networks. DX NetOps Virtual Network Assurance collects inventory and performance data from Nuage.

NOTE

This plug-in currently supports only the VSP (virtual services platform) SD-WAN solution with NSG (network service gateway) configuration of Nuage.

The plug-in collects inventory for the following items:

- Enterprises
- L3 domains
- Sites (3.7.9 and higher only)
- Network services gateway (NSG)
- NSG ports
- Tunnels (3.7.9 and higher only)
- Policy Groups (3.7.9 and higher only)
- Policies/SLA Paths (3.7.9 and higher only)
- Application/SLA Paths (3.7.9 and higher only)
- Alarms and Events

  NOTE
  DX NetOps Spectrum consumes these alarms
- Subnets
- Virtual ports
- Virtual router switch (VRS)
- Virtual services controller (VSC)
- VRS disk
- VSC disk
- Zones

The plug-in collects the following metrics for all QoS queues for network uplink ports:

- Bytes out
- Packets out
- Packets dropped
- Overlimits
- Requeues
- Lended tokens
- Borrowed tokens

The plug-in collects the following metrics for vPorts:

- Packets In/Out
- Bytes In/Out
- Errors In/Out
- Dropped Packets In/Out

The plug-in collects the following metrics for VRSs:

- Average CPU utilization
- Average memory utilization
- System uptime availability

The plug-in collects the following metrics for VSCs:

- Average CPU utilization
- Average memory utilization

The plug-in collects the following metrics for VSC disks:

- Available bytes
- Capacity
- Used bytes

The plug-in collects the following metrics for tunnels (3.7.9 and higher only):

- Jitter
- Latency
- Packet loss

The plug-in collects the following metrics for application/SLA paths (3.7.9 and higher only)

- Percentage of jitter SLA threshold
- Percentage of packet loss SLA threshold
- Percentage of latency SLA threshold

Supported Releases

DX NetOps Virtual Network Assurance supports the following release:

- Nuage 4.0.0 R3

Requirements

- Stats collection must be enabled on the Nuage items.

Plug-in Configuration Example

The following JSON example shows the Nuage plug-in configuration:

```
{
 "PLUGIN_CONFIG": {
     "VSD_HOST_IP": "10.241.17.16",
     "VSD_PORT": 8443,
     "PROTOCOL": "https",
     "STATS_HOST_IP": "10.241.17.26",
     "STATS_PORT": 9200,
     "STATS_PROTOCOL": "http",
     "VSD_USERNAME": "csproot",
     "VSD_PASSWORD": "csproot",
     "NUAGE_ORGANIZATION": "csp",
     "INVENTORY_POLL_RATE": "0 */10 *",
     "INVENTORY_DELTA_TIME": 600,
```

```
      "AVAILABILITY_POLL_RATE": "0 */5 *",
      "AVAILABILITY_DELTA_TIME": 300,
      "PERFORMANCE_POLL_RATE": "0 */5 *",
      "PERFORMANCE_DELTA_TIME": 300,
      "DOMAIN_ID": 0
      }
 }
```

3.7.9 and Higher Only:

```
 {
  "PLUGIN_CONFIG": {
      "VSD_HOST_IP": "10.241.17.16",
      "VSD_PORT": 8443,
      "PROTOCOL": "https",
      "STATS_HOST_IP": "10.241.17.26",
      "STATS_PORT": 9200,
      "STATS_PROTOCOL": "http",
      "VSD_USERNAME": "csproot",
      "VSD_PASSWORD": "csproot",
      "NUAGE_ORGANIZATION": "csp",
      "INVENTORY_POLL_RATE": "0 */10 *",
      "INVENTORY_DELTA_TIME": 600,
      "AVAILABILITY_POLL_RATE": "0 */5 *",
      "AVAILABILITY_DELTA_TIME": 300,
      "PERFORMANCE_POLL_RATE": "0 */5 *",
      "PERFORMANCE_DELTA_TIME": 300,
      "NOTIFICATION_POLL_RATE": "0 */5 *",
      "NOTIFICAION_DELTA_TIME": 300,
      "TIMEZONE": 0,
      "DOMAIN_ID": 0
      }
 }
```

- **VSD_HOST_IP**
  The Virtualized Services Directory (VSD) host
- **VSD_PORT**
  The port that the VSD UI/API server listens on
  Default: 8443
- **PROTOCOL**
  The communication protocol with the VSD
  Values: http or https
- **STATS_HOST_IP**
  The IP address of the stats server
- **STATS_PORT**
  The port the stats server is listening on for REST requests
  Default: 9200
- **STATS_PROTOCOL**

The communication protocol with the stats server
Values: http or https

- **VSD_USERNAME**
  The VSD username
- **VSD_PASSWORD**
  The VSD password
- **NUAGE_ORGANIZATION**
  The name of the Nuage enterprise to manage.
- **INVENTORY_POLL_RATE**
  How often the product collects inventory data
- **INVENTORY_DELTA_TIME**
  Difference between polls (in seconds)
- **AVAILABILITY_POLL_RATE**
  How often the product collects availability data
- **AVAILABILITY_DELTA_TIME**
  Difference between polls (in seconds)
- **PERFORMANCE_POLL_RATE**
  How often the product collects performance data
- **PERFORMANCE_DELTA_TIME**
  Difference between polls (in seconds)

  NOTE

  `PERFORMANCE_POLL_RATE` and `PERFORMANCE_DELTA_TIME` must be even multiples of the poll rate configured for the Nuage environment.
- **NOTIFICATION_POLL_RATE (3.7.9 and higher only)**
  How often the product collects notification data
- **NOTIFICATION_DELTA_TIME (3.7.9 and higher only)**
  Difference between polls (in seconds)
- **TIMEZONE (3.7.9 and higher only)**
  The time zone of the system, which must match the VSD time zone

  WARNING
  If this parameter is set incorrectly, the plug-in might not collect metrics for alarms and events.
- **DOMAIN_ID**
  DX NetOps Virtual Network Assurance assigns inventory from this plug-in to the specified domain.

OpenContrail

OpenContrail is an open source network controller. DX NetOps Virtual Network Assurance collects host, performance, and service chain data from OpenContrail.

The plug-in collects inventory for the following items:

- Controller
- Tenant
- vRouter

NOTE
In DX NetOps Performance Management, the vRouter is reported as a vSwitch.

- Service Function Chain (SFC)
- Virtual Network Function (VNF)
- VM
- Interface

The plug-in collects the following metrics for interfaces on the vRouter host:

- Incoming Bytes
- Outgoing Bytes
- Incoming Packets
- Outgoing Packets
- Interface speed

The plug-in collects the following metrics for the vRouter host:

- Total memory
- Current memory usage
- CPU count

The plug-in collects the following metrics for the vRouter process:

- Resident memory
- Virtual memory
- Peak virtual memory

The plug-in calculates the following metrics:

- VNFs per Hypervisor
- VNFs per Tenant
- SFCs per Tenant

Supported Releases

DX NetOps Virtual Network Assurance supports the following releases of OpenContrail:

- 2.20
- 2.21

Requirements

- The configuration and analytics endpoint ports have connectivity to the DX NetOps Virtual Network Assurance host.
- The Orchestrator server and the Analytics server are running.

Plug-in Configuration Example

The following JSON example shows the OpenContrail plug-in configuration:

```
{
"PLUGIN_CONFIG": {
     "OPENSTACK_KEYSTONE_IP": "10.241.18.159",
     "OPENSTACK_KEYSTONE_PORT": 5000,
     "OPENSTACK_KEYSTONE_USER_TENANT": "admin",
```

```
      "OPENSTACK_KEYSTONE_USER_NAME": "admin",
      "OPENSTACK_KEYSTONE_USER_PASSWORD": "admin",
      "CONTRAIL_ORCHESTRATOR_IP": "10.241.18.156",
      "CONTRAIL_ORCHESTRATOR_PORT": 8082,
      "CONTRAIL_ANALYTICS_IP": "10.241.18.156",
      "CONTRAIL_ANALYTICS_PORT": 8081,
      "PROTOCOL": "http",
      "INVENTORY_POLL_RATE": "0 */5 *",
      "INVENTORY_DELTA_TIME": 300,
      "AVAILABILITY_POLL_RATE": "0 */5 *",
      "AVAILABILITY_DELTA_TIME": 300,
      "PERFORMANCE_POLL_RATE": "0 */15 *",
      "PERFORMANCE_DELTA_TIME": 300,
      "DOMAIN_ID": 0
      }
}
```

- **OPENSTACK_KEYSTONE_IP**
  The hostname or IP address of OpenStack Identity Service (Keystone)
- **OPENSTACK_KEYSTONE_PORT**
  This parameter refers to the port number of OpenStack Identity Service (Keystone). This port can be a public or an administrative endpoint port.
- **OPENSTACK_KEYSTONE_USER_TENANT**
  The tenant name of the user that is used to access OpenStack Orchestrator REST APIs
- **OPENSTACK_KEYSTONE_USER_NAME**
  The username for connecting and executing OpenStack Orchestrator REST API
- **OPENSTACK_KEYSTONE_USER_PASSWORD**
  Password for connecting and executing OpenStack Orchestrator REST API
- **CONTRAIL_ORCHESTRATOR_IP**
  The hostname or IP address of the OpenContrail Orchestrator REST API Server
- **CONTRAIL_ORCHESTRATOR_PORT**
  The port number of the OpenContrail Orchestrator REST API Server
- **CONTRAIL_ANALYTICS_IP**
  The hostname or IP address of the OpenContrail Analytics REST API Server
- **CONTRAIL_ANALYTICS_PORT**
  The port number of the OpenContrail Analytics REST API Server
- **PROTOCOL**The communication protocol with the OpenContrail orchestrator
  Values: http or https (case-sensitive)
- **INVENTORY_POLL_RATE**
  How often the product collects inventory data
- **INVENTORY_DELTA_TIME**
  The time difference between inventory polls (in seconds)
- **AVAILABILITY_POLL_RATE**
  How often the product polls the availability of the controller
- **AVAILABILITY_DELTA_TIME**
  The time difference between availability polls (in seconds)
- **PERFORMANCE_POLL_RATE**

How often the product collects performance data
- **PERFORMANCE_DELTA_TIME**
  The time difference between performance polls (in seconds)
- **DOMAIN_ID** DX NetOps Virtual Network Assurance assigns inventory from this plug-in to the specified domain.

OpenDaylight

OpenDaylight is an open source network controller. DX NetOps Virtual Network Assurance collects service chain data from the topology endpoint.

This plug-in collects inventory for the following items:

- Controller
- Service function chain (SFC)
- Virtual network function (VNF)

The plug-in calculates the following metrics:

- VNFs per Hypervisor
- VNFs per Tenant
- SFCs per Tenant

Supported Releases

DX NetOps Virtual Network Assurance supports the following releases of OpenDaylight:

- Nitrogen

Requirements

- The ODL CONTROLLER PORT must be open to the DX NetOps Virtual Network Assurance host.
- To support service chain reporting, manually configure the topology to create the links. For more information, see Configure The OpenDaylight Topology to Support Service Chain Monitoring.

Plug-in Configuration Example

The following JSON example shows the OpenDaylight plug-in configuration:

```
{
 "PLUGIN_CONFIG": {
     "ODL_CONTROLLER_IP": "10.198.254.162",
     "ODL_CONTROLLER_PORT": 8181,
     "PROTOCOL": "http",
     "ODL_CONTROLLER_USER_NAME": "admin",
     "ODL_CONTROLLER_PASSWORD": "admin",
     "INVENTORY_POLL_RATE": "0 */5 *",
     "INVENTORY_DELTA_TIME": 300,
     "AVAILABILITY_POLL_RATE": "0 */5 *",
     "AVAILABILITY_DELTA_TIME": 300,
     "DOMAIN_ID": 0
     }
}
```

- **ODL_CONTROLLER_IP**
  The hostname or IP address of OpenDaylight Controller
- **ODL_CONTROLLER_PORT**
  The port number of OpenDaylight REST API
- **PROTOCOL**
  The communication protocol with the OpenDaylight REST API
  Values: http or https
- **ODL_CONTROLLER_USER_NAME**
  The username for executing OpenDaylight REST API
- **ODL_CONTROLLER_PASSWORD**
  The password for executing OpenDaylight REST API
- **INVENTORY_POLL_RATE**
  How often the product collects inventory data
- **INVENTORY_DELTA_TIME**
  The time difference between inventory polls (in seconds)
- **AVAILABILITY_POLL_RATE**
  How often the product polls the availability of the controller
- **AVAILABILITY_DELTA_TIME**
  The time difference between availability polls (in seconds)
- **DOMAIN_ID** DX NetOps Virtual Network Assurance assigns inventory from this plug-in to the specified domain.

OpenStack

OpenStack is an open source cloud orchestrator. DX NetOps Virtual Network Assurance collects inventory and performance data from OpenStack.

The plug-in collects inventory for the following items:

- Orchestrator
- Tenant
- Hypervisor
- VM
- Interface
- Network
- Subnet

The plug-in collects the following metrics for VMs:

- Incoming bytes on virtual interfaces
- Outgoing bytes on virtual interfaces
- Incoming packets on virtual interfaces
- Outgoing packets on virtual interfaces
- Disk capacity
- Disk allocation
- Disk usage
- Disk latency
- Disk IOPS
- Disk read request rate
- Disk write request rate
- Disk read bytes rate
- Disk write bytes rate
- CPU time
- CPU utilization
- vCPU count
- Memory
- Memory utilization

The plug-in calculates the following metrics:

- VMs per Hypervisor
- VMs per Tenant
- Networks per Tenant

Supported Releases

DX NetOps Virtual Network Assurance supports the following releases of OpenStack:

- Juno
- Kilo
- Liberty
- Mitaka
- Newton
- Ocata
- Pike

Requirements

- The ports for the following OpenStack services must be open to the DX NetOps Virtual Network Assurance host:
  - Keystone service
    Default: 35357
  - Nova service
    Default: 8774
  - Neutron service
    Default: 9696
  - Ceilometer service
    Default: 8777
  - Gnocchi service

Default: 8041

- To collect performance data for the Ocata release and previous releases, the Ceilometer monitoring component must be installed and running.
- To collect performance data for the Pike release and higher, the Gnocchi monitoring component must be installed and running.
- To collect inventory data, the Keystone user who is specified in the plug-in configuration XML requires administrator access.
  - For Keystone V3 API (Mitaka and later releases), the user must be part of the admin domain and the admin role must be added to the admin domain.

Plug-in Configuration Example

The following JSON example shows the OpenStack plug-in configuration:

```
{
"PLUGIN_CONFIG": {
     "KEYSTONE_IP": "10.241.17.11",
     "KEYSTONE_PORT": 35357,
     "KEYSTONE_USER_DOMAIN": "default",
     "KEYSTONE_USER_TENANT": "admin",
     "KEYSTONE_USER_NAME": "admin",
     "KEYSTONE_USER_PASSWORD": "admin",
     "PROTOCOL": "http",
     "INVENTORY_POLL_RATE": "0 */10 *",
     "INVENTORY_DELTA_TIME": 600,
     "AVAILABILITY_POLL_RATE": "0 */10 *",
     "AVAILABILITY_DELTA_TIME": 600,
     "PERFORMANCE_POLL_RATE": "0 */10 *",
     "PERFORMANCE_DELTA_TIME": 600,
     "SERVICE_ENDPOINT_TYPE": "admin",
     "DOMAIN_ID": 0,

     "GNOCCHI_COMPONENT": "true"
     }
}
```

- **KEYSTONE_IP**
  The hostname or IP address of OpenStack Identity Service (Keystone)
- **KEYSTONE_PORT**
  The administrative port number of OpenStack Identity Service (Keystone)
- **KEYSTONE_USER_DOMAIN**The domain name of the Keystone user that is used to access the OpenStack orchestrator REST API

  NOTE

  The **KEYSTONE_USER_DOMAIN** is case-sensitive for OpenStack versions before Mitaka.
- **KEYSTONE**_USER_TENANT
  The tenant name of the user that is used to access the OpenStack orchestrator REST APIs
- **KEYSTONE**_USER_NAME

The username for connecting and executing the OpenStack orchestrator REST API
- **KEYSTONE**_USER_PASSWORD
  Password for connecting and executing the OpenStack orchestrator REST API
- **PROTOCOL**
  The communication protocol with the OpenStack orchestrator REST API
  Values: http or https
- **INVENTORY_POLL_RATE**
  How often the product collects inventory data
- **INVENTORY_DELTA_TIME**
  The time difference between inventory polls (in seconds)
- **AVAILABILITY_POLL_RATE**
  How often the product polls the availability of the controller
- **AVAILABILITY_DELTA_TIME**
  The time difference between availability polls (in seconds)
- **PERFORMANCE_POLL_RATE**
  How often the product collects performance data
- **PERFORMANCE_DELTA_TIME**
  The time difference between performance polls (in seconds)
- **SERVICE_ENDPOINT_TYPE**
  Whether the urls for all openstack services except the identity service are admin, public, or internal.
  Values: admin or public
  Default: admin
- **GNOCCHI_COMPONENT**
  If the value is true then performance metrics are collected from the Gnocchi service. If the value is false, then performance metrics are collected from the Ceilometer service.
  Values: true or false
  Default: true
- **DOMAIN_ID**
  DX NetOps Virtual Network Assurance assigns inventory from this plug-in to the specified domain.

Open vSwitch

Open vSwitch (OVS) is an open source controller that provisions virtual switches. DX NetOps Virtual Network Assurance collects interface data from Open vSwitch.

> **NOTE**
>
> This documentation applies to 1.0.2 version of the OVS plug-in.

This plug-in collects inventory for the following items:

- VSwitch
- Interface

This plug-in collects the following metrics for virtual interfaces:

- Incoming Bytes
- Outgoing Bytes
- Incoming Packets
- Outgoing Packets
- Collisions
- Incoming CRC Errors
- Incoming Frame Errors
- Incoming RX Overruns
- Incoming Dropped Packets
- Outgoing Dropped Packets
- Incoming Errors
- Outgoing Errors
- Interface Speed

The plug-in collects the following metrics for the vSwitch entity:

- Virtual memory that the OVS processes use
- Resident memory that the OVS processes use
- Total memory of the system where the OVS is running
- Total CPU time that the OVS processes use

Supported Release

DX NetOps Virtual Network Assurance supports the following releases of Open vSwitch:

- 2.8.2

Requirements

- Add a remote to enable external connections on the OVS host. Run the following command on each compute node that DX NetOps Virtual Network Assurance monitors:

```
ovs-appctl -t ovsdb-server ovsdb-server/add-remote ptcp:6640
```

- Configure the OVS host to provide more performance information. Run the following command on the OVS host:

```
ovsdb-client transact '["Open_vSwitch",{"op": "update","row": {"other_config":
 ["map",[["enable-statistics","true"]] ]},"where": [],"table": "Open_vSwitch"}]'
```

Plug-in Configuration Example

The following JSON example shows the Open vSwitch plug-in configuration:

```
{
 "PLUGIN_CONFIG": {
     "OVS_HOST_IPS": [
     "192.168.1.1"
     ],
     "OVS_PORT": 6640,
     "PROTOCOL": "http",
```

```
      "INVENTORY_POLL_RATE": "0 */5 *",
      "INVENTORY_DELTA_TIME": 300,
      "AVAILABILITY_POLL_RATE": "0 */5 *",
      "AVAILABILITY_DELTA_TIME": 300,
      "DOMAIN_ID": 0
      }
}
```

- **OVS_HOST_IPS**The IP addresses of the OVSDB servers
- **OVS_PORT**
  The remote port that the OVSDB servers listen on
- **PROTOCOL**The communication protocol with the OVSDB server
  Values: http or https (case-sensitive)
- **INVENTROY_POLL_RATE**How often the product collects inventory data in cron syntax
- **INVENTORY_DELTA_TIME**The number of seconds in the inventory poll interval
  This value is used for metric calculations.
- **AVAILABILITY_POLL_RATE**
  How often the product polls the availability of the controller/orechestrator
- **AVAILABILITY_DELTA_TIME**The number of seconds in the availability poll interval
  This value is used for metric calculations.
- **DOMAIN_ID** DX NetOps Virtual Network Assurance assigns inventory from this plug-in to the specified domain.

Poll Rate Configuration

Silver Peak

Silver Peak is an SDN solution optimized for data center networks. DX NetOps Virtual Network Assurance collects inventory and performance data from Silver Peak. This plug-in currently supports only the SD-WAN solution with the Orchestrator (Unity Orchestrator Management) configuration of Silver Peak.

The plug-in collects inventory for the following items:

- Sites
- Orchestrator
- EdgeConnects
- EdgeConnects Interfaces
- Tunnels
- Overlay Tunnels
- Policy Groups
- Policies/SLA Classes (Business Intent Overlays)
- Application/SLA Paths
- Alarms and Events

  NOTE
  DX NetOps Spectrum consumes these alarms

The plug-in collects the following performance metrics:

NOTE
For 20.2.2, the APIs used to collect Tunnel data changed to avoid Orchestrator performance issues.

Item Type	VNA Metric Families and Metrics	SNMP Metric Families
Devices		• Availability • Reachability • SNMP Statistic • System • SIP Connection • IPv4 • Generic System • TCP Statistics • UDP Statistics • Interface
Interfaces	• Interface – Bits Per Second – Bits Per Second In – Bits Per Second Out – Packets – Packets In – Packets Out – Discarded Packets Per Second – Discarded Packets Per Second In – Discarded Packets Per Second Out – Maximum Bandwidth – Maximum Bandwidth In – Maximum Bandwidth Out – Percent Discards – Percent Discards In – Percent Discards Out – Speed In – Speed Out – Utilization – Utilization In – Utilization Out	

Item Type	VNA Metric Families and Metrics	SNMP Metric Families
Tunnels • Overlay Tunnel • Underlay Tunnel	• Tunnel – Jitter – Latency – Packet Loss Percentage – Bandwidth Utilization – Provisioned Speed In – Provisioned Speed Out – Availability – Time in Up State – Time in Down State – Time in Unknown State – Percent Time in Up State – Percent Time in Down State – Percent Time in Unknown State – Max Bandwidth Incoming – Max Bandwidth Outgoing – Bytes In **(20.2.2 and Higher Only)** – Bytes Out **(20.2.2 and Higher Only)**	
Application/SLA Paths	• SLA Path – Percentage of Jitter SLA Threshold – Percentage of Packet Loss SLA Threshold – Percentage of Latency SLA Threshold	

Supported Releases

DX NetOps Virtual Network Assurance supports the following release of Silver Peak:

- Unity Orchestrator 8.6.1.40151

Plug-in Configuration Example

The following JSON example shows the Silver Peak plug-in configuration:

```
{
"PLUGIN_CONFIG":{
    "ORCHESTRATOR_HOST": "192.168.3.209",
    "ORCHESTRATOR_HOST_PORT": 932,
    "ORCHESTRATOR_HOST_USER_NAME": "admin",
    "ORCHESTRATOR_HOST_PASSWORD": "admin",
    "PROTOCOL": "https",
    "LOGIN_TYPE": 0,
    "INVENTORY_POLL_RATE": "0 */5*",
    "PERFORMANCE_POLL_RATE": "0 */5*",
    "NOTIFICATION_POLL_RATE": "0 */5*",
    "DOMAIN_ID": "0 */1*",
    }
}
```

20.2.2 and Higher Only:

```
{
"PLUGIN_CONFIG":{
    "ORCHESTRATOR_HOST": "192.168.3.209",
    "ORCHESTRATOR_HOST_PORT": 932,
    "SYSLOG_PORT": 1542,
    "ORCHESTRATOR_HOST_USER_NAME": "admin",
    "ORCHESTRATOR_HOST_PASSWORD": "admin",
    "PROTOCOL": "https",
    "LOGIN_TYPE": 0,
    "ENABLE_REST_API_EVENTS":"true",
    "ENABLE_SYSLOG_EVENTS":"false",
    "INVENTORY_POLL_RATE": "0 */15*",
    "PERFORMANCE_POLL_RATE": "0 */15*",
    "PERFORMANCE_DELTA_TIME": 900,
    "NOTIFICATION_POLL_RATE": "0 */1*",
    "DOMAIN_ID": "0 */1*",
    }
}
```

- **ORCHESTRATOR_HOST_IP**
  The Unity Orchestrator Management host
- **ORCHESTRATOR_HOST_PORT**
  The port that the Orchestrator UI/API server listens on
  Default: 932
- **SYSLOG_PORT** (20.2.2 and Higher Only)
  The port that the DX NetOps Virtual Network Assurance SYSLOG listens to
  Default: 1542
- **ORCHESTRATOR_HOST_USER_NAME**
  The Orchestrator user name
- **ORCHESTRATOR_HOST_PASSWORD**
  The Orchestrator password
- **PROTOCOL**
  The communication protocol with the Orchestrator
  Values: http or https
- **LOGIN_TYPE**
  Values for using the API
  Values: 0 = local, 1 = RADIUS, 2 = TACACS
- **ENABLE_REST_API_EVENT** (20.2.2 and Higher Only)
  Whether to enable event notifications polling through the REST API
  Values: true or false

  NOTE
  You cannot enable this parameter at the same time as the `ENABLE_SYSLOG_EVENTS` parameter.
- **ENABLE_SYSLOG_EVENTS** (20.2.2 and Higher Only)
  Whether to enable event notifications polling through SYSLOG
  Values: true or false

  NOTE
  You cannot enable this parameter at the same time as the `ENABLE_REST_API_EVENT` parameter.
- **INVENTORY_POLL_RATE**

How often the product calls inventory data
- **PERFORMANCE_POLL_RATE**
  How often the product collects performance data
- **PERFORMANCE_DELTA_TIME** (20.2.2 and Higher Only)
  Difference between polls (in seconds) for performance data requests
- **NOTIFICATION_POLL_RATE**
  How often the product collects notification data
- **DOMAIN_ID**
  DX NetOps Virtual Network Assurance assigns inventory from this plug-in to the specified domain

Versa SD-WAN

DX NetOps Virtual Network Assurance collects inventory and performance metrics from Versa SD-WAN to support DX NetOps Performance Management SD-WAN monitoring.

The plug-in collects inventory for the following items:

- Sites

  NOTE

  Sites from Versa SD-WAN map to the Site Groups in Performance Center. If desired, you can manage your site groups in Performance Center to update a site name.
- Router (FLexVNFs Hub and Branch Appliances)
- SLA Class/Profile (Policies corresponding to FLexVNFs Hub and Branch Appliances)
- Interfaces (Virtual Network Interfaces/Sub Interfaces associated to FLexVNFs Hub and Branch Appliances)
- Tunnels (Connectivity between two Virtual Network Interfaces/Sub Interfaces associated to FLexVNFs Hub and Branch Appliances)

  NOTE
  Tunnels between branches and between branches and controllers are now supported.
- Application/SLA Paths (SLA Class/Profile associated with Tunnels)
- Versa Director and Versa Controller

  NOTE

  The Versa Director and Versa Controller inventory items are supported only for DX NetOps Spectrum.

The plug-in collects notifications of following types:

- Alarms (related to FLexVNFs Hub and Branch Appliances)
- Events (related to Alarms)

The plug-in collects the following performance metrics:

Item Types	VNA Metric Families and Metrics
Devices	• CPU – Utilization • Memory – Memory Utilization

Interfaces	• Interface – Incoming Bytes – Outgoing Bytes – Incoming Packets – Outgoing Packets – Incoming Dropped Packets – Outgoing Dropped Packets – Incoming Errors – Outgoing Errors – Interface Speed
Tunnels	• Network Interface – Jitter – Latency – Packet loss (PDU Loss Ratio)
SLA Paths	• Network Interface – Percentage of Jitter SLA Threshold – Percentage of Packet Loss SLA Threshold – Percentage of Latency SLA Threshold

Supported Releases

CA Virtual Network Assurance supports the following releases of Versa SD-WAN:

- Versa SD-WAN 16.1R2

  NOTE

  Only the Versa SD-WAN 16.1R2 version supports out-of-band IP management for the branches that this plugin discovers. Without this IP management, DX NetOps Spectrum cannot automatically poll the branches using SNMP.
- Versa SD-WAN 16.1R1

Requirements

- The Versa Director port must be open to the DX NetOps Virtual Network Assurance host.
- The Versa Analytics port must be open to the DX NetOps Virtual Network Assurance host.

Plug-in Configuration Example

The following JSON example shows the Versa SD-WAN plug-in configuration:

NOTE

You can specify the out of band management IP address for appliances in multiple ways.

If the default out of band management IP address does not work for you, and if the appliance IP addresses are also the out of band management IP address for the appliances in your environment, then setting the `SET_APPLIANCE_IP_AS_OOBM_IP` flag to "true" forces the Versa plug-in to set the appliance IP address as the out of band management IP address for the discovered appliances.

Otherwise, use the `OOBM_INTERFACE_NAME` parameter to specify a name for the interface that is used as the management interface for your appliances (for example, "eth-0/0").

```
{
     "PLUGIN_CONFIG": {
     "PROTOCOL": "https",
```

```
      "DIRECTOR_IP": "13.57.128.2",
      "DIRECTOR_PORT": 9182,
      "DIRECTOR_USER_NAME": "defaultUser",
      "DIRECTOR_PASSWORD": "defaultPasswrd",
      "ANALYTICS_PROTOCOL": "http",
      "ANALYTICS_IP": "13.57.128.2",
      "ANALYTICS_PORT": 8080,
      "ANALYTICS_USER_NAME": "defaultUser",
      "ANALYTICS_PASSWORD": "defaultPasswrd",
      "INVENTORY_POLL_RATE": "0 */10 *",
      "INVENTORY_DELTA_TIME": 600,
      "SET_APPLIANCE_IP_AS_OOBM_IP": "false",
      "OOBM_INTERFACE_NAME": "",
      "PERFORMANCE_POLL_RATE": "0 */15 *",
      "PERFORMANCE_DELTA_TIME": 900,
      "PERFORMANCE_REQUEST_COUNT": 1000,
      "AVAILABILITY_POLL_RATE": "0 */5 *",
      "AVAILABILITY_DELTA_TIME": 300,
      "NOTIFICATION_POLL_RATE": "0 */1 *",
      "NOTIFICATION_DELTA_TIME": 60,
      "MAX_NOTIFICATION_COUNT": 10000,
      "MAX_INV_THREADS": 1,
      "MAX_PERF_THREADS": 1,
      "MAX_NOTIFICATION_THREADS": 1,
      "TIMEZONE": "GMT",
      "DEVICE_FILTER_FILE_PATH": "",
      "DOMAIN_ID": 0
      }
}
```

- **DIRECTOR_IP**
  The IP address of the Versa Director server
- **DIRECTOR_PORT**
  The Versa Director port
  Default: 9182
- **DIRECTOR_USER_NAME**
  The Versa Director user name
- **DIRECTOR_PASSWORD**
  The password for the Versa Director user
- **ANALYTICS_IP**
  The IP address for the Versa Analytics server
- **ANALYTICS_PORT**
  The Versa Analytics port
- **ANALYTICS_USER_NAME**
  The Versa Analytics user name
- **ANALYTICS_PASSWORD**
  The password for the Versa Analytics user
- **PROTOCOL**
  The HTTP security scheme for Versa SD-WAN
  Default: https
- **INVENTORY_POLL_RATE**

How often the product collects inventory data

- **INVENTORY_DELTA_TIME**
  The time difference between inventory polls (in seconds)
- **SET_APPLIANCE_IP_AS_OOBM_IP**
  Whether to use the `ip-address` field value of the Versa device as the out of band management IP address of the device
- **OOBM_INTERFACE_NAME**
  The name of the out of band management interface of the devices and controllers
  Default:""
- **PERFORMANCE_POLL_RATE**
  How often the product collects performance data
- **PERFORMANCE_DELTA_TIME**
  Difference between polls (in seconds) for performance data requests
- **PERFORMANCE_REQUEST_COUNT**
  The response entry count for performance data requests
- **AVAILABILITY_POLL_RATE**
  How often the product polls the availability of the Versa Director
- **AVAILABILITY_DELTA_TIME**
  Difference between polls (in seconds) for availability data requests
- **NOTIFICATION_POLL_RATE**
  How often the product collects notifications
- **NOTIFICATION_DELTA_TIME**
  Difference between notification polls
- **MAX_NOTIFICATION_COUNT**
  The maximum number of historical active alarms to pull during the first run
- **MAX_INV_THREADS**
  The number of threads required to run the Inventory poll
  Maximum: 8
  Minimum:1
- **MAX_PERF_THREADS**
  The number of threads required to run the Performance and Availability poll
  Maximum: 8
  Minimum:1
- **MAX_NOTIFICATION_THREADS**
  The number of threads required to run the Notification poll
  Maximum: 8
  Minimum:1
- **TIMEZONE**
  The time zone of the system, which must match the Versa Director and Versa Analytics time zone

  WARNING

  If this parameter is set incorrectly, the following issues might occur:

  - Incorrect timestamps might appear on performance data.
  - Performance data might be missing.
- **DOMAIN_ID**
  DX NetOps Virtual Network Assurance assigns inventory from this plug-in to the specified domain.

Viptela

Viptela is a software-defined wide area networking (SD-WAN) solution. DX NetOps Virtual Network Assurance collects inventory and performance metrics from Viptela to support DX NetOps Performance Management and DX NetOps Spectrum SD-WAN monitoring.

The Viptela plug-in collects inventory for the following items:

- Sites

  NOTE
  Viptela sites map to site groups in Performance Center. If desired, you can manage your site groups in Performance Center to update a site name.
- vEdge router
- cEdge router (16.x and 17.x)
- vEdge interfaces
- cEdge interfaces (16.x and 17.x)

  NOTE
  cEdge Interface is available for NetOps 20.2.4 or higher versions.
  Performance stats are not supported for cEdge.
- Tunnels
- Application/SLA Paths
- Alarms and events raised on vEdge routers

  NOTE
  DX NetOps Spectrum consumes these alarms.

  For more information, see the Cisco SD-WAN documentation.
- vManage
- vBond
- vSmart

Viptela collects the following performance metrics:

Item Types	VNA Metric Families and Metrics	SNMP Metric Families	NFA Metric Families and Metrics

Devices	• CPU
	  — Utilization
	• Storage Disk Capacity
	  — Disk Utilization
	• Memory
	  — Memory Utilization
		• Availability
		• Device Unique Identifier
		• Environmental Sensor - Fan
		• Environment Sensor - Power Supply
		• Environmental Sensor - Temperature
		• ISDN
		• Reachability
		• SNMP Statistics
		• System	

Interfaces	• Interface – Incoming Bytes – Outgoing Bytes – Incoming Packets – Outgoing Packets – Incoming Dropped Packets – Outgoing Dropped Packets – Incoming Errors – Outgoing Errors – Interface Speed	• Interface	• NetFlow Statistics – Top Enterprise Hosts by Volume – Top Enterprise Protocols by Volume – Top IP Interface Utilization (Flow) – Top Flows by Volume – Interfaces Over Threshold – Routers with the Most Flow Traffic – Top Conversations – Top Hosts – Top Protocols – ToS Summary
Tunnels	• Network Interface – Jitter – Latency – Packet loss – Time in Up State – Time in Down State – Time in Unknown State – Pct Time in Up State – Pct Time in Down State – Pct Time in Unknown State – Bytes In (Gauge) – Bytes Out (Gauge – Packets In (Gauge) – Packets Out (Gauge)	• VPN Interface • IPSec Tunnel Aggregate	
Application/SLA Paths	• Network Interface – Percentage of Jitter SLA Threshold – Percentage of Packet Loss SLA Threshold – Percentage of Latency SLA Threshold	• Application Route SLA Class • Application Route Statistics	

Supported Releases

DX NetOps Virtual Network Assurance supports the following Viptela releases:

- Viptela 20.x (Only 20.2.4 and higher)
- Viptela 19.x.
- Viptela 18.4
- Viptela 18.3
- Viptela 17.2.0
- Viptela 17.1.0

Requirements

- The vManage port must be open to the DX NetOps Virtual Network Assurance host.
- For application/SLA path data, when you provision tunnels in a Viptela network, you must create policies that define the SLA classes for the different types of traffic. If no sla-class policies are defined, DX NetOps Virtual Network Assurance can discover tunnels, but cannot create application/SLA paths.
  For more information, see the Cisco SD-WAN documentation.

Plug-in Configuration Example

Configure the Viptela plug-in to access Viptela vManage with a user other than the 'admin' user. The Viptela user that is used in the plug-in configuration must be granted the 'operator' role for the Viptela plug-in to function properly.

> **NOTE**
> Viptela locks out a user after excessive unsuccessful login attempts. If the password of the plug-in user is changed in Viptela, prevent the plug-in from locking out the user from vManage by updating the Viptela plug-in configuration with the new password. If Viptela data is missing, check whether the user can log in to vManage. If the user is locked out, unlock the user account.
> For more information about how to unlock a user, see the "request aaa unlock-user" command in the Command Reference section of the Cisco SD-WAN documentation.

The following JSON example shows the Viptela plug-in configuration:

> **NOTE**
> In CA VNA 3.7.1, the `OUT_OF_BAND_MGMT_VPN_ID` property has been removed and the `DEVICE_MODEL_PATTERN_VS_OOBM_VPN_ID_PAIRS` property has been added.

```
{
"PLUGIN_CONFIG": {
      "VMANAGE_IP": "10.241.1.5",
      "VMANAGE_PORT": 8443,
      "VMANAGE_USER_NAME": "capm",
      "VMANAGE_PASSWORD": "capm",
      "PROTOCOL": "https",
       "VMANAGE_PROXY_IP": "0.0.0.0",
      "VMANAGE_PROXY_PORT": "0",
      "VMANAGE_PROXY_PROTOCOL": "https",
      "VMANAGE_PROXY_USER_NAME": "",
      "VMANAGE_PROXY_PASSWORD": "",
      "USE_PROXY": "FALSE",
       "DEVICE_MODEL_PATTERN_VS_OOBM_VPN_ID_PAIRS": "{ .*=512 }",
       "INVENTORY_POLL_RATE": "0 */10 *",
       "INVENTORY_DELTA_TIME": 600,
       "INVENTORY_REQUEST_COUNT": 5000,
      "PERFORMANCE_POLL_RATE": "0 */30 *",
      "PERFORMANCE_DELTA_TIME": 1800,
      "PERFORMANCE_REQUEST_COUNT": 1000,
       "VEDGE_PERFORMANCE_SAMPLE_INTERVAL": 300,
      "INTERFACE_PERFORMANCE_SAMPLE_INTERVAL": 300,
      "TUNNEL_PERFORMANCE_SAMPLE_INTERVAL": 300,
       "TIMEZONE": "GMT",
      "AVAILABILITY_POLL_RATE": "0 */5 *",
```

```
      "AVAILABILITY_DELTA_TIME": 300,
      "NOTIFICATION_POLL_RATE": "0 */1 *",
       "NOTIFICATION_DELTA_TIME": 60,
       "SLA_CLASS_POLL_RATE": "0 0 0",
       "SLA_CLASS_DELTA_TIME": 86400,
       "MAX_NOTIFICATION_COUNT": 10000,
       "DOMAIN_ID": 0
      }
}
```

NOTE
The default values for the Viptela plug-in configuration balance performance with efficiency. Gaps might appear in dashboards that display data collected at intervals longer than the dashboard resolution. You can change the dashboard resolution or increase the polling frequency. Increasing the polling frequency increases the load on the vManage host.

- **VMANAGE_IP**
  The IP address of the vManage host.
- **VMANAGE_PORT**
  The vManage port.
  Default: 8443
- **VMANAGE_USER_NAME**
  A vManage user with the netadmin role.
- **VMANAGE_PASSWORD**
  The password for the vManage user.
- **PROTOCOL**
  The HTTP security scheme for vManage.
  Default: https
- **VMANAGE_PROXY_IP**
  The IP address of the vManage proxy.
- **VMANAGE_PROXY_PORT**
  The port of the vManage proxy.
- **VMANAGE_PROXY_PROTOCOL**
  The HTTP security scheme for the vManage proxy.
- **VMANAGE_PROXY_USER_NAME**
  The user name of the vManage proxy.
- **VMANAGE_PROXY_PASSWORD**
  The password of the vManage proxy.
- **USE_PROXY**Whether to use the vManage proxy
  Allowed values: TRUE or FALSE
- **DEVICE_MODEL_PATTERN_VS_OOBM_VPN_ID_PAIRS**
  Represents a device model pattern and the value is the corresponding VPN id of the management interface.
  Default: ".*

  NOTE
  For example, to configure VPN Id 512 only for device models vedge-1000 and 1 for the rests, use the following property value: `"DEVICE_MODEL_PATTERN_VS_OOBM_VPN_ID_PAIRS": "{ vedge-1000=512, .*=1 }"`
- **INVENTORY_POLL_RATE**

How often the product collects inventory data.
- **INVENTORY_DELTA_TIME**
  The time difference between inventory polls (in seconds).
- **INVENTORY_REQUEST_COUNT**
  The default paging size for the Viptela inventory.
- **PERFORMANCE_POLL_RATE**
  How often the product collects performance data.
- **PERFORMANCE_DELTA_TIME**
  Difference between polls (in seconds) for performance data requests.
- **PERFORMANCE_REQUEST_COUNT**
  The response entry count for performance data requests.
- **VEDGE_PERFORMANCE_SAMPLE_INTERVAL**
  How often Viptela records vEdge device performance.
- **INTERFACE_PERFORMANCE_SAMPLE_INTERVAL**
  How often Viptela records interface performance data.
- **TUNNEL_PERFORMANCE_SAMPLE_INTERVAL**
  How often Viptela records tunnel performance data.
- **TIMEZONE**
  The time zone of the system, which must match the vManage time zone.

  WARNING
  Set this parameter correctly to prevent the following issues:

  - Incorrect timestamps might appear on performance data.
  - Performance data might be missing.
  - Alarms and events might not be collected.
- **AVAILABILITY_POLL_RATE**
  How often the product polls the availability of the controller.
- **AVAILABILITY_DELTA_TIME**
  Difference between polls (in seconds) for availability data requests.
- **NOTIFICATION_POLL_RATE**
  How often the product collects alarm and event data.
- **NOTIFICATION_DELTA_TIME**
  Difference between polls (in seconds) for alarm and event data requests.
- **SLA_CLASS_POLL_RATE**
  How often the product collects SLA class data.
- **SLA_CLASS_DELTA_TIME**
  Difference between polls (in seconds) for SLA class data requests.
- **MAX_NOTIFICATION_COUNT**
  The maximum number of historical active alarms to pull during the first run.
- **DOMAIN_ID**
  DX NetOps Virtual Network Assurance assigns inventory from this plug-in to the specified domain.

VMware vSphere

VMware vSphere is a cloud computing virtualization platform. DX NetOps Virtual Network Assurance collects inventory and performance metrics from VMware vSphere.

The plug-in collects inventory for the following items from the vCenter server:

- Data centers
- Clusters
- Hosts
- Virtual machines
- Host interfaces
- Virtual machine interfaces
- vSphere distributed virtual switches (Created by the Cisco ACI Virtual Machine Manager Domain integration with VMware vSphere)
- vSphere distributed virtual switch ports

NOTE

To see performance metrics for ESX hosts, you must enable SNMP on each host and discover the hosts in Performance Center. DX NetOps Virtual Network Assurance collects performance metrics only for Virtual Machines.

The plug-in supports the following events from the vCenter server:

- **DrsVmMigratedEvent**
  A virtual machine migration that the Distributed Resource Scheduler (DRS) recommended
- **VmMigratedEvent**
  A virtual machine migration
- **VmFailedMigrateEvent**
  A failure to migrate a virtual machine
- **VmBeingHotMigratedEvent**
  A virtual machine is hot-migrating
- **VmBeingMigratedEvent**
  A virtual machine is migrating

NOTE

The plug-in queries vCenter events at a configurable rate. The default rate is every 60 seconds.

VMware vSphere collects the following performance metrics:

Item Type	VNA Metric Families and Metrics
Hosts	• CPU and Memory – CPU – CPU Utlization – Memory Usage – Memory – Aggregated Network Incoming Bytes – Aggregated Network Outgoing Bytes – Aggregated Network Incoming Packets – Aggregated Network Outgoing Packets • Disk – Disk Read Requests Rate – Disk Write Requests Rate – Disk Read Bytes Rate – Disk Write Bytes Rates – Disk Capacity – Disk Latency – Disk Allocation – Disk IOPS – Disk Usage
Virtual Machines	• CPU and Memory – CPU – CPU Utlization – Memory Usage – Memory – Aggregated Network Incoming Bytes – Aggregated Network Outgoing Bytes – Aggregated Network Incoming Packets – Aggregated Network Outgoing Packets • Disk – Disk Read Requests Rate – Disk Write Requests Rate – Disk Read Bytes Rate – Disk Write Bytes Rates – Disk Capacity – Disk Latency – Disk Allocation – Disk IOPS – Disk Usage
DVS Ports	• Interface – Incoming Bytes – Outgoing Bytes – Incoming Packets – Outgoing Packets – Incoming Dropped Packets – Outgoing Dropped Packets – Incoming Errors – Outgoing Errors

Virtual Machine Metrics and Host Metrics

The plug-in collects the following metrics for virtual machines and hosts:

NOTE

The default statistics collection level is level 1. From the vSphere Web Client, manage your settings to increase the statistics collection level to level 3 for all the necessary metrics. Disable weekly, monthly, and yearly performance data saving to reduce the required disk space. For more information, see the VMware vSphere documentation.

Statistics collection level	Supported Metrics
Level 1	CPU Time for Virtual Machine and Host
Level 1	Memory for Virtual Machine and Host
Level 1	Disk Usage for Virtual Machine and Host
Level 2	CPU Time for Virtual Machine and Host
Level 2	Memory for Virtual Machine and Host
Level 2	Disk Usage for Virtual Machine and Host
Level 2	Disk Read for Virtual Machine and Host
Level 2	Disk Write for Virtual Machine and Host
Level 3	Disk capacity for Virtual Machine and Host
Level 3	Disk allocation for Virtual Machine and Host
Level 3	Disk usage for Virtual Machine and Host
Level 3	Disk latency for Virtual Machine and Host
Level 3	Disk IOPS for Virtual Machine and Host
Level 3	Disk read request rate for Virtual Machine and Host
Level 3	Disk write request rate for Virtual Machine and Host
Level 3	Disk read bytes rate for Virtual Machine and Host
Level 3	Disk write bytes rate for Virtual Machine and Host
Level 3	CPU time for Virtual Machine and Host
Level 3	CPU utilization for Virtual Machine and Host
Level 3	Memory for Virtual Machine and Host
Level 3	Memory utilization for Virtual Machine and Host

The plug-in calculates the following metrics:

- Virtual machines per hypervisor

Distributed Virtual Switch Port Metrics

The plug-in collects the following metrics for distributed virtual switch ports:

Statistics collection level	Supported Metrics
Level 2	Incoming bytes on virtual interfaces, Hosts, and Distributed Virtual Switch Port
Level 2	Outgoing bytes on virtual interfaces, Hosts, and Distributed Virtual Switch Port

Level 2	Incoming packets on virtual interfaces, Hosts, and Distributed Virtual Switch Port
Level 2	Outgoing packets on virtual interfaces, Hosts, and Distributed Virtual Switch Port
Level 2	Incoming Dropped Packets for Distributed Virtual Switch Port
Level 2	Outgoing Dropped Packets for Distributed Virtual Switch Port
Level 2	Incoming Errors for Distributed Virtual Switch Port
Level 2	Outgoing Errors for Distributed Virtual Switch Port
Level 3	Incoming bytes on virtual interfaces, Hosts, and Distributed Virtual Switch Port
Level 3	Outgoing bytes on virtual interfaces, Hosts, and Distributed Virtual Switch Port
Level 3	Incoming packets on virtual interfaces, Hosts, and Distributed Virtual Switch Port
Level 3	Outgoing packets on virtual interfaces, Hosts, and Distributed Virtual Switch Port
Level 3	Incoming Dropped Packets for Distributed Virtual Switch Port
Level 3	Outgoing Dropped Packets for Distributed Virtual Switch Port
Level 3	Incoming Errors for Distributed Virtual Switch Port
Level 3	Outgoing Errors for Distributed Virtual Switch Port

Supported Releases

CA Virtual Network Assurance (VNA) supports the following releases of VMWare vSphere:

- VMware vSphere 6.0.
- VMware vSphere 6.5.

Requirements

- vSphere plug-in and ACI plug-in must be configured using the same `DOMAIN_ID`.
- vSphere plug-in requires read-only access to vCenter Server running VMware Infrastructure SDK Web Service.
- The URL used by the plug-in for accessing the VMware Infrastructure SDK Web Service is: `https://<vCenter_IP_Address>/sdk/vimService.wsdl`
- If you have multiple vSphere vCenter environments, configure each vCenter to a different domain in DX NetOps Virtual Network Assurance.

Plug-in Configuration Example

The following JSON example shows the VMWare vSphere plug-in configuration:

```
{
"PLUGIN_CONFIG": {
     "VCENTER_IP": "10.241.16.37",
     "VCENTER_USER_NAME": "vnaUser@vsphere.local",
     "VCENTER_PASSWORD": "Password@1"
     "PROTOCOL": "https",
     "INVENTORY_POLL_RATE": "0 */10 *",
     "INVENTORY_DELTA_TIME": 600,
```

```
      "AVAILABILITY_POLL_RATE": "O */5 *",
      "AVAILABILITY_DELTA_TIME": 300,
      "PERFORMANCE_POLL_RATE": "0 */10 *",
      "PERFORMANCE_DELTA_TIME": 600,
      "MAX_PERF_THREADS": 3,
      "NOTIFICATION_POLL_RATE": "0 */1 *",
      "DOMAIN_ID": 0
      }
}
```

20.2.2 and Higher Only:

```
{
"PLUGIN_CONFIG": {
      "VCENTER_IP": "10.241.16.37",
      "VCENTER_USER_NAME": "vnaUser@vsphere.local",
      "VCENTER_PASSWORD": "Password@1"
      "PROTOCOL": "https",
      "INVENTORY_POLL_RATE": "0 */10 *",
      "INVENTORY_DELTA_TIME": 600,
      "AVAILABILITY_POLL_RATE": "O */5 *",
      "AVAILABILITY_DELTA_TIME": 300,
      "PERFORMANCE_POLL_RATE": "0 */10 *",
      "PERFORMANCE_DELTA_TIME": 600,
      "MAX_PERF_THREADS": 3,
      "ENABLE_DVS_PERF    ": "true,",
      "NOTIFICATION_POLL_RATE": "0 */1 *",
      "DOMAIN_ID": 0
      }
}
```

- **VCENTER_IP**
  The IP address of the vCenter server
- **VCENTER_USER_NAME**
  The vCenter Server user name
- **VCENTER_USER_NAME**
  The vCenter server password
- **PROTOCOL**
  The communication protocol with the vCenter server
  Values: http or https (case-sensitive)
- **INVENTORY_POLL_RATE**
  How often the product collects inventory data
- **INVENTORY_DELTA_TIME**
  Difference between polls (in seconds)
- **AVAILABILITY_POLL_RATE**
  How often the product collects availability data
- **AVAILABILITY_DELTA_TIME**

The time difference between availability polls (in seconds)
- **PERFORMANCE_POLL_RATE**
  How often the product collects performance data
- **PERFORMANCE_DELTA_TIME**
  The time difference between performance polls (in seconds)
- **MAX_PERF_THREADS**
  Denotes the number of threads required to run the performance poll
  Max Value: 3
  Minimum Value: 1
- **ENABLE_DVS_PERF** (20.2 and Higher Only)
  Whether to enable performance metrics for DVS ports
  Values: true or false
- **NOTIFICATION_POLL_RATE**
  How often the product collects alarm and event data
- **DOMAIN_ID**
  CA Virtual Network Assurance assigns inventory from this plug-in to the specified domain

Using

DX NetOps Virtual Network Assurance collects SDN and NFV data and provides that information to other products for analysis.

DX NetOps Performance Management

DX NetOps Performance Management provides inventory and performance data for VMs, VNFs, service chains, supporting physical hardware, and vSwitches. For more information, see the documentation.

DX NetOps Spectrum

DX NetOps Spectrum associates the overlay topology from the virtual network with the physical infrastructure of the underlay. For more information, see the documentation.

Manage Domain Groups

To organize inventory that is collected from various plug-ins, create domain groups. Each plug-in assigns inventory to a single domain. Downstream consumers of DX NetOps Virtual Network Assurance data use these domains to organize inventory into meaningful groups for reporting.

To manage domains, go to user interface for the DX NetOps Virtual Network Assurance API at the following address:
`http://gateway_host:8080/vna/`

View the List of Domains

You can view the list of domains and domain IDs.

Follow these steps:

1. Go to the following URL:
   `http://gateway_host:8080/vna/`
2. Show the **Inventory**.
3. Select the following GET endpoint:
   `/v1/inventory/userdomains`

4. Click **Try it out!**
   View the response body.

Create a Domain

Follow these steps:

1. Go to the following URL:
   `http://gateway_host:8080/vna/`
2. Show the **Inventory**.
3. Select the following POST endpoint:
   `/v1/inventory/userdomains/{domainName}`

4. Specify the **domainName**, and click **Try it out!**
   DX NetOps Virtual Network Assurance creates the domain. View the response body to find the domain ID, which is required for plug-in configuration.

Update a Domain

Follow these steps:

1. Go to the following URL:
   `http://gateway_host:8080/vna/`
2. Show the **Inventory**.
3. Select the following PUT endpoint:
   `/v1/inventory/userdomains/{id}/{newDomainName}`

4. Specify the **id** and **newDomainName**, and click **Try it out!**
   DX NetOps Virtual Network Assurance updates the display name for the domain.

Administrating

DX NetOps Virtual Network Assurance does not require user direct user administration. Administer users in the products that consume and display DX NetOps Virtual Network Assurance data, such as DX NetOps Performance Management and DX NetOps Spectrum.

This section includes information about other administrative functions, such as system monitoring and environment configuration.

Update VNA Console Login Credentials

You can update the VNA console login credentials.

Follow these steps:

1. In the REST client interface, type the following URL in the URL field:
   `http://VNA_IP:8080/vna/rest/v1/auth/user`
2. Select **Put** for the method.
3. Select the following headers:
   `"Accept:text/plain", "Content-Type,application/json"`
4. Customize the following parameters in the Body text field:

```
{
 "EXISTING_USER_NAME": "admin",
```

```
 "EXISTING_PASSWORD": "admin",
 "NEW_USER_NAME": "admin1",
 "NEW_PASSWORD": "admin1",
 "CONFIRM_NEW_PASSWORD": "admin1"
}
```

5. Click **Send** to run the method

Update a Forgotten VNA Console Password

If you forget the VNA console password, you can update it.

Follow these steps:

1. Generate a cryptographic SHA-256 hash of the new password text.
2. Convert the hash to HEX encode and update it in the VNA database with the following SQL statement:

```
update vnaconfig set configValue="XXXXXXXXXXXXXXXX" where configKey="SWAGGER_UI_PASSWORD";
```

Back Up and Restore

Back up the DX NetOps Virtual Network Assurance database before an upgrade. To avoid losing valuable data, back up the DX NetOps Virtual Network Assurance database regularly. You can restore an existing backup of the DX NetOps Virtual Network Assurance database.

Back Up the DX NetOps Virtual Network Assurance Database

Create a backup archive of the current database anytime that you plan to reinstall or upgrade the software. We recommend that you create a backup on a regular basis.

Follow these steps:

1. Log in to the DX NetOps Virtual Network Assurance host as 'root', or use the 'sudo' account that you configured for the installation.
2. Back up the database archive to a specified directory using the following command:

```
/opt/CA/VNA/tools/bin/db_backup.sh -
p MySQL_root_password
backupDir/backup_filename
```

   Example:

```
/opt/CA/VNA/tools/bin/db_backup.sh -p admin /tmp/vna_db.sql
```

   Use any secure location with sufficient space for the backup directory.
3. Copy the following files to the backup directory:

```
cp /opt/CA/VNA/data/ID_CACHE.dat backupDir/ID_CACHE.dat
cp /opt/CA/VNA/data/REMOTE_VNA_CACHE.dat backupDir/REMOTE_VNA_CACHE.dat
```

Restore the DX NetOps Virtual Network Assurance Database

You can restore an existing backup of the DX NetOps Virtual Network Assurance database.

Follow these steps:

1. Log in to the DX NetOps Virtual Network Assurance host as 'root', or use the 'sudo' account that you configured for the installation.
2. Stop the application server:

   ```
   service wildfly stop
   ```

3. Restore the database archive from a specified directory using the following command:

   ```
   /opt/CA/VNA/tools/bin/db_restore.sh -
   p MySQL_root_password
   backupDir/backup_filename
   ```

   Example:

   ```
   /opt/CA/VNA/tools/bin/db_restore.sh -p admin /tmp/vna_db.sql
   ```

4. Restore the following files:

   ```
   cp backupDir/ID_CACHE.dat /opt/CA/VNA/data
   cp backupDir/REMOTE_VNA_CACHE.dat /opt/CA/VNA/data
   ```

5. Start the application server:

   ```
   service wildfly start
   ```

Configure Multi-Tenancy for CA Spectrum

If you want to aggregate data from multiple DX NetOps Virtual Network Assurance (VNA) hosts for DX NetOps Spectrum 10.2.3 and higher, you can configure and deploy a multi-tenant environment. In this environment, a VNA Aggregator aggregates data from multiple remote VNA hosts and sends the data to DX NetOps Spectrum with unique entity IDs.

Requirements

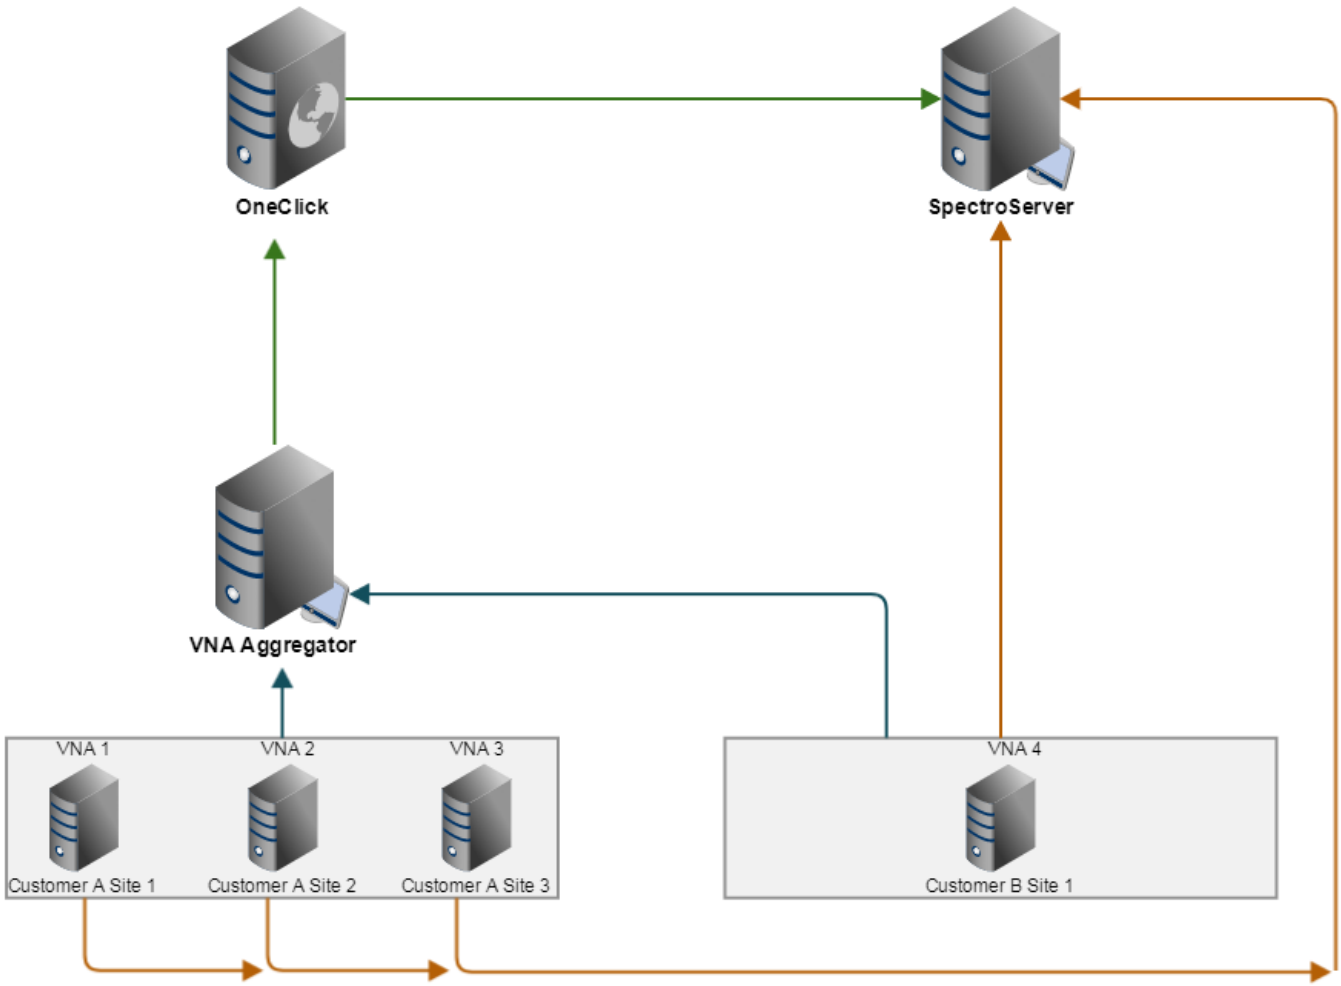
The following requirements apply to a multi-tenant environment:

- The domain name for each VNA host in your multi-tenant environment must be unique. Follow a naming convention (for example, `customer_name_site)` .
- We strongly recommend that the VNA Aggregator be fully dedicated to aggregation. Do not install other plug-ins on this host.
- The VNA Aggregator and OneClick should reside on the same server.
- Do not use or reuse an existing standalone VNA instance as the VNA Aggregator. Always use a freshly installed VNA instance as the VNA Aggregator.

Multi-tenant Architecture

The following diagram shows the system architecture of a multi-tenant environment:

Figure 71: Multi-tenant Architecture



Deploy multi-tenancy

For DX NetOps Spectrum to consume data from multiple VNA hosts, deploy multi-tenancy. Then DX NetOps Spectrum can segregate data on a per site basis for each customer and customers can have multiple sites.

Follow these steps:

1. Navigate to the DX NetOps Virtual Network Assurance API:
   `http://gateway_host:8080/vna/`
2. Expand **Aggregate**.
3. Specify the following GET call:
   `/v1/aggregate/vna`

4. Use a REST client to POST the following JSON parameters for each VNA host:

```
[
      {
            "VNA_HOST": "string",
            "VNA_PORT": 0
      }
]
```

Example:

```
[
      {
            "VNA_HOST": "1.2.3.4",
            "VNA_PORT": 8080
      },
      {
            "VNA_HOST": "5.6.7.8",
            "VNA_PORT": 8080
}
]
```

The connection status changes to "INITIALIZED"

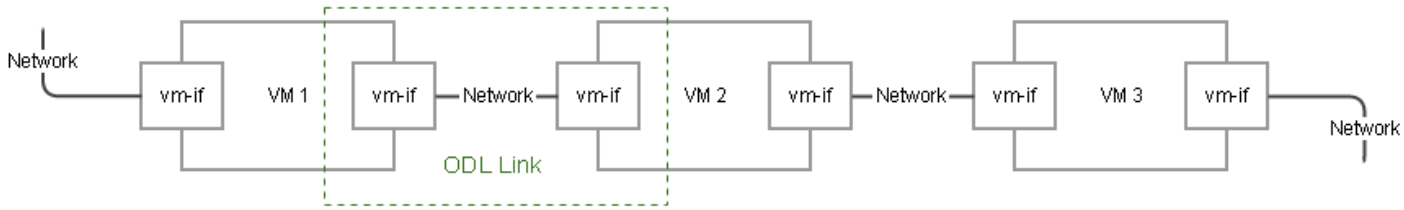
5. Integrate your VNA Aggregator with DX NetOps Spectrum. For more information, see the CA Spectrum documentation.
   When DX NetOps Spectrum connects to receive updates, the VNA Aggregator starts the client for each remote VNA host.
   The status of each remote VNA host changes to "CONNECTED"

Configure The OpenDaylight Topology to Support Service Chain Monitoring

To collect service chain information from the topology endpoint in OpenDaylight (ODL), DX NetOps Virtual Network Assurance requires the ODL topology to be manually configured. The service chain represents VMs connected through the network by virtual interfaces. In ODL, the topology defines the connections between VMs as links. Each node in the topology is a VM and each node termination point is an interface on the VM.

The following diagram shows an example of a flattened topology:

Figure 72: Required ODL Topology



TIP

The ODL topology always has one more link than you have VMs in the service chain.

The following ODL topology creates the previous example:

```
{
```

```
   "network-topology": {
     "topology": [
       {
         "topology-id": "topology-
name",
         "link": [
           {
             "link-id": "c75e6807-d203-4a80-90ed-641292abc2ad",
             "destination": {
               "dest-node": "87565ada-2f75-4d8f-a47a-655c20a01967",
               "dest-tp": "3ba3ae06-e84f-4e01-b67b-b43402a19d86"
             },
             "source": {
               "source-node": "960ac31e-e075-48b1-b35c-7e51a8996a98",
               "source-tp": "6243261b-cdb7-4126-8bc2-562e14719d0f"
             }
           },
           {
             "link-id": "165e5740-31d2-4eaf-ac8b-6e5cf8f3dd45",
             "destination": {
               "dest-node": "RIGHT",
               "dest-tp":
 "RIGHT"
             },
             "source": {
               "source-node": "87565ada-2f75-4d8f-a47a-655c20a01967",
               "source-tp": "2597e994-7266-4e66-97fc-b15a578f5edf"
             }
           },
           {
             "link-id": "bfb7bc3a-d756-40f5-8ae1-b595f77f6b32",
             "destination": {
               "dest-node": "87565ada-2f75-4d8f-a47a-655c20a01967",
               "dest-tp": "78eefad4-5e60-4b67-95ed-cd15bca0edbc"
             },
             "source": {
               "source-node": "LEFT",
               "source-tp":
 "LEFT"
             }
           },
           {
             "link-id": "7040f440-eb17-4a51-a0c3-e6182b9302dc",
             "destination": {
               "dest-node": "960ac31e-e075-48b1-b35c-7e51a8996a98",
               "dest-tp": "c0fff608-14b7-4fdd-9237-53a202f7079a"
```

```
            },
            "source": {
              "source-node": "87565ada-2f75-4d8f-a47a-655c20a01967",
              "source-tp": "edc05766-9480-44b5-8e85-ed28fd14cb3e"
            }
          }
        ],

  "node":
          {
            "node-id": "960ac31e-e075-48b1-b35c-7e51a8996a98",
            "termination-point": [
              {
                "tp-id": "6243261b-cdb7-4126-8bc2-562e14719d0f"
              },
              {
                "tp-id": "c0fff608-14b7-4fdd-9237-53a202f7079a"
              }
            ]
          },
          {
            "node-id": "87565ada-2f75-4d8f-a47a-655c20a01967",
            "termination-point": [
              {
                "tp-id": "3ba3ae06-e84f-4e01-b67b-b43402a19d86"
              },
              {
                "tp-id": "2597e994-7266-4e66-97fc-b15a578f5edf"
              }
            ]
          }
        ]
      }
    ]
  }
}
```

- **"topology-id": "*topology-name*"**The unique name of the service chain in the deployment
- **"link-id":**
  The ID of the OpenStack network that ties two VMs together
- **"dest-node":**
  The OpenStack ID of the VM on the left side of the link
- **"dest-tp":**
  The OpenStack interface ID on the VM that is connected to the network
- **"source-node":**
  The OpenStack ID of the VM on the right side of the link
- **"source-tp":**

The OpenStack interface ID on the VM that is connected to the network

- **"dest-node": "RIGHT"**
  The last network in the chain must have a dest-node and dest-tp set to one of the following values:
  – "RIGHT"
  – "" (empty string)
- **"source-node": "LEFT"**
  The first network in the chain must have a dest-node and dest-tp set to one of the following values:
  – "LEFT"
  – "" (empty string)
- **"node":**
  A list of the nodes IDs and terminations points that are used in the topology

Disaster Recovery

If a large-scale disaster occurs, the disaster recovery plan for DX NetOps Virtual Network Assurance (VNA) enables a switchover to a recovery VNA. The disaster recovery plan involves provisioning a secondary VNA as a recovery VNA and regularly transferring data from the primary VNA.

Configure Disaster Recovery

To configure disaster recovery, install a recovery VNA. To help prevent and minimize data loss in the event of a disaster, back up the primary VNA regularly.

Follow these steps:

1. Install a recovery VNA.
2. Back up the primary VNA regularly.

   NOTE

   Back up the primary VNA to a location that the recovery VNA can access, or copy the backup to the recovery VNA.

Recover from a Disaster

To recover from a disaster, restore the most recent backup files to the recovery VNA and update the Gateway connection information in Performance Center.

Follow these steps:

1. Restore the latest backup files to the recovery VNA.
2. In Performance Center, hover over **Administration**, and click **Monitored Items Management: VNA Gateways**.
3. Select the VNA Gateway and click **Edit**.
4. Specify the recovery VNA host and port, and select the Data Collector that receives VNA data.
   Default Port: 8080
5. Set **Administrative Status** to **Up**, and click **Save**.
   If the Administrative Status is Up, the Data Collector registers VNA to receive inventory and performance data.

Monitor CA Virtual Network Assurance Broker Performance

The DX NetOps Virtual Network Assurance broker is supported for instrumentation with CA Application Performance Management (CA APM). CA APM receives performance metrics about the DX NetOps Virtual Network Assurance service and host.

To verify the supported releases of CA APM, look at the product support matrix for DX NetOps Virtual Network Assurance.

Follow these steps:

1. Edit the following file:
   `/opt/CA/VNA/apm/wily/core/config/IntroscopeAgent.VNA.profile`
2. Add the following lines to the end of the file:
   `introscope.agent.enterprisemanager.transport.tcp.host.DEFAULT=`***`hostname`***
   `introscope.agent.enterprisemanager.transport.tcp.port.DEFAULT=`***`port`***
   - ***hostname*** is the hostname of the CA APM server.
   - ***port*** is the CA APM server port.
     Default: 5001
3. Edit the following file: `/etc/default/wildfly.conf`
4. Add the WILY_HOME environment variable to point to the APM agent installation directory on the DX NetOps Virtual Network Assurance host to the end of the file.**Example:**
   ```
   ...
   export WILY_HOME=/opt/CA/VNA/apm/wily
   ```
5. Restart the wildfly service:
   `sudo service wildfly restart`

Troubleshooting

Use the troubleshooting section to diagnose and resolve issues with DX NetOps Virtual Network Assurance.

Installation Stopped Abruptly

In DX NetOps Virtual Network Assurance 3.6.6, when the installation stops abruptly for any reason, and you start the installation again, the installer does not prompt you to install the product on a custom directory. Perform the following steps to resolve the issue and install the product on a custom directory.

Follow these steps:

1. On the server where the installation stopped, navigate to the `/etc` directory.
2. Delete the VNA.cfg file using the `rm -rf VNA.cfg` command.
3. Follow the steps in the Installing section and complete the installation.

Insufficient Permissions for Install

Symptom:

The following error message appears:

```
Error: Insufficient permissions for installation path: /u01/opt/CA
Path must have executable permission for 'other'.
Exiting the installer...
```

Solution:

Run the following command to ensure that all child and parent directories have the executable permission for 'other'.

```
chmod 755 "Folder_Name"
```

Java Process Suddenly Exits

Symptom:

- The DX NetOps Virtual Network Assurance Java process suddenly exits.
- Root cause unidentified in the VNA log files.
- A file with name hs_err_pidXXXX.log (where XXXX is the VNA Java process PID) is created in the VNA root folder with following text as part of the content:

```
# There is insufficient memory for the Java Runtime Environment to continue.
# Native memory allocation (mmap) failed to map YYYY bytes for committing reserved memory.
```

Solution:

- Increase physical memory or swap space. Check whether the swap backing store is full.
- Decrease Java heap size (-Xmx/-Xms).

Configure DX NetOps Virtual Network Assurance Logging

By default, VNA logging is enabled and set to INFO on the Data Aggregator and Data Collector.

Follow these steps:

1. Go to the following location:
   VNA_host:9990
2. Enter the administrator credentials.
3. Go to **Configuration**, **Subsystems**, **Logging**, and **LOG CATEGORIES**.
4. Edit the logging configurations as desired.

Useful Log Categories

You might find the following log categories useful for diagnosing and resolving issues with DX NetOps Virtual Network Assurance:

- **INVENTORY_SERVICE**Logs inventory updates that are sent from DX NetOps Virtual Network Assurance to DX NetOps Spectrum or DX NetOps Performance Management
  Recommended Log Level: TRACE
  Location: /opt/CA/VNA/wildfly/standalone/log/gateway.log
- **CLIENT_UPDATES**
  Logs client updates that are sent from DX NetOps Virtual Network Assurance to DX NetOps Spectrum or DX NetOps Performance Management
  Recommended Log Level: TRACE
  Location: /opt/CA/VNA/wildfly/standalone/log/gateway.log
- **REST_API = TRACE**
  Logs REST API calls made to DX NetOps Virtual Network Assurance and includes responses that are sent to the caller
  Recommended Log Level: TRACE
  Location: /opt/CA/VNA/wildfly/standalone/log/gateway.log
- **AGGREGATION_SERVICE**Logs messages from the VNA Aggregator**Recommended Log Level:** DEBUG (for a summary of data coming from remote VNAs) or TRACE (for the entire response log coming from remote VNAs)**Location:** /opt/CA/VNA/wildfly/standalone/log/gateway.log
- **OC_ACQUISITION**
  Logs the dump of raw data that is received from the target SDN devices
  Recommended Log Level: DEBUG
  Location: /opt/CA/VNA/collector/*Engine_UUID*/tmp/poll_*
- **SOUTHBOUND_UPDATES**
  Logs the dump of polled data that is sent from the Open Collector to the Broker **Recommended Log Level:** TRACE
  Location: /opt/CA/VNA/debug

View DX NetOps Virtual Network Assurance Logging

VNA logs are available on the Data Aggregator and Data Collector in the following locations:

- *DA_Install_Directory*/apache-karaf-*version*/data/log/sdn.log
- *DC_Install_Directory*/apache-karaf-*version*/data/log/sdn.log

Too Many Open Files Exception

Symptom:

DX NetOps Virtual Network Assurance is polling a larger number of Open vSwitch hosts with the Open vSwitch plug-in.

Exceptions indicating too many open files appear in the following log:

`/opt/CA/VNA/wildfly/standalone/log/gateway.log`

Solution:

Configure the limit on the number of open files. Verify that the `wildfly` user has a limit of at least 65536 on the number of open files. Set this value permanently.

Follow these steps:

1. Log in as the `wildfly` user on the VNA host.
2. Change the `ulimit` for the open files limit to at least 65536:

   ```
   ulimit -n ulimit_number
   ```

   Example:

   ```
   ulimit -n 65536
   ```

3. Open the following file:
   `/etc/security/limits.conf`
4. Add the following lines:

   ```
   # Added by VNA

   * soft nofile 65536

   # Added by VNA

   * hard nofile 65536
   ```

   NOTE

   Restart VNA for these changes to take effect. If you are upgrading, the upgrade process automatically restarts VNA.
5. Verify that the number of open files is set properly:

   ```
   ulimit -n
   ```

   The command returns the limit that you specified earlier.

Product References and Abbreviations

List only CA product names with a shortened version (such as "CA Service Operations Insight (CA SOI)") and abbreviations/acronyms (such as "virtual machine (VM)") that you use in your wiki space. Sort the list alphabetically. Place this page at the bottom of your TOC so that it appears just above the Announcements & News link.

This documentation references the following products and abbreviations:

- CA Application Performance Management
- DX NetOps Performance Management (CA PM)
- DX NetOps Spectrum®
- DX NetOps Virtual Network Assurance (CA VNA)
- Network Functions Virtualization (NFV)
- Software-Defined Network (SDN)
- Virtual Network Functions (VNF)

Product Accessibility Features

CA Technologies is committed to addressing user accessibility in the development of its products and documentation to help all customers, regardless of ability, accomplish vital business tasks.

Documentation Legal Notice

Fault Monitoring

DX NetOps Spectrum is a services and infrastructure management system that monitors the state of managed elements including the following:

- Devices
- Applications
- Host systems
- Connections

Status information such as fault and performance data from these elements is collected and stored. DX NetOps Spectrum constantly analyzes this information to track conditions within the computing infrastructure. If an abnormal condition is detected, the product isolates it, alerts you, and presents the possible causes and solutions.

This section contains everything you need for fault monitoring from getting started to troubleshooting information.

Release Information

DX NetOps Spectrum is one of the most comprehensible extensible portfolios in the industry to manage the underlying IT infrastructure. DX NetOps Spectrum understands the flow of data traffic and use of it to the particular network domain by dramatically simplifying IT management by linking applications, services, and transactions to the underlying infrastructure. For its infrastructure management, DX NetOps Spectrum relies on the area of discovery or infrastructure discovery that is combined with proactive performance monitoring and root cause to yield detailed traffic analysis, flow, and performance.

> **NOTE**
>
> For more information on key features for each DX NetOps Spectrum release, see the Release Comparison table.

Release Notes and upgrade articles prepare you for the new and enhanced features of this release. Understand how the product is compatible with servers, clients, and other software. Learn how to upgrade to the current release and implement the new features:

Upgrading

Features and Enhancements 10.4.2.2

The DX NetOps Spectrum 10.4.2.2 version is the same as DX NetOps 20.2.5 release.

This release includes the following features and enhancements:

OneClick WebApp Enhancements

This release includes the following OneClick WebApp-related enhancements:

- OneClick WebApp Audio Alarm
- OneClick WebApp Security

OneClick WebApp Audio Alarm

From the current release, an audio message announces the new alarm in WebApp.

For more information, see Alarms Tab Preferences.

OneClick WebApp Security

The OneClick WebApp administrator can use the **Admin** console to view all the open WebApp sessions from multiple machines. When you try to launch an open session, you can see a warning message `Session is mirrored by OneClick WebApp Administrator.`

For more information, see OneClick WebApp.

NCM Enhancements

This release includes the following NCM-related enhancements:

- Task Work Queue Size Increased
- Syslog Monitoring Enhancement

Task Work Queue Size Increased

The Task Work Queue Size has been increased to parallelly process a maximum of 200 devices on each DX NetOps Spectrum host.

For more information, see Network Configuration Manager Configurations.

Syslog Monitoring Enhancement

From the current release, when the 'preventDNSlookup' attribute is enabled, instead of resolving the hostname to IP address, DX NetOps Spectrum fetches the model handles of the models from DX NetOps Spectrum Database that has the model name same as hostname received in the Syslog message and asserting Syslog trap on those models. If there are multiple models whose model name matches the hostname from the Syslog message, the trap is asserted on all the matched models.

For more information, see Configuring CA Spectrum to Process Syslog File Matches.

DX NetOps Spectrum Integration Enhancements

This section lists the enhancements to the integration of DX NetOps Spectrum with various other products.

- Integration with DX NetOps Virtual Network Assurance (DX NetOps VNA)

Integration with DX NetOps Virtual Network Assurance (DX NetOps VNA)

This release includes the following enhancement to DX NetOps Spectrum- DX NetOps VNA integration:

- Disable SNMP Modeling
- Support for cEdge Devices
- Scalability and Performance Improvements
- Dump OCS DX VNA Inventory Cache

Disable SNMP Modeling

From the current release, you can disable SNMP model devices from SDN Manager. By default, **Disable SNMP Modeling** option is set to **NO**. If you Enable VNA integration with **Disable SNMP Modeling** option as NO, all the devices which are SNMP reachable get modeled as SNMP model. When DX VNA integration is disabled all DX VNA models except SNMP are deleted.

For more information, see Monitoring SDN Devices.

Support for cEdge Devices

From the current release, cEdge devices are supported.

For more information, see Monitoring SD-WAN for Viptela.

Scalability and Performance Improvements

Prior to the current release, SLA Path used to have the "Topology tab" which displayed the Branch routers connected through Transports. From the current release, the same connections are shown under the SDN Overlay tab. SLA Path models are not displayed under the SDN Manager hierarchy. You can use the locater search to find SLA Path.

For more information, see Monitoring SD-WAN for Versa and Monitoring SD-WAN for Viptela.

Dump OCS DX VNA Inventory Cache

From the current release, inventory cache which maps DX VNA entities with DX NetOps Spectrum model handles, will be dumped in the connected OneClick server. A CSV file is generated under tomcat logs.

For more information, see Monitoring SDN Devices.

Integration Compatibility Matrix

For more information about the integration of DX NetOps Spectrum with other products, see Integration Compatibility.

Platform Support

There are no enhancements to platforms supported in the previous release.

Deprecated Support

From the current release, the following components are not supported:

- CA eHealth
- CA eHealth-CAC

Features and Enhancements 10.4.2.1

This release includes the following features and enhancements:

Processd Enhancement

From the current release, Tomcat and Webtomcat are stopped when processed is stopped.

For more information, see **Process Daemon (processd)** section on Setting Up a Distributed SpectroSERVER Environment page.

NCM Enhancements

This release includes the following NCM-related enhancements:

Permission to Limit NCM to Update One Device at a Time

From the current release, when the privileged role of the user Allow Load Firmware on Multiple Devices is disabled and load firmware task is attempted on more than one device, an error popup should be thrown with the message Restricted Load firmware for a single device, Select the single device to load firmware. when the privileged role of the user **Allow Load Firmware on Multiple Devices** is disabled and load firmware task is attempted on GC with more than one device,

an error popup should be thrown with the message Restricted Load firmware for a single device, maintain single device per GC to load firmware.

For more information, see Network Configuration Manager.

Task Work Queue Size Increased

The Task Work Queue Size has been increased to parallelly process a maximum of 100 devices on each DX NetOps Spectrum host.

For more information, see Network Configuration Manager Configurations.

Event Handling in FT Scenario

From the current release, when DX NetOps Spectrum is set up in FT mode, and the primary host fails, DX NetOps Spectrum runs on the secondary host. In such a situation only events are pulled from DX Performance Management to DX NetOps Spectrum. However, inventory sync is not supported.

For more information, see How to Configure Events for Integration with DX Performance Management.

Encoded/ Plain User Password Using REST API

In the current release, you can encode the user password using the REST API or pass the password as plain text.

For more information, see Alarm Fields, REST Examples, and Attribute Mapping.

Scale SNMPv3 Profile Performance

Active SNMPv3 profiles are available in remote SNMPv3 profiles cache. Invalid and incorrect SNMPv3 profiles are removed from remote SNMPv3 profiles cache to improve the performance of SpectroSERVER.

DX NetOps Spectrum Process Initialization Changed from init to systemctl

From the current release, DX NetOps Spectrum processes are registered with `systemctl` instead of `/etc/init.d`. The use of systemctl helps to reduce the system and application boot time by parallelly booting the processes.

Support to Calculate Threshold Limits for Time-based Results

Specifies the criteria to calculate the threshold. You can specify the minimum, average, or maximum as a threshold limit for Cisco devices and average for non-Cisco devices.

For more information, see Specify Alarm Thresholds for a Test.

OneClick WebApp URLs Included in Alarm Notifier Mail

From the current release, the alarm notification email includes the OneClick WebApp URL.

For more information, see Main Toolbar.

Purge Tomcat and Webtomcat Log Files

From the current release, when the Alarm logs directory exceeds the set threshold, an alarm is displayed with the threshold value. Irrespective of the file size when the threshold value set for `Purge log files older than` is reached, the old log files are deleted.

For more information, see **Purge Tomcat and Webtomcat Log Files** on the OneClick Administration Page.

DX NetOps Spectrum Integration Enhancements

This section lists the enhancements to the integration of DX NetOps Spectrum with various other products.

- Integration with DX NetOps Virtual Network Assurance (DX NetOps VNA)
- Integration with DX Operational Intelligence (DX OI)
- Integration with DX APM

Integration with DX NetOps Virtual Network Assurance (DX NetOps VNA)

This release includes the following enhancement to DX NetOps Spectrum- DX NetOps VNA integration:

You can search the DX VNA models from the **Locator** search.
For more information, see Integrating with DX NetOps Virtual Network Assurance.

Integration with DX Operational Intelligence (DX OI)

This release includes the following enhancement:

- Launch OneClick Console or WebApp from DX OI Alarms
  When `<WebappLaunchUrl></WebappLaunchUrl>` is empty OneClick console is launched and when you provide the WebApp URL the WebApp is launched.
  For more information, see Integrate With DX Operation Intelligence.

Integration with DX APM

From the current release, added support for HTTP in the APM SaaS integration.

For more information, see **Discover Introscope Agents** on the Support for DX NetOps SpectrumIntegration with APM SaaS and DXI page.

Secure Domain Connector (SDC) Enhancement

This release includes the following SDC-related enhancement:

Telnet/SSH Support for SDC Modeled Devices

From the current release, you can communicate from OneCLick console to devices managed through SDC using the telnet and SSH. Select View, Preferences, Topology Tab, Telnet/SSH connection Type to access the option. You can connect through the OC client, using the following preferences:

- Connect to the device through OneClick web server and SpectroServer
- Connect to the device through SpectroServer
- Connect to the device directly

For more information, see Discover Devices Using an SDConnector Host.

Integration Compatibility Matrix

For more information about the integration of DX NetOps Spectrum with other products, see Integration Compatibility.

Platform Support

There are no enhancements to platforms supported in the previous release.

Features and Enhancements 10.4.2

This release includes the following features and enhancements:

NCM Enhancements

This release includes the following NCM-related enhancements:

Task Work Queue Size Increased

The Task Work Queue Size has been increased to parallelly process a maximum of 40 devices on each DX NetOps Spectrum host.

For more information, see Network Configuration Manager Configurations.

Creating NCM Policy Independent of Device Family

In this release, the NCM policy functionality has been enhanced to help you perform various tasks without any issue. Now, you do not need to provide the device family information at the time of creating a policy. You can create an NCM policy independent of the device family. This means that the policy is not tightly coupled with the device family at the time of its creation. This ability now gives you more flexibility to create a policy and then apply it based on your business requirements; for example:

- You can apply a single policy to one or more device families. The policy is then applied to all the devices included in those device families.
- You can also apply multiple policies to a single device family.
- You can apply a single policy to one or more global collections. This, in turn, lets you apply the policy to different device families that are included in the associated global collections.
- You can also apply multiple policies to a single global collection.
- You can apply a policy to one or more individual devices.
- You can view the policy violators at the device family, device, and global collection levels.
- You can also view the devices, device families, and global collections that are associated with a specific policy.

For more information about creating a policy, see the "Create a Policy" section in Network Configuration Manager Policies. For more information about applying policies, see the related sections in Manage Policies. For more information about viewing policy violators and policy associations, see the related sections in View Policy Information.

Comparing with Specified Content Based on a Script

From this release, when defining a multi-line block policy, you can explicitly set a script to validate content for each block of the current configuration. You define custom scripts to validate the content. DX NetOps Spectrum also provides a default script for reference. By default, the bash prompt is used to execute the script.

For more information, see the "Compare with Specified Content Based on Script" section in Network Configuration Manager Policies.

Using CLI Mode for NCM Operations on Juniper JUNOS

This release provides the following two new configuration settings in OneClick for the Juniper JUNOS device family:

- Use CLI mode for capturing configuration
- Use CLI mode for uploading configuration

When you enable these options, Network Configuration Manager (NCM) starts using the CLI mode to perform the NCM operations (capture and upload) on the Juniper JUNOS devices. Previously, only XML RPC was available for executing

the NCM operations on the JUNOS device family. Now, users can decide whether they want to use XML RPC or CLI mode.

For more information, see the "Using CLI Mode for NCM Operations on Juniper JUNOS Device Family" section in Network Configuration Manager Introduction.

NCM Script Mode Using ncmservice

In this release, DX NetOps Spectrum uses the ncmservice (NCM Service) instead of the SRAdmin process to perform the NCM script operations. This implementation helps scale up the NCM script operations.

Support for Cisco FEX Module

In this release, the Cisco FEX modules are discovered and displayed under Chassis Manager. All the FEX ports are listed under the FEX modules.

For more information, see Support for Chassis Devices.

OneClick WebApp Improvements

The following improvements are done in the current release:

- Windows undocking is supported. Click the UP arrow in the title bar of the browser to toggle the window docking.
- DX NetOps Spectrum OneClick WebApp is 508 compliant.
- The memory footprint of Web Tomcat is reduced by around 60%, hence the OneClick WebApp is that much lighter.
- Launch the OneClick WebApp in-context to open the alarm, explorer, and topology. For more information, see Launch OneClick Clients with Context.

DX NetOps Spectrum Integration Enhancements

This section lists the enhancements to the integration of DX NetOps Spectrum with various other products.

- Integration with Unified Infrastructure Management
- Integration with DX NetOps Virtual Network Assurance (DX NetOps VNA)
- Integration with DX Operational Intelligence (DX OI)

Integration with Unified Infrastructure Management

This release includes the following enhancement to DX NetOps Spectrum- UIM integration:

- Handling of unreported Inventory
  Using the new deleteUnreportedEntities property, DX NetOps Spectrum checks the presence of the unreported inventory models in UIM and deletes the models that are no longer present in UIM.
  For more information, see UIM Integration Architecture.

Integration with DX NetOps Virtual Network Assurance (DX NetOps VNA)

This release includes the following enhancements to DX NetOps Spectrum- DX NetOps VNA integration:

- Reduced Logging
  Prior to the current release, by default, the notification messages from the DX NetOps VNA application were logged to stdout.log (Windows)/catalina.out (Linux) tomcat log file causing quick increase in log file size. Now the logging happens only if debug mode is enabled. By default, the notification messages are not logged.
- Upgrading IP devices to SNMP devices
  You can now upgrade the existing IP pingable devices to SNMP devices. Enable the **ApplySNMPCapabilitiestoSDNVMs** attribute to upgrade the IP devices to SNMP devices.

For more information, see the "Upgrade IP Devices to SNMP Devices" section in Monitoring SDN Devices.

- Introducing the Dump_inventory attribute to log the DX NetOps VNA inventory data in CSV format
  For more information, see the "Logging VNA Inventory Data" section in Monitoring SDN Devices.
- Handling issues related to DX NetOps Spectrum-DX NetOps VNA on-demand sync of specific sites
  When a response is not received from DX NetOps VNA, two new states waiting_for_response and sync_failed are added.
  For more information, see the "Handling DX NetOps Spectrum-DX NetOps VNA On-Demand Sync of Particular Sites Issues" section in DX NetOps VNA Standalone and Aggregator Integration.
- Supporting Silver Peak network devices
  DX NetOps Spectrum now supports the monitoring of Silver Peak network devices through DX NetOps VNA integration. This functionality allows you to use the SD-WAN solution that is provided by Silver Peak. SD-WAN stands for Software-Defined Wide Area Networking. It is a combination of Software Defined Networking (SDN) and Wide Area Networking (WAN).
  For more information, see Monitoring SD-WAN for Silver Peak.

Integration with DX Operational Intelligence (DX OI)

This release includes the following enhancement:

- Merging inventory push to a single connector
  This release supports sending the topology inventory and its relations from DX NetOps Spectrum to Topology Analytics Service (TAS) using DX NetOps Spectrum Data Publisher (Spub).
  For more information, see Integrate with DX Operational Intelligence.

Secure Domain Connector (SDC) Enhancements

This release includes the following SDC-related enhancements:

Telnet/FTP Support for SDC-Modeled Devices

This release now supports communication through Telnet/FTP for the SDC-modeled devices. This ability lets you perform the following NCM tasks on SDC-modeled devices using Telnet/FTP as a communication mode:

- Capture
- Upload
- Sync
- Save to Startup

For more information, see the "Telnet/FTP Support for SDC-Modeled Devices" section in NCM Enablement in Secure Domain.

Running NCM Scripts on SDC-Managed Devices

DX NetOps Spectrum now lets you use Perl scripts for any operation that NCM executes on devices managed by SDC. All the operations (such as capturing or writing a startup configuration, capturing or uploading a running configuration, uploading device firmware, reloading a device, and canceling the reload operation on a device) are supported. You can configure scripts within NCM for each of these operations and execute them on the SDC-managed devices. These scripts now also accept model attributes as part of the script parameters.

For more information about supporting NCM operations on SDC-managed devices, see NCM Enablement in Secure Domain. For more information about using customized scripts to perform operations, see Network Configuration Manager Extension Utility.

Added Filtering Mechanism to Filter Traps in SDC

A new action tunnelfwd has been added in this release. This action lets you forward traps through the SDC-SS tunnel. For more information about this action, see the "Configure Filters" section in SDC TrapX Support.

SDC TrapX Enhancements

This release includes the following enhancements:

Spectrum TrapInsight Dashboard View

From this release, DX NetOps Spectrum TrapInsight provides a real-time trap trend analysis dashboard for the distributed DX NetOps Spectrum environment. The administrator can run this tool to get the trap analysis trend; it is disabled by default. This feature is part of SDC with TrapX installation. When a new trap is received, TrapX forwards the trap to Logstash. Logstash processes and sends the trap to the Influx database using the logstash-influx-output plugin.

For more information, see Spectrum TrapInsight Dashboard View.

Converting SDC Setup into SDC-TrapX Setup

In this release, you can convert an SDC setup into an SDC-TrapX setup by simply adding the trapX.config file. You can then add actions in it based on your requirements. You do not need to uninstall the existing environment. Note that the underlying approach has not been changed. For example, users can use their setup either as SDC or SDC-TrapX. They cannot use a combination of both.

For more information, see the "Considerations" section in SDC TrapX Support.

DX NetOps Spectrum API Improvements

This release includes the following enhancement:

Restrict OneClick RESTful Access to Users

As an administrator, you can allow or restrict the access to the OneClick RESTful APIs only to the DX NetOps Spectrum users. You can set API type-level access for GET, POST, PUT, and DELETE.

For more information, see the user access-related scenario in Troubleshooting User Administration.

LDAP User Group Authentication

You can now log in to DX NetOps Spectrum when it is integrated with LDAP even when the user is not present in DX NetOps Spectrum. The user is automatically created in DX NetOps Spectrum during the first login. However, only users part of configured LDAP user groups in DX NetOps Spectrum can log in automatically.

For more information, see the "LDAP User Group Authentication" section in OneClick Administration Pages.

Monitoring IPv6 BGP Peer Session

From this release, DX NetOps Spectrum uses the Cisco BGP MIB to monitor IPv6 and IPv4 BGP Peer sessions. If the device does not have Cisco BGP MIB, then DX NetOps Spectrum uses the BGP standard MIB.

For more information, see BGP Peer Session Monitoring.

Spectrum Performance View (Beta) Improvements

From the current release, DX NetOps Spectrum installer configures the Influx server and automatically creates the user *spectrum*. A new page named InsideView Configuration(beta) is added under the OneClick Administration page to configure InsideView, which has options to save, start, and stop InsideView.

For more information and to configure the influxd using https, see InsideView Configuration (beta) in OneClick Administration Pages and Spectrum Performance View (Beta).

SHA2 Support for SSH/Telnet Sessions from OneClick Clients Using MindTerm

From the current release, DX NetOps Spectrum uses the SHA2 encryption through the MindTerm utility to make Telnet and SSH connectivity.

Supporting SHA-256 and SHA-512 for SNMPv3

DX NetOps Spectrum now supports SHA-256 and SHA-512 hashing algorithms for SNMPv3 communication. This ability helps you communicate with the devices by using a more secure SNMP communication. You can use the appropriate option (SHA256 or SHA512) while creating the SNMPv3 profile. You can then select that created profile to discover (Module Discovery) the related device or to fetch (MIB Tools) the device information.

For more information about how to use these options, see the "Configuring the SNMPv3 Profile" section in Edit SNMPv3 Profiles Dialog.

Adding TraceRoute Option in OneClick

In this release, the TraceRoute option is now available in the OneClick client. Traceroute is a network diagnostic tool that helps you find the *hop* (route) information between a source and destination. The TraceRoute option is enabled for both SpectroSERVER- and SDC-modeled devices. You can access the TraceRoute option by using the shortcut Ctrl+R, right-clicking a modeled device/alarm, or using the toolbar.

For more information, see Main Toolbar.

Enhancement to Export Functionality of IP SLA Test Results

In this release, the functionality to export the IP SLA test results using Spectrum Report Manager (SRM) has been enhanced. An additional option has been introduced on the SPM Data Export page under OneClick Administration. This option lets you specify whether you want to export the minimum, maximum, and/or average value of the IP SLA tests. Based on the selected option, the corresponding data is exported. You can view the same result in the SPMResult file, which is created in the specified directory. These values are picked up from the SPM result events that are created for these tests. By default, the average value is exported.

For more information, see the "SPM Data Export Page" section in OneClick Administration Pages.

Enable/Disable Modeling of a Connection Between Two Ports

This release provides a new attribute (LockPort) on the port model type. This attribute helps you decide whether you want to create connections between two ports. By default, the value of the attribute is set to *No*. This implies that there is no change in the existing behavior while performing the discovery or establishing a connection between two ports. However, if you set the value to *Yes* and again perform the discovery, then no connection is established on the port for which LockPort is set to Yes. The LockPort value acts only when there is no connection between ports. If a connection already exists and you change the port's LockPort value to Yes and again perform the discovery, then no change happens to the existing connection.

For more information, see Enable or Disable Modeling of a Connection Between Two Ports.

Enabling Performance Tuning Options (By Default)

Prior releases of DX NetOps Spectrum introduced the following performance tuning options; however, they were disabled by default. From this release, these options are now enabled by default:

- Improved Fanout Performance

For more information, see the "Improved Fanout Performance" section in Fault Isolation.

- Discover Connections Only toward Access Points
  For more information, see the "Discover Connections Only toward Access Points" section in WLC Manager.
- Self-Health Monitoring
  For more information, see the Self-Health Monitoring article.

IP SLA Test Discovery Enabled for ASR 9900 Series Routers

In previous releases, users were not able to discover IP SLA tests for devices that did not support rttMonCtrlAdminOwner OID. From this release, IP SLA test discovery will be successful for devices that support rttMonCtrlAdminOwner OID or rttMonCtrlAdminTag OID.

Integration Compatibility Matrix

For more information about the integration of DX NetOps Spectrum with other products, see Integration Compatibility.

Platform Support

Support for the following platforms is added in the current release:

- Red Hat Enterprise Linux (RHEL) 8.0 and 8.1
- Microsoft Windows Server 2019

Device Certifications

NOTE

Information! Click **here** to access the Device Certification Database. The Device Certification Database lets you search all DX NetOps Spectrum-certified devices. For more information, see Access the Device Certification Database Online.

Device Certifications in 10.4.2.2 Release

The certification for the following devices are enhanced in this release:

Device Name	Sys OID
Checkpoint Gaia R80.30 VSX	1.3.6.1.4.1.2620.1.6.123.1.49

Device Certifications in 10.4.2.1 Release

The certification for the following devices are enhanced in this release:

Device Name	Sys OID
Teldat Atlas 360	1.3.6.1.4.1.2007.1.1.146
Teldat-V	1.3.6.1.4.1.2007.1.1.191
Teldat C1i+	1.3.6.1.4.1.2007.1.1.123
Cisco VG310	1.3.6.1.4.1.9.1.1769
Cisco VG350	1.3.6.1.4.1.9.1.1557
Cisco Catalyst 9400	1.3.6.1.4.1.9.1.2664
Cisco SNS3495K9	1.3.6.1.4.1.9.1.2139
Cisco Catalyst 6824-X-LE-40G	1.3.6.1.4.1.9.1.2275

Juniper PSA-7000	1.3.6.1.4.1.12532.256.5.1
Juniper PSA-5000	1.3.6.1.4.1.12532.256.3.1
Cisco ASR 1002-HX	1.3.6.1.4.1.9.1.2252
Cisco Catalyst 3850-48U-E	1.3.6.1.4.1.9.1.1768
Catalyst 2960L 8PSLL	1.3.6.1.4.1.9.1.2361
Catalyst 2960CX-8PC-L Switch	1.3.6.1.4.1.9.1.2191
Catalyst 9200	1.3.6.1.4.1.9.1.2694

Device Certifications in 10.4.2 Release

The following is the list of devices certified in this release:

Device Name	Sys OID	Support Level
Silver Peak ECV	1.3.6.1.4.1.23867.1.2.46	Enhanced
SilkWorm 6510	1.3.6.1.4.1.1588.2.1.1.109	Enhanced
Crossbeam C2	1.3.6.1.4.1.6848.1.3.1.4	Enhanced
Crossbeam C25	1.3.6.1.4.1.6848.1.3.1.7	Enhanced
Crossbeam C6	1.3.6.1.4.1.6848.1.3.1.5	Enhanced
LE-427	1.3.6.1.4.1.6141.1.37	Enhanced
LE-311v	1.3.6.1.4.1.6141.1.70	Enhanced
Quidway S6906R	1.3.6.1.4.1.2011.2.23.219	Enhanced
Alcatel SAS-M 24F 2XFP 7210	1.3.6.1.4.1.6527.6.2.1.2.2.2	Enhanced
Catalyst 9500-12Q	1.3.6.1.4.1.9.1.2418	Enhanced
Catalyst 9500-24Q	1.3.6.1.4.1.9.1.2419	Enhanced
Catalyst 9500-40X	1.3.6.1.4.1.9.1.2420	Enhanced
Catalyst 9500-32C	1.3.6.1.4.1.9.1.2566	Enhanced
Catalyst 9500-32QC	1.3.6.1.4.1.9.1.2567	Enhanced
Catalyst 9500-48Y4C	1.3.6.1.4.1.9.1.2568	Enhanced
Catalyst 9500-24Y4C	1.3.6.1.4.1.9.1.2573	Enhanced
Catalyst 9500-16X	1.3.6.1.4.1.9.1.2592	Enhanced
Catalyst 9500	1.3.6.1.4.1.9.1.2688	Enhanced
Cisco ENCS 5408	1.3.6.1.4.1.9.1.2376	Enhanced
Cisco TSCodecG3	1.3.6.1.4.1.9.1.2161	Enhanced
Aruba 3810M-40G-8SR	1.3.6.1.4.1.11.2.3.7.8.5.4	Enhanced
HP A5120-16G SI	1.3.6.1.4.1.25506.11.1.11	Enhanced
Juniper MAG-SM360	1.3.6.1.4.1.12532.254.4.1	Enhanced
Juniper MAG-2600	1.3.6.1.4.1.12532.254.1.1	Enhanced
Cisco SG350-28P	1.3.6.1.4.1.9.6.1.95.28.5	Enhanced
Teldat ATLAS 150	1.3.6.1.4.1.2007.1.1.104	Enhanced

Release Comparison

This release comparison table compares and provides details of the key features available in specific DX NetOps Spectrum release versions:

New Features and Enhancement2	10.4.2.2	10.4.2.1	10.4.2	10.4.1	10.4	10.3.2	10.3.1	10.3.0	10.2.3
Integration with DX NetOps Virtual Network Assurance (DX NetOps VNA): • Support for cEdge Devices • Scalability and Performance Improvements – Monitoring SD-WAN for Versa – Monitoring SD-WAN for Viptela • Disable SNMP Modeling • Dump OCS DX VNA Inventory Cache	Yes	No	No	No	No	No	No	No	No
OneClick WebApp Enhancements • OneClick WebApp Audio Alarm • OneClick WebApp Security	Yes	No	No	No	No	No	No	No	No
NCM Enhancements: • Task Work Queue Size Increased to 200 • Syslog Monitoring Enhancement	Yes	No	No	No	No	No	No	No	No
Deprecated Support: • CA eHealth • CA eHealth-CAC	Yes	Yes	Yes	No	No	No	No	No	No
Task Work Queue Size Increased to 100	Yes	Yes	No	No	No	No	No	No	No
Network Configuration Manager Configurations	Yes	Yes	No	No	No	No	No	No	No
Event Handling in FT Scenario	Yes	Yes	No	No	No	No	No	No	No
Encoded/ Plain User Password Using REST API	Yes	Yes	No	No	No	No	No	No	No
Permission to Limit NCM to Update One Device at a Time	Yes	Yes	No	No	No	No	No	No	No
Scale SNMPv3 Profile Performance	Yes	Yes	No	No	No	No	No	N	
DX NetOps Spectrum Process Initialization Change from init to systemctl	Yes	Yes	No	No	No	No	No	No	No
Support for Different Telnet/ SSH Connection from OneClick Console to Devices	Yes	Yes	No	No	No	No	No	No	No

Support to Calculate Threshold Limits for Time-based Results	Yes	Yes	No	No	No	No	No	No	No
OneClick WebApp URLs Included in Alarm Notifier Mail	Yes	Yes	No	No	No	No	No	No	No
Purge Tomcat and Webtomcat Log Files	Yes	Yes	No	No	No	No	No	No	No
Search DX VNA models from the Locator	Yes	Yes	No	No	No	No	No	No	No
Launch OneClick Console or WebApp from DX OI Alarms	Yes	Yes	No	No	No	No	No	No	No
Added Support for HTTP in the APM SaaS Integration	Yes	Yes	No	No	No	No	No	No	No
Support for Hub-Spoke Topology to monitor SD-WAN for Versa	Yes	Yes	Yes	No	No	No	No	No	No
Support for Silver Peak Network Devices	Yes	Yes	Yes	No	No	No	No	No	No
Spectrum Performance View (Beta) Improvements • InsideView Configuration(beta)	Yes	Yes	Yes	No	No	No	No	No	No
Launch OneClick Clients with Context	Yes	Yes	Yes	No	No	No	No	No	No
Spectrum TrapInsight Dashboard View	Yes	Yes	Yes	No	No	No	No	No	No
Monitoring IPv6 BGP Peer Session	Yes	Yes	Yes	No	No	No	No	No	No
LDAP User Group Authentication	Yes	Yes	Yes	No	No	No	No	No	No
Support for Cisco FEX Module	Yes	Yes	Yes	No	No	No	No	No	No
Compare with Specified Content Based on Script	Yes	Yes	Yes	No	No	No	No	No	No
Integration with Unified Infrastructure Management • Handling of Unreported Inventory For more information, see UIM Integration Architecture.	Yes	Yes	Yes	No	No	No	No	No	No
Integration with DX NetOps Virtual Network Assurance Enhancements • Upgrade IP Devices to SNMP Devices. • Handling DX NetOps Spectrum-VNA On-Demand sync of particular sites Issues • Logging VNA Inventory Data.	Yes	Yes	Yes	No	No	No	No	No	No

Restrict OneClick Restful Access to Users	Yes	Yes	Yes	No	No	No	No	No	No
Integrate with DX OI Connector Using DX NetOps Spectrum Merge Inventory Push to Single Connector	Yes	Yes	Yes	No	No	No	No	No	No
Supporting SHA-256 and SHA-512 for SNMPv3	Yes	Yes	Yes	No	No	No	No	No	No
Using CLI Mode for NCM Operations on Juniper JUNOS	Yes	Yes	Yes	No	No	No	No	No	No
Creating NCM Policy Independent of Device Family	Yes	Yes	Yes	No	No	No	No	No	No
Running NCM Scripts on SDC-Managed Devices	Yes	Yes	Yes	No	No	No	No	No	No
Adding TraceRoute in OneClick	Yes	Yes	Yes	No	No	No	No	No	No
Enhancement to Export Functionality of IP SLA Test Results	Yes	Yes	Yes	No	No	No	No	No	No
Telnet/FTP Support for SDC-Modeled Devices	Yes	Yes	Yes	No	No	No	No	No	No
Enable/Disable Modeling of a Connection Between Two Ports	Yes	Yes	Yes	No	No	No	No	No	No
Spectrum Performance View (Beta)	Yes	Yes	Yes	Yes	No	No	No	No	No
View the Client Details	Yes	Yes	Yes	Yes	No	No	No	No	No
Dockerized DX NetOps Spectrum Deployment using Kubernetes	Yes	Yes	Yes	Yes	No	No	No	No	No
Supporting Single Sign-On Using SAML 2 Authentication	Yes	Yes	Yes	Yes	No	No	No	No	No
Self Certify the Unregistered Devices	Yes	Yes	Yes	Yes	No	No	No	No	No
Supporting Swagger for REST API Documentation	Yes	Yes	Yes	Yes	No	No	No	No	No
Map CA UIM Origins DX NetOps Spectrum Landscapes	Yes	Yes	Yes	Yes	No	No	No	No	No
Export Topology View in PNG and XML Format.	Yes	Yes	Yes	Yes	No	No	No	No	No

DX NetOps Spectrum Report Manager Improvements • Enhanced SRM Alarm Handler • Partition Handler updated • Set Report Manager Preferences • SRM purge process improvement • Reporting Interval is now customizable • Enhanced RpmgrInitializeLandscape.bat/sh script	Yes	Yes	Yes	Yes	No	No	No	No	No
OneClick WebApp (Beta) Improvements • SSO Support for WebApp • Manual start of WebApp is not required • Logging out of WebApp redirects to administration page • Handling WebApp to launch using any available port • Configure OneClick WebApp User Session Timeout	Yes	Yes	Yes	Yes	No	No	No	No	No
Integration with Virtual Network Assurance Enhancements • Addition of Meraki Dashboard API • Support for New fault Codes for Cisco ACI • Retaining the SNMP models on disabling VNA integration • Roll-up Condition being propagated up to SDN Hierarchy	Yes	Yes	Yes	Yes	No	No	No	No	No
Map DX NetOps Spectrum Attributes to CA NIM Custom Attributes	Yes	Yes	Yes	Yes	No	No	No	No	No
Secure Domain Connector (SDC) Fault Isolation	Yes	Yes	Yes	Yes	No	No	No	No	No
SNMPv3 Community String Access Control	Yes	Yes	Yes	Yes	No	No	No	No	No
Support for SDC TrapX Varbind Filtering	Yes	Yes	Yes	Yes	No	No	No	No	No
Support for Diffie-Hellman (DH) Profile on SNMPv3	Yes	Yes	Yes	Yes	No	No	No	No	No
Network Configuration Manager on Secure Domain Connector	Yes	Yes	Yes	Yes	No	No	No	No	No

OneClick WebApp (beta) Improvement	Yes	Yes	Yes	Yes	Yes	No	No	No	No
Support for AdoptOpenJDK Java	Yes	Yes	Yes	Yes	Yes	No	No	No	No
SSL support for DX NetOps Spectrum Overview Dashboard	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No	No
SDC TrapX Support	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No	No
Support for Cisco Meraki	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No	No
Support for AWS Network Monitoring	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No	No
NCM Enhancement - Configuration Search	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No	No
OneClick WebApp (Beta) Improvements	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No	No
Quality Enhancements	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No	No
Platform Updates	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No	No
Introduced the OneClick WebApp - Beta	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No	No
Introduced Network Configuration Manager Capture Using SSH Commands	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No	No
Monitoring SD-WAN for Viptela and Versa	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No	No
Support for DX NetOps Spectrum Integration with APM SaaS and DXI	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No	No
CA Remote Engineer Tool to Collect Troubleshooting Data for DX NetOps Spectrum	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No	No
WLC Manager-Discover Connections only towards Access Points	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No	No
Support for Dynamic VPN (DMVPN)	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No	No
Distribution of Virtual Center (VC) Across Landscapes - DX NetOps Spectrum-CA UIM Integration Enhancements	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No	No
Dockerization with Autoinstall DX NetOps Spectrum DSS	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No	No
Quality Enhancements	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No	No
Multitenant SRM with Jasper Support	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No
DX NetOps Spectrum-CA Digital Operational Intelligence (DOI) Integration	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No
DDMDB Performance Improvements	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No

Installing and Configuring the SCOM Manager	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No
HPIRF Support	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No
Modeling Gateway Enhancements	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No
CXF Upgrade	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No
Filtering Interfaces	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No
OneClick View for 'Communication Link Down Alarms	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No
DX NetOps Spectrum Dockerization	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No
DX NetOps Spectrum and CA APM Integration Enhancements	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No
Co-Existence of CA VNA and CA UIM Integration in DX NetOps Spectrum	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No
Device Certification Updates	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Platform Updates	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No
Multitenancy Support with DX NetOps Spectrum-VNA Integration and DX NetOps Spectrum- UIM Integration Single Point of Integration.	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
VMware vSphere Plugin Support	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
vMotion Support	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
VNA Cisco ACI Faults	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
WebClient Enhancements	Yes	Yes	Yes	Yes	Yes	No	Yes	Yes	Yes
DX NetOps Spectrum-CA SOI Connector Enhancements	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
SRM Jasper Enhancements	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Device Certifications	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes

Integration Compatibility

Following is the compatibility matrix for the third-party and CA products that are integrated with DX NetOps Spectrum:

NOTE
For more information about supported DX NetOps releases, see the NetOps Interoperability.

Integration Product	CA Spectrum 10.4	DX NetOps Spectrum 10.4.1	DX NetOps Spectrum 10.4.2	DX NetOps Spectrum 10.4.2.1	DX NetOps Spectrum 10.4.2.2
DX NetOps Performance Management	3.6 and 3.7	19.4.1 and 3.7	See DX NetOps Interoperability	See DX NetOps Interoperability	See DX NetOps Interoperability
DX NetOps Virtual Network Assurance (DX NetOps VNA)	3.7 and 3.6.5	19.4.1 and 3.7	See DX NetOps Interoperability	See DX NetOps Interoperability	See DX NetOps Interoperability

DX Operational Intelligence (DXOI)	1.3	DX OI SaaS	1.3.3, DX OI SaaS, and 20.06	1.3.3, DX OI SaaS, and 20.06	1.3.3, DX OI SaaS, and 20.2
DX Application Performance Management	10.7 SP3	10.7 SP3, and DX APM SaaS	10.7 SP3, and DX APM SaaS 20.1	10.7 SP3, and DX APM SaaS 20.1	10.7 SP3, and DX APM SaaS 20.1
CA Virtual Assurance for Infrastructure Managers (VAIM)	12.9	12.9	12.9	12.9	12.9
SystemEdge/VAIM	12.9 (VC-AIM 5.9)	12.9 (VC-AIM 5.9)	12.9 (VC-AIM 5.9)	12.9 (VC-AIM 5.9)	12.9 (VC-AIM 5.9)
Unified Infrastructure Managemen (UIM) (Nimsoft) Deploy the hotfixes that are available for the probes.	UIM v8.5.1, v8.5.1 SP1, v9.0.2, and v9.2.0 • EMS probe - v10.2 • nas probe - v9.06 • maintenance_mode probe - 9.02 • spectrumgtw probe - v8.67 • DX NetOps Spectrum UIM Services - v8.67 • AWS Monitoring probe - v5.26 • Microsoft Azure Monitoring probe - v3.11	UIM v20.1, UIM v9.0.2, v9.1.0, and v9.2.0 • Spectrumgtw probe - v8.67, v8.68 • Spectrum UIM Services - v8.67	UIM 20.1, and UIM 9.2.0 • Spectrumgtw probe - v8.68 • Spectrum UIM Services - v8.68	UIM 20.1, and UIM 9.2.0 • Spectrumgtw probe - v8.68 • Spectrum UIM Services - v8.68	UIM 20.3.1, UIM 20.3, UIM 20.1, and UIM 9.2.0 • Spectrumgtw probe - v8.68 • Spectrum UIM Services - v8.68
Service Operations Insight (SOI)	4.2	4.2	4.2 MUK SO09444	4.2 MUK SO09444	4.2 MUK SO09444
DX NetOps Spectrum SOI Connector	2.0.0.259	2.0.0.259	2.0.0.259	2.0.0.259	2.0.0.259

REX Connector	15.0 and 15.1.17	15.0 and 15.1.17	15.0 and 15.1.17	15.0 and 15.1.17	15.0 and 15.1.17

NOTE

To know the specific CA SystemEDGE agent version supported by VAIM 12.9 (VC-AIM 5.9), see VAIM 12.9 documentation.

Product Accessibility Features

CA Technologies, a Broadcom Company, is committed to ensuring that all customers, regardless of ability, can successfully use its products and supporting documentation to accomplish vital business tasks. This section outlines the accessibility features that are part of DX NetOps Spectrum.

Product Enhancements

DX NetOps Spectrum offers accessibility enhancements in the following areas:

- Display
- Sound
- Keyboard
- Mouse
- *[other enhancements if available]*

NOTE

The following information applies to Windows-based and Macintosh-based applications. Java applications run on many host operating systems, some of which already have assistive technologies available to them. For these existing assistive technologies to provide access to programs written in JPL, they need a bridge between themselves in their native environments and the Java Accessibility support that is available from within the Java virtual machine (or Java VM). This bridge has one end in the Java VM and the other on the native platform, so it will be slightly different for each platform it bridges to.

Display

To increase visibility on your computer display, you can adjust the following options:

- **Font style, color, and size of items** Lets you choose the font color, size, and other visual combinations.
- **Screen resolution** Lets you change the pixel count to enlarge objects on the screen.
- **Cursor width and blink rate** Lets you make the cursor easier to find or minimize its blinking.
- **Icon size** Lets you make icons larger for visibility or smaller for increased screen space.
- **High contrast schemes** Lets you select color combinations that are easier to see.

Sound

Use sound as a visual alternative or to make computer sounds easier to hear or distinguish by adjusting the following options:

- **Volume** Lets you turn the computer sound up or down.
- **Text-to-Speech** Lets you hear command options and text read aloud.
- **Warnings** Lets you display visual warnings.
- **Notices** Gives you aural or visual cues when accessibility features are turned on or off.
- **Schemes** Lets you associate computer sounds with specific system events.
- **Captions** Lets you display captions for speech and sounds.

Keyboard

You can make the following keyboard adjustments:

- **Repeat Rate** Lets you set how quickly a character repeats when a key is struck.
- **Tones** Lets you hear tones when pressing certain keys.
- **Sticky Keys** Lets those who type with one hand or finger choose alternative keyboard layouts.

Mouse

You can use the following options to make your mouse faster and easier to use:

- **Click Speed** Lets you choose how fast to click the mouse button to make a selection.
- **Click Lock** Lets you highlight or drag without holding down the mouse button.
- **Reverse Action** Lets you reverse the functions controlled by the left and right mouse keys.
- **Blink Rate** Lets you choose how fast the cursor blinks or if it blinks at all.
- **Pointer Options** Let you do the following:
  - Hide the pointer while typing
  - Show the location of the pointer
  - Set the speed that the pointer moves on the screen
  - Choose the pointer's size and color for increased visibility
  - Move the pointer to a default location in a dialog box

Keyboard Shortcuts

The following table lists the keyboard shortcuts that *[product name]* supports:

Keyboard	Description
Ctrl+X	Cut
Ctrl+C	Copy
Ctrl+K	Find Next
Ctrl+F	Find and Replace
Ctrl+V	Paste
Ctrl+S	Save
Ctrl+Shift+S	Save All
Ctrl+D	Delete Line
Ctrl+Right	Next Word
Ctrl+Down	Scroll Line Down
End	Line End
[other product-specific keyboard commands]	

Topology View using new Accessibility Icon theme

To provide a better user experience and in adherence to VPAT/508 standards, we have enabled an Accessibility theme for the OneClick topology view.

This theme provides new indicators denoting model severity/icon conditions on top of our existing topology view. This will enable model severity view, which is currently color coded, for users who are unable to distinguish between colors. The accessibility icons will have additional indicators so that users can easily identify the difference in the icon model's severity.

The OneClick Console has two icon themes, Accessibility and OneClick. By default, the OneClick icon theme is selected.

To enable the Accessibility theme, follow these steps:

1. Click **Start Console** from the OneClick Administration page.
   The OneClick Console user interface is launched.
2. Navigate to the menu options, **View** > **Icons Theme**, and then select **Accessibility**.
   The OneClick Console automatically refreshes and the Accessibility indicators are displayed in the topology view.

The Icons theme selection is persistent across sessions. Once you have selected an icon theme for your topology, you will view the same theme in the OneClick console every time you logon.

Mapping the Accessibility Icons/ indicators with model severity status:

To revert to the (default) OneClick icon theme, follow these steps:

1. Navigate to the **OneClick Console** menu options, **View** > **Icons Theme**, and then select **OneClick.** The OneClick Console automatically refreshes and the default theme is displayed in the topology view.

Internationalization and Localization

This section describes issues that are related to translation, and also describes other limitations that are related to non-English versions of DX NetOps Spectrum software.

Localization Overview

DX NetOps Spectrum is internationalized to support different languages and is localized to support Japanese. DX NetOps Spectrum displays a non-English language as installed by the user and displays English when the installed language is not supported.

In 10.3.1, the localized product technical documentation is not yet available. Translated documentation is forthcoming, however. The Product Management team can provide a timeline for its availability.

> **WARNING**
> Verify that your system is language-compatible and that your operating system can fully deploy the desired language before installing DX NetOps Spectrum in a non-English locale.

Language and Installation

When you install DX NetOps Spectrum, you pick the language that you want to install. If you select a non-English language, then that language *and* English is installed. If you use the GUI installers, then the languages that you can select from are derived from the System Locale. If you use the distinct installer, you specify the language on the command line. We recommend that you set the system Locale to the desired language before you install DX NetOps Spectrum.

NOTE
Installation into a localized directory is not supported.

English is always installed to provide backup to the language you select. No more than two languages can be installed - English and one non-English language. In this scenario, the non-English language is the primary language and English is the backup. A non-English language cannot be the backup.

EvFormat and PCause files are installed in *$SPECROOT*/SG-Support. English-only installations should see no directory structural difference from previous releases of DX NetOps Spectrum. When a non-English language is installed, the EvFormat and PCause files are installed in *$SPECROOT*/SG-Support/zh_TW (for example) and the English files are installed in *$SPECROOT*/SG-Support. If the non-English version of an EvFormat or PCause file cannot be found, the English version is used instead.

Customizations in *$SPECROOT*/custom follow the same structural configuration.

The suffixes for all EvFormat and PCause file names consist of ISO country and language codes. The following table identifies the supported languages, their suffixes, and sample directory files.

Language	Suffix	Sample Directory and File Name
English, United States	en_US	SG-Support/Event000aa005_en_US
Japanese, Japan	ja_JP	SG-Support/ja_JP/Event000aa005_ja_JP

Rule of Localization Homogeneity

The *Rule of Localization Homogeneity* states that all components in a distributed DX NetOps Spectrum installation must run on servers that use the same operating system Locale. Think of DX NetOps Spectrum as one application running with one language, rather than as a set of distributed services potentially running different languages.

By following the *Rule of Localization Homogeneity*, you ensure that all access and modification of data through different communication paths use one consistent language. Otherwise, myriad languages can be stored in the DX NetOps Spectrum database. The multiple languages cause problems with such data issues as display, fonts, searching, and sorting.

We recommend that you set the Locale on the servers that run DX NetOps Spectrum processes before you install DX NetOps Spectrum. Such servers include the Location server, Processd, SpectroSERVERs, OneClick servers, clients, and the Secure Domain Manager.

Rule of Localization Limits

The *Rule of Localization Limits* states that not everything in DX NetOps Spectrum is localized to a non-English language. Localization is limited because DX NetOps Spectrum manages diverse network devices that generally support only English/ASCII. In addition, the DX NetOps Spectrum core database (ModelType Catalog) is not localized. Therefore, non-English users see English in various places in DX NetOps Spectrum.

Operating System Locale

DX NetOps Spectrum supports the following locales:

- English (ISO code en_US)
- Japanese (ISO code ja_JP)

The "language packs" that are provided for each of these languages let DX NetOps Spectrum display completely in those languages. DX NetOps Spectrum uses the language for the default locale to present values for package.properties, CsEvFormat, CsPCause, and EventTables.

DX NetOps Spectrum also supports any UTF-8 characters, including character encodings such as French, German, Hebrew, Cyrillic, and more. In sum, DX NetOps Spectrum has been internationalized so that any UTF-8 characters can

be used. You can enter data in these encodings, and DX NetOps Spectrum can display that data. However, languages for which language packs are not provided lack localized files for package.property, CsEvFormat, CsPCause and EventTable support. The affected user-interface elements are displayed in English.

Setting the system locale to the proper ISO code lets DX NetOps Spectrum recognize the language support files for the language. English is used when the system locale is set to an unsupported value, such as de_DE (German). German can still be used in DX NetOps Spectrum. However, because no German language pack is available for DX NetOps Spectrum, only the German entered by the user is displayed as German.

You can validate the locale setting that DX NetOps Spectrum uses with one of the following methods. Both methods return the same value to ensure the *Rule of Localization Homogeneity*:

- Send action 0x10405 to the VNM Model to determine which locale the SpectroSERVER is using.
- Open URL http://<*host*><:*port*>/spectrum/restful/oneclick/locale to determine which Locale the OneClick server is using.

Localization Fallback

The following rules apply to the lookup of the language-specific resources: package.properties, EvFormat, PCause, and EventTables:

- If an unsupported Locale is used, everything in DX NetOps Spectrum is presented in English (en_US).
- Package.properties values for OneClick and the OneClick Admin web page:
  - If a package.properties value for OneClick cannot be found in the non-English installation, OneClick attempts to display the English version instead.
  - If a package.properties value for OneClick cannot be found in the English installation, OneClick displays the package.properties key.
- EvFormat, PCause, and EventTables:
  - If an EvFormat or PCause file cannot be found for the non-English version, DX NetOps Spectrum displays a localized error message indicating the specified file is missing. DX NetOps Spectrum then displays the English version of the specified file.
  - If an EventTable file cannot be found for the non-English version, DX NetOps Spectrum displays the EventTable index instead of the value. Consistent with the English version, no error message is generated.
- Customization continues to follow the same rules, as appropriate for the specified Locale.

Limitations and Considerations

Upgrade Considerations

The following upgrades are supported only for English to English. For upgrades from version 9.2 English to Release 9.4 non-English, only the database migration installation is supported, and English values are not converted to non-English.

- 9.2.2 (H09) to 9.4
- 9.2.3 to 9.4
- 9.2.3 (H11) to 9.4
- 9.2.3 (H12) to 9.4
- 9.3.0 to 9.4
- 9.3.0 (H01) to 9.4

For upgrades from version 9.4 (English) to 10.2 (English) only the database migration installation is supported and English values are not converted to non-English. For upgrades from 10.2 English to 10.3 Non-English, all English values are converted to non-English.

- 9.4.x to 10.2
- 10.2 to 10.3

Translation Scope

The following categories of items are not translated in this release of DX NetOps Spectrum.

Core Functionality

- **Internet standards**, such as IP addresses, MAC addresses, and MIB names and contents.
- **Common acronyms**, such as LAN, WAN, ISDN, and IP.
- **Database catalog items**, such as Model Type, Attribute IDs and Names, Relation Names, Enumerations, Flags, and import XML.
- **SNMP and device data**, such as community strings, trap contents, device configurations, GET, and SET MIB data of Type String.
  - An SNMP read of non-ASCII device data is not blocked, but is considered unsupported.
  - An SNMP SET containing non-ASCII data is rejected and an appropriate message is displayed.
  - NCM does not support non-ASCII data at any level.
  - Non-ASCII data is not supported in traps, nor is the subsequent Event processing of varbinds from the trap data, including SeverityMaps, SBG, Event Procedures, and other functional units that process trap-originating varbinds. However, our Support team has performed preliminary field testing with UTF-8 encoded characters in traps and has found no issues. Contact our Support team if you have questions about using CA eHealth SystemEDGE agents in a non-English environment.
- **CORBA (components and APIs)**, such as server names, hostnames, domain names, and DNS names. All servers in a DX NetOps Spectrum DSS environment must use ASCII hostnames and domains.
- **System-level and external utilities**, such as TFTP, FTP, SSH hostnames, and directories. This restriction is necessary in part due to limitations of the external tools. For example, the Cygwin bash shell does not support UTF-8.
- **Non-English usernames and passwords** may not work in all browsers.
- **Debug and output logs**, such as installation logs, VNM.OUT, Tomcat output logs, and Processd_log. In general, user messages are localized. System messages are not localized.
- **Configuration files**, such as .vnmrc, sdm.config, *.idb, and web.xml.
- **Developer tools**, such as dbtools.
- **SBG CsVendor/ParseMaps**. These files support consolidated syslog file matching and trap generation.

OneClick Explorer Tab

- **Products, brands, and logos**, such as DX NetOps Spectrum, IBM, Cisco, and Microsoft.
- **DX NetOps Spectrum feature names**, such as Cluster Manager, QoS Manager, Configuration Manager, and most *Manager names.
- **Model names for default models**, where these names are stored in the database or derived from the model type name. Examples of default models are Universe, World, TopOrg, and LostFound.
- **Hostname translation** depends on usage. For example, hostnames that are needed for DNS and network resolution are not localized.

Miscellaneous

- **Copyrights**, patents, and other legal information.
- **DX NetOps Spectrum version number.**
- **XML tags**. Values may be localized, but not tags.
- **DX NetOps Spectrum installation directories**. DX NetOps Spectrum can be installed in a localized directory, but the directories under *$SPECROOT* remain unlocalized.
- **Brand and product names**, such as DX NetOps Spectrum, Policy Manager, VPN Manager, and CA eHealth.
- **Text** that is embedded in images.
- **DX NetOps Spectrum Billing Application**
- **Command-line Interface**. The CLI is a script language and a debug tool, and as such is not localized. Because the CLI has been internationalized, it can work with localized data in the database.
- **Command-line elements**, including commands, error messages, and user-supplied SpectroSERVER database data.
- **Programmatic values**, such as indexes.

Spectrum Report Manager Limitations

Spectrum Report Manager database migration from the 9.1 J version of DX NetOps Spectrum is not supported.

CABI 3.x does not support Traditional Chinese.

As a workaround, install the English version of CABI on servers that are set to the Traditional Chinese locale, or on any unsupported language operating system.

If you use the English version, change the locale of the CABI server to Traditional Chinese (zh_TW) to enable the display of InfoView pages in Traditional Chinese. Set the following InfoView preferences:

- Product Locale: Traditional Chinese
- Preferred Viewing Locale: Chinese (Taiwan).

DX NetOps Spectrum and NetOps Portal Integration

9.4 integrates with CA Performance Center 2.3.00, which provides internationalization support for the same languages.

OneClick Status Bar Changes

To accommodate internationalization, the status bar in the OneClick user interface has undergone minor changes. In some views, only the Status of a selected item is shown. In such cases, tooltips display more details of item status (for example, "Running - 2 of 2 devices").

Font Considerations

Not all operating systems support every font for every language. If the console displays strange or unreadable characters, consider adjusting the default logical font to display text in Java-based user-interface applications. Examples of default logical fonts include Serif, SansSerif, Monospaced, Dialog, and DialogInput. Examples of Java-based user interface applications include OneClick, MTE, MIB Tools, and Event Configuration.

Regular Expression Considerations

DX NetOps Spectrum uses regular expressions for processing. Many expressions are visible, such as in the Locater search editor. In general, consider the data source that a regular expression evaluates:

- Localized regular expressions are supported for user data that is stored in the DX NetOps Spectrum database. However, not all DX NetOps Spectrum data is localized, which can affect the functionality of the regular expression.
- Although Event Procedures use regular expressions to parse data from traps, DX NetOps Spectrum supports only SNMP traps that contain ASCII data. DX NetOps Spectrum does not support SNMP, traps, and Event Procedures that

use non-ASCII data; however, preliminary field testing found no issues with UTF-8 character encoding in traps, as, for example, from CA eHealth SystemEDGE monitoring.
- DX NetOps Spectrum does not support localized device configuration data. Therefore, it does not support non-ASCII regular expressions for NCM block policies.

Resolved Issues

Resolved Issues in 10.4.2.2

This release contains the following fixed defects:

- **Symptom:** Tunnel interfaces disappear from the OneClick Interfaces list.
  Resolution: Code changes are made to identify the number of visits to avoid duplicates in later visits. (DE461252, 31915552, 10.4.2.2)
- **Symptom:** When an LDAP server gets changed behind a Load-Balancer, it causes an LDAP authentication issue and users cannot log into OneClick Client.
  Resolution: Code changes are made to avoid authentication issues When an LDAP server gets changed behind a Load-Balancer. (DE450066, 31720987, 10.4.2.2)
- **Symptom:** Spectrum InsideView does not monitor the DSS environment having more than six landscapes.
  Resolution: Code changes are made to monitor the DSS environment having more than six landscapes. (DE479367, 32197707, 10.4.2.2)
- **Symptom:** DX NetOps Spectrum is unable to display the Current Firmware version for the Cisco WLCs
  Resolution: DX NetOps Spectrum is reading attribute `bsnAPSoftwareVersion 0x00213a56` to display the firmware version. Now we change the code to read agentInventoryProductVersion 0x00215152 as Firmware version. (DE479855, 32248330,10.4.2.2)
- **Symptom:** Multiple patches that were provided for prior releases are missing.
  Resolution: It' was a porting defect. Changes are made to port various bug fixes which were provided as part of different PTF/debug patches. (DE469356, 32065353, 10.4.2.2)
- **Symptom:** SpectroSERVER crashes while expanding the checkpoint VSX view table.
  Resolution: Code changes are made to stop SpectroSERVER from crashing while expanding the checkpoint VSX view table. (DE467946, 32065353, 10.4.2.2)

Resolved Issues in 10.4.2.1

This release contains the following fixed defects:

- **Symptom:** Duplicate maintenance schedules getting created in DX NetOps Spectrum and DX UIM.
  Resolution: Recreating schedules if there is schedule time change received in maintenance schedule update from UIM. Duplicate maintenance schedules are not created in DX NetOps Spectrum and DX UIM. (DE461033, 10.4.2.1)
- **Symptom:** OneClick WebApp hangs when retrieving alarm details.
  Resolution: Updated the WebSwing to v20.1.5 to resolve the issue. (DE472756, 32137291, 10.4.2.1)
- **Symptom:** When SPUB integrated with the OneClick server, TopologyNameString and collectionModelNameString are not getting updated for GCs and Containers.
  Resolution: Code changes are made to update the GCs and Containers when SPUB integrated with OneClick server. (DE469977, 32170529, 10.4.2.1)
- **Symptom:** The following issues are identified:
  - False 'MODULE REMOVAL DETECTED' Alarms on Juniper Devices in regards to PowerModules.
  - This results in false alarms for event id 0x10f6d.
  - This mismatch is only seen on devices of type MX960 which have a specific PDM (power distribution module) Module integrated.

Resolution: For the PDM module, not relying on jnxOperatingState value, even if it says down, we cannot confirm on the status. Hence, overriding it and avoiding false module down alarms. (DE412869, 10.4.2.1)

- **Symptom:** The bsnAPDisassociated alarm raised on AP is not cleared now.
  Resolution:
  bsnAPAssociated is deprecated and will not be used for clearing of bsnAPDisassociated alarm raised on AP.
  ciscoLwappApAssociated is used for clearing the bsnAPDisassociated alarm.
  (DE470878, 32100629, 10.4.2.1)
- **Symptom:** When I filter alarms using the REST API query, I do not see the total alarms as shown from the OneClick UI report
  Resolution: Code changes are made to filter and display the exact number of alarms. (DE470364, DE416400, 10.4.2.1)
- **Symptom:** Aruba Access Point models are switching between Primary and Secondary controllers very frequently.
  Resolution: Only actively connected Aruba Access Points will be modeled and associated with the controller. Switching is avoided until failover happens. (DE475205, 32176341, 10.4.2.1)
- **Symptom:** Rare, unpredictable SpectroSERVER, and SDC crashes with varying stacks.
  Resolution: Resolved rare multi-threaded memory corruption in core Spectrum code. (DE472576, 10.4.2.1)
- **Symptom:** NRM_LineCard was displayed only for non-empty serial number cards.
  Resolution: Provided requested functionality by doing code changes and also by adding .vnmrc attribute. (DE471204, 32073889, 10.4.2.1)
- **Symptom:** Occasionally whenever we discover the device interface names are the models are not getting populated.
  Resolution: In one of the corner cases, interface names are not getting updated correctly. Added code to fix it. (DE470582,32108738 , 10.4.2.1)
- **Symptom:** Importing User Models using ModellingGateway adds additional Security Community String at the user level and grants all privileges to the user.
  Resolution: Importing User Models using ModellingGateway will import only expected Security Communities as similar to the older environment. No additional Security Communities at the user level will be imported/ added. (DE470548,32099863 , 10.4.2.1)
- **Symptom:** Alarm Activity by users: group report is not working when we enable the security in Report Manager preferences.
  Resolution: Alarm Activity by users: group report works when security is enabled. (DE469636, 32097585 , 10.4.2.1)
- **Symptom:** Empty varbinds was getting dropped by SDC-TrapX when processing the traps.
  Resolution: Allowing empty varbinds in traps when SDC-TrapX is processing the traps. (DE469286, 10.4.2.1)
- **Symptom:** Alarms not synced to OC when network glitch/firewall enable happens
  Resolution: Alarms getting synced with OC after network/firewall restored. (DE468540,32077565 , 10.4.2.1)
- **Symptom:** Rare, unpredictable SpectroSERVER crashes with varying stacks.
  Resolution: Resolved rare multi-threaded memory corruption in core Spectrum code. (DE466467,32040852 , 10.4.2.1)
- **Symptom:** Tomcat log prints a lot many error messages like "Error while updating item_model_mapping table for MH:"
  Resolution: Tomcat log will be free of error messages like "Error while updating item_model_mapping table for MH:" (DE465226, 31934777, 10.4.2.1)
- **Symptom:** WLC trap processing and Meraki interface check causing the memory leak.
  Resolution: WLC trap processing and Meraki interface check do not cause memory growth. (DE464269,31955069 , 10.4.2.1)
- **Symptom:** When exporting a report to excel, clear/set and start/end times stamp showing as 'a' instead of 'AM'
  Resolution: Report data (set/clear or start/end time) in Excel will display the time as 'AM' or 'PM'. (DE462631,31925449 , 10.4.2.1)
- **Symptom:** Multiple security issues fixed.

  - OC server memory increase when TAS integration is enabled
  - Landscapes were missing from Explorer Tab.
  - GlobalCollection creation fails and UI hangs.
  - Subscription request for MTypeSubscription fails with NullPointerException.
  - Andvance Options button in Discover Console fails with NullPointerException.

  Resolution: Fixed Multiple issues as follows (DE461016, 10.4.2.1):

  - OC server memory increase is fixed when TAS integration is enabled with Proxy and sending device interfaces.
  - No Landscapes missing in Explorer Tab.
  - GlobalCollection creation is successful without any exceptions or hang.
  - The subscription request for MTypeSubscription succeeds without any exceptions.
  - Andvance Options button in Discover Console works fine as expected.
- **Symptom:** Multitenant spectrumgtw is creating a model on a different SpectroServer other than the configured on.
  - Multitenant spectrumgtw is creating a model on a different SS other than the configured one
  - VMsync not happening
  - Threads block issues with vmsync and Vmotions.

  Resolution: Fixed issues as follows (DE460275,31905329 , 10.4.2.1):

  - Multitenant spectrumgtw is creating a model on a different SS other than the configured one
    VMsync is failing
    Spectrum_10.03.02.D175: Backported known fixes from 10.4.1 to XSD changes done for vmsync to allow if one the vCenter is not displayed. That is empty relations and vertices, allowing it to process and move them to unreported inventory.
  - Threads block issues with vmsync and Vmotions.
    Spectrum_10.03.02.D175: Added separate thread pools for vmsync, vmotions, and host sync to run independently without waiting for threads. Vmotions tasks will be cleared once vmsync starts.
- **Symptom:** With Save LDAP Passwords to Spectrum DB option set to YES (on LDAP Configuration webpage) and Allow user to log in with spectrum password, if local Authentication fails then go for LDAP Authentication set to NO for the NON-LDAP user, this NON-LDAP user was still able to log in with a local password.
  Resolution: With Save LDAP Passwords to Spectrum DB option set to YES(on LDAP Configuration webpage) and Allow user to log in with spectrum password, if local Authentication fails then go for LDAP Authentication set to NO for the NON-LDAP user, this NON-LDAP user should never be allowed to log in with local password because his account does not exist in LDAP server. (DE458903,31883885 , 10.4.2.1)
- **Symptom:** Customization of Tomcat log path is not supported and hence Tomcat logs continuously prints "WARNING: Tomcat not started yet" every 5 seconds even after Tomcat has been started.
  Resolution: Customization of Tomcat log path is now supported and hence Tomcat logs do not print "WARNING: Tomcat not started yet" after Tomcat starts up. (DE458239, 31866224, 10.4.2.1)
- **Symptom:** SRM not starting with BeanNotReady exceptions in the tomcat startup.
  Resolution: Resolved the BeanNotReady and Context null exception in the SRM tomcat startup. (DE457610, 31869148 , 10.4.2.1)
- **Symptom:** Alarms not synced to OC when network glitch/firewall enable happens
  Resolution: Alarms getting synced with OC after network/firewall restored. (DE457082,31862002 , 10.4.2.1)
- **Symptom:** Special characters in Event causes ArchMgr memory to grow with flat-file configuration.
  Resolution: ArchMgr memory does not grow with flat-file configuration. (DE452069, 31800261, 10.4.2.1)
- **Symptom:** The Discovery console shows vEdge devices as "Unknown" when the discovery process uses multiple SNMP community strings.
  Resolution: Discovery console should discover vEdge devices when it consists of multiple SNMP community strings. (DE439988, 20107725, 10.4.2.1)
- **Symptom:** Auto-discovery fails to model the SNMP devices when invalid SNMP string used.

Resolution: Auto-discovery skips the invalid SNMP strings and model the device with the correct SNMP string. (DE427911, 20037581, 10.4.2.1)

- **Symptom:** Interface tab rendering is taking a long time.
  Resolution: The interface tab takes less time to populate the interfaces hierarchy. (DE470917, , 10.4.2.1)
- **Symptom:** Tomcat log prints lot many error messages like "Error while updating item_model_mapping table for MH :"
  Resolution: Tomcat log will be free of error messages like "Error while updating item_model_mapping table for MH :" (DE472398, 32136166, 10.4.2.1)
- **Symptom:** When service managers are configured to monitor services/resources on other landscape's in the DSS environment, these service managers are not showing the correct state when one of the landscape's get restarted.
  Resolution: The service manager generic starts bit early and tries get the information about resources/service managers from other landscape after restart. But as the communication between the two landscapes is not fully established the SM's are not able to successfully establish the contact. Correct that code by adding those SM's to list which will re-establish connection after landscapes are fully activated. (DE468261, 10.4.2.1)
- **Symptom:** SpectroSERVER crashes while reading the external attributes from the device for the SNMP mib mismatched datatypes.
  Resolution: SpectroSERVER not crashes while reading the external attributes from device for the snmp mib mismatched datatypes. (DE477168, 32215136, 10.4.2.1)
- **Symptom:** DX NetOps Spectrum alerts flashing in/out periodically due to `orb_timeout=120` entry in the .vnmrc file.
  Resolution: Improved SpectroSERVER Heartbeat retry to prevent retry when SpectroSERVER startup. So, OneCLick retry SpectroSERVER Heartbeat in case of Heartbeat lost later due to network issues, but not SpectroSERVER startup time (DE477428, 32219325, 10.4.2.1)
- **Symptom:** CLI show mh attribute 0x129fa fetches empty data.
  Resolution: CLI show mh attribute 0x129fa fetches model handle info. (DE475246, 32175986, 10.4.2.1)

Resolved Issues in 10.4.2

This release contains the following fixed defects:

- **Symptom:** REST subscription delete requests were always successful and were returning a 200 OK response even when the subscription ID was invalid.
  Resolution: REST subscription delete requests will be successful and will return a 200 OK response only for valid subscription IDs. For invalid subscription IDs, it provides the response as 400 BAD_REQUEST. (DE449183, 20321677, 10.4.2)
- **Symptom:** Locator search was returning an error when the list contained more than 250 items.
  Resolution: Locator search is working fine now as the search criteria filtering mechanism on the OneClick server has been enhanced. (DE446038, 20165224, 10.4.2)
- **Symptom:** OneClick Webapp was slow when connected through NAT VPN.
  Resolution: OneClick Webapp now launches quickly when connected through NAT VPN. (DE445051, 20260732, 10.4.2)
- **Symptom:** SpectroSERVER stopped responding during the SDM-SDC socket communication when signed integer was being passed.
  Resolution: SpectroSERVER no longer crashes during the SDM-SDC socket communication. (DE441938, 20139157, 10.4.2)
- **Symptom:** When SNMP requests were taking more time to process, SNMP v3 credentials corresponding to those requests were getting displayed in the plain text in the VNM.out file.
  Resolution: Sensitive SNMP v3 credentials are now getting masked out in the VNM.out file. (DE441789, 20089499, 10.4.2)
- **Symptom:** Export preferences from Group-to-Group were not successful.

Resolution: Now, export preferences from Group-to-Group are working without any issue. (DE441102, 20098500, 10.4.2)

- **Symptom:** NCM policies were not generating alarms on violations. The policies remained green and did not show any violations.
  Resolution: NCM policies now generate alarm as soon as any violation is identified on the associated policy devices. (DE435905, 20080461, 10.4.2)
- **Symptom:** SSH connection from the OneClick console to a device was disconnecting after every few minutes even when the session was being actively used.
  Resolution: DX NetOps Spectrum web server sometimes was getting the NULL value for the port in the HTTP request. This was causing the connection closure due to NumberFormatException. To handle such cases, a configuration for the port in web.xml has been added with the default value as 22. (DE428628, 1367885, 10.4.2)
- **Symptom:** SLM debug (slm_debug) fault code was making the SpectroSERVER unresponsive.
  Resolution: Fixed the fault code in this release. (DE409908, 01324240, 10.4.2)
- **Symptom:** NCM needs to pass model attributes.
  Resolution: NCM now allows passing of model attributes through the command line. (DE448840, 20320396, 10.4.2)
- **Symptom:** OneClick Tomcat was running out of memory.
  Resolution: For users with huge inventory, it was taking more time to respond to the subscription request. As a result, multiple subscription requests were being sent to DX NetOps Spectrum. DX NetOps Spectrum was receiving multiple subscription requests for a single need. It had to send notifications to all those subscriptions (instead of sending a single notification). Eventually, this was causing the out-of-memory issue. This issue is now fixed. (DE452329, 31812662, 10.4.2)
- **Symptom:** The Advanced Options button on the discovery console was not opening.
  Resolution: The Advanced Options button on the discovery console now opens successfully. (DE448279, 20304211, 10.4.2)
- **Symptom:** DX NetOps Spectrum incremental sync with CA PC was taking a long time and was failing/timing-out. DX NetOps Spectrum was synchronizing unnecessary models as Tunnels/SLAPaths.
  Resolution: The Advanced Options button on the discovery console now opens successfully. DX NetOps Spectrum incremental sync with CA PC is now quicker and is not failing/timing-out. DX NetOps Spectrum now does not sync unnecessary models to CA PC. (DE425532, 20031392, 10.4.2)
- **Symptom:** Creation and saving of V3 management profiles was making SpectroSERVER unresponsive.
  Resolution: The issue has been resolved. Now, the engineID is not updated for 127.0.0.1. (DE449679, 31697282, 10.4.2)
- **Symptom:** AlarmClear stopped responding while processing the response message received from SpectroSERVER.
  Resolution: This issue has been fixed in this release. The issue was occurring when NCM sync task was coinciding with AlarmClear. (DE445737, 20129167, 10.4.2)
- **Symptom:** When migrating DSS landscapes from 10.2.1 to 10.4 by using the Modeling Gateway, some of the features (Alarm Filters and Global Collection Hierarchy) were not getting imported.
  Resolution: Alarm Filters and Global Collection Hierarchy are now getting imported successfully. Appropriate attributes have been added to the modelinggatewayresource.xml file. (DE444697, 20107478, 10.4.2)
- **Symptom:** During policy creation, watches were showing only for the first landscape.
  Resolution: Appropriate code changes have been made to ensure that watches for all the landscapes are shown. (DE444671, 20102819, 10.4.2)
- **Symptom:** DX NetOps Spectrum stops responding after a policy is applied to a global collection.
  Resolution: Fixed the issue by adding the validation of 8 MB to the Attr data length value. The issue was occurring because the Attr data length value was going above 8 MB; that is, the database field size value. (DE440918, 20111260, 10.4.2)
- **Symptom:** The trap storm alarm was not getting cleared even when the device was in maintenance.

Resolution: Added a check to process the trap storm stop event so that the trap stop alarm is cleared. (DE439806, 20107829, 10.4.2)

- **Symptom:** SpectroSERVER was not responding.
  Resolution: This issue was occurring because of negative nsize getting converted by the htonl() syscall. The issue has been resolved now. (DE429253, 20002093, 10.4.2)
- **Symptom:** Duplicate models were getting created in DX NetOps Spectrum for the CA UIM devices.
  Resolution: Duplicate models are no longer getting created. (DE418965, 01360123, 10.4.2)
- **Symptom:** Users were observing performance issues in the product.
  Resolution: The product now works as expected without any performance issues. (DE401831, 01279345, 10.4.2)
- **Symptom:** OnceClick server was running out of memory with Java heap space error.
  Resolution: The issue was occurring because of the low web server memory. It has been fixed now. (DE451492, 20313084, 10.4.2)
- **Symptom:** Users were facing issues while building Syslog Filter views (Nexus devices (7K, 9K models).
  Resolution: Changes are done to attach CiscSyslogApp model to Nexus devices. XML changes are also done to bring the syslog OneClick view for Nexus devices. (DE445204, 20261490, 10.4.2)
- **Symptom:** The Component Detail view was showing incorrect values for Secunet SINA Box. For example, the information like "Software Version" was appearing as a long string of numbers instead of a valid version number.
  Resolution: The Component Detail view was not showing the correct value for the attributes of Secunet SINA Box devices that had octet string as datatype. This issue has been fixed. (DE444712, 20199577and 31784985, 10.4.2)
- **Symptom:** The SPM tests that were scheduled and discovered from the device were not running on the configured time interval.
  Resolution: With the defect being fixed, the test is being scheduled and run after the configured time interval, as expected. (DE443008, 20076530, 10.4.2)
- **Symptom:** TL1 models were causing segment fault during the secondary SepctroSERVER startup.
  Resolution: The secondary SpectroSERVER now starts up without any issue. (DE457761, 31874041, 10.4.2)
- **Symptom:** Timeout failures were occurring on the DX NetOps Spectrum side for the PM Alarm View reports.
  Resolution: The Alarms API has been updated to perform better. Now, OneClick will fetch all alarms from SpectroSERVER based on the time range and will perform model filtering at the OneClick level instead of passing to SpectroSERVER. (DE448189, 20294595, 10.4.2)
- **Symptom:** Users did not want to create connections to certain devices by using the LockConnection attribute. However, the connections were getting created.
  Resolution: The LockConnection attribute serves a different purpose. To resolve this issue, a new attribute LockPort has been created on the port model type. This new attribute allows users to achieve the desired functionality. (DE441622, 20093962, 10.4.2)
- **Symptom:** Heartbeat was getting lost between a SpectroSERVER on one location and a OneClick server on another location. This was causing issues with the stability of the environment and continued monitoring of the network.
  Resolution: If the heartbeat is not received in 5 minutes, then it forces the domain connection to SpectroSERVER. (DE434135, 20067429, 10.4.2)
- **Symptom:** OneClick was not showing the Firmware and Serial Number information in Asset Information for Fortinet devices, which are certified.
  Resolution: Updated the default value for NRM_RunningFirmwareAttr to read the fgSysVersion for the Fortinet devices. (DE431916, 1333237, 10.4.2)
- **Symptom:** SpectroSERVER stopped responding while creating a map between the Ports and OID value list and during unpacking the OID value for Juniper hub routers/devices.
  Resolution: It was found that the value was a Component_OID (Instance_ID) of an interface, which was NOT a regular OID. To fix this issue, the value of 'is_an_object_id' is set to FALSE. (DE433667, 20066484, 10.4.2)
- **Symptom:** Weekly and monthly schedules were not running correctly.

Resolution: Corrected the behavior of weekly and monthly discovery schedules. (DE449745, 20306898, 10.4.2)

- **Symptom:** During topology update for SLA paths, rendering connection between vEdge devices and SDN_Transports was returning pipe issues. The pipe links were disappearing after appearing for some time.
  Resolution: During topology update for SLA paths, rendering connection between vEdge devices and SDN_Transports now returns link pair objects to render the connection. (DE459699, 31850589, 10.4.2)

Known Issues

This release includes the following known issues:

Cannot Start or Stop SDC on Linux If CAPKIHOME Not Set

Symptom: I tried to stop/start SDC on Linux from the SDC installed location (/opt/CA/SDMConnector/bin). DX NetOps Spectrum throws the following error if CAPKIHOME is not set.

```
n./SdmConnectorService.exe --stop
Please check atleast one of the following conditions are met.
*) Set CAPKIHOME environment variable.
            *) Pass valid second parameter to etpki_lib_init function. Ex: if the second parameter is /a/b/c/
[lib]cryptocme2.[dll][so][sl], it is assumed that /a/b/c has all the required CAPKI shared libraries
```

Resolution: Set the CAPKIHOME environment variable to export CAPKIHOME=/opt/CA/SharedComponents/CAPKI.

OneClick Jasper Integration Not Working in Kubernetes Docker Environment

Symptom: OneClick Jasper integration is not working in Kubernetes Docker environment.

Resolution: Review the following information:

First step: Create NodePort

apiVersion: v1 kind: Service metadata: name: ocstwonodeport spec: type: NodePort ports: - port: 3306 protocol: TCP name: mysql selector: name: ocstwo

Second step: Edit Jasper call

jdbc:mysql://<mastername>:45673/reporting

for example: [root@autok-c74vm1 hari]# kubectl get svc -n spectrum NAME TYPE CLUSTER-IP EXTERNAL-IP PORT(S) AGE ocsone ClusterIP 10.233.59.221 <none> 9443/TCP,8080/TCP 18h ocsonenodeport NodePort 10.233.53.13 <none> 3306:31905/TCP 20s [root@autok-c74vm1 hari]#

So, basically, "ocsone" is the Tomcat svc and "ocsonenodeport" is the MySQL svc for the port mapping.

```
jdbc:mysql://http://10.17.153.220:31905/reporting" dir="ltr">10.17.153.220:31905/reporting
```

Reconciliation Not Happening When Elastic Has a Large Number of Alarms

Symptom: Reconciliation does not happen when elastic has a large number of alarms.

Resolution: No known resolution for the issue as of now.

Bi-Monthly Patches (BMPs) on 10.4.2

> **NOTE**
>
> There are currently no BMPs released on the current release. Watch this space for any future release.

Bi-Monthly Patch(BMP) is a bundle of PTF patches available on top of a DX NetOps Spectrum GA-release. DX NetOps Spectrum BMPs are released in every two months cadence on a regular schedule. DX NetOps Spectrum Bi-Monthly

Packs are self-extracting install files for each of the supported operating systems. The BMP must be installed on both the SpectroSERVER and OneClick server. For installation and uninstall instructions, refer to the Release Notes of the BMP.

Third-Party Software License Acknowledgements

DX NetOps Spectrum 10.4.2.1

Third-party software was used in the creation of DX NetOps Spectrum. All third-party software has been used in accordance with the terms and conditions for use, reproduction, and distribution as defined by the applicable license agreements. The following list contains the third-party software license agreements for applications that are added/ included as part of the current release of DX NetOps Spectrum:

- Adopt OpenJDK 1.8u265
- Tomcat 9.0.37
- WebSwing 20.1.5

> **NOTE**
> To view the license agreements for 10.4.2.1, click here.

DX NetOps Spectrum 10.4.2

Third-party software was used in the creation of DX NetOps Spectrum. All third-party software has been used in accordance with the terms and conditions for use, reproduction, and distribution as defined by the applicable license agreements. The following list contains the third-party software license agreements for applications that are added/ included as part of the current release of DX NetOps Spectrum:

- Adopt OpenJDK 1.8u242 Hotspot
- Apache CXF 3.3.5
- Apache HTTP Server 2.4.41
- certifi 2019.11.28
- chardet 3.0.4
- Cygwin 3.1.4
- ehcache 3.8.1
- idna 2.8
- Logstash 7.6.2
- MindTerm 4.2.2
- MySQL 5.7.27
- Struts 2.5.22
- Tomcat 9.0.34
- urllib3 1.25.8
- WebSwing 20.1

> **NOTE**
> To view the license agreements 10.4.2 release, click here.

Getting Started

DX NetOps Spectrum provides robust, comprehensive and sophisticated capabilities IT organizations need to effectively monitor and manage their dynamic, complex infrastructure. DX NetOps Spectrum is a single platform that features proactive network change management, fault isolation, and root cause analysis. With DX NetOps Spectrum, you can track, manage, and optimize not only the network infrastructure but the business services running on top of it.

DX NetOps Spectrum offers:

- **Service-aware management**
  DX NetOps Spectrum helps staff discover, model, monitor, and manage the relationships between the infrastructure and the business services it supports.
- **Intelligent fault detection**
  DX NetOps Spectrum delivers patented technologies that automate device discovery and root cause analysis, speeding issue detection and remediation.
- **Proactive change management**
  DX NetOps Spectrum delivers the visibility and control that administrators need to minimize the erroneous changes that lead to performance issues and outages.
- **Comprehensive device and platform coverage**
  With DX NetOps Spectrum, managers can gain comprehensive visibility across physical, virtualized and cloud environments, and across vendors, including SDNs.
- **Customized, role-based views**
  DX NetOps Spectrum offers pre-packaged, easily customizable dashboards and reports that can be tailored to the specific needs of administrators, users, and customers.

Overview

DX NetOps Spectrum is a services and infrastructure management system that monitors the state of managed elements including the following:

- Devices
- Applications
- Host systems
- Connections

Status information such as fault and performance data from these elements is collected and stored. DX NetOps Spectrum constantly analyzes this information to track conditions within the computing infrastructure. If an abnormal condition is detected, the product isolates it, alerts you, and presents the possible causes and solutions.

Client-Server Model

The DX NetOps Spectrum design is based on the client-server model.

- Its primary server, the SpectroSERVER, is responsible for collecting, storing, and processing data.
- The SpectroSERVER uses Inductive Modeling Technology (IMT) to perform these functions. IMT combines an object-oriented database and the intelligence of inference handlers. The object-oriented database contains model types that define the representation of each managed element, and models that represent specific managed elements. The object-oriented database also contains relations that define possible associations between model types.
- The inference handlers provide more functionality to this system by reacting to events that DX NetOps Spectrum or managed elements produce.
- The SpectroSERVER stores data in the knowledge base where model types, models, and relations are defined.
- The SpectroSERVER polls manage elements and receives alert information from the computing infrastructure.
- The SpectroSERVER analyzes and stores this information in the knowledge base, and let the client applications access this information.

Client Applications

DX NetOps Spectrum includes a number of client applications.

- Its main client application is OneClick.
- OneClick provides the graphical user interface to monitor the network and to launch other client applications.
- OneClick Console provides views that contain icons, tables, and graphs to represent the different elements of the network. These graphical components present status information and provide access to management facilities specific to the managed element they represent.
- All client application data is retrieved from the SpectroSERVER.

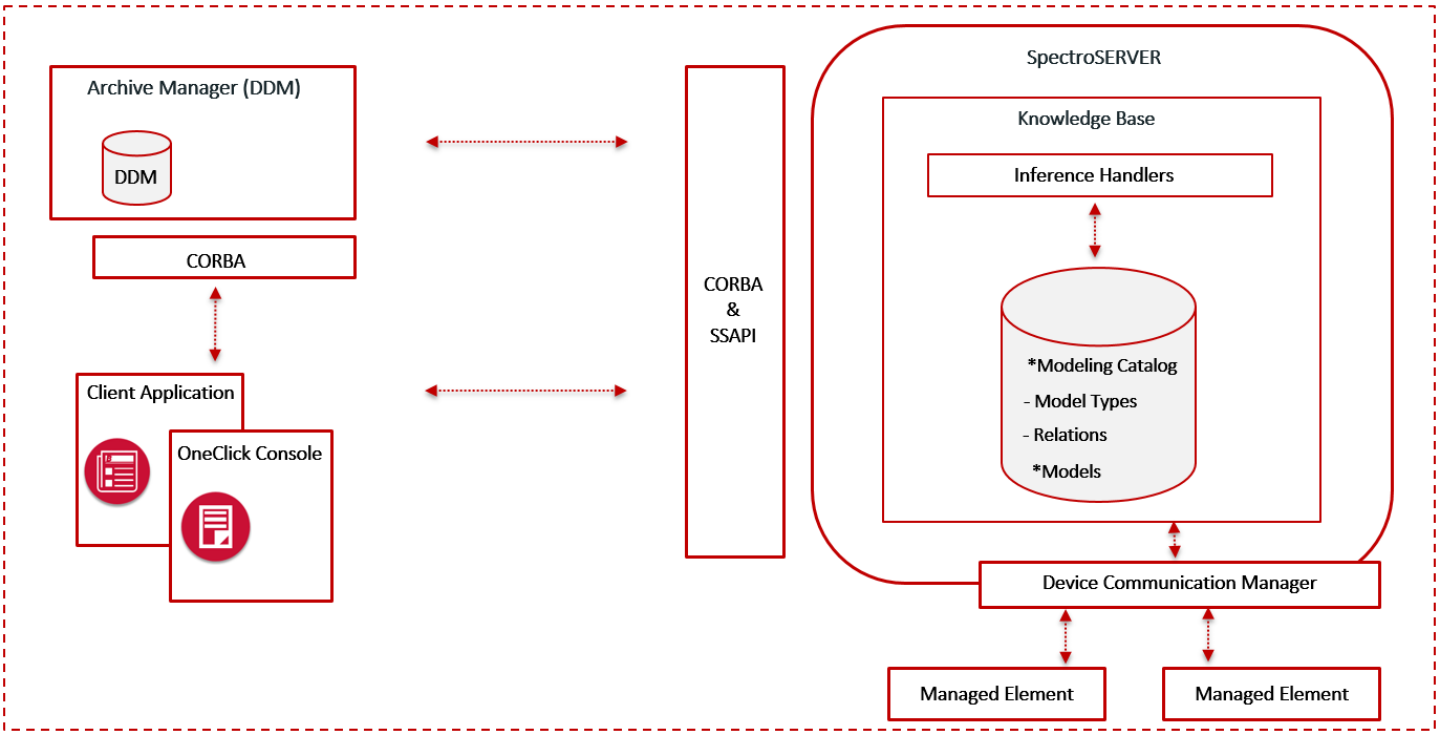
SpectroSERVER and Spectrum Databases Overview

This section explains the functions and components of SpectroSERVER, and also explains functions of the various DX NetOps Spectrum databases available.

SpectroSERVER

The SpectroSERVER is the primary server for DX NetOps Spectrum. The SpectroSERVER functions as a database server, a modeling engine, and a device manager. The SpectroSERVER processes events, generates alarms, and tracks statistics for managed elements. The client applications get this information through the SpectroSERVER application programming interface (SSAPI) and the DX NetOps Spectrum CORBA interface.

The following illustration shows the SpectroSERVER components in a simplified view:



NOTE
The SpectroSERVER is also referred to as the VNM (Virtual Network Machine). Specifically, the term VNM refers to the portion of the SpectroSERVER that is responsible for modeling managed elements.

DX NetOps Spectrum Databases

DX NetOps Spectrum includes the following databases:

- SpectroSERVER database.

For more information, see the Database Management section.
- Distributed Data Manager (DDM) database, which stores DX NetOps Spectrum events and statistical data for use across multiple landscapes.
  For more information, see the Database Management section.
- MIB Tools database, which supports the MIB Tools utility.
  For more information, see the Certification section.
- Reporting database, which support Report Manager and Service Manager.
  For more information, see the Install Report Manager section.

Knowledge Base

The knowledge base is a main component of the SpectroSERVER. The knowledge base comprises both the data and the procedural information necessary to manage computing infrastructure.

The knowledge base includes a component that stores model types, models, relations, and event and statistical information. A sophisticated system of models and relationships between models lets the knowledge base represent and store information about the network elements. This system of models and their relationships, when viewed as a single logical entity, describes the physical and logical topology of the computing infrastructure. DX NetOps Spectrum builds its *root cause analysis* capabilities on this foundation.

All models in the knowledge base are based on templates that are known as *model types*. The model types define the properties that make up an instantiated model. All model types are stored in the knowledge base modeling catalog.

The knowledge base also contains processes that give some intelligence to model types. These processes include inference handlers and actions. Process data is stored in memory while the SpectroSERVER is running and is also part of the knowledge base.

The knowledge base uses the Archive Manager and the Distributed Data Manager (DDM) to store the historical event and statistical information about specific models. This information is accumulated over time, letting DX NetOps Spectrum gain extensive knowledge about the computing infrastructure being managed.

Modeling Catalog

The modeling catalog is the metadata repository of the knowledge base. The modeling catalog objects ship with DX NetOps Spectrum and are relatively static, but you can manipulate some catalog aspects for tuning purposes. You can also customize the modeling catalog to make DX NetOps Spectrum aware of new network technologies or new types of managed network elements. The following sections describe the various specific types of objects that are included in the modeling catalog.

Model Types

The model types correspond primarily to managed element families and are the templates that are used to build models. The model types contain the information, or attributes, required to manage a specific type of managed element. The model types possess the intelligence that tells DX NetOps Spectrum how the managed element represented by the model type behaves. This intelligence also describes how the managed element reacts to events occurring on the managed element or elsewhere in the network.

For example, the DX NetOps Spectrum modeling catalog contains a NokiaFW model type. This model type represents certain types of Nokia Firewalls such as IP330, IP440, IP650, and IP740. DX NetOps Spectrum uses it to create a model that represents a specific Nokia Firewall in a network.

Each model type is uniquely identified in the modeling catalog using a *model type handle* number, typically represented in hexadecimal format.

Model Type Attributes

Each model type has attributes that define the characteristics and properties of the managed element that the model type represents. These attributes can be either internal or external. The internal attributes reflect information that is specific to the DX NetOps Spectrum management of a particular element. The external attributes reflect objects from the MIBs that the managed element supports. All attributes have default values that are associated with the model type.

In many cases, attributes take on new values when a model of a specific model type is instantiated. The attribute values are specific to the managed element that the model represents. Some attributes, however, are shared attributes. All models of the given model type access the same shared attributes and their values. These attributes and values are not duplicated in memory or the database for each model.

Each attribute is uniquely identified in the knowledge base using a number that is known as an *attribute ID*, typically represented in hexadecimal format. Many attributes are used across numerous model types. For example, almost every model type in the modeling catalog uses the attribute Modeltype_name or IPAddress. The attribute IDs for these attributes remain the same across all model types. This normalization of attributes is achieved by using model type inheritance.

Relations

Relations define the potential ways in which model types can be related to each other. Relations are defined in the DX NetOps Spectrum knowledge base. Examples of relations are Contains, Manages, and Connects_to. Each relation has a unique number, typically represented in hexadecimal format, that identifies it. This identifier is known as a *relation handle*.

Meta-Rules

Meta-rules give meaning to a relation by defining the context in which the relation is used. A meta-rule identifies the model types that can participate in a relation. To understand the concept of a meta-rule, think of model types and relations as nouns and verbs, respectively. Noun and verb phrases are combined to form a sentence. For a sentence to be meaningful, it must meet three criteria:

- The sentence must be in the format (subject) noun + verb + (object) noun.
- The sentence must be logical; one cannot use any verb to link any two nouns.
- The sentence must reflect reality.

The DX NetOps Spectrum notion of meta-rules enforces the second criterion. Meta-rules can be defined on a verb to limit the nouns that the verb can link. Define meta-rules carefully, so that the restrictions they impose on verbs are logical. Typically, several meta-rules govern each verb.

Consider a language where the following nouns and verbs are defined as the model types and relations for the objects constituting a network. Further, assume that meta-rules are defined to impose a logic on the way the nouns and verbs can be used together. Meta-rules are defined for a relation and consist of two model types: a left model type and a right model type. This left-right order in meta-rules is the format for building logical sentences. The left model type is the subject, the relation is the verb, and the right model type is the object of the sentence.

- **Nouns**
  building
  room
- **network**
  LAN
  printer
  workstation
- **Verbs**
  contains
  collects
- **Meta-rules**
  contains [building, room], [room, workstation]

collects [LAN, printer], [LAN, workstation], [network, LAN]

To create logical statements in this language, the first two criteria must be met. The following examples meet the first and second requirements and are realistic representations of a computing infrastructure:

- Engineering building contains a testing lab
- The testing lab contains workstation ABC
- Engineering LAN collects workstation ABC
- Engineering LAN collects LaserJet printer

The following sentences are invalid because they do not use the noun/verb/noun format, and therefore do not meet the first criterion:

- Contains building collects
- Room LAN workstation

The following sentences meet the format requirement, but are either illogical or do not follow the defined meta-rules:

- Building contains workstation
- LAN collects room
- Printer collects LAN

Cardinality of Relations

Relations are defined to have a cardinality of either one-to-many or many-to-many. For example, the Contains relation has a one-to-many cardinality. A meta-rule has been defined to let the Contains relation exist between the Room model type and the Workstation model type. As Contains is a one-to-many relation, a single room can contain many workstations, but a single workstation can only be in one room.

The Connects_to relation is an example of a many-to-many relation. A meta-rule has been defined to let the Connects_to relation exist between the switch and router model types. A single switch is connected to many different things, one of them the router. Likewise, a router is connected to many things, one of them being a switch.

The cardinality of relations lets DX NetOps Spectrum models be logically linked, associated, or combined in ways that can truly represent real-world computing infrastructures.

Model Type Hierarchy

The model types are built in a hierarchical fashion. The more general model types are built first, and the more specific model types are derived from the general types. A model type is derived using the principle of inheritance. Multiple inheritances are used to derive a model type from multiple base model types.

A derived model type inherits both the attributes and the intelligence of the model type or model types from which it is derived. The derived model type also participates in the same meta-rules as the base model types. In addition, the derived model type uses the same inference handlers that the base model types use.

Model types that are derived from multiple base model types inherit attributes and inference handlers from the base model types using a specific order. As a result, the derived model type cannot inherit an attribute or an inference handler multiple times. Inheritance also determines the initial value of an attribute. The new attributes, both internal and external, and new inference handlers can be added to the derived model type. The derived model type is a more specific type than its base.

Models in Knowledge Base

Along with storing model types, the knowledge base stores all the models that have been instantiated to represent elements of the computing infrastructure. A model is created by instantiating a specific model type. A copy of the template (the model type) is made, and the copy is then used to represent a real-world element in the computing infrastructure.

When a model is instantiated, the attributes of that model type take on values. The knowledge base also stores the current value for each model attribute. Some of these model attributes are “shared,” being common to all elements of the same type, and describe aspects or behavior of the model type. Each model of a given model type has the same value for these shared attributes. The unshared attributes have values which can differ for each model according to the current working condition in the infrastructure. The values of the attributes describe the unique aspects, characteristics, and behavior of the single model.

Associations of Models

When DX NetOps Spectrum creates a representation of computing infrastructure components using models, these models do not exist as isolated elements. Models relate to one another as the elements relate to one another in the computing infrastructure. When DX NetOps Spectrum instantiates a model, the applicable relations between the model and other models are also instantiated. An instantiated relation is known as an association. The association must follow the meta-rules that define the relation. OneClick and other client applications enforce meta-rules, not the SpectroSERVER.

Inference Handlers

The inference handlers define the behavior and intelligence of a model type. Each inference handler can perform a specific task. A task can be as simple as changing the value of an attribute. Or, a task can also be as complex as discovering all the managed elements on a network segment. An inference handler can also perform a generic task like calculating an average. Or, an inference handler can perform a detailed task specific to a model type, such as creating models of LAN switch ports. Basically, the inference handlers are the many pieces of intelligence that are the heart of DX NetOps Spectrum. DX NetOps Spectrum can offer its many infrastructure management capabilities because of inference handlers.

An inference handler is a C++ code segment that is associated with a model type. An inference handler is typically a dormant piece of code that supports a wide variety of triggers. Once triggered, an inference handler performs a task. The result of the task can be a new piece of data, an altered modeling scheme, or another DX NetOps Spectrum subsystem (such as another inference handler) triggered. Once the processing of inference handler ends, it goes into an idle state and awaits another trigger.

The inference handlers specify the behavior for models according to their model type and how the model type reacts to certain conditions. They can define:

- The behavior of a model when it is created, destroyed, or activated.

  NOTE
  A model is activated when it establishes the necessary communication with the managed element that it is modeling.
- The behavior of a model if the values of its attributes change, or if an event is generated on it.
- The behavior of a model when it forms a new association with another model, or when the model is removed from an existing association.
- How to handle certain actions.

The inference handlers are related to model types within the knowledge base, and they execute for instantiated models of that model type. When the external condition of two models of a model type changes in a similar way, the reaction of both models is similar. However, the values of the attributes of a specific model that reflect the status of that model have an impact on the inference handler. The attribute values of one model can be different from the attribute values of the other model. Therefore, even though the external condition is the same and the inference handlers react similarly for each model, the result of the reaction by the two models of the same model type can be different.

For example, an inference handler that is associated with a model type that represents a router is designed to perform one specific task: To create models that represent the interfaces of the router whenever a new router model

is instantiated. Once this task ends, the job of the inference handler finishes. The inference handler then waits for the creation of the next router model from this model type, so it can perform this job again.

The router model type has attributes that record the number and type of interfaces that exist on the router. Each instantiated router model represents a specific router in the computing infrastructure. And, it is likely that each router model has different values for these attributes. The number and type of interface models that the inference handler creates, are based on these values. Thus, if multiple router models are created in the knowledge base representing different routers of the type in the network, the same inference handler creates a different (but appropriate) number and type of interface models for each new router model.

The previously mentioned inference handler can once again be triggered when the router model receives a notification that the real-world router has been reconfigured. The reconfiguration can cause the number or type of interfaces on the router to change. When this change occurs, the inference handler recreates these interface models using the new information. This dynamic adaptive modeling capability is an example of one of the fundamental uses of inference handlers throughout DX NetOps Spectrum.

Actions

DX NetOps Spectrum defines a set of operations that can be performed on a model, such as reading or writing an attribute. To expand possible operations, DX NetOps Spectrum allows *actions*. An action is an operation that is not part of the basic set of operations that DX NetOps Spectrum defines for use with a model. Sending an action to a model causes the model type to react in some way. For example, it can return requested data to the action sender, or it can cause the model type to perform a specific task.

'reporting' Database

DX NetOps Spectrum Report Manager (SRM) uses a MySQL database named '**reporting**' to store data. This database contains all the tables that are required to store the data that is used by SRM application to generate reports.

At startup, the DX NetOps Spectrum Report Manager retrieves the data from the primary Archive Manager for each SpectroSERVER through OneClick and stores the data in the SRM databases.

Following is the list of tables and views in the '**reporting**' database.

The relations shown in the following diagrams merely indicate table relations. They do not indicate 1:1 or 1: many relations.

Interpret the column icons as indicated below:

- Represents a Primary Key

- Simple NOT NULL column

- Simple column which can be NULL

Tables

alarm_user

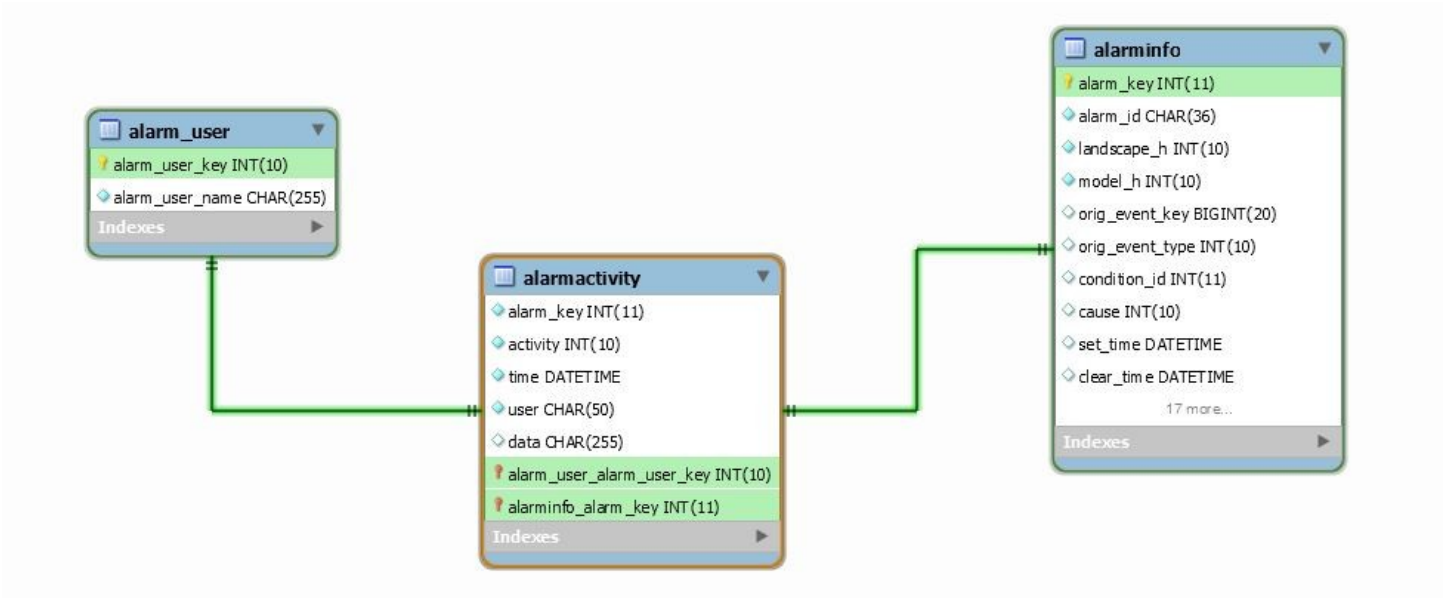
Description

This table lists the users who can manage the alarms in DX NetOps Spectrum.

Columns

Field	Type	Null	Key	Default	Extra	Comment
alarm_user_name	char(255)	NO	UNI			Name of the DX NetOps Spectrum user, who can manage the alarms.
alarm_user_key	int(10) unsigned	NO	PRI		auto_increment	Unique key for each user, who manages the alarm in DX NetOps Spectrum

Relations



alarmactivity

Description

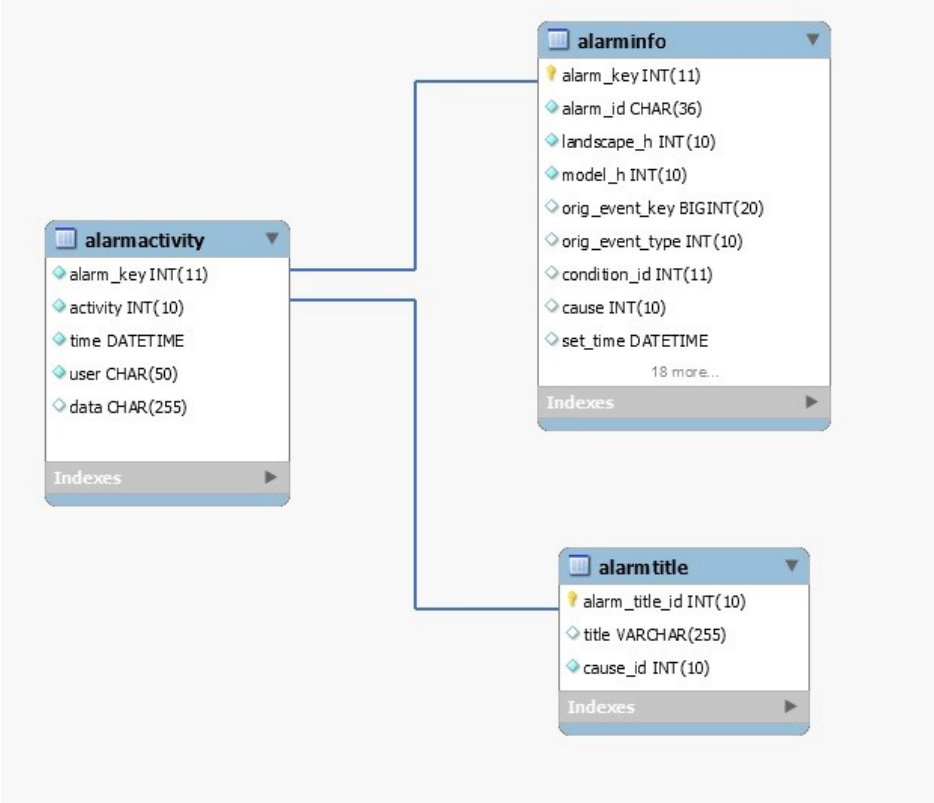
The alarmactivity table stores all the alarm activity that is monitored by SRM. The activity field denotes the type of alarm event generated. This field can be one of the following:

- Set alarm event
- Acknowledge alarm event
- Assign troubleshooter alarm event
- Clear alarm event
- User cleared alarm event
- Assign trouble ticket alarm event

Columns

Field	Type	Null	Key	Default	Comment
user	char(50)	NO	MUL		Name of the user, handling the alarm
time	datetime	NO	MUL	0000-00-00 00:00:00	Time of the activity performed in the alarm.
data	char(255)	YES			
alarm_key	int(11) unsigned	NO	MUL		Key value for specific type of Alarms.
activity	int(10) unsigned	NO	MUL		Activity that is performed by the user on the specific alarm.

Relations



alarmcondition

Description

This table represents the alarm criticality and condition.

Columns

Field	Type	Null	Key	Default	Comment
criticality	tinyint(2)	NO	UNI		Criticality of the alarm like Minor, Major, Critical
condition_name	varchar(11)	NO			Condition name of the alarm, which is mapped to the criticality.
condition_id	int(10) unsigned	NO	PRI		Unique ID for the alarm condition.

Relations

alarminfo

Description

This table contains all the alarm information including the assignee and trouble ticket IDs.

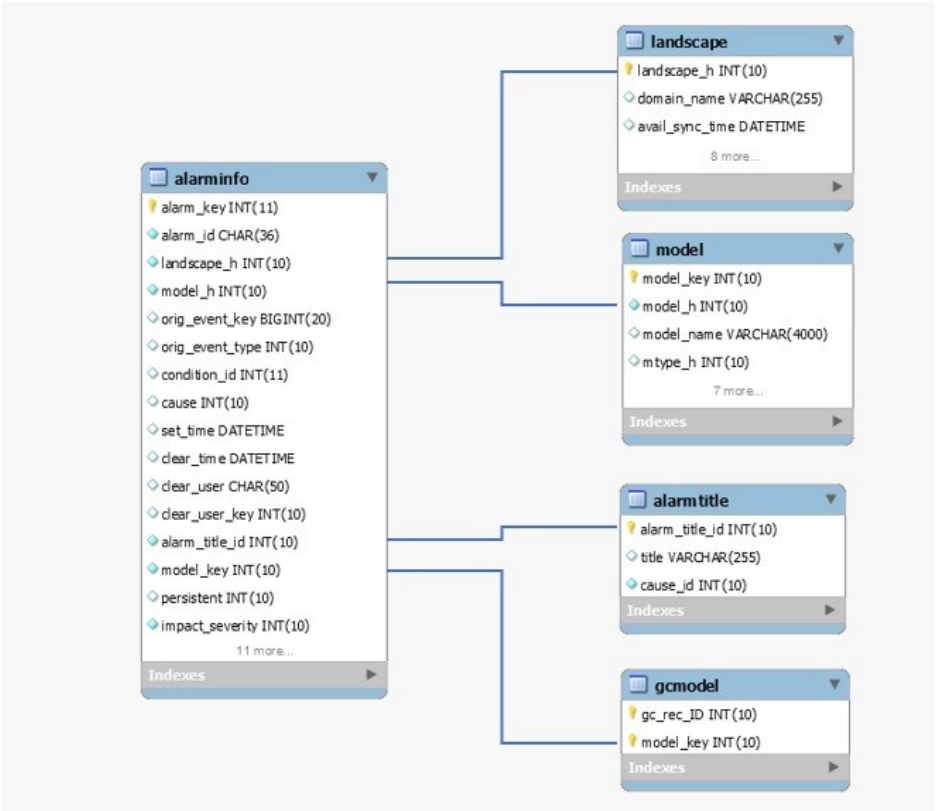
The alarminfo table stores relevant information for an alarm. There is one entry per unique alarm id, as opposed to the alarmactivity table which can have multiple entries for a single Alarm ID. An entry in this table is created when a “set alarm event” is received by SRM. The table is updated through the life of the alarm as each of the other alarm events are received by SRM.

Columns

Field	Type	Null	Key	Default	Comment
set_troubleticket_user_key	int(10) unsigned	YES	MUL		Trouble ticket user key for the specific alarm.
set_troubleticket_time	datetime	YES			Time of the trouble ticket assigned.
set_troubleticket_id	char(255)	YES			Trouble ticket ID of the alarm.
set_time	datetime	YES	MUL		Originated time of the alarm.
persistent	int(10) unsigned	YES	MUL	2	
orig_event_type	int(10) unsigned	YES			Originating event type for the alarm.
orig_event_key	bigint(20) unsigned	YES			Originating event key for the Alarm.
model_key	int(10) unsigned	NO	MUL	0	Unique model key for each alarm.
model_h	int(10) unsigned	NO	MUL		Model handle of the device, which has the alarm on it.

last_assigning_user_key	int(10) unsigned	YES	MUL		
last_assigned_user_key	int(10) unsigned	YES	MUL		
last_assigned_time	datetime	YES			
landscape_h	int(10) unsigned	NO			Landscape handle of the server, where the alarm present.
impact_severity	int(10) unsigned	NO		0	Severity of the alarm.
first_assigning_user_key	int(10) unsigned	YES	MUL		
first_assigned_user_key	int(10) unsigned	YES	MUL		
first_assigned_time	datetime	YES			First assigned time of the alarm to specific user.
condition_id	int(11)	YES			Condition of the alarm, which is mapped to the criticality.
clear_user_key	int(10) unsigned	YES	MUL		
clear_user	char(50)	YES			User who acknowledge the alarm.
clear_time	datetime	YES			When the alarm is cleared from DX NetOps Spectrum.
cause	int(10) unsigned	YES	MUL		Cause/Event ID of the specific alarm.
alarm_title_id	int(10) unsigned	NO	MUL	1	Unique ID for alarm title.
alarm_key	int(11) unsigned	NO	PRI		Unique ID for each alarm present in DX NetOps Spectrum
alarm_id	char(36)	NO	UNI		Alarm ID for specific type of alarms.
ack_user_key	int(10) unsigned	YES	MUL		Specific key for the user who acknowledges the alarm.
ack_time	datetime	YES			When the user acknowledge the alarm.

Relations



alarmtitle

Description

This table represents the title information of DX NetOps Spectrum alarms.

Columns

Field	Type	Null	Key	Default	Extra	Comment
title	varchar(255)	YES				Title of the Alarm.
cause_id	int(10) unsigned	NO	MUL			Cause or Event ID of specific type of alarm in DX NetOps Spectrum
alarm_title_id	int(10) unsigned	NO	PRI		auto_increment	Unique ID for each alarm present in DX NetOps Spectrum.

Relations

backups

Description

This table contains list of database backups.

bo_only_user

Description

This table includes the Business object user information.

boxi_user_sync

Description

This table includes the Business object user sync information.

bucketactivitylog

Description

This table includes the event information from the landscape to process in SRM database.

ca_reportstrings

Description

This table represents the information of localized string for the identifier.

configchangelog

Description

This table contains the information about NCM configuration file and logs.

Columns

Field	Type	Null	Key	Default	Extra	Comment
last_modified	bigint(20)	NO				Last_Modified time of the configuration file.
id	int(10) unsigned	NO	PRI		auto_increment	Unique ID of Configuration file.
filename	varchar(255)	NO				Name of the Configuration file.
content	blob	NO				Content of the configuration file

contentpkg

Description

This table represents the installation content package information.

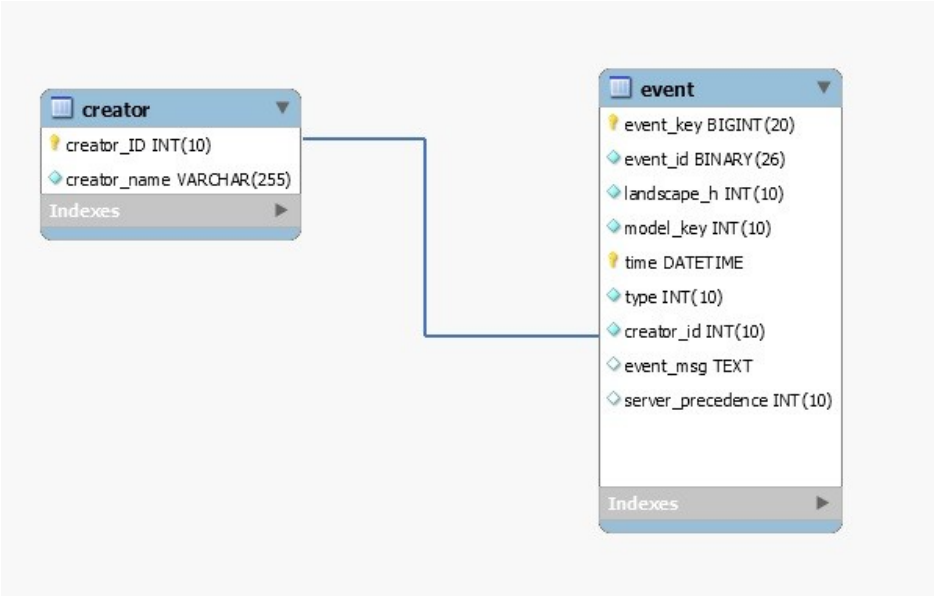
The contentpkg table associates content packages with Crystal Enterprise folder IDs. This table is not meant to be reported against, but instead is actually used by the Report Manager to help identify installation and security issues. A content package might only be installed once and this table helps identify if that is the case.

creator

Description

This table includes the model creator information.

Relations



data_retention_policy_changelog

Description

This table includes the information about the data retention policy.

devicemodel

Description

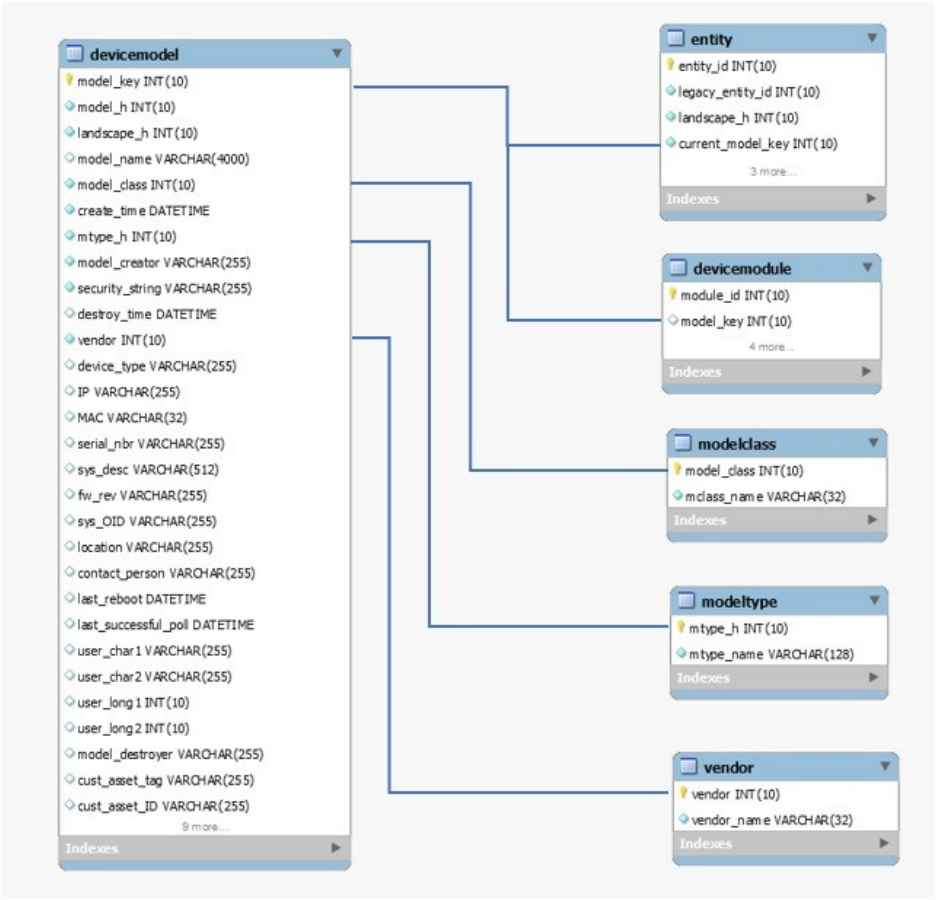
This table represents the complete device model information.

The devicemodel table is filled in initially as the Report Manager extracts model information from the respective SpectroSERVERs. New records are added by the Report Manager as it responds to model creation events for device models.

Certain attributes of this table can change and as such the Report Manager needs a way to keep up with these changes. To keep up with these changes, the Report Manager periodically requests current values for these attributes. These requests are made to the appropriate models through the OneClick architecture. Initially this period for updating device data is set to once every 24 hours.

The user-defined fields are to be left blank, but provide the administrator an opportunity to extend the Report Manager database to include data that is applicable to their assets.

Relations



devicemodel_uda

Description

The devicemodel_uda table contains user-defined polling attribute information.

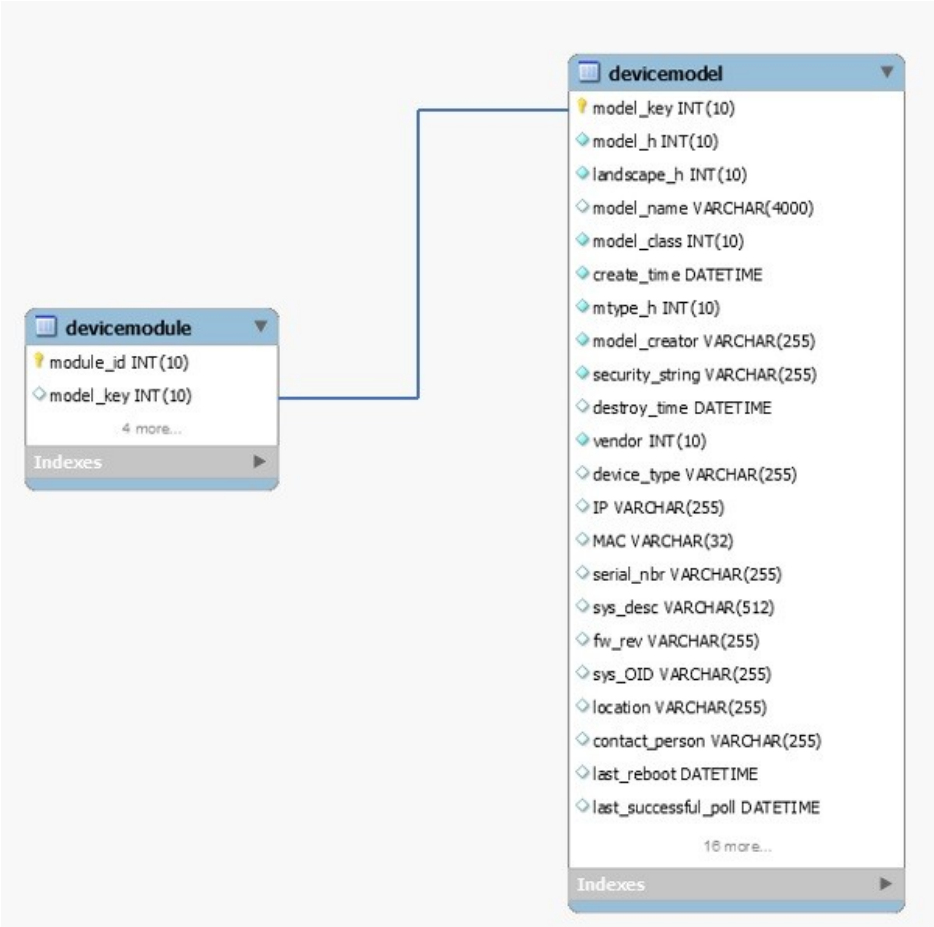
devicemodule

Description

This table includes the chassis information like module name, serial number etc.

This table captures the relationship between Chassis device models and the board modules contained within. This table is dynamically kept up to date.

Relations



Columns (till 10.2.1 release)

Field	Type	Null	Key	Default	Extra
module_id	int(10) unsigned	NO	PRI	NULL	auto_increment
model_key	int(10) unsigned	YES	MUL	NULL	
module_index	int(10)	YES		NULL	
module_name	varchar(255)	YES		NULL	
serial_nbr	varchar(255)	YES		NULL	
software_rev	varchar(255)	YES		NULL	

Columns
(from 10.2.2 release)

Field	Type	Null	Key	Default	Extra
module_id	int(10) unsigned	NO	PRI	NULL	auto_increment
model_key	int(10) unsigned	YES	MUL	NULL	
physical_index	int(10)	YES		NULL	
physical_modelname	varchar(255)	YES		NULL	
physical_name	varchar(255)	YES		NULL	

physical_class	int(10)	YES		NULL	
physical_contained_in	int(10)	YES		NULL	
serial_nbr	varchar(255)	YES		NULL	
software_rev	varchar(255)	YES		NULL	

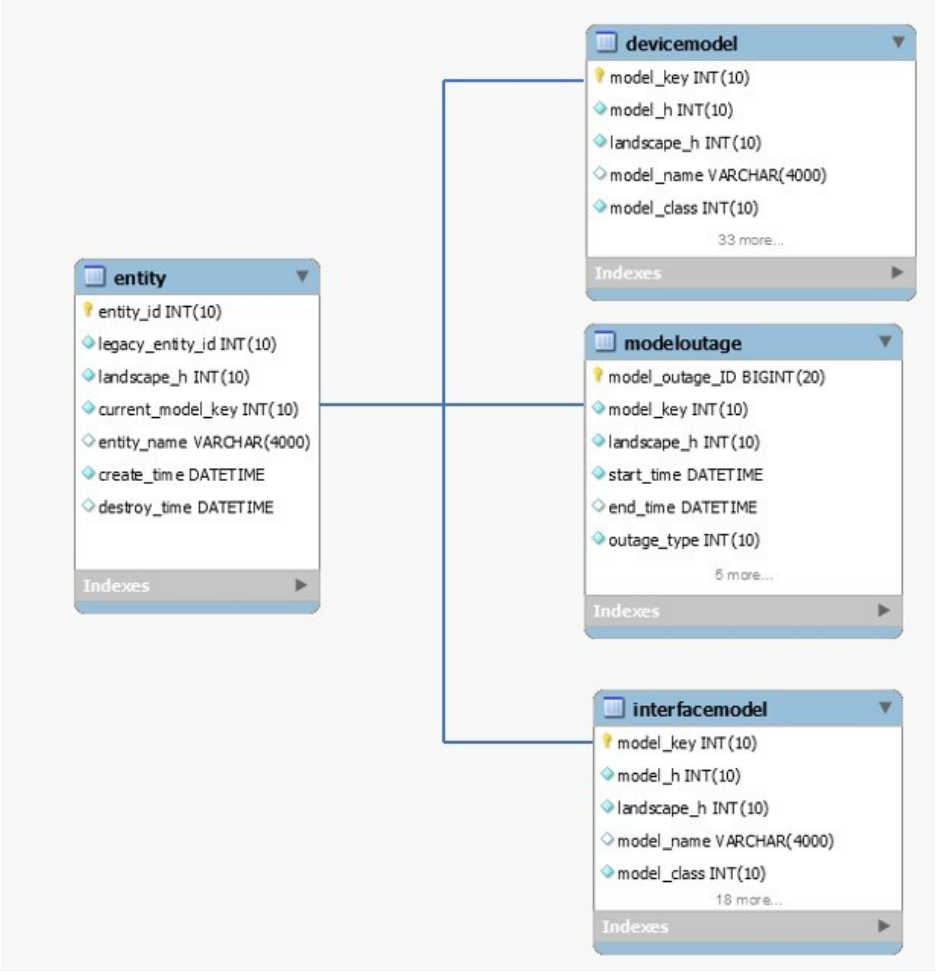
entity

Description

This table maintains distinct devices/interfaces across ALL landscapes.

The entity table is used to identify all entities uniquely that can be reported on. As new unique entities are added to the database, new entity records are created. Entity table record creation is closely tied to devicemodel and interfacemodel table record creation. The current_model, create_time, and destroy_time columns always correspond to the most recently created model.

Relations



entitygroup

Description

This table is about taking the device assets and grouping them into predefined groups that are based on Vendor, Model Class, Landscape.

The EntityGroup table is initially filled in during the startup of the Report Manager application. Queries are made to the individual SpectroSERVERs to learn of the existing model collections (which are actually models themselves).

The EntityGroup table is then kept up to date by having the Report Manager watch for the creation (and destruction) events of the collection models. When a new event occurs indicating the creation of one of these collection models, the name for that collection model is immediately obtained. A search of the EntityGroup table for a record with that name is performed. If no such record exists, one is immediately added. If a record does exist, no further processing is necessary.

entitygroupentity

Description

The EntityGroupEntity table is initially filled in during the startup of the Report Manager application. As EntityGroups are added to the system, queries are made back to each of the servers to determine the membership of those groups. In determining membership, the SpectroSERVER identifies a set of models. Each model can then be referenced in either the devicemodel or interfacemodel table. From there, an entity ID can be obtained and an appropriate entry can be made into this table.

The EntityGroupEntity table can then be kept up to date by monitoring the relationship changes associated with those collection models.

entitygrouptype

Description

The EntityGroupType table is filled in at the time of table creation. EntityGroupTypes are pre-defined before any EntityGroups have been defined. Table records include:

entity_group_type	eg_type_name
101	Vendor group
102	Model Class group
103	Landscape group
1000	User-Defined group
1001	User-Defined group

entitymodel

Description

The entitymodel is used to identify all model handles that an entity has had. This table gets filled in as part of the Entity table updating. When a record gets added to either the devicemodel or interfacemodel table, a process is kicked off to identify if this “new” model is either an existing/known entity, or a new (previously unknown/un-modeled) entity.

A new record gets added to the entitymodel table every time a “new” model record gets added to either the devicemodel or devicemodel table. When a record is added to the entitymodel table, the record is recorded with a timestamp. This timestamp enables the Report Manager to identify the most current model that represents an entity.

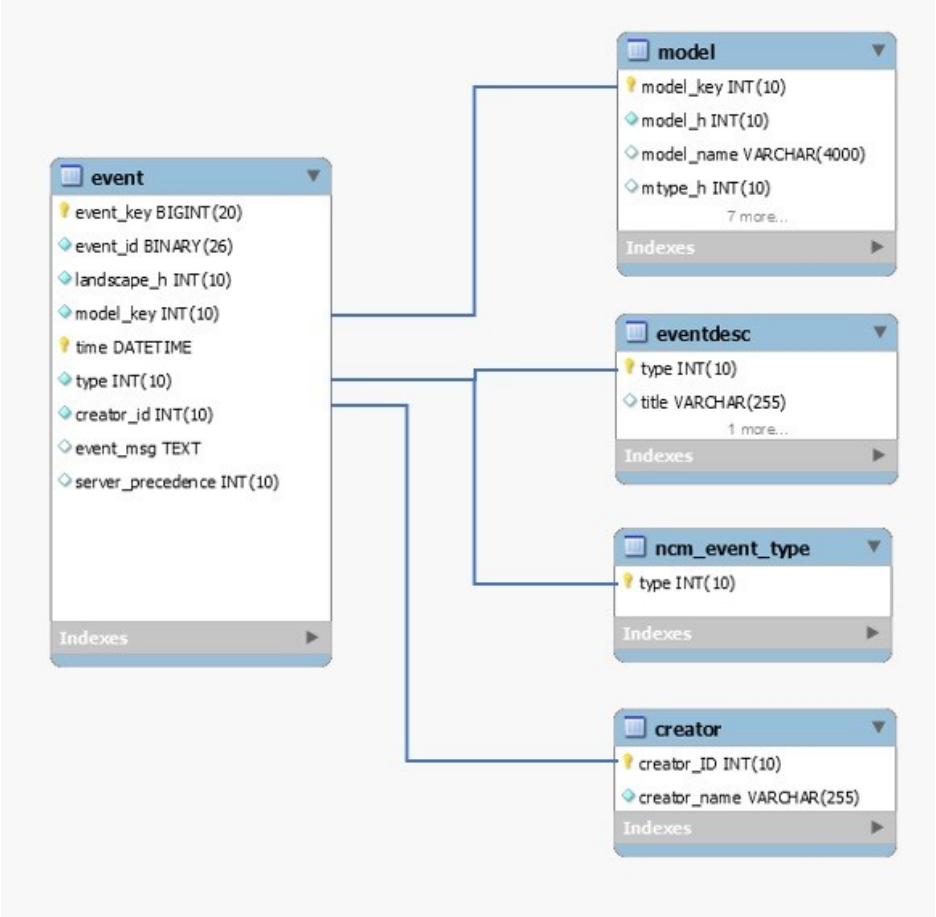
Columns

event

Description

This table described the complete event information like event ID, message, time etc.

Relations



eventactivitylog

Description

Contains number of events processed in each polling cycle for every landscape.

Columns

Field	Type	Null	Key	Default	Extra	Comment
log_id	int(10) unsigned	NO	PRI		auto_increment	Unique log id for each event processing polling cycle
landscape_h	int(10) unsigned	NO	MUL			landscape handle of SS

poll_start_time	datetime	NO				The time when polling cycle started
poll_end_time	datetime	YES				The time when polling cycle end
nbr_of_events	int(10) unsigned	YES				number of events processed in the current polling cycle

eventdesc

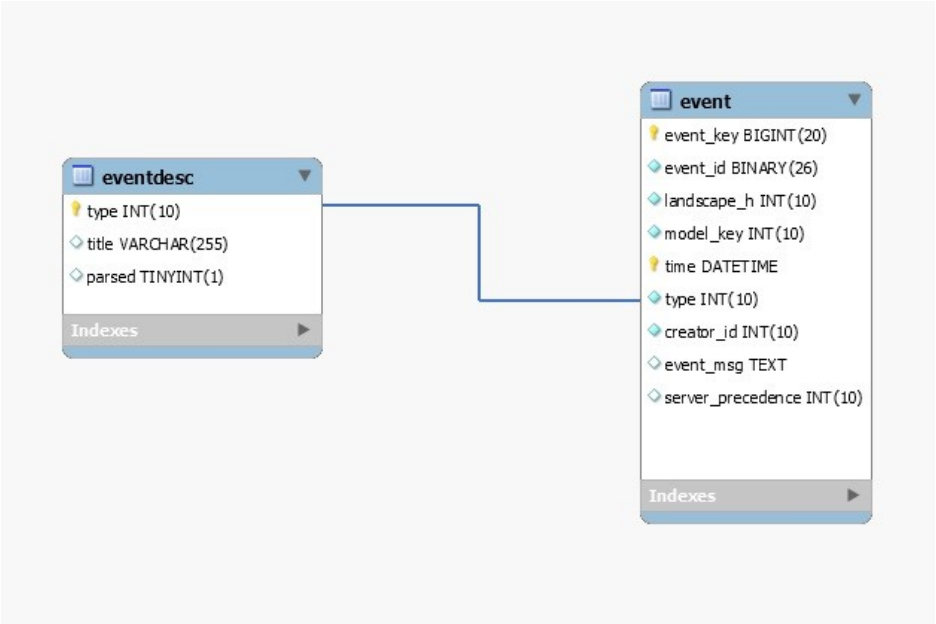
Description

Contains static list of events.

Columns

Field	Type	Null	Key	Default	Comment
type	int(10) unsigned	NO	PRI	0	Event Type
title	varchar(255)	YES			Event title
parsed	tinyint(1)	YES		0	

Relations



folderhierarchy

Description

Contains folder hierarchy present in OneClick explorer view.

Columns

folderidmap

Description

This table maps the SRM entitygroupid of the folder to the CsUniqueID that identifies the folder in One Click and DX NetOps Spectrum. This table is used for custom collection hierarchies.

Columns

Field	Type	Null	Key	Default	Comment
cs_unique_id	char(36)	NO	PRI		
folder_id	int(10) unsigned	NO	MUL		

gcmodel

Description

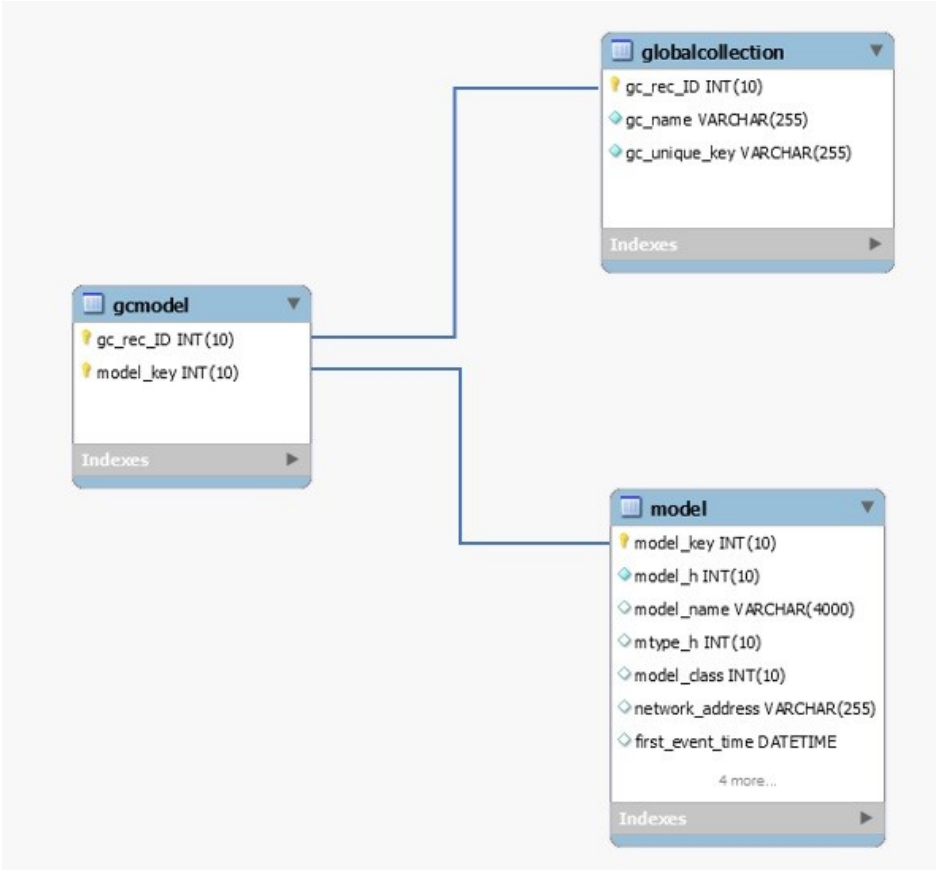
Contains mapping between global collections and models present in it.

Please note that this table does not include a flag like 'destroyed' or 'startdate/enddate' for the relation between the model and the global collection. It only represents the current assignment.

Columns

Field	Type	Null	Key	Default	Comment
gc_rec_ID	int(10) unsigned	NO	PRI		global collection record ID
model_key	int(10) unsigned	NO	PRI		model key of the model present in the global collection

Relations



globalcollection

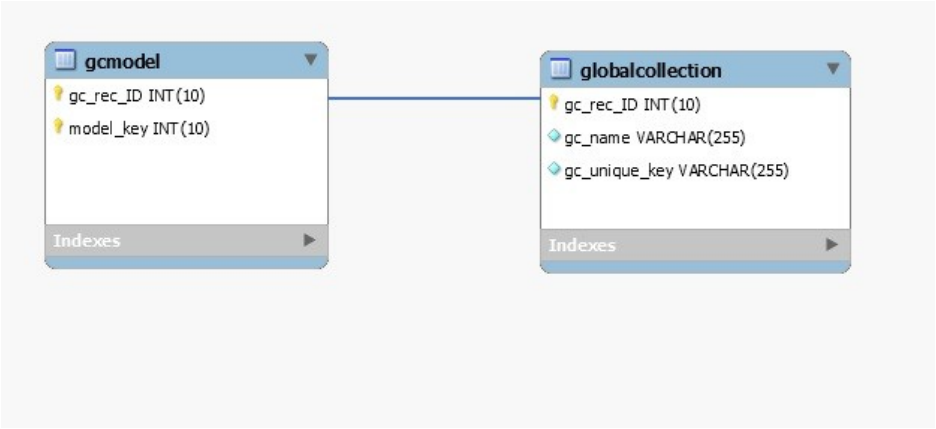
Description

Contains list of global collections.

Columns

Field	Type	Null	Key	Default	Extra	Comment
gc_rec_ID	int(10) unsigned	NO	PRI		auto_increment	unique record ID for each global collection
gc_name	varchar(255)	NO				Name of global collection
gc_unique_key	varchar(255)	NO	UNI			unique key for each global collection

Relations



groupentitygroups

Description

This table stores mapping of group_id to entity _group_id .

Since entity groups of type 'folder' can be made up of multiple entity groups (of type folder, collection or both), this table allows you to find all the entity groups that make up the specified entity group.

> **NOTE**
> When finding all entities of a specified entity group, use this table, not the entitygroup table.

Columns

Field	Type	Null	Key	Default	Comment
group_id	int(10) unsigned	NO	PRI		
entity_group_id	int(10) unsigned	NO	PRI		

handleractivitylog

Description

Containing the log of bucket processing done by all handlers for each landscape.

Columns

Field	Type	Null	Key	Default	Extra	Comment
log_id	int(10) unsigned	NO	PRI		auto_increment	Unique log id for each processing done by the handler
landscape_h	int(10) unsigned	NO	MUL			Landsacpe handle
staging_table	varchar(255)	NO	MUL			Name of the bucket which is getting processed
process_start_time	datetime	NO				Processing start time

process_end_time	datetime	YES				Processing end time
last_event_seq	int(10) unsigned	YES				
event_log_id	int(10) unsigned	NO	MUL			

handlerrollback

Description

This table stores model outage rollback data.

Columns

Field	Type	Null	Key	Default	Comment
landscape_h	int(10) unsigned	NO	PRI		
model_outage_update_ongoing	int(10) unsigned	NO		0	
last_model_outage_id	bigint(20) unsigned	YES			
last_model_outage_event_key	bigint(20) unsigned	YES			
dev_outage_update_ongoing	int(10) unsigned	NO		0	
last_dev_outage_id	int(10) unsigned	YES			
last_dev_event_time	datetime	YES			
int_outage_update_ongoing	int(10) unsigned	NO		0	
last_int_outage_id	int(10) unsigned	YES			
last_int_event_time	datetime	YES			

installedreports

Description

This table contains the file names of the reports that are loaded into the database by SRM. The report ID of the report that is stored in the database with its parent folder ID are also listed. This table is consulted when add or updating reports within SRM.

Columns

Field	Type	Null	Key	Default	Comment
report_ID	int(10) unsigned	NO	PRI		
parent_folder_ID	int(10) unsigned	NO			
file_name	varchar(255)	NO			

interfacemodel

Description

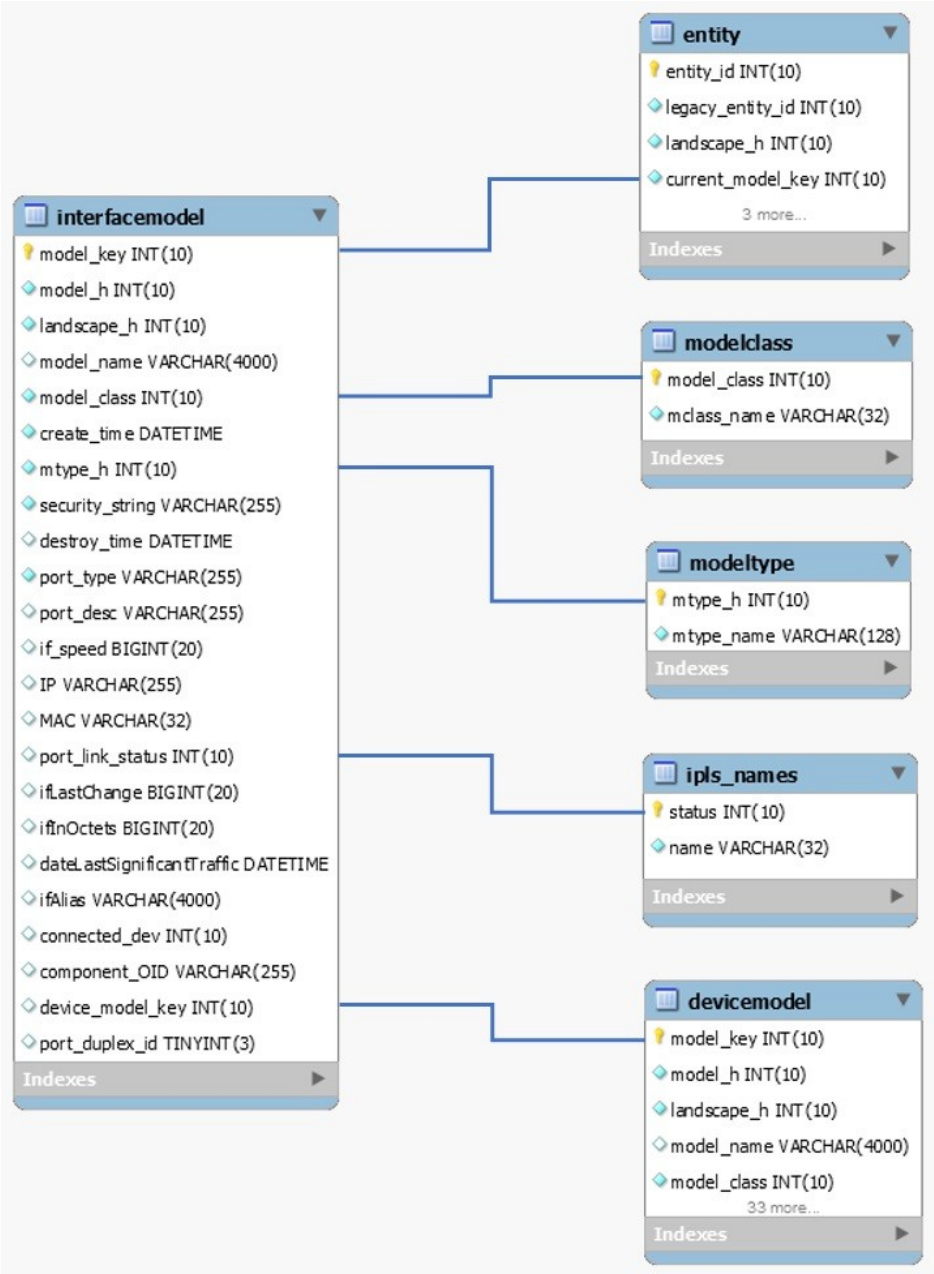
Contains interface information for all device models.

The interfacemodel table is filled in initially as the Report Manager extracts model information from the respective SpectroSERVERs. New records are added by the Report Manager as it responds to model creation events for interface models. The models that are reported on within the interfacemodel table are initially limited to those models that represent physical interfaces. Logical interfaces are not recognized or reported on with this first phase.

Columns

Field	Type	Null	Key	Default	Comment
model_key	int(10) unsigned	NO	PRI	0	model key of the interface
model_h	int(10) unsigned	NO	MUL		model handle of interface
landscape_h	int(10) unsigned	NO	MUL		Landscape handle of SS where the model is present
model_name	varchar(4000)	YES	MUL		Model name of the interface
model_class	int(10) unsigned	NO	MUL		model class of the interface
create_time	datetime	NO			Interface model creation time
mtype_h	int(10) unsigned	NO	MUL		Model Type Handle of the interface
security_string	varchar(255)	NO			security string of interface
destroy_time	datetime	YES			Destroy time of the interface model
port_type	varchar(255)	NO	MUL		Interface / port type
port_desc	varchar(255)	YES			Interface or port description
if_speed	bigint(20) unsigned	YES			Speed of the interface
IP	varchar(255)	YES			IP address of the interface
MAC	varchar(32)	YES			MAC address of the interface
port_link_status	int(10) unsigned	YES	MUL		Port or Interface link status
ifLastChange	bigint(20) unsigned	YES			value of ifLastChange mib attribute
ifInOctets	bigint(20) unsigned	YES			Value of ifInOctets mib attribute
dateLastSignificantTraffic	datetime	YES			The time when the last traffic is seen on the interface or port
ifAlias	varchar(4000)	YES			Contains the value of ifAlias mib attribute
connected_dev	int(10) unsigned	YES			Contains the interface to which this is connected
component_OID	varchar(255)	YES			
device_model_key	int(10) unsigned	YES	MUL		Model key of the device
port_duplex_id	tinyint(3) unsigned	YES			

Relations



ipls_names

Description

This table contains the different values for the port_link_status on an interface model found in the interfacemodel table. This table is filled when it is created with the following values:

Status	Name
0	Good
1	Bad
2	Unknown

3	Disabled
4	Unreachable
5	Init
6	L inked Port Bad
7	Linked Device Bad
8	Dormant
9	Port In Maintenance
10	Bad Suppressed
11	WA Link Bad
12	LL In Maintenance
13	Always Down

Columns

Field	Type	Null	Key	Default	Comment
status	int(10) unsigned	NO	PRI		Status number
name	varchar(32)	NO			Status name

Relations

landscape

Description

Contains the last poll /sync times for each landscape

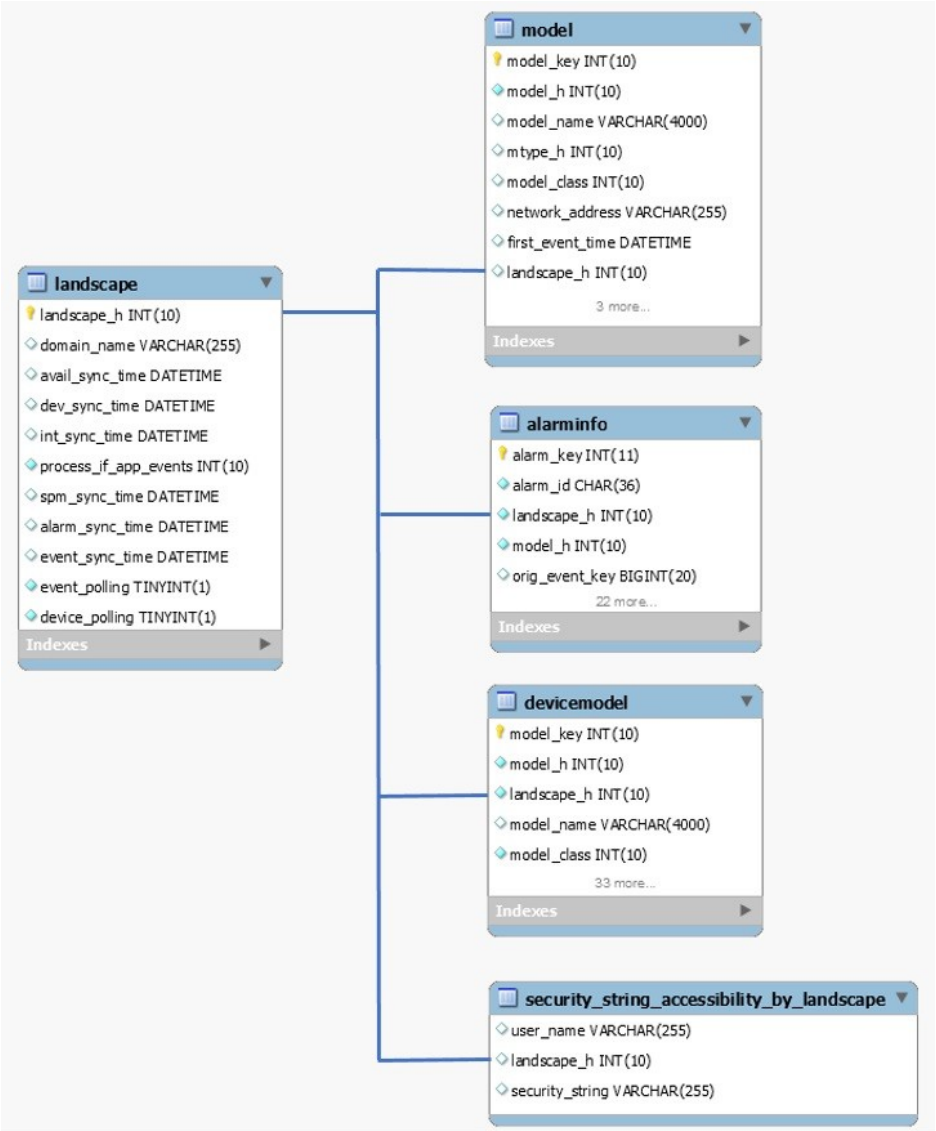
The landscape table lists those landscapes that report manager has seen. The dev_sync_time is the time the last known device event was recorded for the given landscape. The int_sync_time time is the time the last known interface event was recorded.

Columns

Field	Type	Null	Key	Default	Comment
landscape_h	int(10) unsigned	NO	PRI		Landscape handle which is polled by report manager
domain_name	varchar(255)	YES			Domain name of the landscape
avail_sync_time	datetime	YES			The last sync time for availability
dev_sync_time	datetime	YES			The last sync time for device availability
int_sync_time	datetime	YES			The last sync time for interface information

process_if_app_events	int(10)	NO		0	Indicates if it is ok to process application lost /react events for the interfaces
spm_sync_time	datetime	YES			The last sync time for SPM information
alarm_sync_time	datetime	YES			The last sync time for alarms information
event_sync_time	datetime	YES			The last sync time for events information
event_polling	tinyint(1)	NO		1	contains 1 if the event polling is enabled for this landscape else 0
device_polling	tinyint(1)	NO		1	Contains 1 if Asset polling is enabled else 0

Relations



managementoutage

Description

This table stores the management outages for the monitored landscapes.

Columns

Field	Type	Null	Key	Default	Extra	Comment
outage_ID	int(10) unsigned	NO	PRI		auto_increment	
landscape_h	int(10) unsigned	NO	MUL			
start_time	datetime	NO				
end_time	datetime	YES				
outage_type	int(10) unsigned	NO	MUL			

managementoutagetype

Description

This table lists the different types of management outages. This table is filled at table creation time with the following values:

- Expected
- Unexpected
- History

Columns

Field	Type	Null	Key	Default	Comment
outage_type	int(10) unsigned	NO	PRI		
outage_desc	varchar(32)	NO			

model

Description

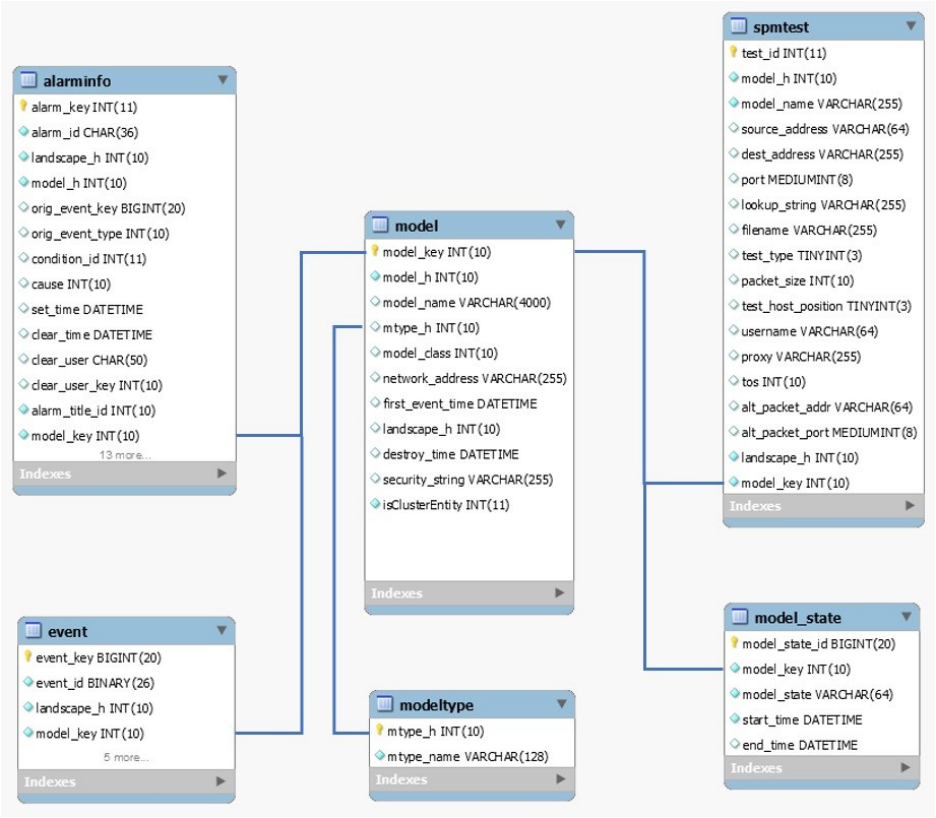
Contains information of all the DX NetOps Spectrum models. This table stores general model information.

Columns

Field	Type	Null	Key	Default	Extra	Comment
model_key	int(10) unsigned	NO	PRI		auto_increment	Unique Model Key for model
model_h	int(10) unsigned	NO	MUL	0		Model Handle of the model
model_name	varchar(4000)	YES	MUL			Name of the Model
mtype_h	int(10) unsigned	YES	MUL			Model Type Handle of the model
model_class	int(10) unsigned	YES	MUL			model class of the model

network_address	varchar(255)	YES				IP or Network address of the model
first_event_time	datetime	YES		2000-01-01 00:00:00		The time when first event got generated on the model
landscape_h	int(10) unsigned	YES	MUL			Landscape handle of SS where the model is present
destroy_time	datetime	YES	MUL			The time when model is destroyed
security_string	varchar(255)	YES	MUL	*UNKNOWN*		security string of the model
isClusterEntity	int(11)	NO		0		Flag that indicated if the model is cluster or not

Relations



model_state

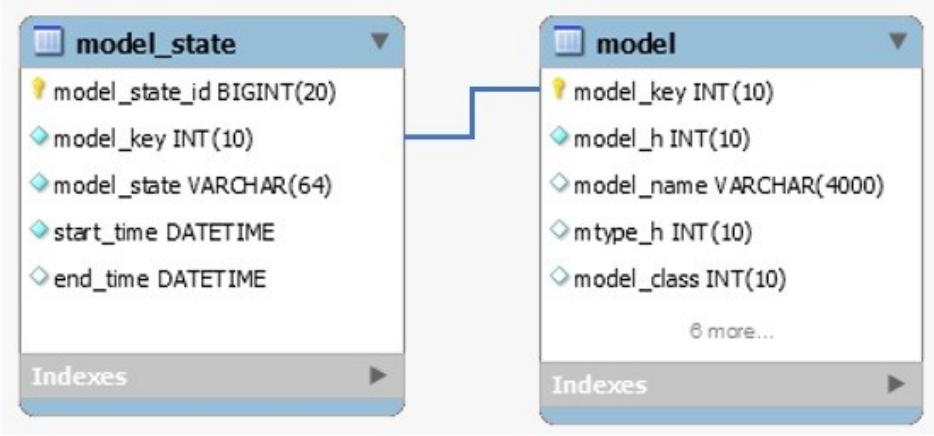
Description

Contains information about model state.

Columns

Field	Type	Null	Key	Default	Extra	Comment
model_state_id	bigint(20) unsigned	NO	PRI		auto_increment	Unique ID for each model state
model_key	int(10) unsigned	NO	MUL			Model key of the model
model_state	varchar(64)	NO	MUL			Model state
start_time	datetime	NO				The time when the model is in this state
end_time	datetime	YES				The time when the model is no longer in this state

Relations



modelclass

Description

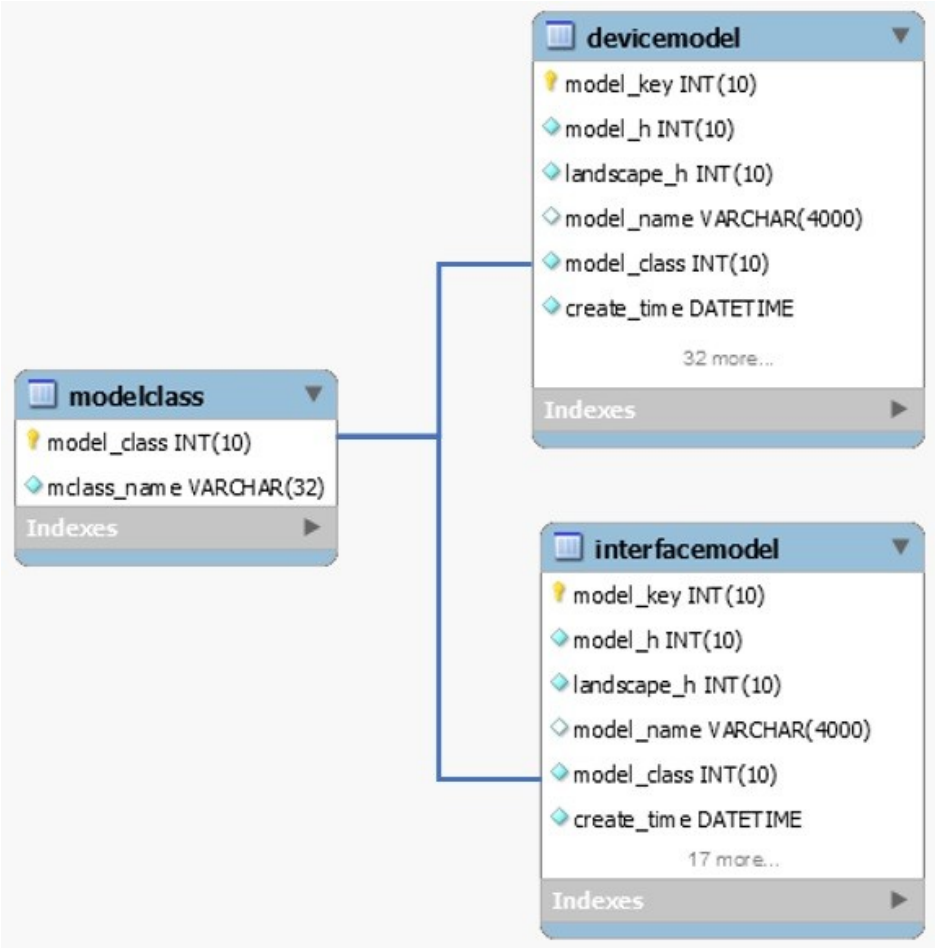
Contains static list containing list of all model class names.

The modelclass table is filled in at the time of table creation.

Columns

Field	Type	Null	Key	Default	Extra	Comment
model_class	int(10) unsigned	NO	PRI			unique number for model class
mclass_name	varchar(32)	NO	MUL			Name of the model class

Relations



modeloutage

Description

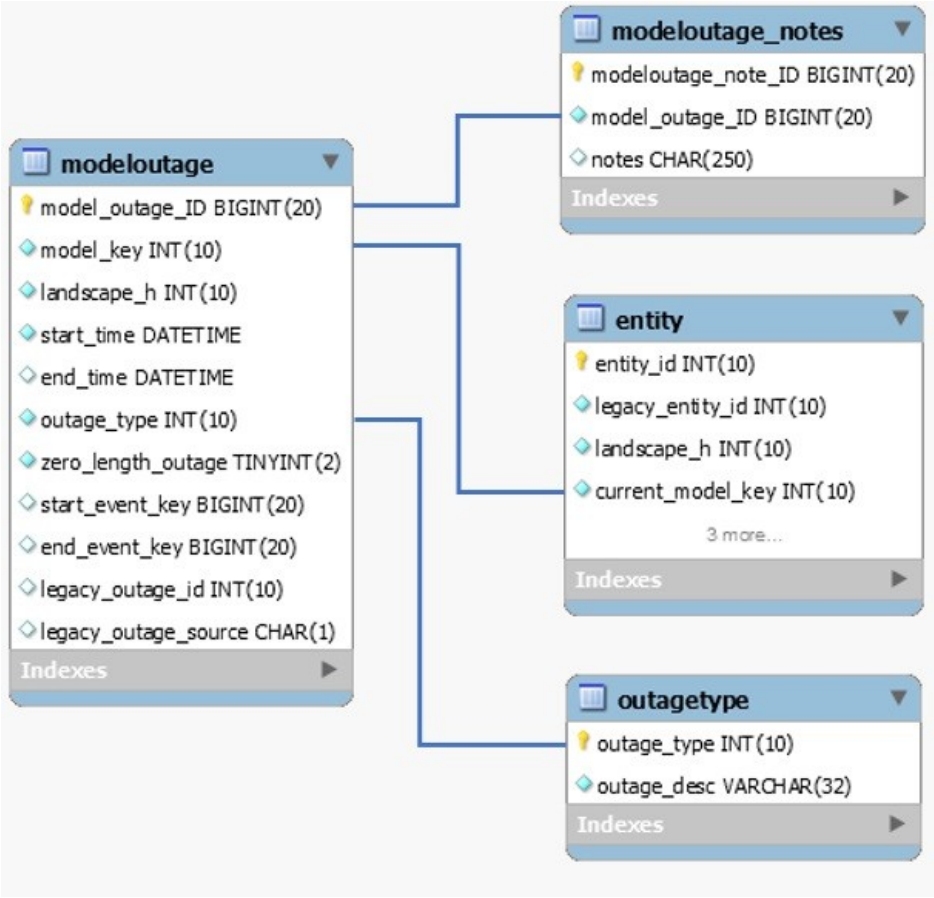
Contains all the outages for the model.

Columns

Field	Type	Null	Key	Default	Extra	Comment
model_outage_ID	bigint(20) unsigned	NO	PRI		auto_increment	Unique ID for each outage of the model
model_key	int(10) unsigned	NO	MUL			Model Key of the model
landscape_h	int(10) unsigned	NO	MUL			landscape handle of SS where the model is present
start_time	datetime	NO	MUL			The time when the outage started for the model
end_time	datetime	YES	MUL			The time when the outage got end for the model
outage_type	int(10) unsigned	NO	MUL			Type of outage on the model
zero_length_outage	tinyint(2)	NO	MUL	0		
start_event_key	bigint(20) unsigned	YES	MUL			

end_event_key	bigint(20) unsigned	YES	MUL			
legacy_outage_id	int(10) unsigned	YES				
legacy_outage_source	char(1)	YES				

Relations



modeloutage_notes

Description

Contains notes for each outage for the model.

Columns

Field	Type	Null	Key	Default	Extra	Comment
modeloutage_note_ID	bigint(20) unsigned	NO	PRI		auto_increment	unique ID for each model outage note
model_outage_ID	bigint(20) unsigned	NO	MUL			Outage ID corresponding to the outage ID in model table
notes	char(250)	YES				model outage notes

Relations

modeltype

Description

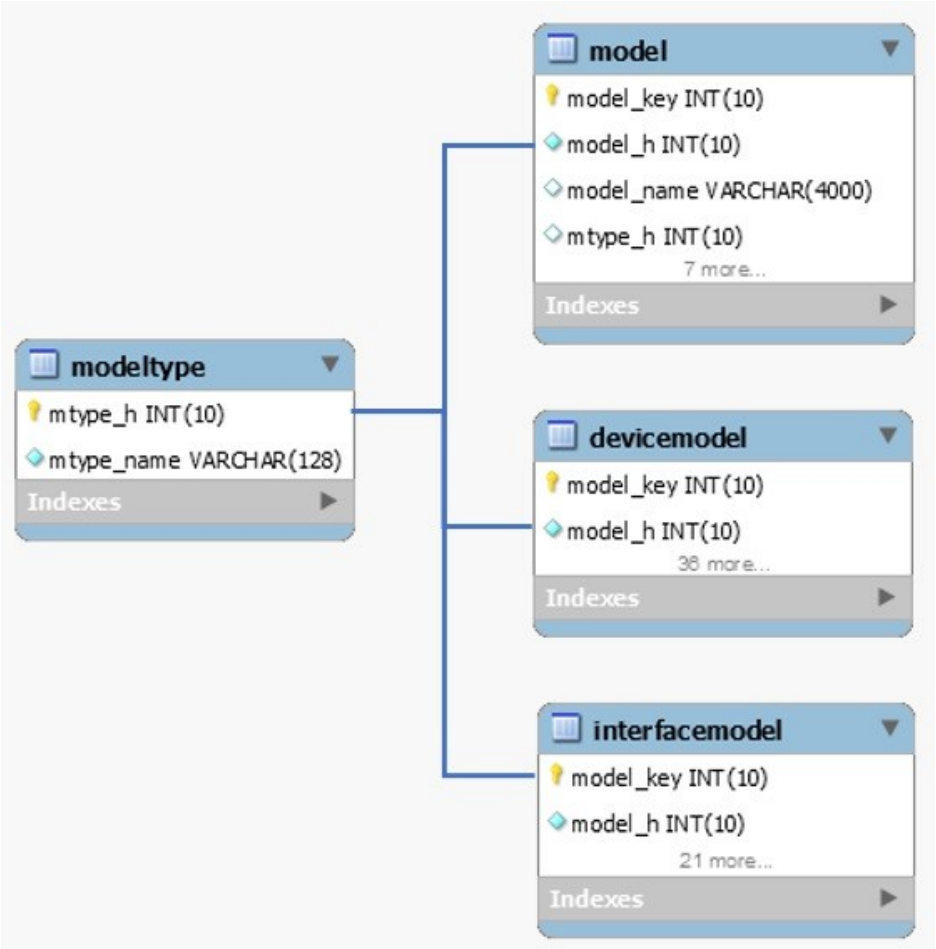
Contains Static list of all model type handles and their names.

The modeltype table is filled in as the Report Manager is starting up. The Report Manager contacts one of the SpectroSERVERs and sends a query requesting the handle and name for all device model types. Once this query is returned, the modeltype table is updated.

Columns

Field	Type	Null	Key	Default	Comment
mtype_h	int(10) unsigned	NO	PRI		Model type handle
mtype_name	varchar(128)	NO			Model Type Name

Relations



ncm_config

Description

Columns

Field	Type	Null	Key	Default	Extra	Comment
config_id	int(10) unsigned	NO	PRI		auto_increment	
config_text_id	int(10) unsigned	NO	MUL			
device_model_key	int(10) unsigned	NO				
change_time	datetime	YES				
trap_from	varchar(255)	NO				
trap_user	varchar(255)	NO				
trap_on	varchar(128)	YES				
lines_changed	int(11)	YES				
rel_lines_changed	int(11)	YES				
violated_policies	varchar(3000)	YES				

compliant_policies	varchar(3000)	YES				
spec_user_name	varchar(255)	YES				
comm_mode	varchar(128)	YES				
landscape	varchar(128)	YES				

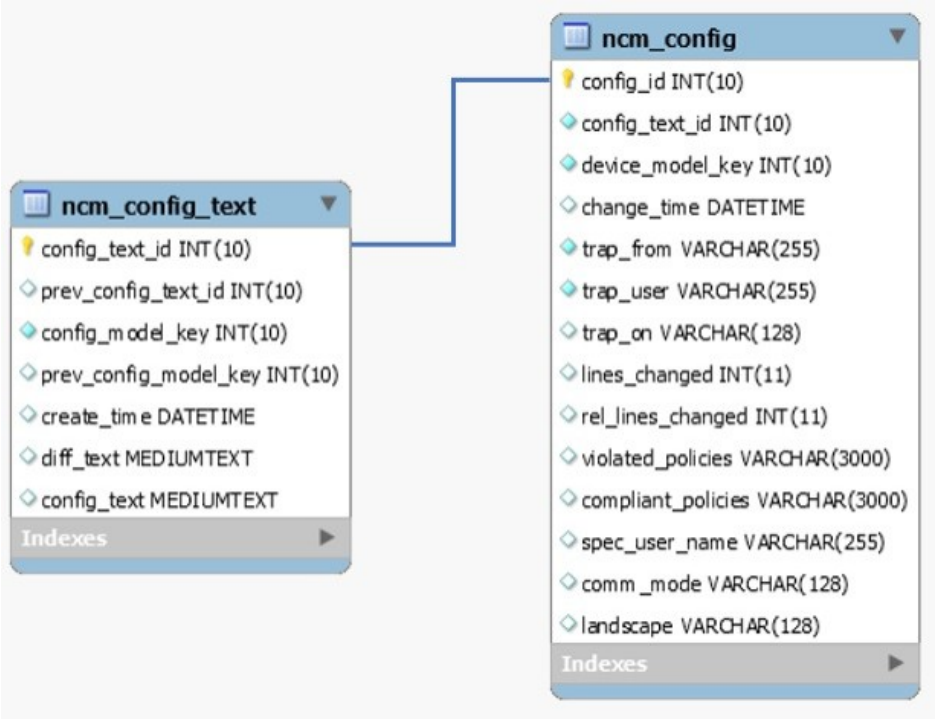
ncm_config_text

Description

Columns

Field	Type	Null	Key	Default	Extra	Comment
config_text_id	int(10) unsigned	NO	PRI		auto_increment	
prev_config_text_id	int(10) unsigned	YES	MUL			
config_model_key	int(10) unsigned	NO	MUL			
prev_config_model_key	int(10) unsigned	YES				
create_time	datetime	YES				
diff_text	mediumtext	YES				
config_text	mediumtext	YES				

Relations



ncm_event_type

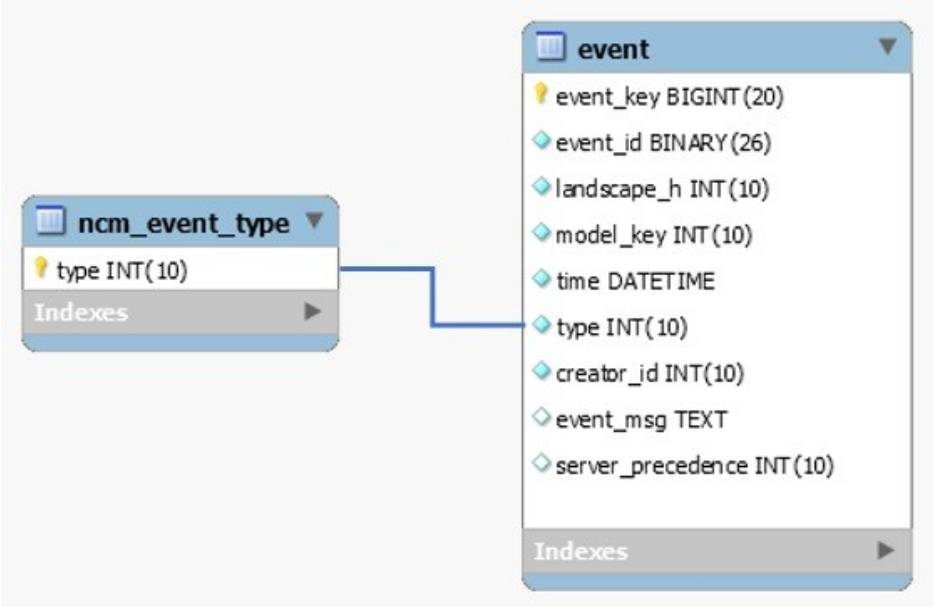
Description

Contains static list of all NCM event types

Columns

Field	Type	Null	Key	Default	Extra	Comment
type	int(10) unsigned	NO	PRI			NCM Event type

Relations



oc_user

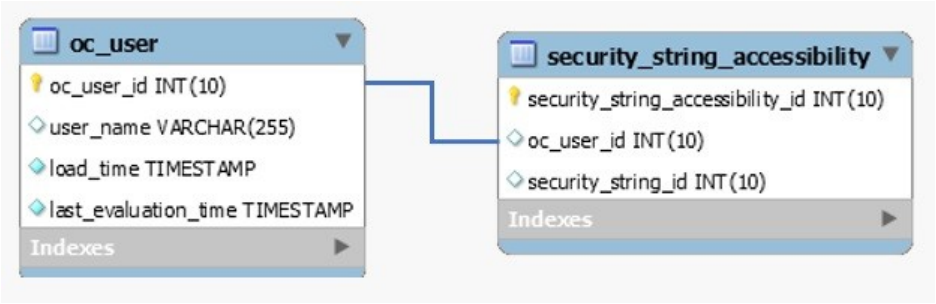
Description

This table contains list of oneclick users

Columns

Field	Type	Null	Key	Default	Extra	Comment
oc_user_id	int(10) unsigned	NO	PRI		auto_increment	
user_name	varchar(255)	YES	UNI			
load_time	timestamp	NO		CURRENT_TIMESTAMP		
last_evaluation_time	timestamp	NO		0000-00-00 00:00:00		

Relations



outagetype

Description

This table contains list outage types and descriptions

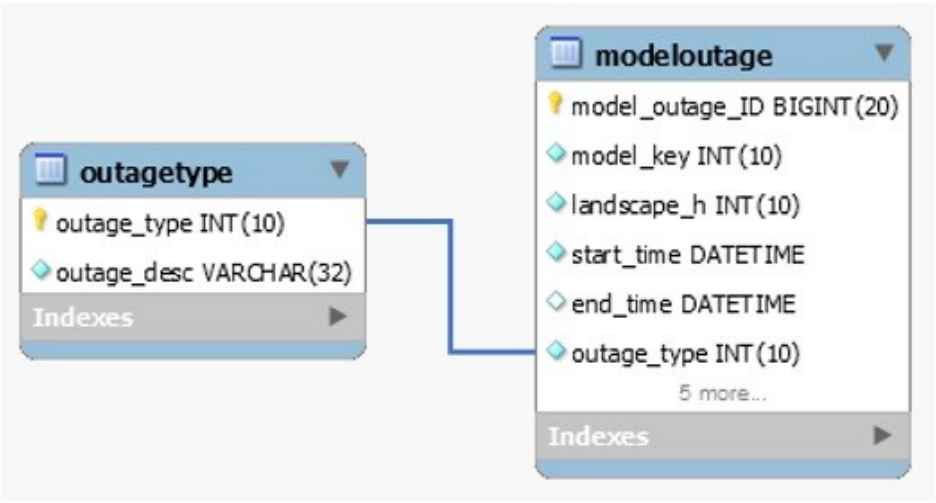
This table is filled in at the time of table creation. Outage types are pre-defined before any outages occur. Table records include:

outage_type	outage_desc
0	Initial
1	Unplanned
2	Planned
3	Exempt

Columns

Field	Type	Null	Key	Default	Extra	Comment
outage_type	int(10) unsigned	NO	PRI			
outage_desc	varchar(32)	NO				

Relations



pcause

Description

This table provides a mapping of cause codes to their titles. It is populated as each new cause is encountered by the alarm handler.

Columns

Field	Type	Null	Key	Default	Extra	Comment
cause_id	int(10) unsigned	NO	PRI			
title	varchar(100)	YES				

performance

Description

This table contains MySQL configuration settings for SRM DB, mostly static data

Columns

Field	Type	Null	Key	Default	Extra	Comment
id	int(10) unsigned	NO	PRI		auto_increment	
runcode	char(255)	YES				
runtime	datetime	YES

portduplex

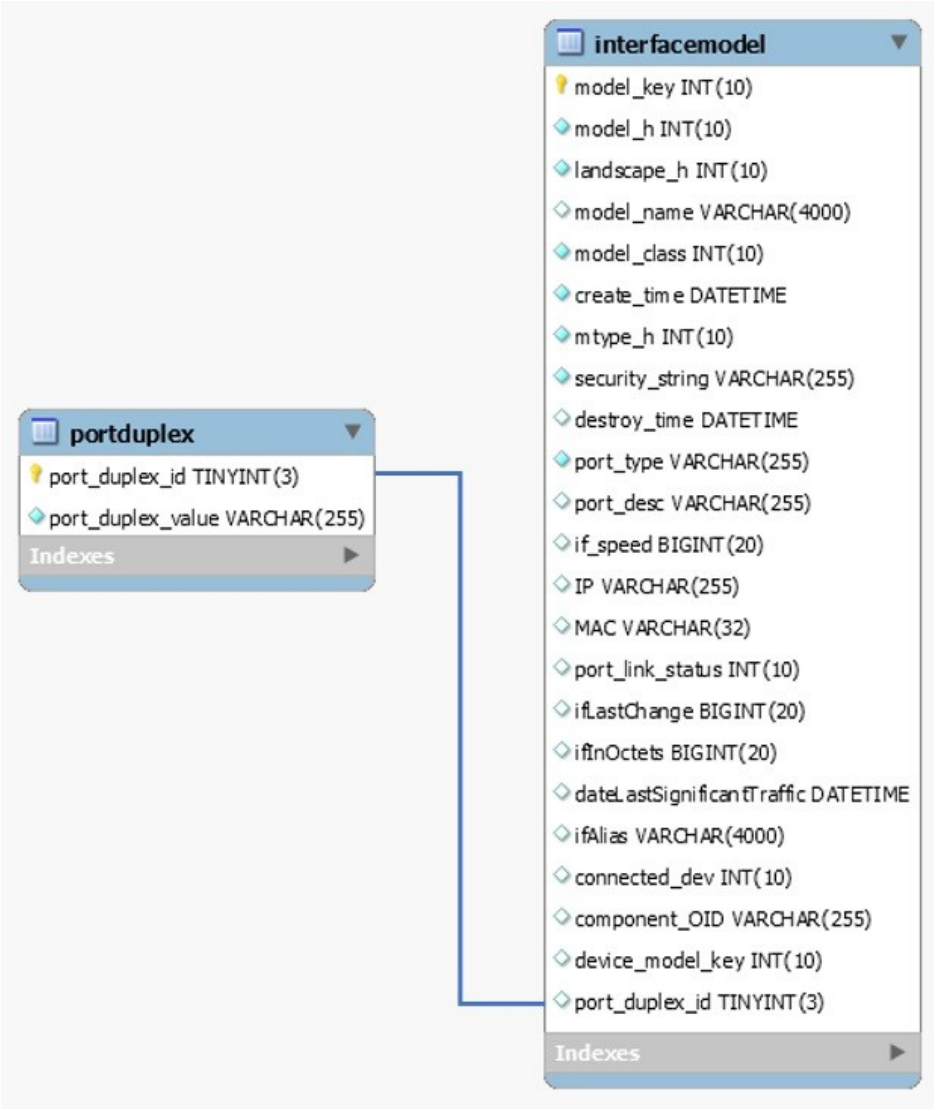
Description

This table contains port duplex IDs and corresponding values

Columns

Field	Type	Null	Key	Default	Extra	Comment
port_duplex_id	tinyint(3) unsigned	NO	PRI			
port_duplex_value	varchar(255)	NO				

Relations



registry

Description

This table provides a storage area for SRM to maintain different properties and attributes of the SRM application. The table stores generic mappings using key/value pairs. Registry entries can have one of the following types:

type id	type name
0	Boolean
1	String
2	Hidden
3	List
4	List Entry

Columns

Field	Type	Null	Key	Default	Extra	Comment
reg_user	varchar(255)	NO	PRI

schemaversion

Description

This table stores data related to SRM schema versioning, change log etc. for one-time changes. Table 'schemaversion_recurring' table stores recurring changes.

Internal table, do not edit

Columns

Field	Type	Null	Key	Default	Extra	Comment
change_id	int(10) unsigned	NO	PRI		auto_increment	
session_id	int(10) unsigned	YES				
name	varchar(255)	NO	UNI			
category	varchar(255)	NO				
schema_comments	varchar(255)	NO				
major	tinyint(4)	NO				
minor	tinyint(4)	NO				
service_pack	tinyint(4)	NO				
start_time	datetime	YES				
end_time	datetime	YES				
duration_secs	int(11)	YES				
state	enum('A','N','F')	YES		A		
state_details	text	YES				

schemaversion_recurring

Description

This table stores data related to SRM schema versioning, change log etc. of recurring changes.

Internal table, do not edit

Columns

Field	Type	Null	Key	Default	Extra	Comment
change_id	int(10) unsigned	NO	PRI		auto_increment	

session_id	int(10) unsigned	YES				
name	varchar(255)	NO	MUL			
category	varchar(255)	NO				
schema_comments	varchar(255)	NO				
major	tinyint(4)	NO				
minor	tinyint(4)	NO				
service_pack	tinyint(4)	NO				
start_time	datetime	YES				
end_time	datetime	YES				
duration_secs	int(11)	YES				
State	enum('A','N','F')	YES		A		
state_details	text	YES				

schemaversion_session

Description

Table stores data related to SRM schema versioning session information. Internal table

Columns

Field	Type	Null	Key	Default	Extra	Comment
session_id	int(10) unsigned	NO	PRI		auto_increment	
session_name	varchar(255)	NO				
start_time	datetime	NO				
end_time	datetime	YES				
duration_secs	int(11)	YES				
state	enum('A','F')	YES				

security_string

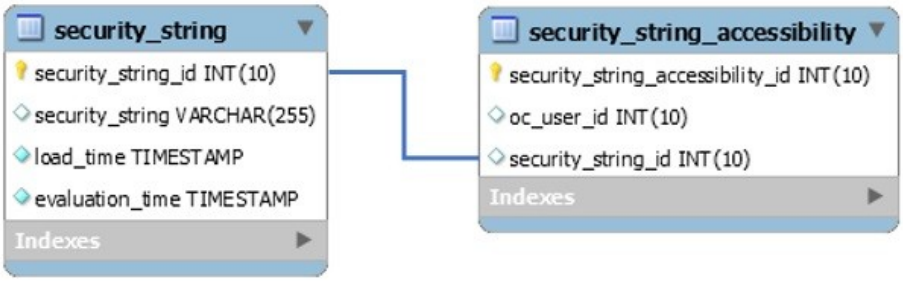
Description

This table stores list of unique security string IDs and security strings for models in reporting DB.

Columns

Field	Type	Null	Key	Default	Extra	Comment
security_string_id	int(10) unsigned	NO	PRI		auto_increment	
security_string	varchar(255)	YES	UNI			
load_time	timestamp	NO		CURRENT_TIMESTAMP		
evaluation_time	timestamp	NO		0000-00-00 00:00:00		

Relations



security_string_accessibility

Description

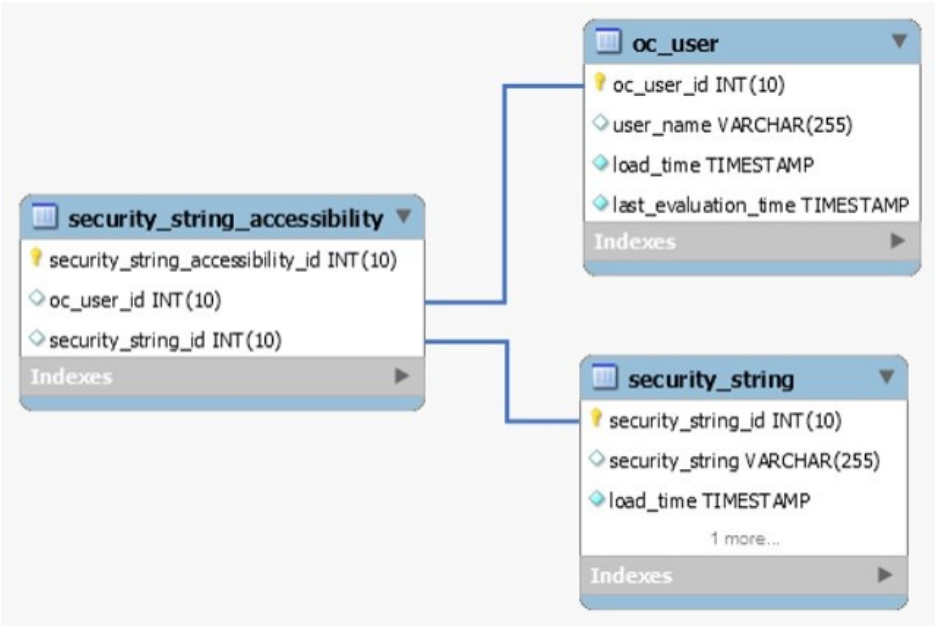
This table stores security string accessibility information. Maps Oneclick user ID to security string ID.

Internal table, do not edit

Columns

Field	Type	Null	Key	Default	Extra	Comment
security_string_accessibility_id	int(10) unsigned	NO	PRI		auto_increment	
oc_user_id	int(10) unsigned	YES	MUL			
security_string_id	int(10) unsigned	YES				

Relations



sm_attributes

Description

Service Manager attributes table - static data

Columns

Column name	Type	Null	Key	Default	Comment
attrID	int(10) unsigned	NO	PRI		Attribute ID of service manager model class
attrName	varchar(255)	NO			Attribute name of service manager model class

Relations

sm_customermhs

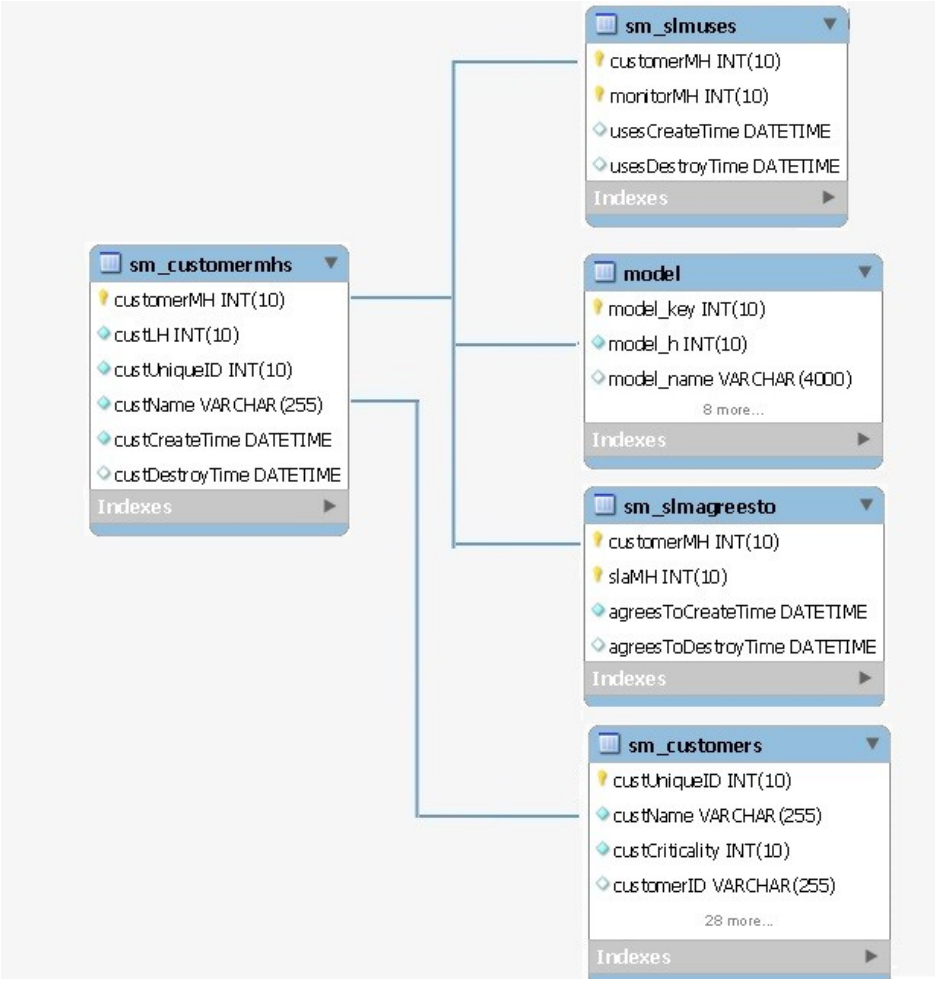
Description

This table stores service manager - customer model handles

Columns

Field	Type	Null	Key	Default	Comment
customerMH	int(10) unsigned	NO	PRI		Customer model handle
custLH	int(10) unsigned	NO			
custUniqueID	int(10) unsigned	NO	MUL		UniqueID of the customer
custName	varchar(255)	NO			customer name
custCreateTime	datetime	NO			customer create time
custDestroyTime	datetime	YES			customer destroy time

Relations



sm_customers

Description

This table stores Service manager – customer details

Columns

Field	Type	Null	Key	Default	Extra	Comment
custUniqueID	int(10) unsigned	NO	PRI		auto_increment	Customer unique ID
custName	varchar(255)	NO	UNI			Customer Name
custCriticality	int(10) unsigned	NO				Customer criticality

Relations

sm_monitormaps

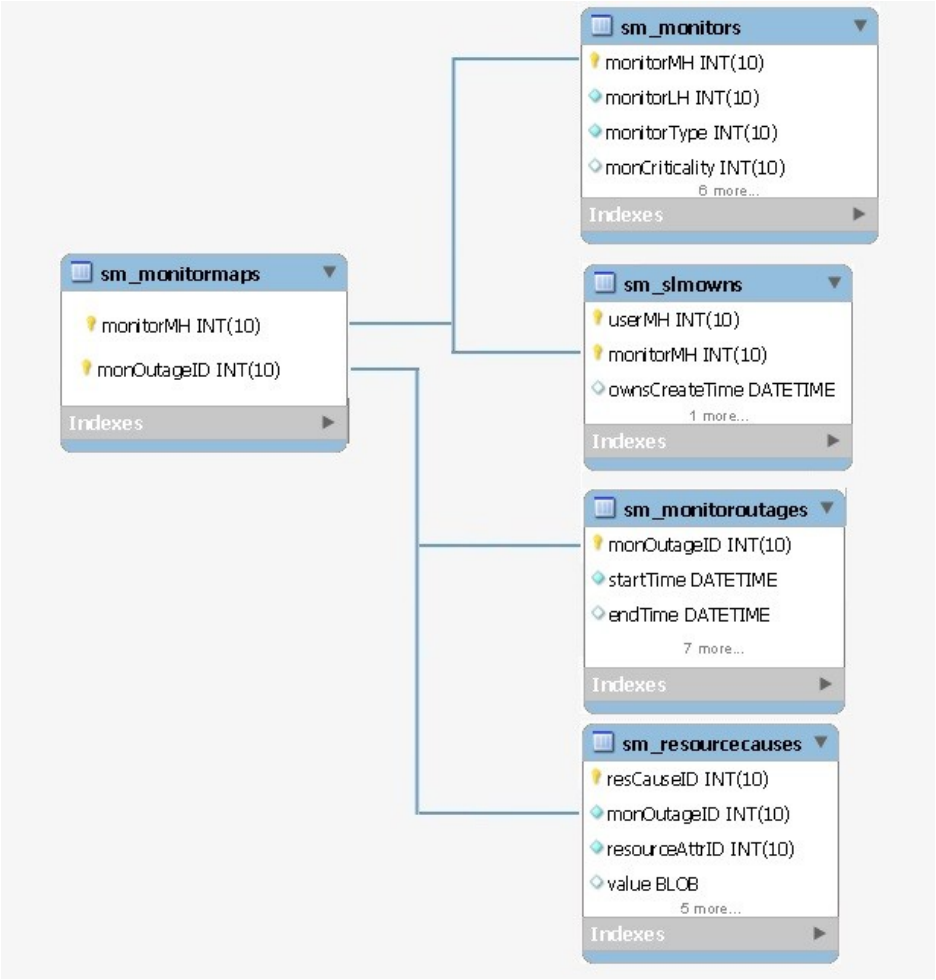
Description

This table stores the mapping of monitor model handle to outage ID

Columns

Field	Type	Null	Key	Default	Extra	Comment
monitorMH	int(10) unsigned	NO	PRI			Model handle of the monitor
monOutageID	int(10) unsigned	NO	PRI			Monitoring outage ID

Relations



sm_monitoroutages

Description

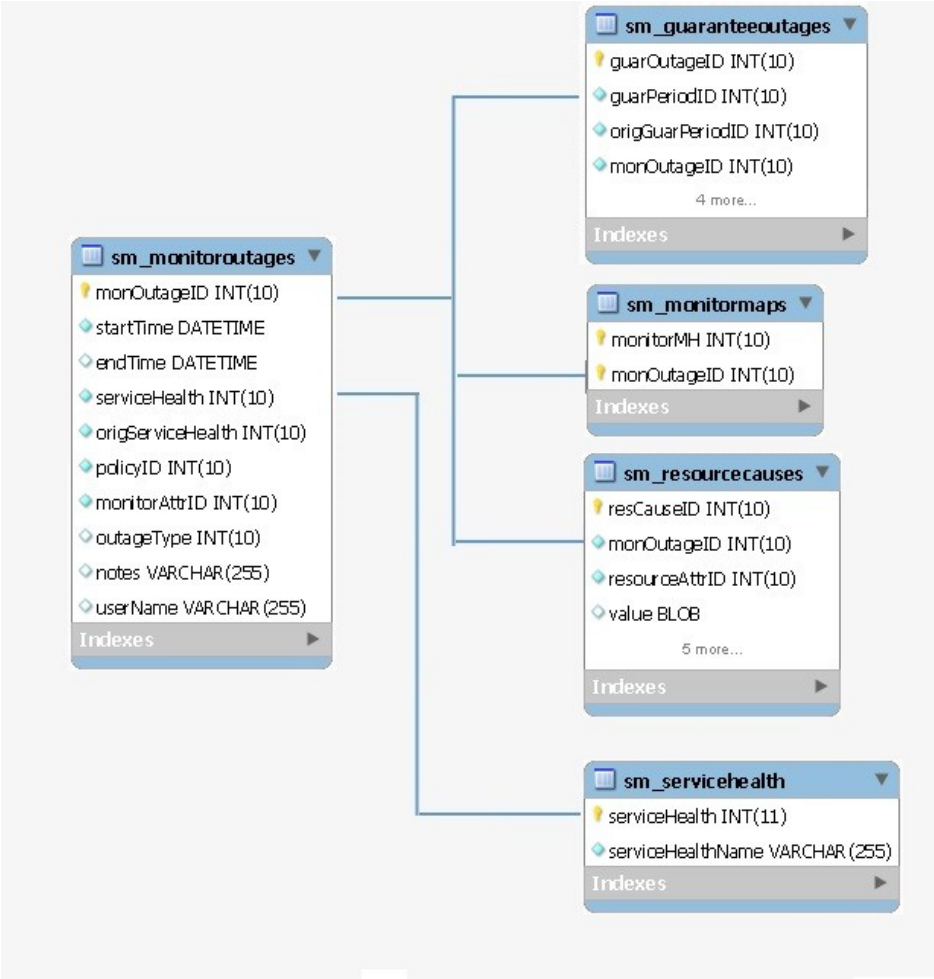
This table stores Service manager - Outages

Columns

Field	Type	Null	Key	Default	Extra	Comment
monOutageID	int(10) unsigned	NO	PRI		auto_increment	Monitoring outage ID
startTime	datetime	NO				Outage starting time
endTime	datetime	YES				Outage ending time
serviceHealth	int(10) unsigned	NO	MUL			Service health
origServiceHealth	int(10) unsigned	NO				Default service health
policyID	int(10) unsigned	NO				policy ID

monitorAttrID	int(10) unsigned	NO				Monitor attribute ID
outageType	int(10) unsigned	YES				Type of outage
notes	varchar(255)	YES				'notes' for the outage
userName	varchar(255)	YES				User name

Relations



sm_monitors

Description

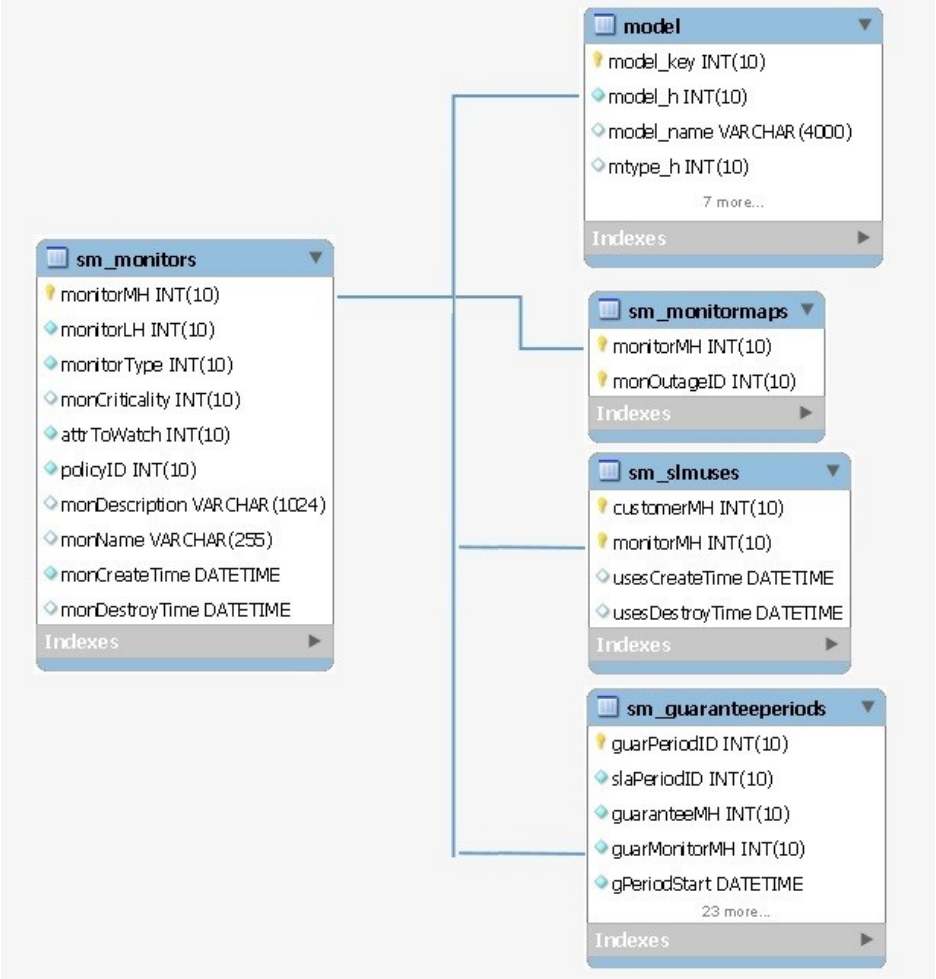
This table stores data of monitor model

Columns

Field	Type	Null	Key	Default	Comment
monitorMH	int(10) unsigned	NO	PRI		Model handle of the monitor

monitorLH	int(10) unsigned	NO			Landscape handle of the monitor
monitorType	int(10) unsigned	NO			type of monitor
monCriticality	int(10) unsigned	YES			Monitor criticality
attrToWatch	int(10) unsigned	NO			Attribute to watch
policyID	int(10) unsigned	NO			Policy ID
monDescription	varchar(1024)	YES			Description of the monitor
monName	varchar(255)	YES			Name of the monitor
monCreateTime	datetime	NO			Monitor creation time
monDestroyTime	datetime	YES			Monitor destroy time

Relations



sm_periods

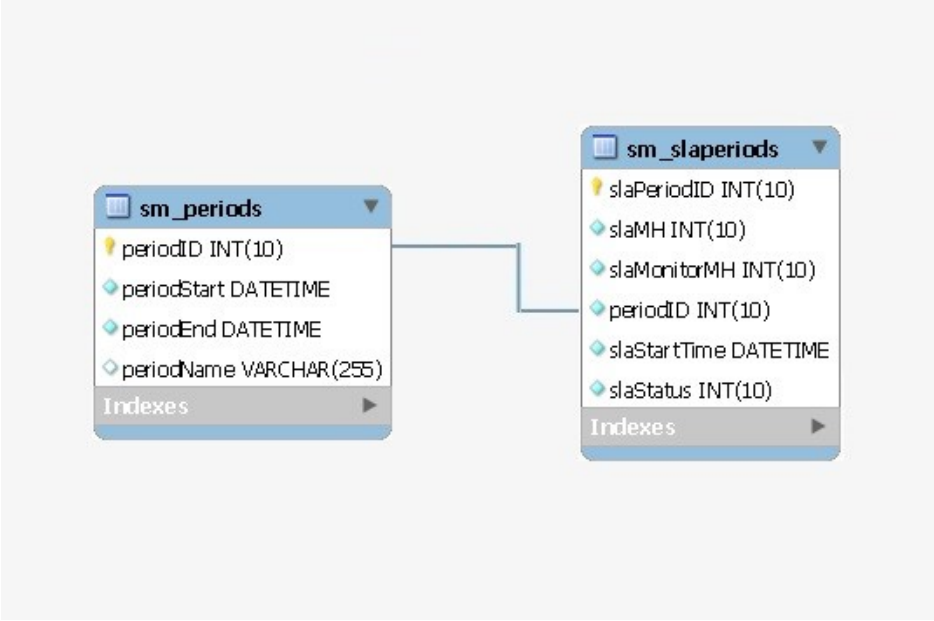
Description

Service Manager Gurantee period Information.

Columns

Field	Type	Null	Key	Default	Extra	Comment
periodID	int(10) unsigned	NO	PRI		auto_increment	Unique ID for each Guarantee period.
periodStart	datetime	NO				Guarantee Start period.
periodEnd	datetime	NO				Guarantee End period.
periodName	varchar(255)	YES				Guarantee period Name.

Relations



sm_policies

Description

Contains information about Service Manager policies.

Column

Field	Type	Null	Key	Default	Comment
policyName	varchar(255)	NO			Name of the Policy
policyID	int(11)	NO	PRI		Unique Policy ID for each service.
policyDescription	text	NO			Description of the Policy

Relations

sm_resourcecauses

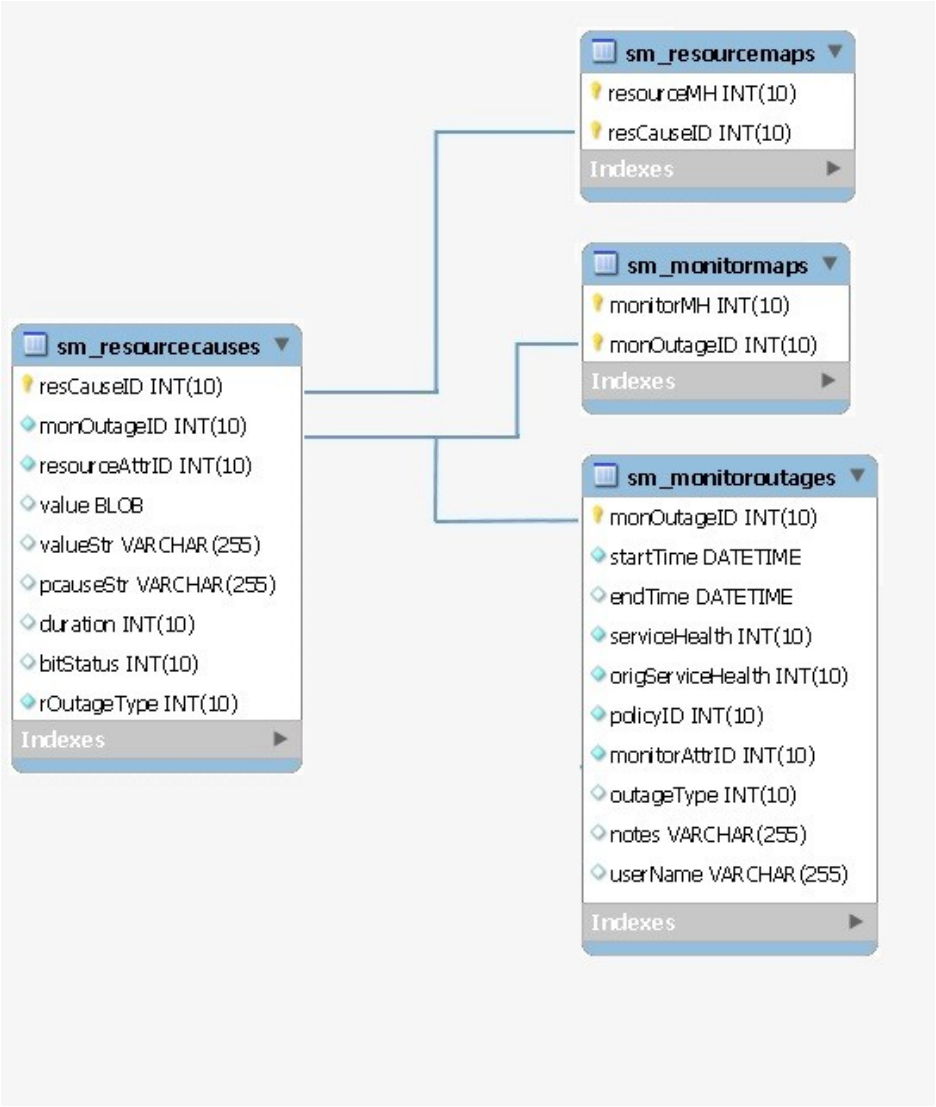
Description

The name of the table used to store the resource outages that make up each monitor outage. Each resource outage contains the model handle of the resource model that the outage was on, and the value that caused the monitor outage.

Column

Field	Type	Null	Key	Default	Extra	Comment
valueStr	varchar(255)	YES				Alarm status of the Resource.
value	blob	YES				Value that caused the monitor outage
rOutageType	int(10) unsigned	NO				Type of the Outage happened to the Resource.
resourceAttrID	int(10) unsigned	NO				Attribute ID of the Resource Monitor
resCauseID	int(10) unsigned	NO	PRI		auto_increment	Unique Cause ID of the Resource.
pcauseStr	varchar(255)	YES				Alarm Title of the Resource.
monOutageID	int(10) unsigned	NO	MUL			Unique Outage ID of the Resource Monitor
duration	int(10) unsigned	YES				Duration of the Event.
bitStatus	int(10) unsigned	YES				bitStatus

Relations



sm_resourcemaps

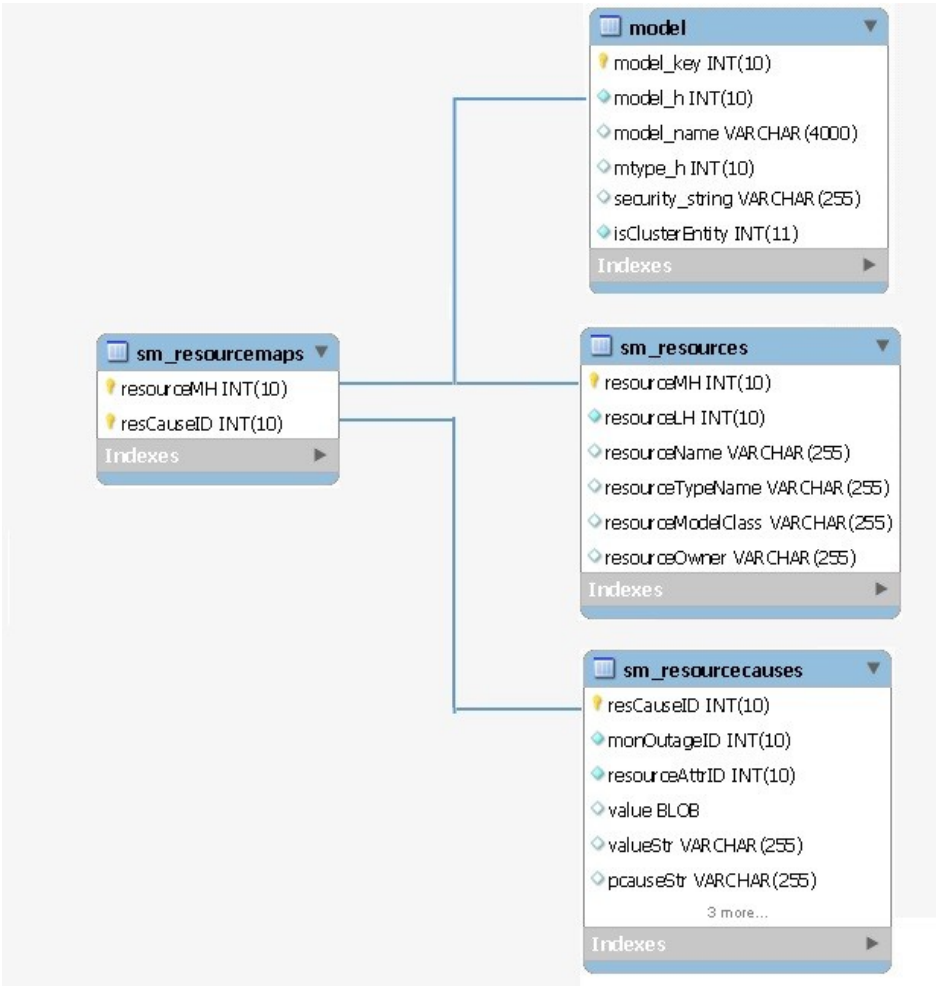
Description

The name of the table used to store the mapping between a resource cause and the model that caused it.

Column

Field	Type	Null	Key	Default	Comment
resourceMH	int(10) unsigned	NO	PRI		Unique Model_Handle of the Resource.
resCauseID	int(10) unsigned	NO	PRI		Unique Cause ID of the Resource.

Relations



sm_resources

Description

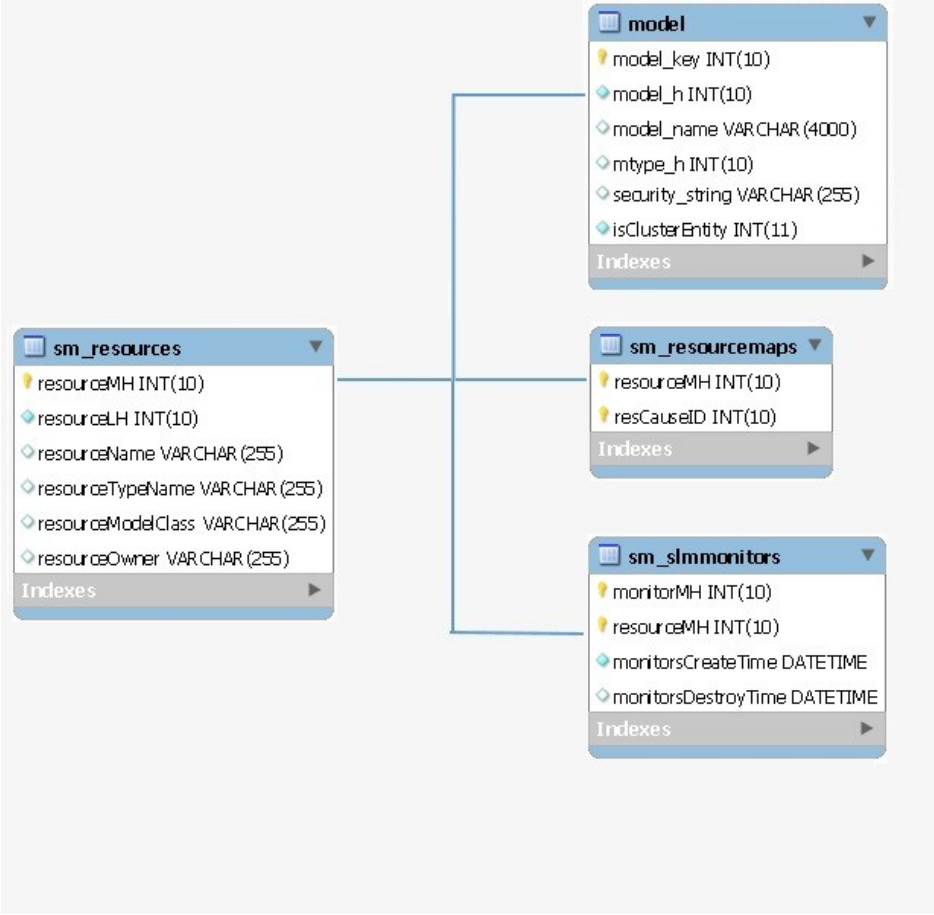
The name of the table that contains all the resources used by a service or attribute monitor.

Column

Field	Type	Null	Key	Default	Comment
resourceTypeName	varchar(255)	YES			Model_Type of the Resource.
resourceOwner	varchar(255)	YES			Owner of the resource
resourceName	varchar(255)	YES			Name of the Resource.
resourceModelClass	varchar(255)	YES			Model_Class of the Resource.
resourceMH	int(10) unsigned	NO	PRI		Unique Model_Handle of the Resource.

resourceLH	int(10) unsigned	NO			Landscape Handle of the Resource.

Relations



sm_schemaversion

Description

The name of the table that contains the current schema version of the SLM DB.

Column

Field	Type	Null	Key	Default	Comment
versionID	varchar(255)	NO	PRI		Unique version ID of the Schema.
comments	varchar(255)	NO			Brief description on the installed version.

Relations

sm_servicehealth

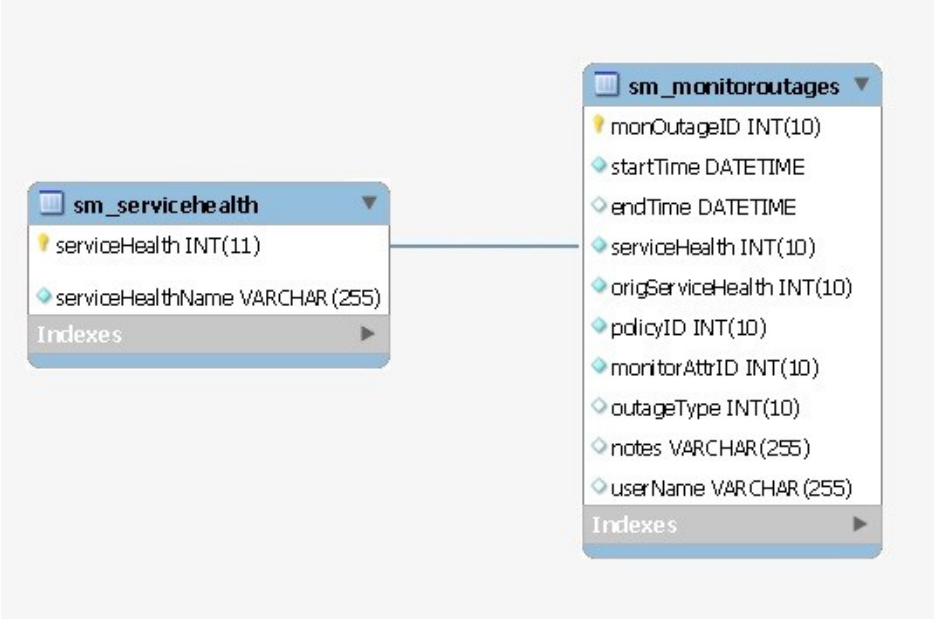
Description

The name of the table used to store attribute type data.

Column

Field	Type	Null	Key	Default	Extra	Comment
serviceHealthName	varchar(255)	NO				Name of the Service.
serviceHealth	int(11)	NO	PRI			Health of the Service.

Relations



sm_slaperiods

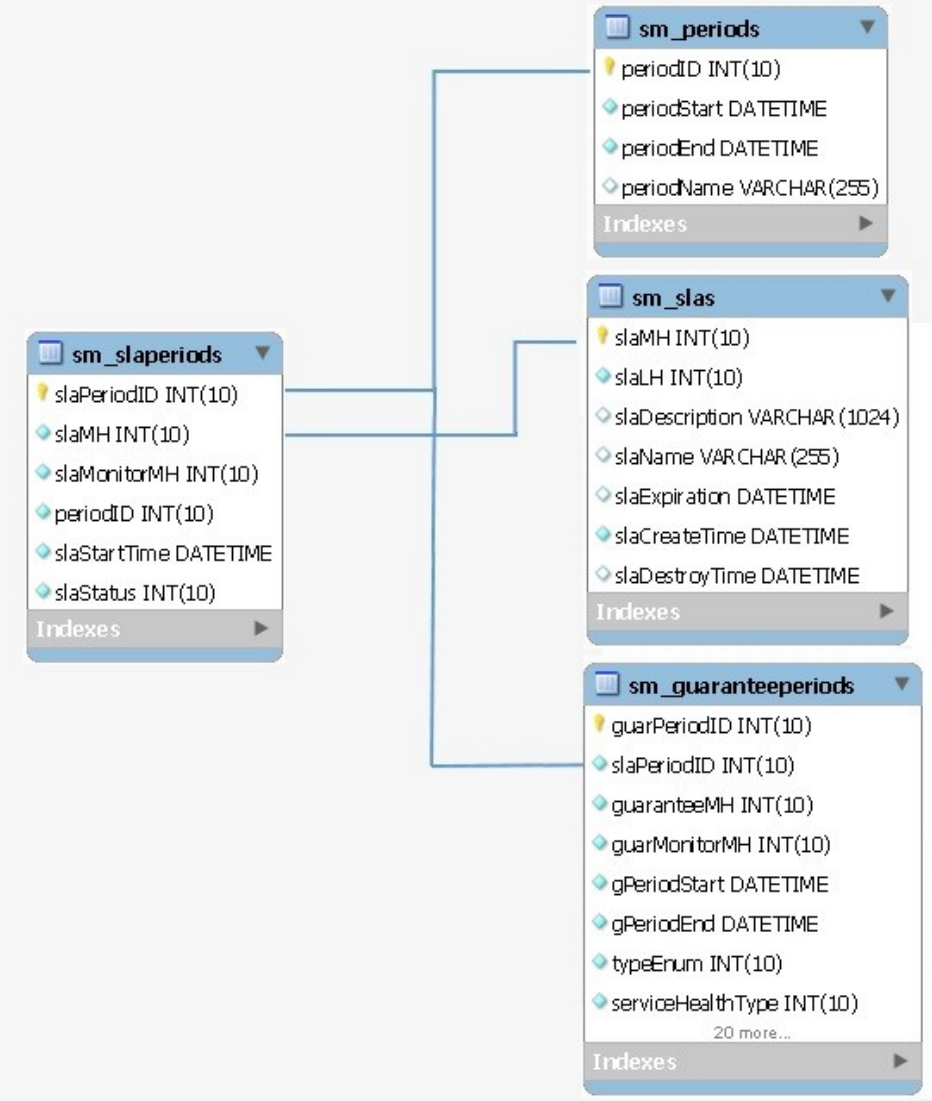
Description

Contains Information of Service Level Agreement.

Columns

Field	Type	Null	Key	Default	Extra	Comment
slaPeriodID	int(10) unsigned	NO	PRI		auto_increment	Unique Period ID for each SLA.
slaMH	int(10) unsigned	NO	MUL			Model_Handle of SLA.
slaMonitorMH	int(10) unsigned	NO				Model_Handle of slaMonitor.
periodID	int(10) unsigned	NO				Period ID of each SLA.
slaStartTime	datetime	NO				Start time of SLA.
slaStatus	int(10) unsigned	NO				Status of SLA

Relations



sm_slas

Description

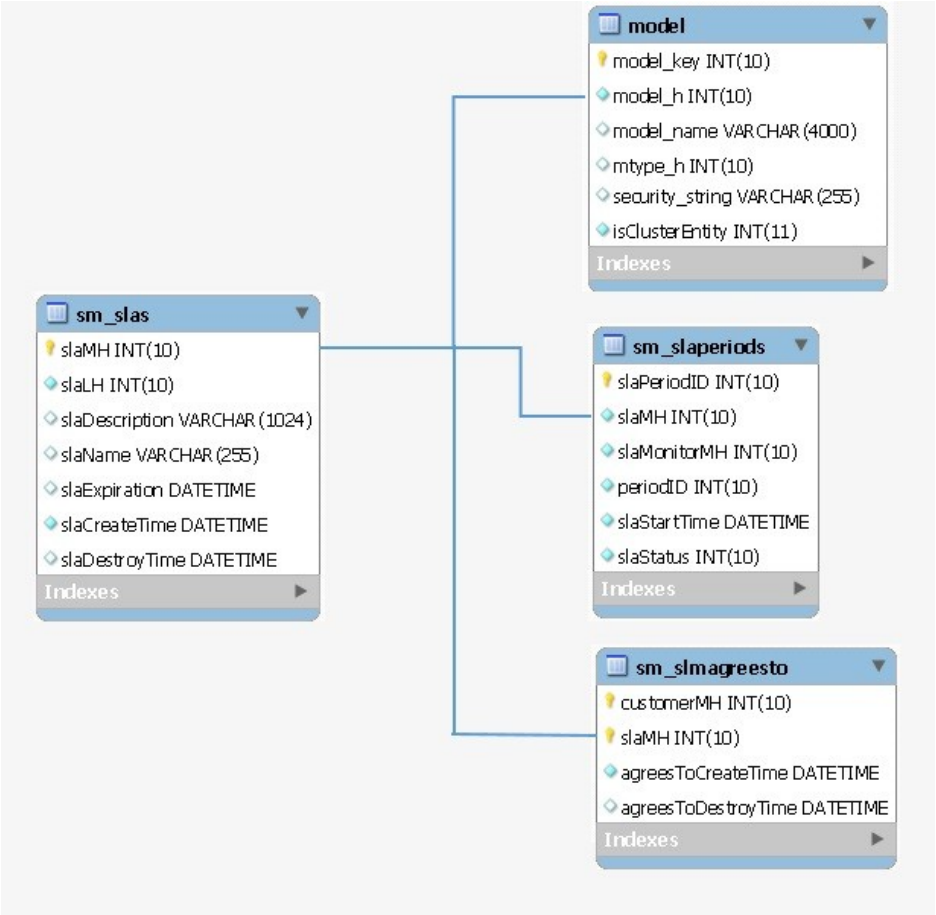
Contains information of all SLA models.

Columns

Column Name	Type	Null	Key	Default	Comment
slaMH	int(10) unsigned	NO	PRI		Model handle of SLA
slaLH	int(10) unsigned	NO			Landscape Handle of SpectroServer where the SLA is present
slaDescription	varchar(1024)	YES			Description of SLA
slaName	varchar(255)	YES			Name of the SLA

slaExpiration	datetime	YES			SLA expiration time
slaCreateTime	datetime	NO			Time when SLA is created
slaDestroyTime	datetime	YES			Time when SLA is destroyed

Relations



sm_slmagreesto

Description

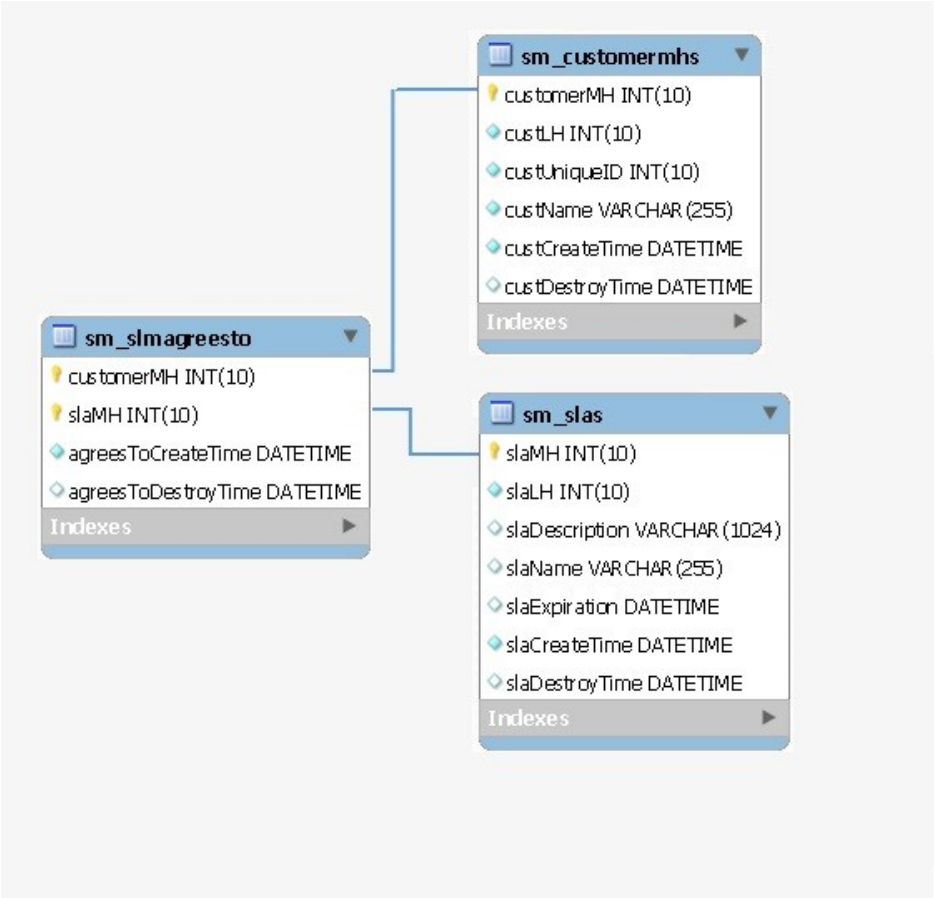
Contains associations between customers and their SLAs.

Columns

Field	Type	Null	Key	Default	Comment
customerMH	int(10) unsigned	NO	PRI		Model handle of customer in decimal
slaMH	int(10) unsigned	NO	PRI		model handle of SLA in decimal

agreesToCreateTime	datetime	NO			The time when customer is associated with SLA
agreesToDestroyTime	datetime	YES			The time when association between customer and SLA is removed

Relations



sm_slmlandscapes

Description

Contains last event retrieved time for each landscape.

Columns

Field	Type	Null	Key	Default	Comment
landscapeHandle	int(10) unsigned	NO	PRI		Landscape handle of SpectroServer
domainName	varchar(255)	NO			Domain Name of SpectroServer

servSyncTime	datetime	YES			Time the last event retrieved from the landscape

Relations

sm_slmmonitors

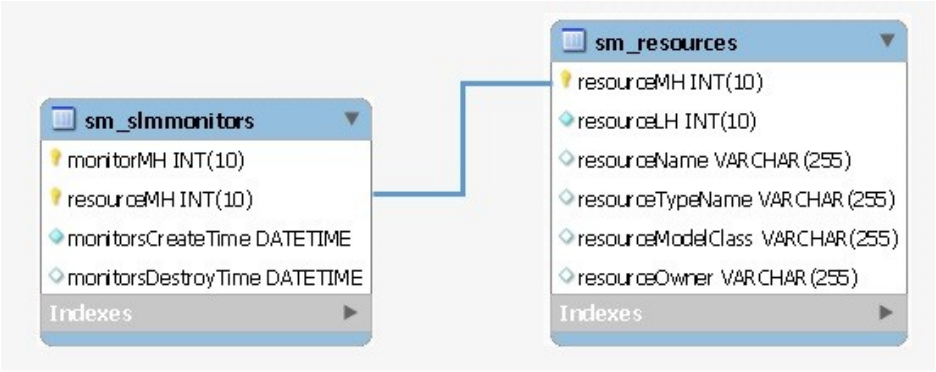
Description

Contains the association between services, resource monitors, and resources.

Columns

Field	Type	Null	Key	Default	Comment
monitorMH	int(10) unsigned	NO	PRI		contains Model handles of services and resource monitors
resourceMH	int(10) unsigned	NO	PRI		Contains model handles of resource monitors and resources (devices)
monitorsCreateTime	datetime	NO			Creation time of monitors (resource monitor or resources/ devices)
monitorsDestroyTime	datetime	YES			Destory time of monitors (resource monitor or resources/ devices)

Relations



sm_slmowns

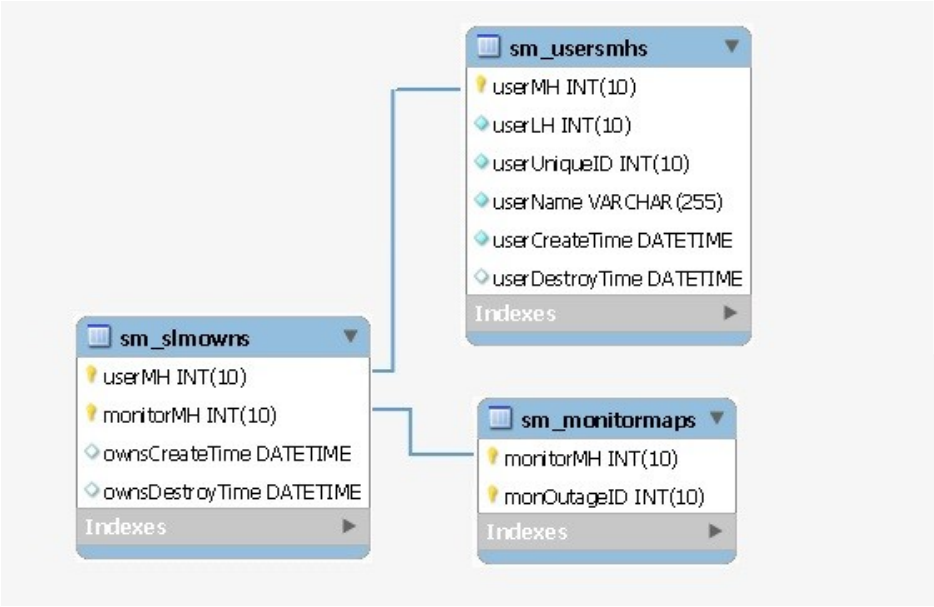
Description

Contains information about the services used by user (owner).

Columns

Field	Type	Null	Key	Default	Comment
userMH	int(10) unsigned	NO	PRI		User model handle
monitorMH	int(10) unsigned	NO	PRI		Model handle of the service that user (owner) uses
ownsCreateTime	datetime	YES			user (owner) creation time
ownsDestroyTime	datetime	YES			user (owner) destroy time

Relations



sm_slmuses

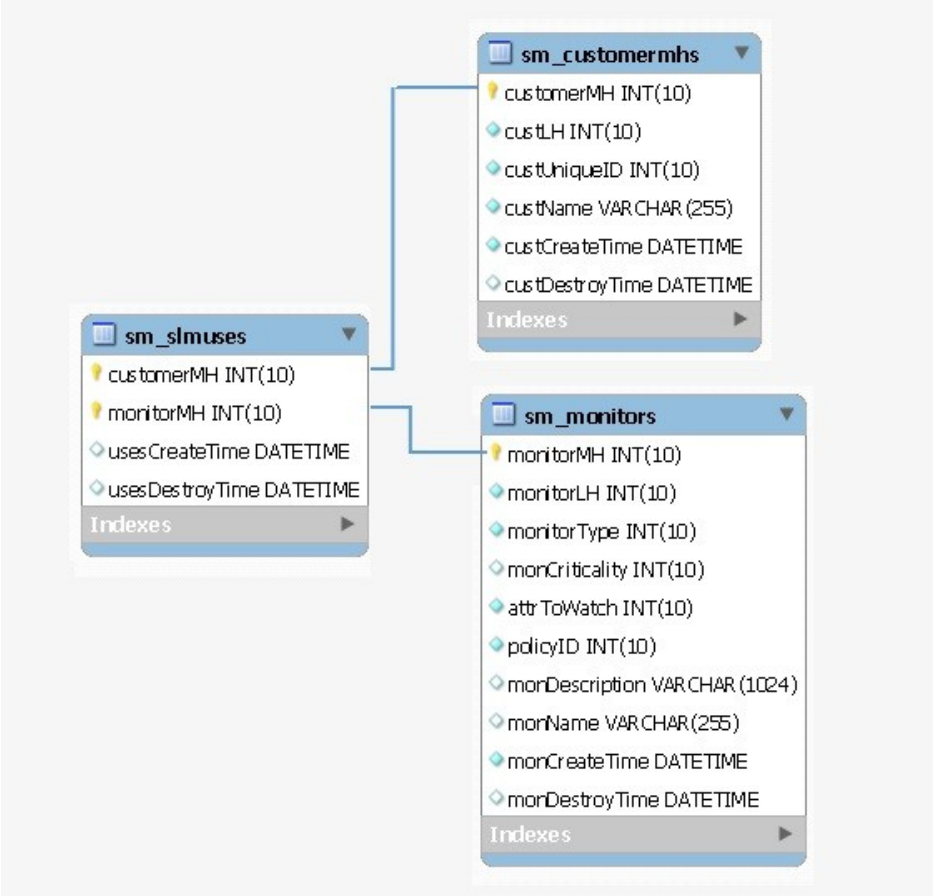
Description

Contains the information about the services used by customer.

Columns

Field	Type	Null	Key	Default	Comment
customerMH	int(10) unsigned	NO	PRI		Customer Model Handle
monitorMH	int(10) unsigned	NO	PRI		Model handle of the service that the customer use
usesCreateTime	datetime	YES			customer creation time
usesDestroyTime	datetime	YES			customer destroy time

Relations



sm_users

Description

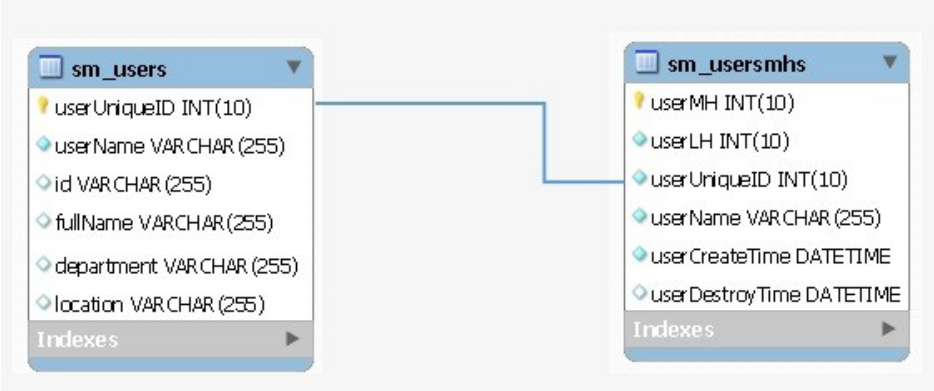
Contains contact information of users.

Columns

Field	Type	Null	Key	Default	Extra	Comment
userUniqueID	int(10) unsigned	NO	PRI		auto_increment	Auto incremented unique user IDs
userName	varchar(255)	NO	UNI			Name of the User
id	varchar(255)	YES				User ID
fullName	varchar(255)	YES				full name of the user
phone	varchar(255)	YES				Phone number of the user
email	varchar(255)	YES				email id of the user
street	varchar(255)	YES				street name of the user

city	varchar(255)	YES				city of the user
state	varchar(255)	YES				state of the user
country	varchar(255)	YES				country of the user
organization	varchar(255)	YES				organization of the user
site	varchar(255)	YES				site of the user loacated
department	varchar(255)	YES				Department of the user
location	varchar(255)	YES				Location of the user

Relations



sm_usersmhs

Description

Contain information about service owners or service users.

Columns

Field	Type	Null	Key	Default	Comment
userMH	int(10) unsigned	NO	PRI		service owner model handle
userLH	int(10) unsigned	NO			Landscape handles of the SS where the user is present
userUniqueID	int(10) unsigned	NO	MUL		Auto incremented unique user ids
userName	varchar(255)	NO			Name of service user / owner
userCreateTime	datetime	NO			The time when user created
userDestroyTime	datetime	YES			The time when user Destroyed

wirelessaps

Description

The table wirelessaps list the following details for event(s) raised on Wireless Controller / Access Points.

Field	Type	Null	Key	Default	Extra	Comment
ap_id	bigint(20) unsigned	NO	PRI	NULL	auto_increment	Unique Identifier
event_key	bigint(20) unsigned	NO		NULL		Event key for the Alarm.
timestamp	datetime	NO		NULL		Timestamp corresponds with time at which event occurred.
controller_mh	int(10) unsigned	NO	MUL	NULL		Model Handle of the WLC Controller.
ap_mh	int(10) unsigned	NO	MUL	NULL		Model Handle of the Access Point.
ap_grpName	varchar(255)	NO	MUL	NULL		Access Point Group Name.
clients_connected	int(10) unsigned	YES		0		Number of Clients connected to Access Point.

data_sent	bigint(20) unsigned	YES		0		The number of bytes sent on the Access Point.
data_received	bigint(20) unsigned	YES		0		The number of bytes received on the Access Point.

wkpeventfilemap

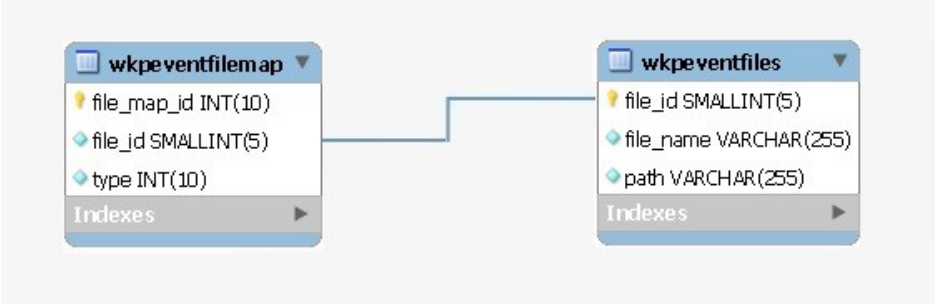
Description

The table wkpeventfilemap maps the event types found in the XML file and maps them to the file from which they were read.

Columns

Field	Type	Null	Key	Default	Extra	Comment
file_map_id	int(10) unsigned	NO	PRI		auto_increment	Event file map ID
file_id	smallint(5) unsigned	NO	MUL			Event file ID
type	int(10) unsigned	NO				Event file type

Relations



wkpeventfiles

Description

This table lists all the event filter XML files that were read from custom directory in OneClick.

Event filters are uniquely named sets of any number of predefined event codes. When users configure an event report, they can elect to specify in the Select the Event Types to include or exclude a field whether to include or exclude data in the report from events in a particular event filter.

An event filter is defined by an XML file that specifies the event codes. Users can create new event filter files, and they can copy and modify the event filter files included with Report Manager. This file resides in custom directory of OneClick.

Report manager reads the event filter XML files from custom directory of OneClick. Once read, the data from each XML file is added to two tables: wkpeventfiles and wkpeventfilemap.

Table wkpeventfiles lists all the XML files that were read from the custom directory.

Columns

Field	Type	Null	Key	Default	Extra	Comment
file_id	smallint(5) unsigned	NO	PRI		auto_increment	Event file ID
file_name	varchar(255)	NO				Event file name
path	varchar(255)	NO				Event file path

Description

View definition to list the security string access data for users of all landscapes

Remarks

View: All Landscapes

v_user_report_security

Description

View definition as a union of all OC users and BO users

Remarks

View: All Landscapes

The SpectroSERVER and Threads

The SpectroSERVER handles requests from many client applications while simultaneously accessing the disk and the network. For better efficiency, the SpectroSERVER operates using a multithreaded architecture that has less overhead than running separate processes.

The SpectroSERVER creates some threads at startup that terminate only when the SpectroSERVER terminates. The SpectroSERVER creates other threads dynamically and terminates them when they are no longer needed. For example, each time a client connects to the SpectroSERVER or makes a request through an API, a new thread is started.

Typically, it is not necessary to be concerned about this internal threading mechanism. However, this concept can become important on a heavily loaded system when advanced tuning is required to maximize your system throughput.

Managed Elements

The SpectroSERVER uses models to represent managed elements, and these models are based on the model types that are defined in the modeling catalog. Some model types can be instantiated to represent a device, an application, or a host that operates in the computing infrastructure. The SpectroSERVER can communicate directly with these managed elements using SNMP, if appropriate. Some model types are instantiated into models that act as containers and are used to group other models. For example, you can create a LAN model to group certain managed elements on a network segment. Or you can create a Room model to group the managed elements in one room.

A container model can contain either other container models or models that represent managed elements, or both, depending on the container model type. For example, an IPClassB container can contain a model representing a router, and it can also contain several LAN models representing a range of subnets. However, a Building model can only contain container models: a Floor, a Section, or a Room.

The SpectroSERVER uses *management modules* to manage the specific elements of a computing infrastructure. A management module is made up of model types, relations, inference handlers, and support files. A management module uses a series of models to represent each component of the specific type of managed element. The managed element can be represented with a device model. The device functionality is supported with a combination of other types of models, such as application models. Each major functional component of a managed element can be modeled as a separate application or can be incorporated into the device model. An application often corresponds to the functionality of a MIB, or a section of that MIB.

All the models that are used to represent a managed element are based on model types that are defined in the modeling catalog. The associations that the models have with one another are based on the relations and meta-rules that are defined in the modeling catalog. The SpectroSERVER can implement various associations, such as the following examples:

- A container model can contain models representing managed elements or container models
- Connections between device or port models can be established representing physical or logical connectivity
- Application models that support a device model express relations showing what functionality a device provides

> **NOTE**
> Not all model types that are defined in the DX NetOps Spectrum knowledge base can be used to create a model in OneClick. Some function only as base model types from which other model types are derived.

Device Discovery

DX NetOps Spectrum supports an automatic method of discovering and modeling managed elements and connections within the computing infrastructure. *Discovery* is a OneClick feature that automates the process of discovering and modeling the entities in your IT infrastructure. You can create and edit Discovery and modeling configurations to

customize and simplify the process. DIscovery also lets you filter and export the results of Discovery or modeling sessions.

Discovery comprises two components. The Discovery application scans IP address ranges or lists and reads a select group of key MIB objects from each SNMP-enabled managed element encountered. The result is presented to you or is sent to the SpectroSERVER for modeling. The server-side, or back-end, Discovery process uses the key MIB objects of each managed element to determine the best model type to use. Then Discovery creates an instance of that model type to represent that managed element.

After the models are created and activated for the managed elements that Discovery finds, the back-end Discovery process determines their placement and connectivity. Model placement and connectivity are based partially on user-specified options. Based on their IP address, models of bridges and workstations are placed inside a LAN container. These models are then connected to other bridges using spanning tree and source address tables, which are read from the MIBs of the managed elements. Models of routers are placed in network containers or in the Universe. These models are connected to LAN models or to other routers using IP addresses and masks, IP route table information, or proprietary discovery protocol MIBs.

DX NetOps Spectrum also lets you create specific models from the OneClick Console. Two methods can be used. The first method uses the IP address or the DNS name of the managed element. With this information, the SpectroSERVER contacts the managed element and retrieves the name, vendor, description, location, and sysOID of the managed element. DX NetOps Spectrum then creates a model using the model type that best represents the functionality of this device.

You can also create a model by first selecting a model type as a base. In this case, you provide an IP address or a DNS name so the SpectroSERVER can communicate with the managed element. However, the model type that you select is instantiated, regardless of the SpectroSERVER assessment of managed element functionality. The SpectroSERVER creates all of the appropriate supporting model types and matches the functionality that the MIBs for the managed element describe.

Device Communication Manager

The Device Communication Manager (DCM) is the interface between the SpectroSERVER and the managed elements. The DCM includes various protocol interfaces that communicate with managed elements using a specific protocol. One interface exists for each of the two supported protocols, SNMP and ICMP. When the SpectroSERVER communicates with a managed element, the request is sent to the appropriate protocol interface in the DCM. The DCM, in turn, passes the request to the managed element.

Polling

The SpectroSERVER constantly updates its knowledge of network conditions using polling and logging services. The DCM handles communication with the managed element being polled. Model type attributes are defined as either external (to be obtained from the managed element) or internal (stored either in memory or the database). Some external attributes are defined as *polled*, which means that the SpectroSERVER regularly polls the managed elements. The polling frequency depends polling_interval attribute value that is defined for the model. Values of external attributes that do not have polling set are obtained from the managed element upon each client application or inference handler request.

> **NOTE**
> Polling affects the performance of the SpectroSERVER and the network. Shorter polling intervals can limit the responsiveness of the SpectroSERVER and can generate an unacceptable amount of network traffic.

Logging

Attributes can also be defined as being logged, meaning that their values are written through the Archive Manager to the DDM database. The frequency with which values are logged is based on both the polling_interval and the Poll_Log_Ratio defined for the model.

For example, you can set the Poll_Log_Ratio to 10 and polling_interval to 60. This setting logs the attribute value to the statistics file every tenth poll, or every 600 seconds.

NOTE
Logging affects the performance of the SpectroSERVER and the network. Smaller logging ratios can limit the responsiveness of the SpectroSERVER and can generate an unacceptable amount of network traffic.

Alerts, Events, and Alarms

DX NetOps Spectrum is a services and infrastructure management system that notifies you when a fault occurs in a managed element in your network. One way that DX NetOps Spectrum accomplishes this functionality is by receiving alerts (usually SNMP traps) from problem areas in the computing infrastructure. DX NetOps Spectrum then converts those alerts into events and alarms to be displayed in DX NetOps Spectrum applications.

DX NetOps Spectrum uses a series of support files that are named event configuration files to indicate how alerts, events, and alarms are processed. DX NetOps Spectrum receives alerts from problem areas within the managed infrastructure. DX NetOps Spectrum converts alerts into events and alarms, which are displayed in OneClick event and alarm views. Alerts, events, and alarms let DX NetOps Spectrum notify you about significant occurrences in your IT infrastructure.

Alerts

An alert is an unsolicited message that a managed element sends to DX NetOps Spectrum. The primary management protocol that DX NetOps Spectrum uses to communicate with managed elements is SNMP. An SNMP-compliant managed element can send an alert, which is known as a trap. Managed elements with SNMP traps enabled can be configured to direct their traps to the SpectroSERVER. The SpectroSERVER uses the source IP address of the trap to identify the model that is associated with that managed element. Once the model is known, the trap is processed as directed by the AlertMap file that is associated with that model type. An AlertMap file exists for most device model types within DX NetOps Spectrum. The AlertMap is an ASCII file that is used to map SNMP traps into DX NetOps Spectrum events.

Events

An event is an object representing an instantaneous occurrence within DX NetOps Spectrum. Events usually indicate that something significant has occurred regarding the model or another component. Most device model types have an associated EventDisp event configuration file. An EventDisp file is an ASCII file that indicates how an event is processed. After an AlertMap file converts an SNMP trap into an event, the EventDisp file tells DX NetOps Spectrum how to handle this event for this model. The processing of an event can include logging the event and generating an alarm.

Alarms

An alarm is an object which indicates that a user-actionable, abnormal condition exists in the managed environment. Usually an alarm is generated as a result of a received trap -- that is, when an event has occurred and the EventDisp file specifies alarm generation. A configured watch can also generate an alarm, as can DX NetOps Spectrum detecting an abnormal situation that is not based on an event. After the abnormal condition that caused the alarm ends, another event clears the corresponding alarm or you can clear it. Alarm notifications can be sent to applications and inference handlers that need this information. DX NetOps Spectrum can examine myriad network events, analyze them, and produce few important alarms.

Landscapes and the Distributed SpectroSERVER

A landscape is the DX NetOps Spectrum term for a network domain that a single SpectroSERVER manages. A landscape is composed of the models, associations, attribute values, alarms, events, and statistics belonging to a specific SpectroSERVER. Each landscape that is contained in a network is unique, and a unique landscape handle (ID) identifies each landscape. A landscape icon can represent each landscape in the OneClick Console. The landscape icon provides a graphical representation of a SpectroSERVER knowledge base.

The Distributed SpectroSERVER (DSS) is a powerful modeling feature that enables the distribution of management for portions of a large-scale network. The work can be distributed either geographically or across multiple servers in a single physical location. DSS can improve DX NetOps Spectrum performance when managing a computing infrastructure by distributing the network load that management traffic introduces. DSS can also delegate management functions to remote workstations.

Using a DSS, you can create a unified representation of the computing infrastructure, which is composed of multiple landscapes, each with its own local SpectroSERVER. In a DSS environment, a SpectroSERVER client, such as the OneClick Console, can access information from more than one SpectroSERVER simultaneously.

> **NOTE**
> The Distributed SpectroSERVER Administration section contains tips on how to segment your network into landscapes.

10.2 enables you to opt for increased capacity and scale by allowing you to monitor huge number of devices with fewer landscapes. Using the Huge Landscape Handle type (during installation), you can create landscapes which can support huge model count (beyond 1 Million models per SpectroSERVER). Landscape handles are multiples of 64. This option is only available for fresh installs and best suited for new DSS environments and new single-server installations. This capability is not supported for upgrade and migration scenarios. Currently you can scale upto 2 million models per SpectroSERVER.

You need to use the same Landscape Handle type throughout DSS environment, i.e. if you select Huge Landscape Handle type during installation, you need to assign the landscape handles in multiples of 64, and if you select the Legacy Landscape Handle type, you need to assign landscape handles in multiples of 4.

> **WARNING**
>
> For upgrade and migration scenarios, DX NetOps Spectrum automatically uses Legacy Landscape Handle type. All pre-10.2 landscape handles belong to Legacy Landscape Handle type.

When you model multiple landscapes using DSS, the database for each landscape must contain identical modeling catalogs. All model types that exist in the modeling catalog for one landscape must also exist in the modeling catalog of every other landscape. Hence, if you install add-on applications in one landscape, the same applications must be installed on every landscape. For example, if you install VPN Manager in one landscape, install VPN Manager in all landscapes.

Administration of all the modeling catalogs in a distributed environment is made easier with the concept of a master catalog. The master catalog is the SpectroSERVER that you designate to update the other SpectroSERVERs in the landscape map. When a change is necessary, it is made to the master catalog. The entire master catalog is manually copied to all other SpectroSERVERs in the landscape map, propagating all changes and keeping the modeling catalogs consistent.

> **NOTE**
> See the Distributed SpectroSERVER Administration section for more information.

> **NOTE**
>
> From 10.3 onwards, you can load the catalog of the Legacy Landscape on a Huge Landscape and vice versa (using SSdbload -c option). However you will not see the landscape details displayed. For more information on the landscape details, see the Known Anomalies section.

Client Applications Overview

The main DX NetOps Spectrum client application is OneClick. A few other DX NetOps Spectrum client applications also let you interact with the information that is stored and processed on the SpectroSERVER.

You can use the following client applications when customizing DX NetOps Spectrum or integrating with DX NetOps Spectrum:

- **AlarmNotifier:** This application is used to forward alarm data to user-defined scripts or third-party applications. For more information, see About AlarmNotifier.
- **SANM:** This application is used with the AlarmNotifier to specify policies that filter alarm data sent to user-defined scripts or third-party applications. For more information, see Spectrum Alarm Notification Manager (SANM).
- **Report Manager:** This application is a full-featured system that creates reports from data that is extracted from the knowledge base on the SpectroSERVER. Report Manager relies on two more client applications: CA Business Intelligence and InfoView.

For more information, see the AlarmNotifier, Spectrum Alarm Notification Manager (SANM), Report Manager sections.

The following applications are not DX NetOps Spectrum clients, but they are required for some optional DX NetOps Spectrum customization and integration.

- **Process daemon:** The process daemon is a process launching and tracking daemon that lets DX NetOps Spectrum control various processes running on a workstation. The process daemon starts processes when requested by an application, such as the Control Panel. The process daemon can also start processes on system boot when configured to do so. The process daemon automatically restarts critical processes when they stop unexpectedly. The DX NetOps Spectrum Control Panel is the only executable actively launched by you, the DX NetOps Spectrum user. The process daemon launches all other applications following a request by the user or another application. The process daemon operates in the background and is transparent to you. The process daemon automatically starts during DX NetOps Spectrum installation and whenever the system is started.
- **Model Type Editor:** This application is used to derive new model types that support the development of new management modules.

OneClick Console

The OneClick Console displays information from the SpectroSERVER using icons and views. Icons are illustrations of the models that are defined to represent the managed elements of your computing infrastructure. Views are the various ways in which data from the SpectroSERVER is organized for display.

OneClick Console Icons

Icons are graphic representations of instantiated models that are based on model types from the DX NetOps Spectrum modeling catalog. The various icons can represent individual managed elements, groups of managed elements, geographic locations, users, landscapes, connections between models, and so on. Pipes are a special type of icon and are used to represent the connectivity between managed elements.

General information about a model, such as the model name and model type name, is visible on the icon. Detailed information about a model is found within various icon subviews that are accessed by double-clicking the icon. Some icons use color to indicate the condition of the managed elements that they represent.

Hierarchical Views

A view in DX NetOps Spectrum is a way to organize data so it can be displayed or manipulated. Hierarchical views represent ways to structure your network data. When structuring your network data in the XML file, you select from elements that represent each of the hierarchical views. Two types of hierarchical views exist: Topology and Location.

Topology View

The Topology view is really an abstraction of networking components. When working with this view, you represent the physical or logical components of your network and group these components, while factoring in their logical connectivity. You can also represent connections graphically, using pipes that show how devices are connected at the port or device level. In the <oc> Console, this view appears as the Universe topology.

NOTE
For more information about the Universe topology view, see Modeling and Managing Your IT Infrastructure.

Location View

The Location view organizes your network data by physical location. Using this view that you can depict your network in geographical terms. You can start with your global offices and can go right to the wiring closet on each floor of each building in each region where your offices are located. In the <oc> Console, this view appears as the World topology.

NOTE
For more information about the World topology view, see Modeling and Managing Your IT Infrastructure.

Reporting with CA Business Intelligence (CABI)

DX NetOps Spectrum Reporting uses CA Business Intelligence (CABI) to display reports.

CABI is a reporting and analytic software package that DX NetOps Spectrum and other CA products use to present information. DX NetOps Spectrum uses CABI to integrate, analyze, and present information that is required for effective enterprise IT management, through reports.

CABI includes SAP BusinessObjects Enterprise XI, which is a complete suite of information management, reporting, query, and analysis tools.

CABI installs SAP BusinessObjects Enterprise XI as a standalone component. The installation runs independently of DX NetOps Spectrum and other CA products, allowing various CA products to share Business Intelligence services. CABI installation is a distinct and separate activity within the overall CA product installation process.

NOTE
For more information, see the CA Business Intelligence Implementation section and the CA Business Intelligence Release Notes .

InfoView Report Management

BusinessObjects Enterprise InfoView (InfoView) is a web-based interface that lets you manage reports with the following features:

- Browsing and searching capabilities.
- Content access (creating, editing, and viewing).
- Content scheduling and publishing.

The InfoView functions like a Windows application rather than a simple web application. The InfoView toolbar dynamically changes to provide actions through context menus consistent with the function you want to perform. InfoView provides context menus, by simply clicking the right mouse button. You can double-click items in a window to execute default actions. Report structures are consistent and provide powerful security and authorizations.

InfoView provides access to the WebIntelligence (WEBI) designer. This designer lets you create customized reports with a simple drag-and-drop interface. Custom data object selection with effective filtering options, enables powerful reporting capabilities for your environment.

You can access InfoView from the OneClick home page or directly from a Web browser. The typical URL format is as follows:

```
http://<hostname>/InfoViewApp
```

NOTE
For more information, see the Report Manager section.

Attribute and Relation Definitions

This section explains what Attributes and Relations are in DX NetOps Spectrum. Some examples of Attribute and relation are also listed in the following sections:

- Attributes
- Attribute Descriptions
- Relation Descriptions

Attributes

The concept of an attribute and its role regarding models and model types is outlined in Model Type Attributes.

Many attributes in the knowledge base are counterparts of **Management Information Base** (**MIB**) variables. External attributes directly correspond to specific MIB variables. Internal attribute values can be derived from the values of MIB variables. These values have often undergone some mathematical calculations to arrive at their DX NetOps Spectrum value. The naming conventions typically make the relationship between the attribute and the MIB variable evident.

The following tables show the attributes that have been defined to help you integrate other applications with DX NetOps Spectrum. These attributes are used when creating a management module, using the Southbound Gateway Toolkit, or using the Modeling Gateway Toolkit. Each table is a quick reference with attributes grouped by functionality.

NOTE
You can access specific information about attributes and relations from the Model Type Editor. For more information, see the Model Type Editor section.

Application Model Discovery

Attribute	Attribute ID	Found On
default_attr	0230006	Application model types

Device Model Discovery

Attribute	Attribute ID	Found On
DeviceNameList	0x1293E	Device model types
DeviceType	0x23000e	Device model types
Disposable_Precedence	0x114e2	Device model types
Enable_IH_Spec_Dev_Name	0x3d0062	Device model types
Enable_IH_Device_Name	0x3d0008	Device model types
Image_Index	0x3d0001	Device model types
System_OID_Verify	0x110bb	Device model types
System_OID_Verify_List	0x12910	Device model types

General Model Type Information

Attribute	Attribute ID	Found On
CompanyName	0x118b8	Device and application model types
Description	0x230017 and 0x118bc	Device, application, and interface model types
DeviceType	0x23000e	Device model types
Manufacturer	0x10032	Device model types
MMName	0x1196a	Device and application model types
MMPartNumber	0x1196b	Device, application, and interface model types
Model_Class	0x11ee8	Device model types
Model_Name	0x1006e	Device, application, and interface model types
Modeltype_Name	0x10000	Device, application, and interface model types
Vendor_Name	0x11570	Device, application, and interface model types

Network Information

Attribute	Attribute ID	Found On
Network_Address	0x12d7f	Device, application, and interface model types
Network_Mask	0x12dbc	Device, application, and interface model types

Polling Information

Attribute	Attribute ID	Found On
polling_interval	0x10071	Device, application, and interface model types
poll_log_ratio	0x10072	Device, application, and interface model types
pollingstatus	0x1154f	Device, application, and interface model types

Port Identification

Attribute	Attribute ID	Found On
ifAlias	0x11f84	Interface model types
if_Index	0x11348	Interface model types
ifName	0x11f60	Interface model types
if_Phys_Addr	0xd0399	Interface model types
ip_address	0x12dbb	Interface model types

SNMP Information

Attribute	Attribute ID	Found on
Community_Name	0x10024	Device, application, and interface model types
CommunityNameForSNMPSets	0x11a7f	Device, application, and interface model types
isManaged	0x1295d	Device, application, and interface model types
Security_String	0x10009	Device, application, and interface model types

Attribute Descriptions

This section provides more information about the attributes that are outlined in the previous tables.

> **NOTE**
> You can access more information about each attribute by using the Model Type Editor. Details, such as the attribute ID, the data type of the attribute value, or the attribute flags that are set for the attribute, are available. See the Model Type Editor section.

Several attribute flags can be set for each attribute including these main ones:

- **External:** When set to TRUE, this flag indicates that the value for this attribute is maintained outside of the SpectroSERVER. This setting also indicates that an update of the attribute value is done either at a user request or at a polling interval.
- **Readable:** When set to TRUE, this flag informs the SpectroSERVER that a client or other application is allowed to read this attribute value from the SpectroSERVER. If the External flag is set, set this flag according to the MIB definition of the Readable variable for this attribute. If the External flag is not set, set this flag as desired.
- **Writable:** When set to TRUE, this flag informs the SpectroSERVER that a client or other application can write this attribute value to the SpectroSERVER database. If the External flag is set, set this flag according to the MIB definition of the variable for this attribute. If the External flag is not set, set this flag as desired.
- **Shared:** When set to TRUE, this flag declares that one value exists for this attribute and that all models of the current model type share it. The value is not duplicated in memory or in the database for each model.

The following list contains descriptions for the attributes that one or more of the DX NetOps Spectrum integration points uses or references.

- **Community_Name**
  Identifies the SNMP community string that is used when DX NetOps Spectrum attempts to communicate with a managed element using SNMP. This attribute is evaluated when performing SNMP gets. If the attribute CommunityNameForSNMPSets is empty, this attribute is used when performing SNMP sets, too.
- **CommunityNameForSNMPSets**
  Specifies the community name that is used when performing SNMP sets. If left blank, the Community_Name attribute value is used for SNMP sets.
- **CompanyName**

Specifies the company name the device and application model types use. This value is set equal to the name of the company that developed the model type.

- **default_attr**
  Identifies the applications that a particular managed element supports. This attribute is used in the application Discovery process. The value of the default_attr is set equal to the attribute ID of an attribute that represents a MIB object which uniquely identifies the MIB.
- **Description**
  Provides a textual description of the model type.
- **DeviceNameList**
  Contains the device names that correspond to the OIDs in the SysOIDVerifyList attribute. To use this attribute to set the device name, set the Enable_IH_Device_Name attribute and the Enable_IH_Spec_Dev_Name attribute to TRUE.
- **DeviceType**
  Holds the name of the device type when the model type represents only one specific type of device. The value of this attribute is displayed in the field at the bottom of the icon for the model. If multiple device types exist for a given device, use the DeviceNameList attribute.
- **Disposable_Precedence**
  Contains a value that the DX NetOps Spectrum device discovery mechanism uses to resolve conflicts in the device model type selection process. A conflict occurs when multiple model types have a System_OID_Verify value that matches the SystemObjectID of the managed element. To resolve the conflict, Discovery uses the model with the highest Disposable_Precedence value.
- **Enable_IH_Spec_Dev_Name**
  When the Enable_IH_Spec_Dev_Name attribute is TRUE, DX NetOps Spectrum uses the Enable_IH_Device_Name inference handler to determine the vendor name using the enterprise number from the device.
- **Enable_IH_Device_Name**
  When the Enable_IH_Device_Name attribute is TRUE, DX NetOps Spectrum uses the Enable_IH_Spec_Dev_Name inference handler to read the device System Object ID to determine the product name.
- **ifAlias**
  Corresponds to this value from the MIB II Interface table.
- **ifIndex**
  Corresponds to this value from the MIB II Interface table.
- **ifName**
  Corresponds to this value from the MIB II Interface table.
- **if_Phys_Addr**
  Corresponds to this value from the MIB II Interface table.
- **Image_Index**
  Links a GnSNMPDev model with an icon image that represents the model. Possible values and their corresponding images are as follows:
  - **1**
    Generic Device
  - **2**
    Bridge
  - **3**
    Router
  - **4**
    Hub
  - **5**
    PC
  - **6**
    Terminal Server
  - **7**

Workstation
  - **8**
    Switch
- **ip_address**
  Specifies the IP address that is associated with an interface model.
- **isManaged**
  Indicates if a device model is managed. When this attribute is set to TRUE, DX NetOps Spectrum manages this device using SNMP communication.
- **Manufacturer**
  Used with a device model to show the manufacturer responsible for the device.
- **MMName**
  Holds the management module name for device and application models.
- **MMPartNumber**
  Contains the part number that the management module developer has assigned to the management module. Most device, application, and interface models use this attribute.
- **Model_Class**
  The Model_Class defines the type of device that the model represents. The following table lists the model classes that are available in DX NetOps Spectrum and their respective integer identifier. For example, the model class SWITCH uses the identifier 2.
  - **0**
    UNKNOWN
  - **1**
    OTHER
  - **2**
    SWITCH
  - **3**
    ROUTER
  - **4**
    SWITCH_ROUTER
  - **5**

- **136**

CLUSTER
– **137**
VMWARE_VCENTER

- **Model_Name**
Specifies the name that is given to the model. A model name distinguishes the model from others of that type.
- **Modeltype_Name**
Specifies the textual name of the model type.
- **Network_Address**
Contains the network address of the device model. DX NetOps Spectrum uses this value to identify and communicate with the model. This value is usually an IP address.
- **Network_Mask**
Further identifies the logical location for a device model on the network.
- **polling_interval**
Used by most device, application, and interface models. The value of this attribute identifies the number of seconds that must pass between polling requests. You can set this attribute in the Model Information view.
- **poll_log_ratio**
Identifies the polling cycle that logs the polled attributes. For example, a value of 10 means that the polled attributes are logged every tenth polling cycle. This attribute is found on most device, application, and interface models.
- **pollingstatus**
Controls if polling occurs for the model. Most device, application, and interface models use this attribute. A value of TRUE means that polling is enabled for the model. A value of FALSE means that polling is disabled for the model.
- **Security_String**
Defines the SNMP community strings that have access to this model. Most application, device, and interface models use this attribute.
- **System_OID_Verify**
Contains a System Object ID value that Discovery uses to determine the appropriate model type for representing a device. DX NetOps Spectrum assigns the model type when instantiating a model to represent a managed element. DX NetOps Spectrum identifies the appropriate model type by matching the System Object ID of the managed element to the System_OID_Verify value for that model type. If multiple model types are found to have a matching value, the model with the highest Disposable_Precedence value is used. If a model type is used to represent a family of devices, the SysOIDVerifyList attribute is used instead of the System_OID_Verify attribute.
- **SysOIDVerifyList**
Contains a list of System Object ID values that Discovery uses to determine the appropriate model type for representing a device. DX NetOps Spectrum assigns the model type when instantiating a model to represent a managed element. DX NetOps Spectrum identifies the appropriate model type by matching System Object ID of the managed element to a value from the model type SysOIDVerifyList list. If multiple model types are found to have a matching value, the model with the highest Disposable_Precedence value is used.
- **Vendor_Name**
Identifies the vendor of the managed element. Most device, application, and interface models use this attribute.
- **PortDuplex**
The PortDuplex attributes defines the duplex type of an interface. The following are the list of values available for PortDuplex attribute in DX NetOps Spectrum.
1. half duplex
2. full duplex
3. auto
4. unknown
5. disagree

Relation Descriptions

The following relations are among the most important for the DX NetOps Spectrum functionality:

- **Connects_to**
  The Connects_to relation is a many-to-many relation type. Connects_to forms a connection between two models. This relation establishes a connection between a port model and a device or topology model.
- **Contains**
  The Contains relation is a one-to-many relation type. This relation lets a model contain other models. The Location models use the Contains relation to determine the location or device models that can be contained within the location model. DX NetOps Spectrum tests the rules for this relation when you attempt to add or copy models to the Location models.
- **HASPART**
  The HASPART relation is a many-to-many relation type. HASPART establishes an association between a device model and the models that represent the components of the device. Typically, these components are the interface models of the device. However, this relation can also establish an association between a component model and its components.
- **Links_with**
  The Links_with relation is one-to-many relation type. This relation is used to represent a resolved connection between two models. This relation is found typically between two-port models. Both the Link view and Live Pipes rely heavily on this relation.
- **Manages**
  The Manages relation is a one-to-many relation type. This relation forms an association between an application model and the device model that is running it. The Manages relation can also form an association between an element management system model and the element models of this system.
- **Provides**
  The Provides relation is a one-to-many relation type. This relation identifies which applications provide which sub-applications. The Provides relation can also be used to determine which application provided a particular sub-application.

Sizer Tool

The DX NetOps Spectrum Sizer tool is an online web-based sizing tool. This multipurpose tool can provide you with the knowledge of the computer resources that are required to manage a given network that is based on the hardware platform of the choice of the customer. The following section contains detailed instructions for using the DX NetOps Spectrum Sizer tool.

Sizing

Sizing is the capability to estimate computer resource requirements for a given software application. The ability to provide accurate sizing information has become essential to the success of DX NetOps Spectrum. The sizing information is vital to the presales process and is used by customers, partners, and CA teams to assist customers in troubleshooting performance problems.

Working with Sizer

Working with the sizer tool is simple. The user enters in either actual data that is collected from a current network of the customer or virtual data for a network the customer expects to attain in the future. From this data, the sizer runs through a series of calculations. The built-in algorithms of DX NetOps Spectrum Sizer tool comes from performance testing and validation of the software with the supported computer systems. The DX NetOps Spectrum Performance Analysis Team continuously tests and validates the sizer algorithms as new versions of the software are developed.

Knowledge of the supported CA applications and their associated technologies is assumed.

Launching the Sizer

The DX NetOps Spectrum Sizer tool has a 25-minute time-out on the server. If you are idle for more than 25 minutes, you are automatically logged out and your sizing is discarded. Therefore, it is important to have all necessary sizing information with you before logging on to the server. Attempting a sizing without proper information is not recommended, as it most likely results in either an unfinished or inaccurate sizing. Read the Data Collection for DX NetOps Spectrum Sizer section in this article before attempting a sizing.

You can access the DX NetOps Spectrum Sizer tool through a web browser. Click the following link to access the Sizer tool.

http://consumer.interop.ca.com/sizer/

NOTE

Information! Chrome is the recommended browser for Sizer.

System Requirements for DX NetOps Spectrum Sizer

Browser

The DX NetOps Spectrum Sizer tool requires a browser that:

- Accepts cookies (must be turned on).
- Displays tables.
- Performs automatic redirection.

See Browser Configuration for a list of web browsers that are known to work and how to configure them.

Display

- Recommended: 1024 x 768 or higher with 256+ colors
- Minimum: 800 x 600 with 16+ colors
- 640 x 480 is not recommended

Browser Configuration

Microsoft Internet Explorer

Follow these steps to enable cookies:

- Open **Tools** menu, and click **Internet Options**.
- Click the Privacy tab.
- Click the **Advanced** button.
- Select '**Override automatic cookie handling**' checkbox under Cookies section.
- Select **Accept** radio buttons for '**First-party Cookies**' and '**Third-party Cookies**'.
- Select **Always accept cookies** checkbox.

What is a Cookie?

Cookies help a server (our online sizing server) to store information about a computer web session. The cookies that are used by our web server expire 25 minutes after your last access to the sizer. For Sizing, cookies are necessary, as the sizer requires tracking of your input as you go from one sizer page to another.

Sizer Registration

The registration process for DX NetOps Spectrum Sizer tool is a simple, one-time process. Once you are a registered user, you have access to all available options. To become a registered user, Click the '**Register**' link on the Sizer main page. At the register page, fill in at least the required fields to complete the registration. After registering with Sizer, there is a maximum one-business-day turnaround on sizer usage authorization (usually authorization is given within minutes of registering).

The registrations are currently accepted for resellers, outsourcers, and employees of CA Technologies and its partners.

NOTE

The sizer database security work is in progress, we recommend do not use your company password.

The following fields appear on the registration page. A field proceeded by a * is mandatory**. Please register only once.**

- *Enter a username
- *Enter a password
- *Retype password
- *First Name
- *Last Name
- *Email
- *User Type (Direct Sales, Reseller, End User, Support, Outsourcer, Other)
- *Organization (If CA Technologies then put department.)
- Street address
- Address (cont.)
- City
- State/Province
- Zip/Postal code
- Country
- Phone

Once you are a registered user, you can log in and can perform full sizings, create custom accounts, recall any and all previously completed sizings, and E-mail your results in plain text. If you forget your password, send an E-mail to spectrum-sizer.pdl@broadcom.com with your user name and we E-mail you the password.

Data Collection for DX NetOps Spectrum Sizer

Good preparation is the key here. A sizing generated with the sizing tool is only as accurate as the data entered into it. The more accurate the supplied data is, the more accurate the sizer output reflects the required resources to manage the network. The data that is needed for an accurate sizing includes:

- The name of the customer (Company Name, which is used as the Account Name in the sizer)
- Is the sizing for a 'new sale' or for 'support' of an existing customer
- The version of DX NetOps Spectrum to be sized
- The number and types of all devices (for example, switches/routers/hubs) to be managed
- The average number of active interfaces on the devices to be managed
- Number of servers and end systems to be managed
- The desired poll rate for each network device

(***See Appendix A for a fill-in-the-blanks DX NetOps Spectrum sizing worksheet***)

Sizer Login

Log in to use all the available options in Sizer.

Follow these steps:

1. On the main page, click **Start Sizing**.
   The login page appears.
2. Enter your registered sizer username and password.
   You have three attempts to enter your correct username and password before you are sent to the registration page.

After login, the ***Main Sizing Page*** *appears*. You can select either a 'New Sizing' OR a 'Recall Sizing'.

At any time during the sizing, you can always click the **Log Out** link at the top of any page to quit the sizer.

Account Setup

The sizers have been designed to use accounts. An account is used to harbor DX NetOps Spectrum sizings for a particular customer. Upon the first use of the sizer, you are required to enter an account name. Use a meaningful account name such as the name of the customer, this makes it easier for you to manage sizing information of your customer account. A new account name is only saved if sizing is completed for that account (that is, upon sizing for a new customer, complete one sizing to store the account name in our database for future sizing reference).

Recalling a Sizing

The sizer supports the ability to recall completed sizings that are stored in our database. A recalled sizing acts exactly the same as a regular sizing. You can change previously entered information, and then E-mail the recalled sizing.

Modes of a recalled sizing:

- *Just to see its final report output* - when recalling a sizing in this mode, only the end-results are available. You can view the results, e-mail them, or print them to see the end results.
- *As a starting point for a new sizing* - a recalled sizing in this mode uses the recalled sizing as a starting point for a new sizing. All the values of the recalled sizing become the default values for the new sizing. This mode is useful if you want to edit the data in a previous sizing to try different 'what if' scenarios.

  NOTE

  Not completed sizing is ever overwritten. Each completed sizing is assigned a unique id from our server. Therefore, if you recall a sizing to use as a starting point for a new sizing, and you do not change the sizing note or the account name, the only way to tell the sizings apart is by the time/date stamp.

Follow these steps to recall a sizing:

1. Log in to the DX NetOps Spectrum Sizer tool using your registered sizer username and password.
2. At the main sizing page, select **Recall Sizing**.
3. Choose the mode of recall and the account that the sizing belongs to.
4. Click **OK**.The Account Sizing information for the recall account appears.

Performing a Sizing

After you have successfully registered and are logged in, you are ready to size. Sizing is straightforward provided you have all the necessary information with you. When using the DX NetOps Spectrum Sizer tool, be sure to use the **built-in** sizer navigation buttons. If the browser navigation buttons are used, the sizer cannot track your session (**i.e. do not use the browsers 'BACK' button, instead use the 'BACK' button located at the bottom of the sizer page**).

Follow these steps:

1. Select Account Type, Sizing Type, SizingNote, and DX NetOps Spectrum version for sizing
   a. Create an account for the customer or select an existing account that you previously created. Each client/customer must have only one account; however, you can have multiple sizings for each account.
   b. Select the Type of sizing from either a 'New Sale' sizing or a 'Support' sizing.

c. Select the version of DX NetOps Spectrum to be sized.
d. Enter a short Note or keywords about the sizing. The 'Sizing Note' and date of sizing are used to differentiate your sizings.
e. Click NEXT.

2. Depending on the selection for 'Sizing Type' in Step#1, you see different options in Step#2.
   If you select 'New Sale', then you see the following options:
   a. Percentage of devices managed via SNMPv3: Approximate percentage of SNMP v3 devices (% out of the total managed devices).
   b. Percentage of devices managed via SDM: Approximate percentage of devices managed by SDM (% out of the total managed devices).
   c. Future growth: Approximate percentage of expected future device growth (% out of total managed devices).

   If you select 'Support', then you must enter details about the approximate forecast of the server capacity. You see the following options:
   a. Allowed SpectroSERVER capacity (the desired percentage CPU utilization per server); 50 percent is recommended to allow for network growth and transient conditions that require more CPU.
   b. Number of WebServers: Number of OneClick servers that user planned to set up.
   c. Number of Global Collection Elements (that is, 1000): Total number of GC elements that user plans to have across all global collections.
   d. Number of Alarms (that is, 2000): Approximate total number of alarms that are expected from all the managed devices.
   e. Number of Events/sec (that is, 50): Approximate number of events/sec expected from all the managed devices.
   f. Percentage of devices with active port monitoring (that is, pollPortStatus, LivePipes) % of devices that are expected to have active port monitoring.
   g. Percentage of devices managed via SNMPv3: Approximate percentage of SNMP v3 devices (percentage out of the total managed devices).
   h. Percentage of devices managed via SDM: Approximate percentage of devices that are managed by SDM (% out of the total managed devices).
   i. Future growth: Approximate percentage of expected future device growth (% out of total managed devices).
3. Select that the computer platforms/speeds for which the sizer uses when it calculates resource requirements (that is, select the machines which you want to size for). Select at least one computer. Click NEXT.
4. Select devices to be managed (use the completed worksheets from Appendix A for reference). By clicking the 'Save New Entries' button, you stay in step 4, all your devices are entered into the database and you are able to enter more devices (useful if you have more than five different types of devices). Click NEXT. If you have devices with different interfaces, you can divide the quantity of the devices according to interfaces and then enter the devices number in the Quantity field. You can enter interfaces for these devices in Step 5.
5. Enter the 'number of interfaces' for network devices that have a variable number of interfaces.

   NOTE
   If none of the devices you selected in step 4 have variable interfaces, you might not be able to do anything in this step. Click NEXT.
6. This step allows you to go back to any of the five previous steps and change your input. Backtracking is only necessary if the input you entered was incorrect or incomplete.
   Click FINISH to save the sizing and get the output.
   Once the sizing is saved in our database, you can recall the sizing in the future. You also have the option at the top of the screen of E-mailing the completed sizing.

   NOTE

   You can run the perfcollector9 script and can review the <machinename>_SizerInfo.txt file for some of this data (if DX NetOps Spectrum is already installed and running). This task helps you to verify whether they are running over the recommended capacity.

Interpreting the Sizer Results

The finished sizing is a one-to-two page summary of your input data, configuration recommendations of the sizer computer (server), and any other important information you should be aware of while interpreting the results.

DX NetOps Spectrum

The areas of interest for the DX NetOps Spectrum Sizer are the ***SpectroSERVER Sizing*** , and ***Please Note*** sections. The other (top) sections are simply a summary of the data you entered into the sizer.

Following is a partial example of a completed DX NetOps Spectrum sizing (that is, simply the areas of interest are shown).

SpectroSERVER Sizing

# Systems	RAM (GB)	%Utilized	Platform	CPU	Speed (GHz)	OS	Other Info
1	4	10	Linux Intel	Xeon quadcore	3	Red Hat® Enterprise Linux® 6.x	32/64-bit (64-bit only for 10.x)

The *SpectroSERVER* chart is a listing of characteristics about the machines you chose to size for. Each line represents a different type of computer and how many are required to run DX NetOps Spectrum with the given network characteristics.

The following table explains each column of the chart.

Metric	*Description*
#Systems	The number of server machines that are required to meet data input characteristics.
RAM	The minimum amount of memory each server computer must possess. For example, for 10.x, SS starts at around 500MB and reaches 10GB in the peak load of 1 million models.
%Utilized	The amount of server utilization per computer during steady-state polling.
Platform	The server computer type.
CPU	The server computer CPU type.
Speed (MHz)	The server computer CPU speed.
OS	The server computer operating system.
Other Info	Any additional information specific to the server computer.

Please Note:

- This initial sizing is based on the raw SpectroSERVER capacity that is required to manage the network described by the information that is provided to CA Technologies by the client. Actual requirements might vary depending on network architecture and the business requirements of the client.
- **For NT systems** a striped disk configuration consisting of a minimum of two 10,000 RPM SCSI drives is required to achieve this level of performance.

The ***Please Note*** information is a summary of any additional information you are aware of when interpreting and conveying the sizer results.

NOTE

If the tool returns two or more SpectroSERVERs required based on the input of the user, then the actual recommendation would be to have three SpectroSERVERs. One of them is a dedicated MLS with limited modeling while the other two servers would be used to do the actual modeling/management.

Email Last Sizing

A great feature of the DX NetOps Spectrum Sizer tool is the ability to e-mail the results obtained. Once sizing is completed, there is a link at the top of the screen that allows you to e-mail the calculated results to yourself, the customer, or other colleagues for their concurrence. The e-mail option is also available with the recall feature (that is, a recalled sizing can be e-mailed).

> **NOTE**
> Our server sends e-mail in plain text so you can read the results on all E-mail platforms.

Appendix A: DX NetOps Spectrum Sizing Worksheet

Customer Name: _____

Your name: _____

Your e-mail address: _____

The version of SPECTRUM to be sized: _____

Router Information:

Tier	# Routers	# Interfaces per Router	Poll Interval (sec)
1			
2			
3			

Managed Devices:

Qty	Device Type	Poll Interval (sec)

Number of servers and end nodes (workstations) to be managed, i.e. Winwatch:_____

The desired poll rate for each managed end node (default is 600 seconds):_____

Installing and Upgrading

This section provides information about the prerequisites, system requirements, and the relevant procedures that you need to follow to install and upgrade DX NetOps Spectrum and all the related components.

Service Pack and Patch Install

DX NetOps Spectrum engineering is committed to providing high-quality enhancements and features with each service pack to delight its customers and add value to their experience. Each service pack includes all the maintenance updates published prior to this update. By installing the appropriate service pack, you ensure that your systems are up-to-date with the latest information.

NOTE

To install a patch on a service pack or an existing major release, see DX NetOps Spectrum Patch General Information.

Patch Version	Key Features	Certification Packs and Bi-Monthly Packs Changes Included
10.4.2	Currently, no BMPs are available for 10.4.2.	Not Applicable
10.4.1	Currently, no BMPs are available for 10.4.1.	Not Applicable
10.4	The **10.4.0_BMP_10.4.001** pack includes various fixes. See the Bi-Monthly Patches (BMPs) on 10.4 for more information on the defects and fixes in the pack.	10.4.0_BMP_10.4.001
10.3.2	The **10.3.2_BMP_10.3.201** pack includes various fixes. See the Bi-Monthly Patches (BMPs) on 10.3.2 for more information on the defects and fixes in the pack.	10.3.2_BMP_10.3.201
10.3.1	The 10.3.1_BMP_10.3.102 includes the 10.3.1_BMP_10.3.101 fixes and fixes for other defects. See the Bi-Monthly Patches (BMPs) on 10.3.1 for more information on the defects and fixes in the cert pack.	10.3.1_BMP_10.3.102 10.3.1_BMP_10.3.101

10.3.0	The **10.3.0_BMP_10.3.002** includes the **10.3.0_BMP_10.3.001** fixes and other defects. See the Bi-Monthly Patches (BMPs) on 10.3 for more information on the defects and fixes in the cert packs.	10.3.0_BMP_10.3.002 10.3.0_BMP_10.3.001
10.2.3	• Expanded fault management support for Cisco® Application Centric Infrastructure (Cisco ACI™) software-defined data center (SD DC) controller • Support for VMware vSphere® environments, which is a common layer in a Cisco ACI environment • Multi-tenancy for SDx environment for managing different customers or different sites • Expanded support for Juniper Networks® SRX and EX Series devices • Additional new capabilities 1. a. a. Direct integration with CA Digital Operational Intelligence for fault and inventory data analytics b. Enhanced gateway probe for DX NetOps Spectrum – CA UIM integration and improved integration with CA Systems Performance for Infrastructure Managers (formerly CA SystemEDGE) c. 13 new dashlets and 3 new dashboards in conjunction with CA Business Intelligence d. Web client enhancements e. New device certifications	Spectrum_10.02.03.Cert_Pack_001
10.2.2	• Unified Dashboards and Reporting for Infrastructure Management • Multi-Tenant support in DX NetOps Spectrum • Alarm Filter for DX NetOps Spectrum and CA UIM Bidirectional Integration • OneClick Quick Device Search Enhancements • WebClient Enhancements	Spectrum_10.02.02.BMP_10.2.201 Spectrum_10.02.02.Cert_Pack_001

10.2.1	• DX NetOps Spectrum and CA UIM Integration Enhancements • Additional Event mapping from CA UIM Probes to DX NetOps Spectrum • ESX Host Server Maintenance Mode enhancement • SNMP Profile synchronization • SSL communication between Spectrum Gateway (spectrumgtw) probe and DX NetOps Spectrum • Launch CA App Experience Analytics (AXA) Dashboard from WebClient • CA Spectrum10.2.1 Platform Updates • Network Configuration Manager (NCM) Enhancements	Spectrum_10.02.01.BMP_10.02.101 Spectrum_10.02.01.Cert_Pack_002 Spectrum_10.02.01.Cert_Pack_001a

For more information, see the respective link: 10.3 Solutions and Patches and 10.2 Solutions and Patches.

NOTE

It is not recommended to install any patch unless you have the problem the patch is meant to resolve, or you anticipate having the problem.

Prerequisites

NOTE
If you are on 9.2.x, upgrade to 9.3 (or later) to directly upgrade to 10.2 first, and then to the latest service pack release (such as 10.2.3). Installing a base version, such as 10.2.0, is mandatory before installing a service pack.

Install Service Pack

1. Sign in to the support.broadcom.com site.
2. Click Enterprise Software.
3. Click Product Downloads.
4. Enter the product name (for example, Spectrum) in the search bar and click the search icon.
5. Click the link that is displayed after the search is completed
6. Select the release and version to download.
7. After the download is done, follow the instructions given on the install page.

Post Install Tasks

NOTE

After upgrading to 10.2.3, you must install CABI 4.1 SP3 for generating reports. The 10.0 release is not compatible with earlier versions of CABI. CABI 4.1 SP3 is a fresh installation and it does not support upgrades from CABI 4.1 SP3.x. For more information, see Upgrade CABI section.

- 10.2.3 supports JasperReports Server for generating reports. For more information, see CABI JasperReports Server (Windows) and CABI JasperReports Server Integration with DX NetOps Spectrum.
- To see the CABI (BOXI), CABI (JasperReports Server) compatibility with 10.2 and earlier versions of DX NetOps Spectrum, refer Integration Compatibility.

General Patch Information

DX NetOps Spectrum PTF (Program Temporary Fix) and Debug patches should only be applied if customers are experiencing the problem they are meant to resolve or debug. Both PTF and Debug patches are built for specific releases, these are listed as prerequisites for installing. After each Symptom and Resolution, there are two reference numbers listed in parenthesis, the first is the original defect reported to Sustaining Engineering, the second is the original customer support case opened with DX NetOps Spectrum support. CA testing of PTF and Debug patches is limited to the original use case in which the patch was created. As such, PTF and Debug patches are built with consideration of code conflicts for the original customer they were built for.

> **NOTE**
>
> Customers needing PTF and/or Debug patches that were not specifically built for them, should open a new support case for the request.

How to Obtain

The new case must include a copy of the <$SPECROOT>/Install-Tools/.history file and state what operating systems the patches are needed for.

DX NetOps Spectrum Patch Best Practices

Although all PTF and Debug patches can be uninstalled, it is recommended that customers first make a backup copy of their DX NetOps Spectrum install area. This should include a recent save of the DX NetOps Spectrum modeling database.

How to install a Patch on DX NetOps Spectrum

This video describes the environment, best practices, and a step-by-step procedure to install a patch.

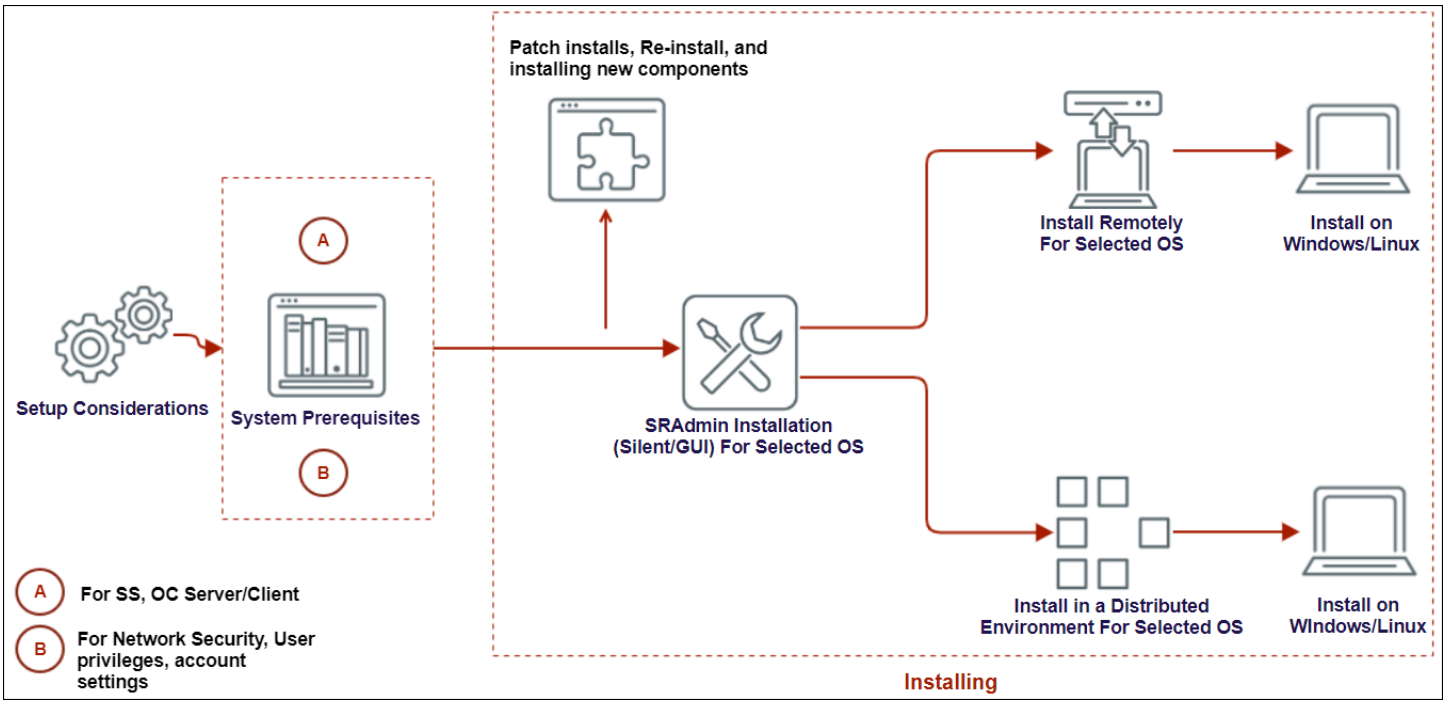
Fresh Install

Installing DX NetOps Spectrum for the first time?

Install the latest version of DX NetOps Spectrum to manage your underlying IT infrastructure effectively. Installing DX NetOps Spectrum with its various components, dramatically simplifies IT management by linking applications and services to the network for detailed traffic analysis, flows, and performance. This section provides you with a detailed step-by-step guide to install DX NetOps Spectrum.

Installation Process

The following diagram shows the overall process:



The tasks outlined in the diagram are as follows:

1. Review the system requirements and set up considerations to learn more about memory, processor speeds, and disk space.
2. Review the SpectroSERVER, OneClick Server and Client system requirements for Windows and Linux.
   Optional: To launch the OneClick Console and OneClick add-on applications, Install JRE for Windows and Linux.
3. Review the prerequisites page for the opted operating system such as Windows and Linux to set up the administrator privileges, user account controls, network, and security settings.
4. Install SRAdmin (through either GUI or silent mode on the selected operating system) to install DX NetOps Spectrum in a distributed environment or remotely before installing DX NetOps Spectrum on the select operating systems.
5. Install DX NetOps Spectrum on Windows and Linux.

Additional Information

- Files created during the installation
- Post-installation configurations
- Starting DX NetOps Spectrum OneClick web server, starting and launching the OneClick client.
- OneClick Web Server Upgrades and New OneClick Privileges

NOTE

Learn more about installing DX NetOps Spectrum Report Manager and Unified Dashboards and Reporting for Infrastructure Management.

System Requirements

WARNING
10.3 (or later) only supports 64-bit operating systems; it does not support 32-bit operating systems.

System Configurations

The configuration information in this section provides guidelines for running DX NetOps Spectrum at peak efficiency. You can achieve optimal system performance when all system resources are robust enough so that a single resource does not limit the other resources. System resources include memory, processor speeds, and disk space.

> **NOTE**
>
> Consult your support or sales representative for more help in determining the best configuration for your network.

You cannot define all configurations and system requirements for all users because of the following complexities and variables:

- Polling frequency
- Device types
- Number of devices in a network

> **WARNING**
> Installing OneClick on a single-CPU SpectroSERVER host system can degrade the performance of both SpectroSERVER and OneClick. To maximize the performance of both, we recommend that you install OneClick on a separate, dedicated computer. If you upgrade SpectroSERVER components, you might also need to upgrade OneClick.

System Support and Setup Considerations

Virtualization Environments

DX NetOps Spectrum supports the following virtualization environments for Windows and Linux

> **NOTE**
> For information about CA VMware guidelines, see Virtualization.

Rule of Localization Homogeneity

The *Rule of Localization Homogeneity* states that all components in a distributed DX NetOps Spectrum installation must run on servers that use the same operating system Locale. Think of DX NetOps Spectrum as one application running with one language, rather than as a set of distributed services potentially running different languages.

By following the *Rule of Localization Homogeneity*, you ensure that all access and modification of data through different communication paths use one consistent language. Otherwise, myriad languages can be stored in DX NetOps Spectrum database. The multiple languages cause problems with such data issues as display, fonts, searching, and sorting.

We recommend that you set the Locale on the servers that run DX NetOps Spectrum processes before you install DX NetOps Spectrum. Such servers include the Location server, Processd, SpectroSERVERs, OneClick servers, clients, and the Secure Domain Manager.

Disk Striping and RAID

For optimum performance, you can run DX NetOps Spectrum on systems with multiple, ultra-wide, 10,000 RPM, SCSI disk drives that use disk striping or RAID (redundant array of independent disks) technologies.

Disk striping is a technique of spreading data over multiple disk drives. RAID is a disk drive system that uses two or more drives in combination for fault tolerance and performance improvement.

Symantec PCAnywhere

Symantec pcAnywhere™ can cause Java to lock and prevent Java applications from launching. Java applications include OneClick Console, DX NetOps Spectrum Control Panel, Model Type Editor, and Performance View. The processes start, but the GUIs do not launch. If you stop PCAnywhere, Java-based applications launch and the GUIs display correctly.

To resolve this issue, install or upgrade to DirectX version 9.0 B, which is available at http://support.microsoft.com.

Alternatively, you can stop the PCAnywhere Host Service before installation. After you install DX NetOps Spectrum and OneClick, you can enable the PCAnywhere Host Service again.

Antivirus Software and Data Backup

DX NetOps Spectrum does not include antivirus software. We recommend installing your preferred antivirus software to protect your networking environment.

> **WARNING**
> To avoid database corruption, exclude DX NetOps Spectrum installation areas and DX NetOps Spectrum files from scans by any local or remote instances of antivirus software. DX NetOps Spectrum installation areas include OneClick and Report Manager installation areas.

Exclude all DX NetOps Spectrum installation areas, including OneClick and Report Manager installation areas, from scans by data backup programs.

Swap Space Recommendations

Windows

> **NOTE**
> DX NetOps Spectrum 10.4.2 has not been validated on Windows Server 2012. However, Broadcom will support any DX NetOps Spectrum product issues, if found. We reserve the right to have you upgrade to Windows Server 2016 (or later) if deemed necessary.

Amount of Installed RAM	Recommended swap space
16- 32 GB	16 GB

Red Hat Enterprise Linux

> **WARNING**
>
> From 10.2.2 and above, support for RHEL 5.x is discontinued. From 10.4.1, support for RHEL 6.x is discontinued.

Amount of installed RAM	Recommended swap space	Recommended swap space if allowing for hibernation
2GB - 8GB	The same amount of RAM	2 times the amount of RAM
8GB - 64GB	At least 4GB	1.5 times the amount of RAM

^ Disk Drives: For optimum performance, run DX NetOps Spectrum on systems with Multi-disk RAID configurations @ 10,000 RPM or greater.

SpectroSERVER and OneClick Requirements

> **WARNING**
> 10.0 and higher versions support only 64-bit operating systems. They do not support 32-bit operating systems.

SpectroSERVER and OneClick Servers

The following table lists the system configurations necessary for SpectroSERVER and OneClick.

NOTE
The following table assumes that each SpectroSERVER manages fewer than 4000 devices with an average of 100 ports on each device.

Component	**Platform**	**SpectroSERVER Only**	**OneClick Server Only**	**SpectroSERVER and OneClick Server**	**OneClick Server Only with Integrations Enabled** (for example, with DX CAPM, DX UIM, DX ServiceDesk, DX VNA and so on)
Memory (RAM) Actual requirements are dependent on the configuration and number of managed devices.	Windows and Linux	8 GB Minimum 32 GB Recommended	8 GB Minimum 16 GB Recommended	16 GB Minimum 32 GB Recommended	32 GB Minimum
Processor	Windows and Linux	Quad-core processor (Minimum Single Core)	2+ GHz dual processor	2.5+ GHz dual processor	2.5+ GHz dual processor
Disk^°	Windows and Linux	Serial Attached SCSI disks @ 10,000 RPM or greater	Serial Attached SCSI disks @ 10,000 RPM or greater	Serial Attached SCSI disks @ 10,000 RPM or greater	Serial Attached SCSI disks @ 10,000 RPM or greater

^ Disk Drives: For optimum performance, run DX NetOps Spectrum on systems with at least Serial Attached SCSI disks @ 10,000 RPM or greater.

WARNING

10.1 and higher versions do not support 32-bit Java clients.

NOTE

64-bit clients are required to take advantage of the increased capacity of 64-bit CA Spectrum 10.1. However, if the additional scale of 64-bit is not needed, and if required, the 32-bit Java client should perform adequately. As a general rule, the maximum heap size of 32-bit clients on Windows systems will range from 1.4 to 1.6 GB of memory.
If this is exceeded the client will **NO LONGER LAUNCH** until a 64-bit client is utilized.

For more information on memory requirements for OneClick web server, see Configure OneClick Web Server Memory Settings.

OneClick Considerations

OneClick consists of a web server-based component and a client-based component, each of which requires different software. The OneClick web server includes the following items:

- Apache Tomcat servlet engine
- MySQL database management system
- Java 2 Software Development Kit (SDK)

NOTE
DX NetOps Spectrum supports only the version of the JDK that ships with OneClick.

The OneClick client includes the following item:

- Java Runtime Environment (JRE) with Java Web Start.

If Microsoft Internet Explorer 10 or later version is installed on the OneClick clients, set the browser security level to medium-low to avoid security-related issues. Or, if the Internet Explorer 10 or later version security level is high, be sure to add the OneClick website to the list of Trusted Sites.

By default, the OneClick website is automatically run in Compatibility Mode if the OneClick web server is installed within an intranet. In Internet Explorer 10 or later versions, intranet sites run in Compatibility Mode by default. Run Internet Explorer in Compatibility Mode to support the DX NetOps Spectrum - CA Service Desk Manager integration and Spectrum Report Manager. For more information, consult the Microsoft website.

OneClick and Report Manager Considerations

If you are installing OneClick with Report Manager, see the Install Report Manager for installation information.

The following table lists the system configuration for OneClick with Report Manager running in the environment.

Component	Platform	OneClick with Report Manager
Memory (RAM)	Windows and Linux	8 GB Minimum 16 GB Recommended
Processor	Windows and Linux	2.5+ GHz dual processor
Disk°†	Windows and Linux	Serial Attached SCSI disks @ 10,000 RPM or greater

* We highly recommend a separate, dedicated system for Report Manager. So, install OneClick with Report Manager and use this OneClick instance only for SRM activities.

[a] Assumes that Report Manager is monitoring the SpectroSERVER (polling for event data and asset change data). Otherwise, 1536 MB is acceptable.

^ Or any comparable Intel x86 1.5 GHz or better processor.

° Disk Drives: For optimum performance, run DX NetOps Spectrum on systems with at least Serial Attached SCSI disks @ 10,000 RPM or greater.

OneClick and Service Manager Considerations

If you are installing OneClick with Service Manager, the following recommendations should be considered:

- Service Manager must be installed on the computer where the SpectroSERVER is installed *and* on the computer where OneClick is installed. The modeling catalog and all modeling intelligence exist within the SpectroSERVER database. The historical database and event handling code exist on the OneClick web server, which is installed with OneClick.
- We recommend that you also install Service Manager when you install Report Manager with OneClick. Installing these components together ensures that the Service and SLA Reporting tables are populated.

  NOTE
  For more information about Service Manager, see Service Manager.

Install JRE

The OneClick Console and OneClick add-on applications require Java Runtime Environment (JRE). JRE includes the Java Web Start client, which is required to run Java Network Launching Protocol (JNLP) applications like OneClick.

NOTE
You must perform the steps recommended in this topic on the DX NetOps Spectrum client side.

After you install JRE, you can start OneClick.

NOTE
10.4.2 supports AdoptOpenJDK JRE (8u242). You can, however, use your corporate license with Oracle to run the Oracle JRE and launch the DX NetOps Spectrum Web Start.

Prerequisites to Install JRE and Java Web Start

To run the OneClick Console on your Windows system, install JRE and Java Web Start. Confirm the following prerequisites before proceeding:

- You have the correct URL for the OneClick web server system.
- You can access the OneClick web server system using HTTP on a web browser.
- Your account allows you to log in to the OneClick web server.
- You have downloaded JRE from AdoptOpenJDK/licensed Oracle JRE, which supports Java Web Start.

Install AdoptOpenJDK JRE with Java Web Start on Windows

To run the OneClick Console on your Windows system, install the AdoptOpenJDK JRE and Java Web Start.
Follow these steps:

1. Log in to your Windows system.
2. Open the OneClick home page in a browser using the URL that your administrator provided. The URL has the following format: *http://hostname:portnumber/*

   NOTE
   Hostname is the name of the OneClick web server. Use portnumber only if the OneClick web server does not use the default port 80. If you cannot access the OneClick web server, notify your administrator.
3. Enter your OneClick login credentials, if prompted. The OneClick home page opens.
4. Navigate to the Install JRE page.
5. Download and launch the installer.
6. Read and accept the license.
7. On the Custom Setup screen, select the features that you want to install.
8. (Optional) Change the default installation directory.
9. Click the directory tree with (x) checkmark to select the following additional features.
   - Set JAVA_HOME variable
   - IcedTea-Web

   NOTE
   These features are installed on the local drive.
10. Click Next.
11. Click Install.
12. When the installation completes, click Finish to close the program.

Associate .jnlp Files with Java Web Start

The file that launches OneClick is a JNLP file. Verify that the .jnlp file extension is mapped to the javaws.exe application.

Follow these steps:

1. Open Windows Explorer.
2. Select Tools, Folder Options. The Folder Options dialog opens.
3. Select the File Types tab. A list of registered file types is displayed.

4. Scroll down and select JNLP. The bottom portion of the dialog displays Details for the ‘JNLP’ extension.
5. Verify that the details for the ‘JNLP’ extension box indicate the following information:
   – **For Windows 2000/2003:** The file opens with javaws.
   – **For Windows XP:** The file opens with Java Web Start Launcher.

   If JNLP files are not set as described, you can manually map the .jnlp extension to the javaws.exe application.
6. Select Change in the Details for ‘JNLP’ extension box. The Open With dialog opens.
7. Scroll down and select ‘javaws’ or ‘JavaTM Web Start Launcher’ and select OK.
8. Select OK in Folder Options.
9. Exit Windows Explorer. The .jnlp file extension is now mapped to the Java Web Start application and can launch the OneClick Console.

Install JRE and Java Web Start on Linux

To run the OneClick Console on your Linux system, install JRE and Java Web Start. On Linux platforms, Oracle no longer provides self-extracting installers. Instead, they provide a tarball that contains the JRE binaries, but does not set any environment variables. To run the OneClick client on Linux, you can download the JRE from the OneClick web page and can associate the .jnlp file type with the Java Web Start application, javaws, using the Mozilla Firefox web browser.

Follow these steps:

1. Log in to your Linux system.
2. Open the OneClick home page in a web browser by using the URL that your administrator provided. The URL has the following format: *http://<hostname>:<portnumber>/*

   NOTE
   <*hostname*> is the name of the OneClick web server. Use <portnumber> only if the OneClick web server does not use the default of port 8080. If you cannot access the OneClick web server, notify your administrator.
3. Enter your OneClick login credentials, if prompted. The OneClick home page opens.
4. Download the JRE (tar.gz) from the OneClick Administration page and save the tar.gz file.
5. Open a terminal session (bash shell or kshell) and execute the following command to extract the binaries:

   ```
   tar -zxvf file_name
   ```
6. After extraction, execute the following commands to set the environment variables:

   ```
   export JAVA_HOME=Path_of_Extracted_Folderexport PATH=$PATH:$JAVA_HOME/bin
   ```

   where “Path_of_Extracted_Folders” corresponds to the location of the binaries after you have extracted them.
7. Associate the .jnlp file type with the Java Web Start application for the OneClick Console to launch:
   a. Select Start Console in Firefox.
   b. Select Open with and select javaws, in the JRE directory (<*JRE*>/bin/javaws).
   c. Select OK.

   The .jnlp file type is now associated with Java Web Start.

Launch 32- or 64-Bit Java Console when Both 32- and 64-Bit Java are Installed on a Client Machine

If you want to force 64-bit or 32-bit OC client, replace <resources> tag with one that specifies an architecture - "amd64" for x64 and "x86" for x32, see the following examples.

You can copy oneclick.jnlp to oneclick32.jnlp or oneclick64.jnlp, and can customize platform and memory, and then new launch points are added automatically to the OC admin page.

NOTE

For arch specifiers to work properly, you must exactly match the JRE version or ensure the "Allow new versions" checkbox is checked in the supported JRE version configuration.

Modify the following values in the oneclick.jnlp file:

- For 32-bit - oneclick32.jnlp:

<resources arch="x86"> for x32

<j2se version="1.8.0_112" href="http://java.sun.com/products/autodl/j2se"
initial-heap-size="96m" max-heap-size="**512m**"/>

- For 64-bit - oneclick64.jnlp:

<resources arch="amd64"> for x64

<j2se version="1.8.0_112" href="http://java.sun.com/products/autodl/j2se"
Initial-heap-size="96m" max-heap-size="**1024m**"/>

Follow these steps:

1. Navigate to: *$SPECROOT/tomcat/webapps/spectrum/oneclick.jnlp*
2. Copy the oneclick.jnlp to oneclick32.jnlp or oneclick64.jnlp in the same location.
3. Navigate to the DX NetOps Spectrum OneClick Web Server home page to launch the OneClick console.
4. Do one of the followings:

- Select x32 to launch a 32-bit OneClick client
- Select x64 to launch a 64-bit OneClick client

System Requirements for Linux

Linux System Requirements

The following table summarizes DX NetOps Spectrum support for Linux operating systems:

System Requirement/ DX NetOps Spectrum Component	OneClick Client	OneCLICK SERVER	SpectroSERVER
Operating System	Red Hat Enterprise Linux 8.0 and 8.1 (64-bit) Red Hat Enterprise Linux 7.x (64-bit) X-based desktop environment (such as KDE or GNOME)	Red Hat Enterprise Linux 8.0 and 8.1 (64-bit) Red Hat Enterprise Linux 7.x (64-bit)	Red Hat Enterprise Linux 8.0 and 8.1 (64-bit) Red Hat Enterprise Linux 7.x (64-bit)
Memory (RAM) [1]	Dependent on the configuration and number of managed devices	Dependent on the configuration and number of managed devices	Dependent on the configuration and number of managed devices
Processor	Dependent on the configuration and number of managed devices	Dependent on the configuration and number of managed devices	Dependent on the configuration and number of managed devices
Disk Space Dependent on the configuration and number of managed devices	Dependent on the configuration and number of managed devices	HDD:100 GB (Minimum 50 GB).	HDD:100 GB (Minimum 50 GB).
Graphical User Interface	X11 system that the JRE supports	Motif	Motif
Java Components	AdoptOpenJDK JRE (8u242)	AdoptOpenJDK JRE (8u242)	AdoptOpenJDK JRE (8u242)
Web Browser	Firefox 10.0 or later	Firefox 10.0 or later	Firefox 10.0 or later

System Requirement/ DX NetOps Spectrum Component	OneClick Client	OneCLICK SERVER	SpectroSERVER
Video System	A video card that supports 32-bit color at 1024x768 pixel resolution and a 20" monitor or larger.	A video card that supports 32-bit color at 1024x768 pixel resolution and a 20" monitor or larger.	A video card that supports 32-bit color at 1024x768 pixel resolution and a 20" monitor or larger.
PDF Document Viewer	Acrobat Reader X or later	None	None
Packages	See "Required Packages" below.	See "Required Packages" below.	See "Required Packages" below.

NOTE

1. See Swap Space Recommendations.
2. From 10.2.2 and above, support for RHEL 5.x is discontinued. From 10.4.1, support for RHEL 6.x is discontinued.
3. 10.3 (or later) Report Manager uses CABI r6.4.x as the report delivery engine.
4. For information about the platforms that CA Business Intelligence JasperReports® Server - 6.4.x supports, see System Requirements.
5. Do not set your foreground font color to white. If this font color is set to white, you cannot read the text on your screen during the installation.
6. Install Perl 5.26.2, if not available.
7. For more information on memory requirements for OneClick web server, see Configure OneClick Web Server Memory Settings.

Required Packages

Install the following RPMs and its dependencies, for the respective RHEL version:

NOTE
For purposes of identification, 32-bit RPMs for Red Hat Enterprise Linux contain "i386" or "i686". The 64-bit RPMs contain "x86_64".

Package	64-bits	32-bits	noarch
abrt	x		
elfutils-libelf	x		
expat	x	x	
fontconfig	x	x	
freetype	x	x	
glibc	x	x	
ksh	x		
libaio	x		
libcanberra-gtk2	x		
libgcc	x	x

NOTE

1. Required only for OneClick WebApp. See, Steps to Run OneClick WebApp on Linux.

SpectroSERVER Server Minimum Requirements for Virtual Machine

You can allocate dedicated memory (RAM) to your Virtual Machine by enabling the **Reserve all guest memory (All locked)** option. By allocating dedicated memory, you ensure that your VM's memory is not shared with other VMs on the same ESX.

For more information on other VMware configuration, see Virtualization.

System Requirements for Windows

Windows System Requirements

The following table summarizes DX NetOps Spectrum support for Microsoft Windows operating systems.

System Requirement/ DX NetOps Spectrum Component	OneClick Client	OneClick Server	SpectroSERVER
Operating System	Windows 8.1 Windows 10 Pro (64-bit) Windows Server 2016 Windows Server 2019	Windows Server 2016 Windows Server 2019	Windows Server 2016 Windows Server 2019
Memory (RAM) Dependent on the configuration and number of managed devices	8 GB (Minimum 4 GB)	8 GB	16 GB (Minimum 8 GB)
Processor	Dependent on the configuration and number of managed devices.	Dual-core processor	Quad-core processor (Minimum Single Core)
Disk Space Dependent on the configuration and number of managed devices	Dependent on the configuration and number of managed devices	50 GB	100 GB (Minimum 50 GB)
Java Components	AdoptOpenJDK JRE (8u242) Java 8 with x64 JRE is mandatory	AdoptOpenJDK JRE (8u242)	AdoptOpenJDK JRE (8u242)
Web Browser	• Firefox 10.0 or later (verified version - Firefox 39.0) • Internet Explorer 8.0 or later (verified version - 11.0) Internet Explorer 10 and later versions entail some special requirements. For more information, see OneClick Considerations. • In Windows 10, only IE 11 is supported and the default browser EDGE is not supported for OneClick Client[5]	Firefox 10.0 or later	Firefox 10.0 or later

System Requirement/ DX NetOps Spectrum Component	OneClick Client	OneClick Server	SpectroSERVER
Video System	A video card that supports 32-bit color at 1024x768 pixel resolution and a 20" monitor or larger.	Same	Same
PDF Document Viewer	Acrobat Reader X or later	Same	Same

NOTE

1. DX NetOps Spectrum 10.4.2 has not been validated on Windows Server 2012. However, Broadcom will support any DX NetOps Spectrum product issues, if found. We reserve the right to have you upgrade to Windows Server 2016 (or later) if deemed necessary.
2. 10.3 (or later) Report Manager uses CABI r6.4.x as the report delivery engine.
3. For information about the platforms that CA Business Intelligence JasperReports® Server - 6.4.x supports, see System Requirements.
4. For more information on memory requirements for OneClick web server, see Configure OneClick Web Server Memory Settings.
5. Microsoft EDGE is supported from DX NetOps Spectrum 10.4.2.2 release.

SpectroSERVER Server Minimum Requirements for Virtual Machine

You can allocate dedicated memory (RAM) to your Virtual Machine by enabling the **Reserve all guest memory (All locked)** option. By allocating dedicated memory, you ensure that your VM's memory is not shared with other VMs on the same ESX.

For more information on other VMware configuration, see Virtualization.

Prerequisites

Before beginning with the DX NetOps Spectrum the installation process, we recommend that you consider the following:

- Prerequisites for Windows
- Prerequisites for Linux

WARNING
10.4 (or later) supports 64-bit operating systems; it does not support 32-bit operating systems.

IMPORTANT
You must first install 10.4.2 as the base version to install DX NetOps Spectrum 10.4.2.1 or 10.4.2.2 release.

Prerequisites for Windows

NOTE

Ensure that you meet the following prerequisites before you install DX NetOps Spectrum on a Windows system.

Administrator Privileges

To install DX NetOps Spectrum, log in as Administrator or as a user with administrator privileges.

NOTE
If you plan to install DX NetOps Spectrum as a user other than Administrator, turn off User Account Control (UAC).

DX NetOps Spectrum installation software requires administrator privileges to evaluate available resources and to run custom installation scripts. An initial installation generates residual files with administrator ownership. Subsequent upgrade installations also require administrator privileges.

User Account Control (UAC)

To install DX NetOps Spectrum as a user other than Administrator, User Account Control (UAC) must be turned off. UAC is a Windows security component that prompts you for permission when a task requires administrator privileges.

During DX NetOps Spectrum installation, the installation user is elevated to an administrator in DX NetOps Spectrum Remote Administration (SRAdmin). UAC would then need to prompt the user for permission, which is not possible because SRAdmin is a non-interactive service. Disabling UAC allows the installation to run continuously.

> **NOTE**
> Disabling UAC is required for DX NetOps Spectrum installation as a user other than the Administrator only. After installation and during normal DX NetOps Spectrum operation, UAC can be enabled.

How to Disable UAC on Windows Server 2016 (or Later)

To install DX NetOps Spectrum as a user other than Administrator, UAC must be turned off. The following procedure describes how to disable UAC:

> **WARNING**
> DX NetOps Spectrum 10.4.2 has not been validated on Windows Server 2012. However, Broadcom will support anyDX NetOps Spectrum product issues, if found. We reserve the right to have you upgrade to Windows Server 2016 (or later) if deemed necessary.

Follow these steps:

1. From the Start menu, select Control Panel, User Accounts.
2. Click "Change User Account Control settings".
3. Move the slider down to the bottom line, Never notify, and click OK.
4. Disable UAC in Local Security Policy. UAC is now disabled.

How to Disable UAC in Local Security Policy on Windows Server:

In addition to the UAC setting, a Local Security Policy option for UAC must also be disabled, as described in the following procedure.

Follow these steps:

1. In a Run dialog, enter secpol.msc and click OK.
2. In the Local Security Policy window, select the Security Settings, Local Policies, Security Options folder.
3. Right-click the "User Account Control: Run all administrators in Admin Approval Mode" policy, and select Properties.
4. Select Disabled, and click OK.
   The necessary Local Security Policy option for turning off UAC has been disabled.

Fixed IP Address on Windows

Ensure that the system on which you want to install DX NetOps Spectrum has a fixed IP address. You can enable DHCP on the system when the DHCP server issues a static address that never changes.

Emergency Repair Disks

We recommend that you create an emergency repair disk (ERD) before installing DX NetOps Spectrum, because the installation can corrupt files. You can use the ERD to restore Windows configuration files. We recommend that you also create an ERD after successfully installing DX NetOps Spectrum.

NOTE
Windows Help files contain detailed instructions on creating an ERD.

Network and Security Settings

To use email for applications (such as DX NetOps Spectrum Enterprise Alarm Manager), configure the user profile that is logged in and running DX NetOps Spectrum to send email using the supported service provider.

Set security as required for the directory where you install DX NetOps Spectrum. If you set the security before installation, DX NetOps Spectrum preserves the changes to the directory hierarchy security.

NOTE
Restart your system after you make changes.

User Audit

If the user auditing feature is enabled on Windows, every action is audited, resulting in many entries in the Windows Event Log. We recommend that you disable the Windows user auditing feature because it slows DX NetOps Spectrum system performance.

Convert the File System to NTFS

We recommend that you install DX NetOps Spectrum in an NTFS file system partition. If your disk drive is formatted as a FAT partition, convert the Windows file system to NTFS.

Follow these steps:

1. Run the CONVERT utility at the command prompt as per the following syntax:
   ```
   CONVERT C: /FS:NTFS
   ```
   NOTE
   You can run the conversion utility without damaging or deleting existing data. If the hard drive is already converted, a message appears. You can get more help on the convert command by typing '"help convert" in your command-line interface.
2. Restart your system for the reformatting to take effect. The file system is converted.

Prerequisites for Linux

Ensure that you meet the following prerequisites before you install DX NetOps Spectrum on a Linux system.

Root Privileges

DX NetOps Spectrum and DX NetOps Spectrum Remote Administration (SRAdmin) Daemon installations require root privileges to evaluate available resources and run custom installation scripts. Installing under the root ensures root privileges for the setuid executable, which lets the SpectroSERVER connect to SNMP ports. Because an initial installation generates residual files with root ownership, subsequent upgrade installations also require root privileges.

Fixed IP Address

Ensure that the system on which you plan to install DX NetOps Spectrum has a fixed IP address. You can enable DHCP on the system when the DHCP server issues a static address that never changes.

NOTE
DX NetOps Spectrum should only be installed on a static IP address that is from the Network Interface Card and cannot be installed on a sub-interface.

Hosts File

Ensure that the /etc/hosts file has the following format:

```
127.0.0.1 localhost localhost.localdomain
<external IP> <external names>
```

- ***external IP***
  Is the static DNS IP of the host.
- ***external names***
  Are the DNS short names.

Make sure that the first line has the local host after the loop-back address. The loop-back line must have localhost as the official host name.

You can add nicknames after the local host. For example:

```
127.0.0.1 localhost localhost.localdomain
```

The following example is incorrect and would cause host resolution and security problems with DX NetOps Spectrum:

```
127.0.0.1 <external name> localhost localhost.localdomain
```

NFS-Mounted File Systems

For DX NetOps Spectrum install directories that are an NFS-mounted file system, we recommend that you set the NFS mount options to ‘hard’ and ‘nointr’. These settings help ensure database consistency.

However, as there are many possible problems with such a setup, including severe performance impacts, we recommend that you avoid NFS mounts, if possible.

If you *do* use the 'hard' and 'nointr' NFS mount options, take extra care to obtain good database backups.

We do not recommend the 'soft' option at any time.

SE Linux Configuration with RHEL

You can install this release of DX NetOps Spectrum on SE Linux in the Enforcing mode with 6.x. By default, with RHEL 7.x, SE Linux is set up in the Enforcing mode.

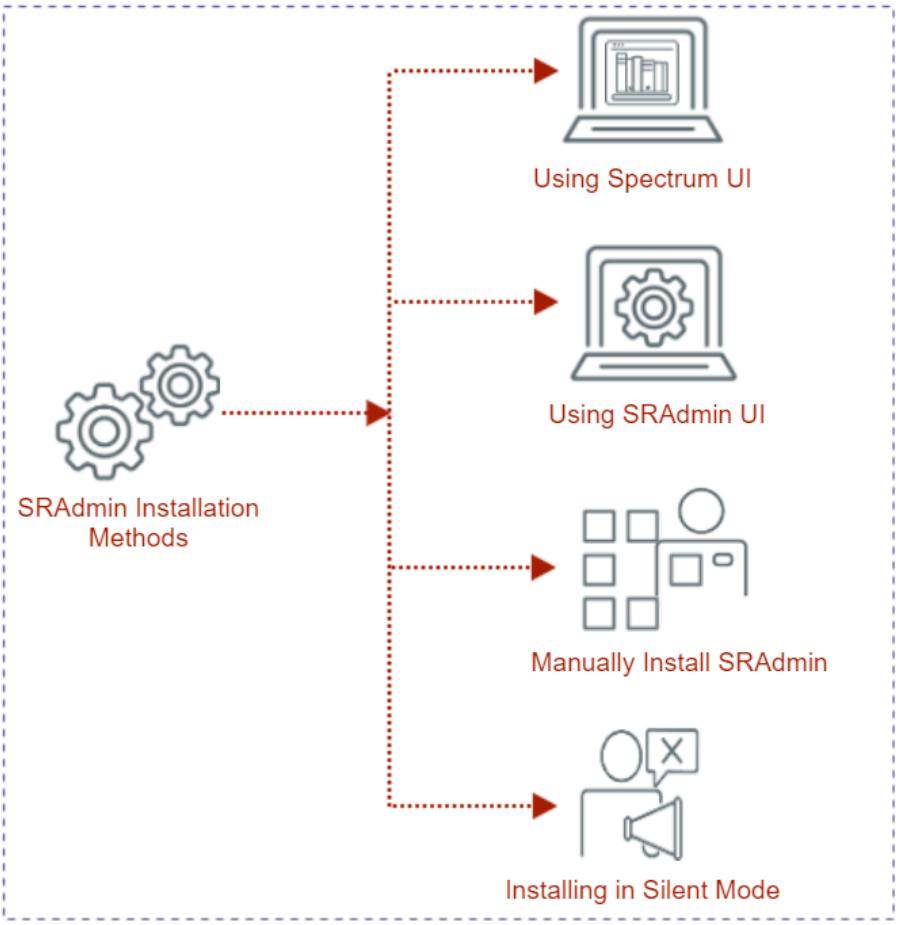
You can change to the permissive mode by editing the following file: /etc/selinux/config

The line that can be adjusted is SELINUX=permissive.

SRAdmin Installation Methods

Installation Methods

The following diagram shows the SRAdmin installation methods at a high level:



As outlined in the diagram, you can install SRAdmin through the following methods:

- DX NetOps Spectrum GUI
  If you install DX NetOps Spectrum on a local computer from the DX NetOps Spectrum GUI, SRAdmin can be installed during the installation process. You cannot install SRAdmin from the DX NetOps Spectrum GUI when you install remotely. If you are using the DX NetOps Spectrum GUI locally to upgrade from a release earlier than 9.0, SRAdmin cannot be automatically upgraded on the local machine. Instead, you have the option to install it.
- SRAdmin GUI
  Install SRAdmin from the SRAdmin GUI when you want to perform a remote installation or a distributed installation of DX NetOps Spectrum. You can also install SRAdmin from the SRAdmin GUI as an alternative to using the DX NetOps Spectrum GUI installation to perform a local DX NetOps Spectrum installation.
- Manually install SRAdmin on Linux and Windows platforms

  NOTE
  As an alternative to the GUI install options, install SRAdmin manually.
- Install SRAdmin in silent mode on Linux and Windows platforms

  NOTE
  As an alternative to the GUI and manual install options, install SRAdmin in silent mode.

Install SRAdmin Daemon

Install SRAdmin from the SRAdmin GUI when you want to perform a remote installation or a local distributed installation of DX NetOps Spectrum. You can also install SRAdmin from the SRAdmin GUI as an alternative to using the DX NetOps Spectrum GUI installation to perform a local DX NetOps Spectrum installation.

> **NOTE**
> If you are upgrading DX NetOps Spectrum from a post 9.0 release, you do not need to install SRAdmin. SRAdmin is automatically upgraded.

Follow these steps:

1. Ensure that you have met the installation prerequisites for Linux, or Windows.
2. Ensure that you are logged in as root when installing on Linux (unless you are using a sudoers file for root permissions). Ensure that you are logged in as a user with Administrator rights if you are installing on Windows.
3. Insert the installation media into the appropriate drive.
   The Install dialog appears.
4. Click Install DX NetOps Spectrum Remote Administration.
   The License Agreement dialog appears.
5. Scroll through and read the license agreement, accept the agreement, and click Next.
   The Destination Location dialog appears with the default directory.
6. Click Next if you want to install in the default location or click Choose and select a different directory and then click Next.

   > **NOTE**
   > The default directory for Windows is C:/Program Files/SRAdmin. The default directory for Linux is /sw/SPECTRUM/SRAdmin.

   A dialog appears with a progress bar.

   > **NOTE**
   > On Linux platforms, the following warning could appear before the installer launches, if you launch the installer from a shell. This warning does not cause any problems with your installation and can be disregarded:

   ```
   awk: cmd. line:6: warning: escape sequence `\.' treated as plain `.'
   ```

   The Installation Complete dialog appears once the installation is complete.
7. Click Done to exit.
   SRAdmin Daemon is installed.

Manually Install SRAdmin Daemon on Windows

You can manually install SRAdmin as an alternative to installing SRAdmin from the DX NetOps Spectrum GUI or the SRAdmin GUI.

> **NOTE**
> Run the visual studio runtime installation before you net start sradmin on Windows. From the command prompt, go to <*spectrum cd directory*>/nt/nttools/VS2012 and run vcredist_x86.exe.

Follow these steps:

1. Ensure that you have met the installation prerequisites.
2. Insert the DX NetOps Spectrum installation media into the appropriate drive.
3. Log in as Administrator or a user with administrator privileges.

   > **NOTE**
   > If you are running the Cygwin32 bash shell, exit it.
4. Open the command prompt and shift to the Program Files directory.

5. Create the SRAdmin directory by entering:
   ```
   mkdir SRAdmin
   ```
6. Run cd SRAdmin.
7. Copy the DX NetOps Spectrum Remote Administration Daemon from the installation media to the SRAdmin directory by entering:
   ```
   copy <installation_media drive>\sdic\windows\sradmin.exe
   ```
8. Install the DX NetOps Spectrum Remote Administration Daemon by entering:
   ```
   sradmin.exe --install
   ```
9. Start the DX NetOps Spectrum Remote Administration Daemon by entering:
   ```
   sradmin.exe --start
   ```
   SRAdmin Daemon is installed.

Manually Install SRAdmin Daemon on Linux

You can manually install SRAdmin as an alternative to installing SRAdmin from the DX NetOps Spectrum GUI or the SRAdmin GUI.

Follow these steps:

1. Ensure that you have met the installation prerequisites.
2. Insert the installation media into the appropriate drive.
3. Log in as root and create the SRAdmin directory path by entering:
   ```
   mkdir -p /sw/SPECTRUM/SRAdmin
   ```
   This directory path is stored in the S99sradmin file in the /etc/rc2.d/ directory.
4. Copy the SRAdmin Daemon to the SRAdmin directory by entering:
   ```
   cp <installation_media drive>/sdic/linux/sradmin.exe /sw/SPECTRUM/SRAdmin
   ```
5. Copy sradmin.rc2 to the initialization directory by entering:
   In 10.4.2, run the follwoing command:
   ```
   cp <installation_media drive>/sdic/linux/sradmin.rc2 /etc/init.d/sradmin
   ```
   In 10.4.2.1, run the follwoing command:
   ```
   cp <installation_media drive>/sdic/linux/sradmin.rc2 /etc/systemd/system/sradmin.service
   ```
6. Change the file permissions by entering:
   In 10.4.2, run the follwoing command:
   ```
   chmod 500 /etc/init.d/sradmin
   ```
   In 10.4.2.1, run the follwoing command:
   ```
   chmod 500 /etc/systemd/system/sradmin.service
   ```
7. Run the following command:
   ```
   /sbin/chkconfig --add sradmin.service
   ```
8. Start the DX NetOps Spectrum Remote Administration Daemon by entering:
   In 10.4.2
   ```
   /etc/init.d/sradmin start
   ```
   In 10.4.2.1
   ```
   systemctl start sradmin
   ```
   SRAdmin Daemon is installed.

Install SRAdmin Daemon in Silent Mode on Windows

As an alternative, you can install SRAdmin Daemon on Windows using silent mode.

NOTE
By default, a silent installation of SRAdmin Daemon is installed into the /sw/SPECTRUM/SRAdmin/directory. To install SRAdmin Daemon into another directory, run the following command before completing the silent installation procedure:

```
srainstall.bin -f <properties file>
```

NOTE
The properties file now contains the following text:

```
INSTALLER_UI=silent
USER_INSTALL_DIR=/sradmin
```

Follow these steps:

1. Ensure that you have met the installation prerequisites.
2. Insert the installation media into the appropriate drive.
3. Log in as Administrator or as a user with administrator privileges.
4. Open the command prompt and go to the appropriate drive.
5. Run the following command:
   ```
   sdic\nt\ srainstall.exe -i silent
   ```
   SRAdmin Daemon is silently installed.

Install SRAdmin Daemon in Silent Mode on Linux

As an alternative, you can install SRAdmin Daemon on Linux using silent mode.

NOTE
By default, a silent installation of SRAdmin Daemon is installed into the /sw/SPECTRUM/SRAdmin/directory. To install SRAdmin Daemon into another directory, run the following command before performing the following procedure:

```
srainstall.bin -f <properties file>
```

NOTE
The properties file now contains the following text:

```
INSTALLER_UI=silent
USER_INSTALL_DIR=/sradmin
```

Follow these steps:

1. Ensure that you have met the installation prerequisites.
2. Insert the installation media into the appropriate drive.
3. Log in as root and navigate to the following directory path:
   ```
   <installation_media drive>/sdic/linux
   ```
4. Run the following command:
   ```
   srainstall.bin -i silent
   ```

   NOTE
   On Linux platforms, the following warning can appear before the installer launches. This warning does not cause problems with your installation and can be disregarded:

   ```
   awk: cmd. line:6: warning: escape sequence `\.' treated as plain `.'
   ```

   SRAdmin Daemon is silently installed.

Install DX NetOps Spectrum in Silent Mode

Create the Host Installation Information File

The Distributed Installer (distinst.exe) uses the information in the Host Installation Information (HII) file to complete the distributed installation.

Follow these steps:

1. Create a text file using a text editor, for host installation information. Alternatively, you can use the hostargs.<*time*> file located in the <*$SPECROOT*>Install-Tools/LOGS/<*version_date*> directory as a starting point.

   NOTE
   The hostargs.<*time*> file does not exist for a new installation.
2. Enter the HII file parameters for each computer on which you plan to install DX NetOps Spectrum.
3. Save the file with a valid filename in a directory, for example, tmp. As long as it is valid, the HII filename is not important.

   NOTE
   You need this file name when you run the distributed installation client.
4. Exit the text editor.
   The HII file is created.

HII File Parameters

The following table describes the parameters in the Host Installation Information File:

Parameter	Description
remote_host=<*remote host to install on*>	The hostname of the target system for the installation. **Note:** Do not enter an IP address OR localhost in place of a hostname.
l_handle=<*landscape handle*>	The landscape handle of the remote system. Required only for SpectroSERVER installations.
install_dir=<*path*>	The directory where DX NetOps Spectrum is installed. For example, /usr/Spectrum or C:/win32app/Spectrum.
install_owner=<*username*>	The owner of the installation.
main_loc_serv=<*location server*>	The hostname of the Main Location Server (required for all-non patch installations). You can only specify a remote hostname if you are installing a SpectroSERVER. **Note:** Do not enter an IP address in place of a hostname.
vcd_path=<*vcd path*>	The path of the installation information. For example, if the installation files are in the local directory, /tmp/SpectrumInstallMedia, enter vcd_path=/tmp/SpectrumInstallMedia
ss_install=yes|no	(Optional) **Default** = Yes for a new installation. Select No if you do not want to install the SpectroSERVER on the remote computer. For first-time installations only.
huge_landscape_handle =yes|no	**Default** = No; "yes" for huge landscape handle type ; "no" for legacy landscape handle type Considered if ss_install=yes; For first-time installations only. For more information, see Landscape Handles.
oc_install=yes|no	(Optional) **Default** = No. Select No if you do not want to install OneClick on the remote computer. For first-time installations only.

xtn_install=yes|no	(Optional) **Default** = Yes for a new installation. Select No if you do not want to install components marked as XTN. For first-time installations only. **Note:** If you set the ss_install parameter to Yes, set the xtn_install parameter to Yes. Do not set xtn_install to Yes when the components marked as XTN are not installed with either OneClick or the SpectroSERVER.
install_type=full|minimal	**Default** = Full. Full indicates standard installation type (all DX NetOps Spectrum components). Select minimal for Remote Operations Server. Required for new installations only.
patch=yes|no	(Optional) **Default** = No. Select Yes for patch installations. **Note:** This parameter is applicable only when upgrading to Service Pack/Hot Fix releases on top of a base release version (for e.g. upgrading to 10.2.1 from 10.2), and does not apply to PTF (Patch Temporary Fix) files or in migration scenarios (for e.g. Migrating from 9.x to 10.x).
same=yes|no	(Optional) **Default** = No. Select Yes to re-install files that have the same version as the presently installed version.
overwrite=yes|no	(Optional) **Default** = No. Select Yes to overwrite all files when selecting same=yes and to avoid the process of comparing installed files with the files to be installed. Files are not preserved.
locale=<*value*>	(Upgrades and Migrations only) Specifies the language to install (evformat/ pcause/eventtables). Do not use this parameter when you are upgrading from 9.3 or 9.3 H01. **Values**: en_US = English; ja_JP = Japanese; zh_CN = Simplified Chinese; zh_TW = Traditional Chinese.
exclude_parts=<*PART-NUMBE*R>; <*PART-NUMBER*>	Excludes components from installation. This list is saved for future upgrades/ patches. For example: exclude_parts=SA-RPT-MGR excludes DX NetOps Spectrum Report Manager from a OneClick distributed installation. exclude_parts=SA-CFMGR;SA-SPM excludes NCM and SPM from a OneClick distributed installation.
ignore_disk_space=yes|no	(Optional) **Default** = No. Select Yes if you want to install, regardless of the disk space warnings.
remove_vnmdb_lock=yes|no	**Default** = No. Removes the vnmdb lock file if one exists. Enter Yes only if SpectroSERVER is not running.
srm_source_host=<*hostname*>	(Optional) Report Manager option (default = no migration). The MySQL hostname needed to obtain the DX NetOps Spectrum Report Manager database.
	(Optional) Report Manager option (default = no migration). The MySQL password is required for the DX NetOps Spectrum Report Manager database.
srm_ss_servers=<*server lists*> (separated by ";")	(Optional) Report Manager option (default = Main Location Server). The SpectroSERVERs from which Report Manager gathers information.
tomcat_port=xxxxxx	The port number for Apache Tomcat. **Default**: 80 for Windows; 8080 for Linux.
tomcat_root=<*tomcat root directory*>	An existing Apache Tomcat directory. The default is the OneClick install directory.

server_username=<*user name*>	(Optional) Used by the Process Daemon (processd) server on Windows only. For a Windows domain, the syntax is <*domain*>\<*username*>. Default = SRAdmin username.
server_password=<*password*>	(Optional) Used by the processd server on Windows only. Default = SRAdmin password.

Creating the Password File

A password file contains accounts and passwords for remote computers. You can create a password file on Linux, and Windows. You add one entry per host to this file. Each line contains:

- host name
- root/administrator account name
- root/administrator account password

You can use a pound (#) or a backslash (\) in the password file. Insert a backslash before the characters of the password or DX NetOps Spectrum interprets them as a comment line.

For example, if your password is test#computer, enter it in the password file as test\#computer. If your password is test \computer, enter it in the password file as test\\computer.

NOTE
You can use a sudoers file to provide users with limited root permissions for remote clients. Root permissions apply only to the commands required to install DX NetOps Spectrum. This option is available for Linux operating systems.

Create a Password File

You can omit a root/administrator password in the password file and only enter a host name and user name. In this case, the DX NetOps Spectrum distributed installation client prompts you to enter a password at the command line.

After you enter a password, the installer asks if you want to use this same password for all entries. If you answer “No," you are prompted for a password each time a host in the password file does not have a password entry.

Follow these steps:

1. Create a password file using a text editor.
2. For each system in which you plan to install DX NetOps Spectrum, add an entry with the host name, account name, and password. Enter this information in the following order:
   – On Linux:
   ```
   <host name> <root account name> <root password>
   ```
   – On Windows:
   ```
   <host name> <administrator account name> <administrator password>
   ```
   NOTE
   The <*root password*> and the <*administrator password*> are optional.
3. Save the file with a valid file name in a directory. If the password file name is valid, it is not important.

   NOTE
   Use this file name for running the distributed installation client.
4. Exit the text editor.
   The password file is created.

Grant Limited Root Permissions (Linux)

Sudo (super user do) is a third-party application. Using this application, a system administrator can let users run certain commands as root or as another user. DX NetOps Spectrum is compatible with the sudoers file (which the Sudo

application uses). Specifically, you can use the sudoers files to grant users root permissions that are needed for running the DX NetOps Spectrum installation on remote systems. This file eliminates the need for the installation program to have full root permissions on all of the remote systems where DX NetOps Spectrum is installed.

> **NOTE**
> DX NetOps Spectrum does not use the actual Sudo application to change user permissions. Instead, it parses the applicable information in the sudoers file to provide installation permissions to the specified user. For information about the Sudo application, see http://www.courtesan.com/sudo/.

SRAdmin Daemon must be installed on all the computers where you plan to install DX NetOps Spectrum. You also need a sudoers file on all the computers where you plan to install DX NetOps Spectrum.

Execute the following steps on each remote computer where you are installing DX NetOps Spectrum.

Follow these steps:

1. Add the following entry to the sudoers file. This entry provides the specified user permission to run the sradmin.exe program as root:
   ```
   <username> <client_host> = <path_to_sraadmin>/sradmin.exe
   ```
   - ***username***
     Specifies the user with root permissions for running the installation. You can set this parameter to ALL to indicate that all users can have root permissions.
   - ***client_host***
     Specifies the name of the local host system (that is, the system where you plan to run the distributed installation). You can set this parameter to ALL to indicate all host computers that exist in the NIS/DNS namespace.
   - ***path_to_sradmin***
     Specifies the path to the sradmin.exe application. The default path is /sw/SPECTRUM/SRAdmin/. You can also use ALL in place of <*path_to_sraadmin*>/sradmin.exe, which indicates that the user has root access to all programs on the specified server.

     > **NOTE**
     > The entry must be on a single line. Do not use line continuation characters.
2. Create a symbolic link file named sudoers in the directory where the sradmin.exe application exists. By default, this directory is /sw/SPECTRUM/SRAdmin. You can use the following command to create the symbolic link file:
   ```
   ln -s <full path to sudoers file from step 1> sudoers
   ```
3. Verify that the following conditions are met:
   - Root(0) owns both of these files.
   - The group is set to root(0).
   - The permissions for the files are 0440.

   Limited root permissions are granted.

Change the Sudoers File Owner (Linux)

By default, root owns the sudoers file. However, to limit the number of users who can access the sudoers file, you can change its owner. Then, modify the sradmin.exe startup parameters so that the sradmin.exe application honors only the configuration found in the sudoers file that the specified user owns. Sudoers files that other users own are ignored.

To change the sudoers file owner, add the --sudoowners parameter to the command line in the S99sradmin file that is used for starting sradmin.exe.

Follow these steps:

1. Open the following file:
   - On Linux: /etc/rc2.d/K09sradmin
2. Locate the following line:
   ```
   $SRADHOME/sradmin.exe --start
   ```

3. Add the following parameter to this line:
   ```
   --sudoowners=<username>
   ```
   – ***username***
   Specifies the user who owns the sudoers file. For example, you can enter:
   ```
   $SRADHOME/sradmin.exe --start --sudoowners=bsmith
   ```
4. Save and close the file.
   The sudoers file owner is changed.

Run the Distributed Installation Client on Windows

The prerequisites for running the distributed installation client on a Windows system are as follows:

- Verify that the time settings for the following systems are synchronized within 2 minutes of each other:
  – The Windows system running the installation
  – The remote hosts receiving the installation.
  If the time setting is not synchronized, the distributed installation fails to authenticate with the SRAdmin Daemon on the remote systems.
- Verify that all DX NetOps Spectrum processes in the distributed environment (including the SpectroSERVER and the OneClick clients) are shut down.
- Verify name resolution.

Follow these steps:

1. Log on to the Windows system.
2. Install SRAdmin Daemon.
3. Create the password file.
4. Create the Host Installation Information file.
5. Locate the distributed installation client (sdicnt.exe):
   – If you are installing from the installation media, the executable is located in <*installation_media drive*>:\sdic directory.
   – If you are installing from a downloaded patch, the executable is located in the <*$SPECROOT*>/Install-Tools/sdic directory.
6. (Optional) Run a verification test before running the DX NetOps Spectrum Distributed Installation Client. This test verifies user names and passwords in the password file, checks SRAdmin versions on remote computers, and validates VCD paths. To run this test, enter the following command:
   ```
   <pathtoexecutable>\sdicnt.exe -h <host file> -p <password file> -test
   ```
   – ***pathtoexecutable***
   Specifies the location of the distributed installation client.
   – ***host file***
   Specifies a file containing the remote host installation information. Include this path when the host file is not located in the same directory as the distributed installation client.
   Example: -h C:/tmp/hostinfo
   – ***password file***
   Specifies the file containing account and password information. Include this path when the password file is not located in the same directory as the distributed installation client.

   NOTE
   Results of the test appear on the screen and in the LOGS_*YYYYMMDD* subdirectory (*YYYY*=year, *MM*=month, *DD*=day). This subdirectory is located in the same directory as the DX NetOps Spectrum Distributed Installation Client.
7. Run the DX NetOps Spectrum Distributed Installation Client as follows:
   ```
   <pathtoexecutable>\sdicnt.exe -h <host file> -p <password file>[-accept]
   ```

- ***pathtoexecutable***
  Specifies the location of the DX NetOps Spectrum Distributed Installation Client (sdicnt.exe).
- ***host file***
  Specifies a file containing the remote host installation information. Include this path when the host file is not located in the same directory as the distributed installation client.
  Example: -h C:/tmp/hostinfo
- ***password file***
  Specifies the file containing account and password information. Include this path when the password file is not located in the same directory as the distributed installation client.
- **-accept**
  (Optional) Acknowledges the license agreement and accepts its terms without the agreement appearing on your screen. This option allows for a silent installation.
  The license agreement is located in the following places:
  - In the installation directory, <*install dir*>/Install-Tools/license/license.txt.
  - On the installation media, <*installation_media*>/<*plat*>/license/license.txt, where *plat* is either nt, sunos, or linux.

    NOTE
    You do not need to perform the following two steps when you use the -accept command.

You can exit the installation at any time by pressing Ctrl + C; however, the remote installations continue.

NOTE
Results of the installation appear on the screen and in the LOGS_*YYYYMMDD* subdirectory. This subdirectory is located in the directory where you ran the distributed installation client.

8. Review the license agreement. When complete, accept the terms of the agreement and continue the installation by entering Y (yes), and pressing Enter.

   NOTE
   Pressing Enter scrolls line-by-line, and pressing the space bar scrolls page-by-page.

   After the installation is complete, the message Installation Complete appears. Running the distributed installation client on Windows is complete.

Run the Distributed Installation Client on Linux

The prerequisites for running the distributed installation client on a Linux system are as follows:

- Verify that the time settings for the following systems are synchronized within 2 minutes of each other:
  - The Linux system running the installation
  - The remote hosts receiving the installation

  If the time setting is not synchronized, the distributed installation fails to authenticate with the SRAdmin Daemon on the remote systems.
- Verify that all DX NetOps Spectrum processes in the distributed environment (including the SpectroSERVER and the OneClick clients) are shut down.
- Verify name resolution.

Follow these steps:

1. Log on to the Linux system.
2. Install SRAdmin Daemon.
3. Create the Host Installation Information file.
4. Create the password file.
5. Locate the distributed installation client (sdiclinux.exe for Linux):

- If you are installing from the installation media, the executable is located in the *<installation_media mount>*/sdic directory.
- If you are installing from a downloaded patch, the executable is located in the *<$SPECROOT>*/Install-Tools/sdic directory.

6. (Optional) Run a verification test before running the distributed installation client. This test verifies user names and passwords in the password file, checks SRAadmin versions on remote computers, and validates VCD paths. To run this test, enter the following command:
   - For Linux:

     ```
     <pathtoexecutable>/sdiclinux.exe -h <host file> -p <password file> -test
     ```

     NOTE
     Results of the test appear on the screen and in the LOGS_*YYYYMMDD* subdirectory (*YYYY*=year, *MM*=month, *DD*=day). This subdirectory is located in the same directory as the distributed installation client.
7. Run the distributed installation client as follows:
   - For Linux:

     ```
     <pathtoexecutable>/sdiclinux.exe -h <host file> -p <password file>
     [-accept]
     ```

   You can exit the installation at any time by pressing Ctrl + C; however, the remote installations continue.

   NOTE
   Results of the installation appear on the screen and in the LOGS_*YYYYMMDD* subdirectory. This subdirectory is located in the same directory as the distributed installation client.
8. Review the license agreement. When complete, accept the terms of the agreement and continue the installation by entering Y (yes), and pressing Enter.

   NOTE
   Pressing Enter scrolls line-by-line, and pressing the space bar scrolls page-by-page.

   After the installation is complete, the message Installation Complete appears. Running the distributed installation client on Linux is complete.

Distributed Installations Without the Root Password

Under certain conditions, you can run a distributed installation in a Linux environment without being prompted for a user name and password.

For this scenario to work properly, run the distributed installation from the local machine as root. The installation program automatically executes without asking for a user name or password.

NOTE
This process does not automate the acceptance of the DX NetOps Spectrum license agreement. You must manually agree to the terms of the license agreement before the installation can proceed.

Log Files

The DX NetOps Spectrum Distributed Installation Client creates a subdirectory named LOGS_*YYYYMMDD* (*YYYY*=year, *MM*=month, and *DD*=day when the installation was started). This subdirectory contains a file for each system where you install DX NetOps Spectrum. To view these files, you need write permissions to the directory where you started the distributed installation client.

These files use the following naming convention:

```
<host_name>.HH.MM
```

host_name

Specifies the remote host name.

- ***HH***
  Specifies the hour when the installation started.
- ***MM***
  Specifies the minute when the installation started.

  NOTE
  Results of a distributed installation appear in the LOGS_*YYYYMMDD* subdirectory.

Installation Duplication

After you complete a DX NetOps Spectrum GUI installation, you can use the hostargs.<*time*> file located in the <*$SPECROOT*>Install-Tools/LOGS/<*version_date*> directory of the new installation as a baseline for more installations. The only potential change that is needed is the remote_host parameter in the hostargs<*time*> file.

Also, add values to the server_user name and server_password parameters for either of these scenarios:

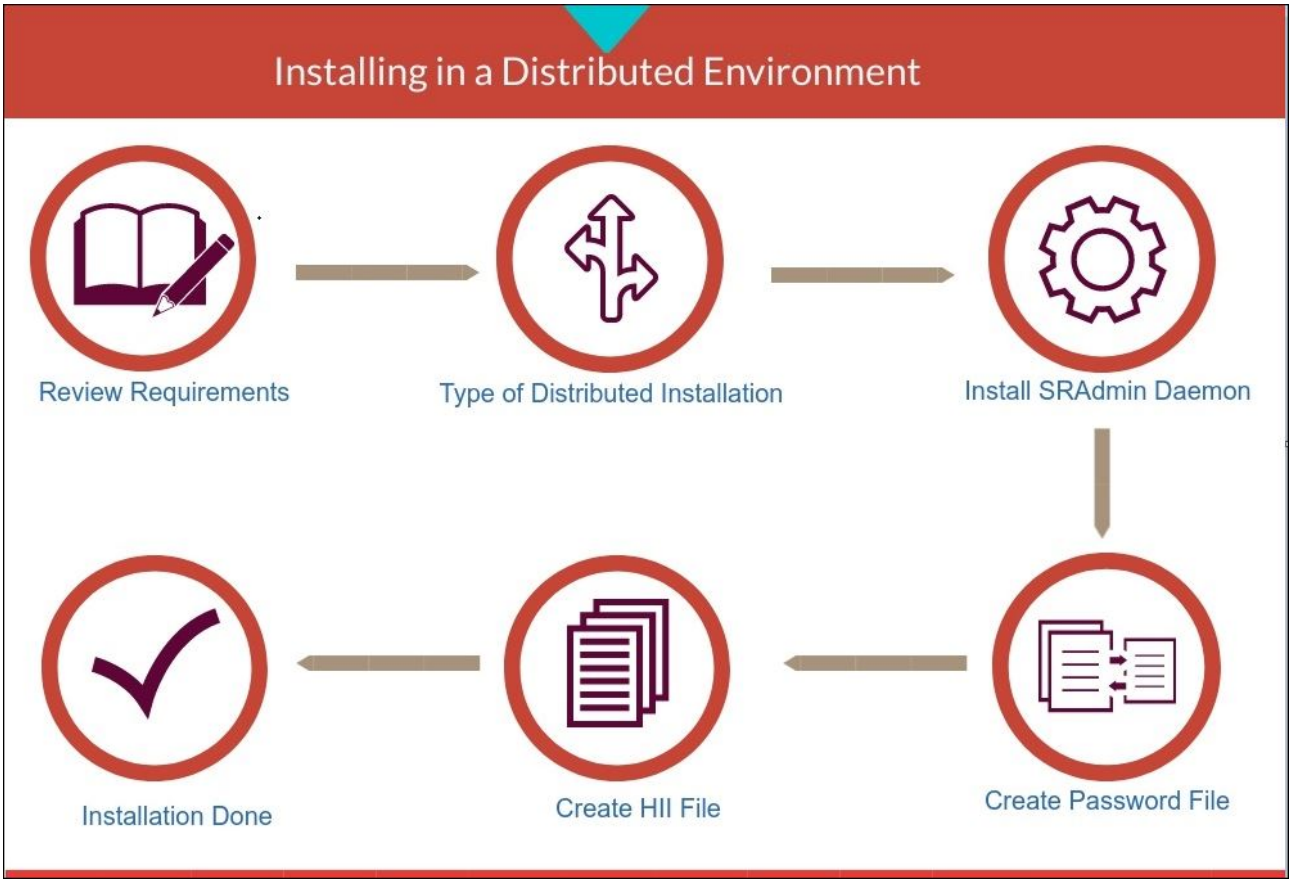
- You are installing on Windows in a domain
- You do not want the existing user name and password used in the <*password file*>.

If you are installing DX NetOps Spectrum on Windows in a domain, create a password file.

Installing DX NetOps Spectrum in a Distributed Environment

Process Overview

The following diagram shows the overall process:



Distributed Installation Requirements

Ensure that you meet the following requirements before you start a distributed installation:

- Check the Release Information about any new parameters that are required for the Host Installation Information file.
- Establish a TCP/IP connection from the target system to remote systems.

  NOTE
  In firewall environments, ensure that port 46517 is opened during a distributed installation.
- Verify that the time setting on the installer host is synchronized to within 2 minutes of the time setting on the remote hosts. This setting is required for secure authentication with the DX NetOps Spectrum Remote Administration Daemon.
- Verify that the remote hosts have sufficient disk space. The DX NetOps Spectrum distributed installation copies temporary files to temporary directories on the target system. Therefore, it requires at least 100 MB of disk space in the temp or tmp directories. For Windows, you can edit the default TEMP location as a user Environment Variable.

Types of Distributed Installations

DX NetOps Spectrum lets you select the type of distributed installation that meets your requirements.

The following table shows the available types of distributed installations and their corresponding procedures found in this section:

Type of Distributed Installation	Procedures
DX NetOps Spectrum installation on Linux	Install SRAdmin Daemon. Create a Root/Administrator Password File and create the Host Installation Information File. Run the Distributed Installation Client on Linux.
Upgrading DX NetOps Spectrum from 9.3 or later on Linux	Install SRAdmin Daemon. Create a Root/Administrator Password File and create the Host Installation Information File. Run the Distributed Installation Client on Linux.
DX NetOps Spectrum installation on Windows	Install SRAdmin Daemon. Create a Root/Administrator Password File and create the Host Installation Information File. Run the Distributed Installation Client on Windows.
Upgrading DX NetOps Spectrum from 9.3 or later on supported Windows platforms	Install SRAdmin Daemon. Create a Root/Administrator Password File and create the Host Installation Information File. Run the Distributed Installation Client on Windows.

How to Perform a Distributed Installation

The DX NetOps Spectrum distributed installation is a command-line interface that lets you install DX NetOps Spectrum and the OneClick web server (locally and remotely). Different types of installations can be performed on each system. For example, you can install the following items in a single distributed installation:

- SpectroSERVER only
- OneClick web server only
- SpectroSERVER and OneClick web server

A DX NetOps Spectrum distributed installation has the following components:

- **DX NetOps Spectrum Remote Administration (SRAdmin) Daemon**
  Allows for secure, remote installations without requiring that you manually set up the NFS mounts or Microsoft Network File shares. A time-critical Triple-DES encryption is used to ensure that the root/Administrator account/password information is safe when it is passed between daemons. Install SRAdmin on each remote system where you install DX NetOps Spectrum.
- **DX NetOps Spectrum Distributed Installation Client (sdicsol.exe for Linux, and sdicnt.exe for Windows)**
  Launches multiple installations across multiple machines and collects the results of these installations. The distributed installation client requires the following files:
  - **Password file**
    Contains accounts and passwords for remote computers.
  - **Host installation file**
    Contains installation information. The topic HII File Parameters contains important information about the required contents of this file.

To perform a distributed installation, complete these steps

1. Install SRAdmin Daemon.
2. Create the password file
3. Create the HII file.

Installing DX NetOps Spectrum Remotely

Installing DX NetOps Spectrum Remotely

You can use Telnet to install DX NetOps Spectrum remotely over your network. You can also use the GUI or distributed installation to install DX NetOps Spectrum remotely. For example, you can use the Windows GUI installer to install DX NetOps Spectrum to a Linux system using the installer for that platform.

You can only perform one system installation at a time. You need the host name of the remote system and the administrator ID and password.

Follow these steps:

1. Install the DX NetOps Spectrum Remote Administration Daemon (SRAdmin) on the computer where you want to install DX NetOps Spectrum remotely.
2. See Install DX NetOps Spectrum to perform the installation.
   DX NetOps Spectrum is installed remotely.

   WARNING

   It is mandatory to reboot the server after you complete a fresh SpectroSERVER installation while installing 10.2.

OneClick Web Server and SpectroSERVER on Separate Systems

To install the OneClick web server and a SpectroSERVER on separate systems, repeat the installation process for each system installation. Be sure to select the appropriate components on the Select Options dialog during installation. You can also use the distributed installation to install different components to separate systems at the same time.

Mount the Installation Media on Linux

If Volume Management is disabled, set up an installation media mount-point directory. Then, run a mount command to access the installation software on the installation media. This procedure varies depending on whether the installation is local (the target system is the host for the drive) or remote (a system other than the target hosts the drive).

If a Linux system has Volume Management enabled, the installation media mounts automatically.

NOTE
Use these steps to mount the CABI r4.1 SP3 installation media.

Follow these steps:

1. Insert the installation media into the appropriate drive.
2. Mount the <*installation_media*> file system by running the following command, where <*installation_media*> is the directory you created:
   – On Linux:

   ```
   mount -t iso9660 /dev/dvd /mnt/<installation_media>
   ```
3. The installation media is mounted.

Start the Installation on Windows

You can start the DX NetOps Spectrum installation on Windows platforms.

WARNING
You cannot install a released version of DX NetOps Spectrum on top of a beta or evaluation version of the product. Instead, uninstall the beta or evaluation version first.

Follow these steps:

1. Stop all non-DX NetOps Spectrum running applications.
2. Stop the following DX NetOps Spectrum applications:
   - Shut down all OneClick clients by logging off all users from OneClick in the Client Details web page in the OneClick home page.

     NOTE
     For more information about shutting down OneClick clients, see OneClick Administration.
   - Stop the SpectroSERVER and the Archive Manager by clicking Stop SpectroSERVER in the DX NetOps Spectrum Control Panel and then close the DX NetOps Spectrum Control Panel. Or you can stop the SpectroSERVER and Archive Manager from the command line by running the "<$SPECROOT>/bin/stopSS.pl" as Spectrum Owner at the command prompt.

     NOTE
     For more information about the DX NetOps Spectrum Control Panel, see OneClick Administration.
   - Stop all VnmSh connections.

     NOTE
     For more information about stopping VnmSh connections, see the Command Line Interface User.
   - Close all Bash shells.
3. Ensure that you have met the Installing and Upgrading.

   WARNING
   Disable your antivirus software's real-time protection before installing DX NetOps Spectrum. Disabling helps avoid potential problems with files that could be in use by the real-time protection software.
4. Log in as a user with administrator rights.
5. Insert the installation media into the appropriate drive. If autorun is disabled, you can double-click setupnt.exe from the Explorer view to start the installation.

The installation starts.

Start the Installation on Linux

You can install DX NetOps Spectrum on Linux platforms.

WARNING
You cannot install a released version of DX NetOps Spectrum on top of a beta or evaluation version of the product. Instead, uninstall the beta or evaluation version first.

Follow these steps:

1. Stop all non-DX NetOps Spectrum running applications.
2. Stop the following DX NetOps Spectrum applications:
   - Shut down all OneClick clients by logging off all users from OneClick in the Client Details web page in the OneClick home page.

     NOTE
     For more information about shutting down OneClick clients, see OneClick Administrator.
   - Stop the SpectroSERVER and the Archive Manager by clicking Stop SpectroSERVER in the DX NetOps Spectrum Control Panel and then close the DX NetOps Spectrum Control Panel. Or you can stop the SpectroSERVER and Archive Manager from the command line by running the "<$SPECROOT>/bin/stopSS.pl" as Spectrum Owner at the command prompt.

     NOTE
     For more information about the DX NetOps Spectrum Control Panel, see the OneClick Administration.
   - Stop all VnmSh connections.

NOTE
For more information about stopping VnmSh connections, see the Command Line Interface User space.

- Close all Bash shells.

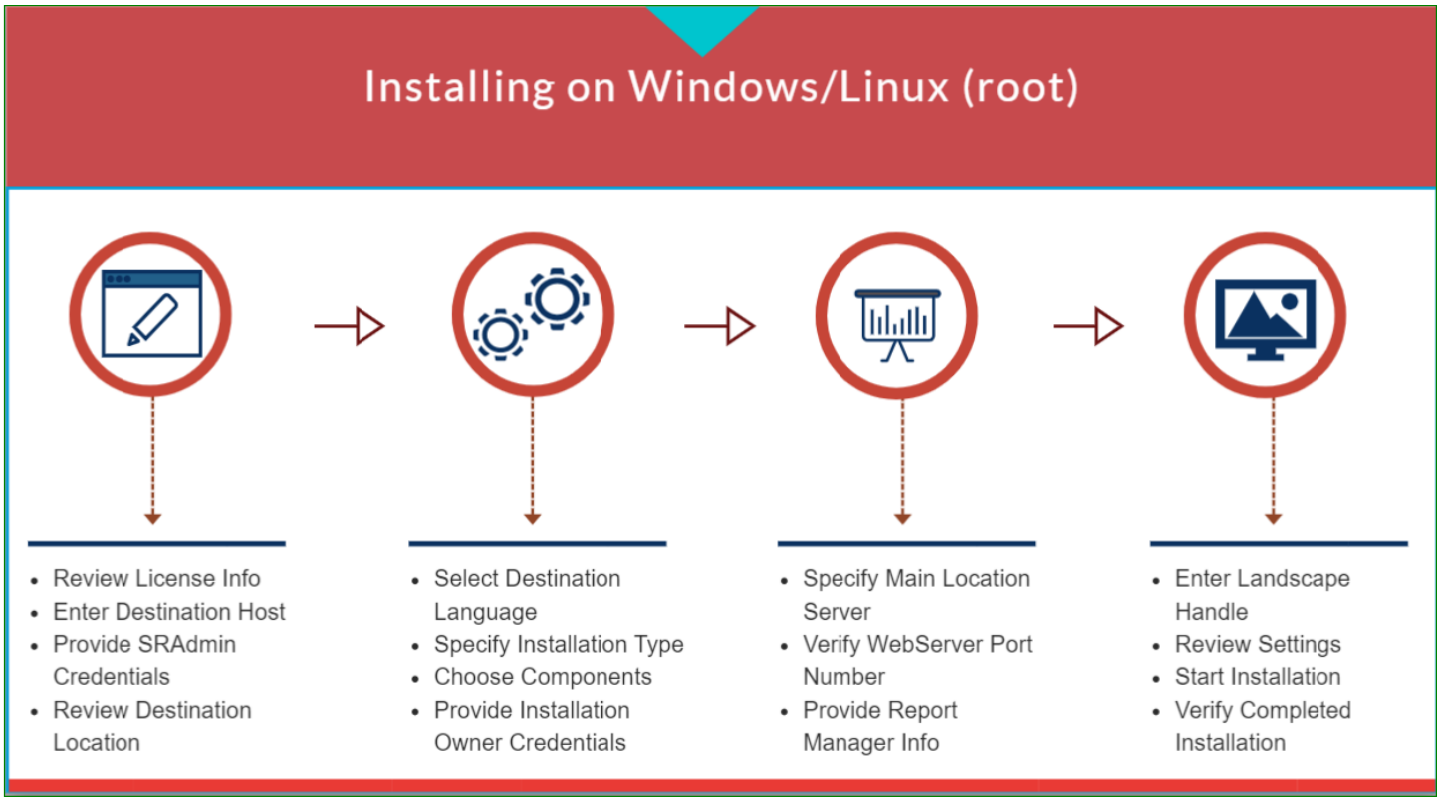
3. Ensure that you have met the system requirements for Linux.
4. Ensure that you have met the prerequisites.
5. Download the DX NetOps Spectrum TAR package for Linux into the appropriate drive.
6. Extract the DX NetOps Spectrum TAR package for Linux by using the "gunzip" command, and then the "tar - xvf" command at the command prompt.
7. If necessary, set your DISPLAY variable to the hostname of the target system:
   - From a C shell, enter:
     ```
     setenv DISPLAY <hostname>:0
     ```
   - From Bourne or Korn shells, enter:
     ```
     DISPLAY=<hostname>:0 ; export DISPLAY
     ```
     NOTE
     Run echo $DISPLAY to confirm this setting is in effect.
8. To display the DX NetOps Spectrum installation GUI on a remote system, run the following command from the target system:
   ```
   /usr/openwin/bin/xhost +<hostname>
   ```
   - ***hostname***
     Is the name of the target system.
9. Perform one of the following steps:
   - For Linux, navigate to the extracted TAR folder, and run the setuplin.exe executable file.
10. Double-click the Installer icon

Installing DX NetOps Spectrum on Windows and Linux (root User)

You can install DX NetOps Spectrum on Windows and Linux (root user).

NOTE
For more information about the prerequisites, see the prerequisites section.

The following diagram shows a summarized view of the installation steps:



WARNING
The C:\Program Files\CA directory on Windows platforms and the /opt/CA directory on Linux platforms are automatically created during a first-time installation of DX NetOps Spectrum. DX NetOps Spectrum components that are also common to other CA products are intentionally installed into this directory. This directory is automatically updated as needed during a DX NetOps Spectrum upgrade. Do not remove files from this directory.

Follow these steps:

1. Start the installation on Windows or Linux.
   The **Install** dialog opens.
2. Select the **Install DX NetOps Spectrum** option.

   NOTE

   On Linux platforms, the following warning could appear before the installer launches if you launch the installer from a shell.

   This warning does not cause any problems with your installation and can be disregarded.

   ```
   awk: cmd. line:6: warning: escape sequence `\.' treated as plain `.'
   ```

   The **Introduction** dialog opens.
3. Click **Next** to proceed.
   The **License Agreement** dialog opens.
4. Scroll through and read the license agreement, accept the agreement, and click **Next**.
   The **Destination Host** dialog opens.
5. Enter the name of the host system where you are installing DX NetOps Spectrum and click **Next**.

NOTE
If you are installing DX NetOps Spectrum and OneClick on remote platforms on your network, follow the steps in Installing DX NetOps Spectrum Remotely.

The **SRAdmin Authentication** dialog opens.

NOTE
If the 'Unable to connect to DX NetOps Spectrum Remote Administration Daemon (SRAdmin)' dialog appears, install SRAdmin before continuing with the installation. To install SRAdmin, click Install on this dialog.

6. Enter a **username** and **password** as follows, and click **Next**:
   - For a **Windows** installation, enter a username that has administrator rights and verify the domain name (if applicable).
   - For **Linux** installation, enter a username with root access. Or, you can use a ***sudoers*** file for root permissions.

     NOTE
     If you have root access when starting this installation, you are not prompted for a user name and password. Ensure that usernames do not exceed 16 characters.

   The **Destination Location** dialog opens.
7. Click **Next** to install DX NetOps Spectrum in the default directory. The default directory for Windows is C:\win32app \SPECTRUM .The default directory for Linux is /usr/SPECTRUM
   - If you are performing an in-place upgrade, the installation program detects the previous installation directory.

     WARNING
     When performing an in-place upgrade, do not change the default destination to a location other than the directory containing the DX NetOps Spectrum database you are upgrading. On Linux, do not use / opt/SPECTRUM as an installation directory. This location and name are reserved for a directory that is created automatically during the installation.
   - To install DX NetOps Spectrum in a location other than the default directory, click **Choose**, select a location, and click **Next**. This option only appears for a local installation (not for a remote installation).

     WARNING

     Ensure there are no spaces in the path name. You cannot install DX NetOps Spectruminto a directory that contains a space anywhere in the path. Spaces within the directory path cause the installation to fail.

   The installer reports, it is extracting installation information. Then, the **Select Destination Language** dialog opens.
8. Select the language in which you want to install, and click **Next**.
   Localized CsEvFormat, CsPCause and **EventTables** is installed for the selected language.
   The **Select Options** dialog opens.
9. Select either one of the Installation Type:
   - **Standard:** Allows the installation of the SpectroSERVER, the OneClick server, and all other DX NetOps Spectrum components.
   - **Remote Operations Server:** Allows the installation of minimal components to run the SpectroSERVER and OneClick server.

   Components are displayed based on the type of installation you entered.

   NOTE
   If you are performing an upgrade, add-on components that exist in your current implementation appear for the Remote Operations Server option.
10. Select the items that you want to install from the **components list** and click **Next**.

    WARNING
    Installing OneClick on a single-CPU SpectroSERVER host system can degrade the performance of both SpectroSERVER and OneClick. We recommend installing OneClick on a separate dedicated system.

The **Host Evaluation** dialog opens.

11. Scroll down to verify that no warnings appear, and click **Next** to proceed.
    The DX NetOps Spectrum **Installation Owner** dialog opens.
12. Enter the **username** and **password** as follows, and click **Next**. This username is used to create the initial DX NetOps Spectrum user (if installing SpectroSERVER) and becomes the installation owner. For a OneClick installation, the username also determines the SpectroSERVERs to which the OneClick web server connects:
    - For a **Linux** installation, enter the username for the host system. The installation owner must be a non-root user.
    - For a **Windows** installation, enter either the domain user username and password or the local user username and password.

      WARNING
      When installing DX NetOps Spectrum on a computer in a domain, the username for the DX NetOps Spectrum installation owner cannot be the same as the computer hostname.

    NOTE

    The username and password are also used to configure the DX NetOps Spectrum Process Daemon service. The username and password are not used or stored in DX NetOps Spectrum

    NOTE
    If the installation owner is a non-administrator, you cannot restart the process service as the installation owner. However, because you typically do not need to restart the service on a normal daily basis, we recommend that the installation owner is a non-administrator. Using a nonadministrator helps increase security and simplify password maintenance.

    NOTE

    For first-time installations, the default DX NetOps Spectrum password for the installation owner is spectrum.

    WARNING

    When installing OneClick, be sure to specify a DX NetOps Spectrum username to which the administrative license is associated. This user needs access to all models in DX NetOps Spectrum (ADMIN access). We recommend that you specify the installation owner that you specified during the SpectroSERVER installations. This user must also exist on the installation host and does not need to be a Windows administrative user.

    The **Main Location Server** dialog opens.
13. When you install DX NetOps Spectrum components, you also automatically install a location server. However, if you install OneClick only, you do not automatically install a location server.

    NOTE
    In a distributed environment, DX NetOps Spectrum uses location servers to maintain the VNM landscape map and provide connection services to client applications. For more information about location servers and the main location server, see the Distributed SpectroSERVER Administration.

    Enter a **hostname** for the main location server and click **Next**.

    NOTE
    DX NetOps Spectrum must be able to resolve the hostname, regardless of whether you provide a fully qualified hostname.

    The **Web ServerPort Number** dialog shows the default value.
14. **(Optional)** Enter a port number other than the default, and click **Next**.

    NOTE
    The default port is 80 for Windows and 8080 for Linux.

If you have previously selected **Report Manager** from the components list, the **Report Manager Servers** dialog opens.

15. If the **Report Manager Servers** dialog opens, select each SpectroSERVER that you want Report Manager to report about and click **Next**.
    The DX NetOps Spectrum **Report Data Migration Panel** dialog opens.
16. If you are performing a Spectrum Report Manager migration, enter the **source hostname** and **root password** for the report database and then click **Next**. Otherwise, leave the fields blank.
    ```
    bc obase=16 <decimal value> * 262144<CTRL>D
    ```
    The bc utility displays a hexadecimal value that you enter in the Landscape Handle box, prefixed by 0x. For example, a decimal value of 24 multiplied by 262144 yields a hexadecimal value of 600000. You would enter 0x600000 in the Landscape Handle field. Unique landscape handles are crucial if you are configuring a distributed SpectroSERVER environment.
    If you are performing an in-place upgrade the **Review Settings** dialog opens, click **Install** to install **DX NetOps Spectrum.**
17. The **Landscape Handle** dialog opens. Enter a value as instructed on the dialog for the landscape handle. **For more information about Landscape Handles, see** Landscape Handles in Setting up a Distributed SpectroSERVER.

    NOTE

    In a Distributed SpectroSERVER environment, you cannot select a mix of Legacy and Huge landscapes. For example, if you have an existing SpectroSERVER running in Legacy and want to add a new SpectroSERVER, you cannot add a Huge Landscape, even if you are installing it from scratch.

    In a Distributed SpectroSERVER environment, all your SpectroSERVERs should be either Legacy or Huge Landscapes.

    This dialog appears only when you are installing a SpectroSERVER. This dialog does not appear during upgrade or migration scenarios.
    What is a landscape handle?
    A landscape is a network domain that a single SpectroSERVER manages. A landscape includes all the models, associations, attribute values, alarms, events, and statistics of a SpectroSERVER. Each landscape in a network is unique, and a unique landscape handle (ID) identifies each.

    NOTE

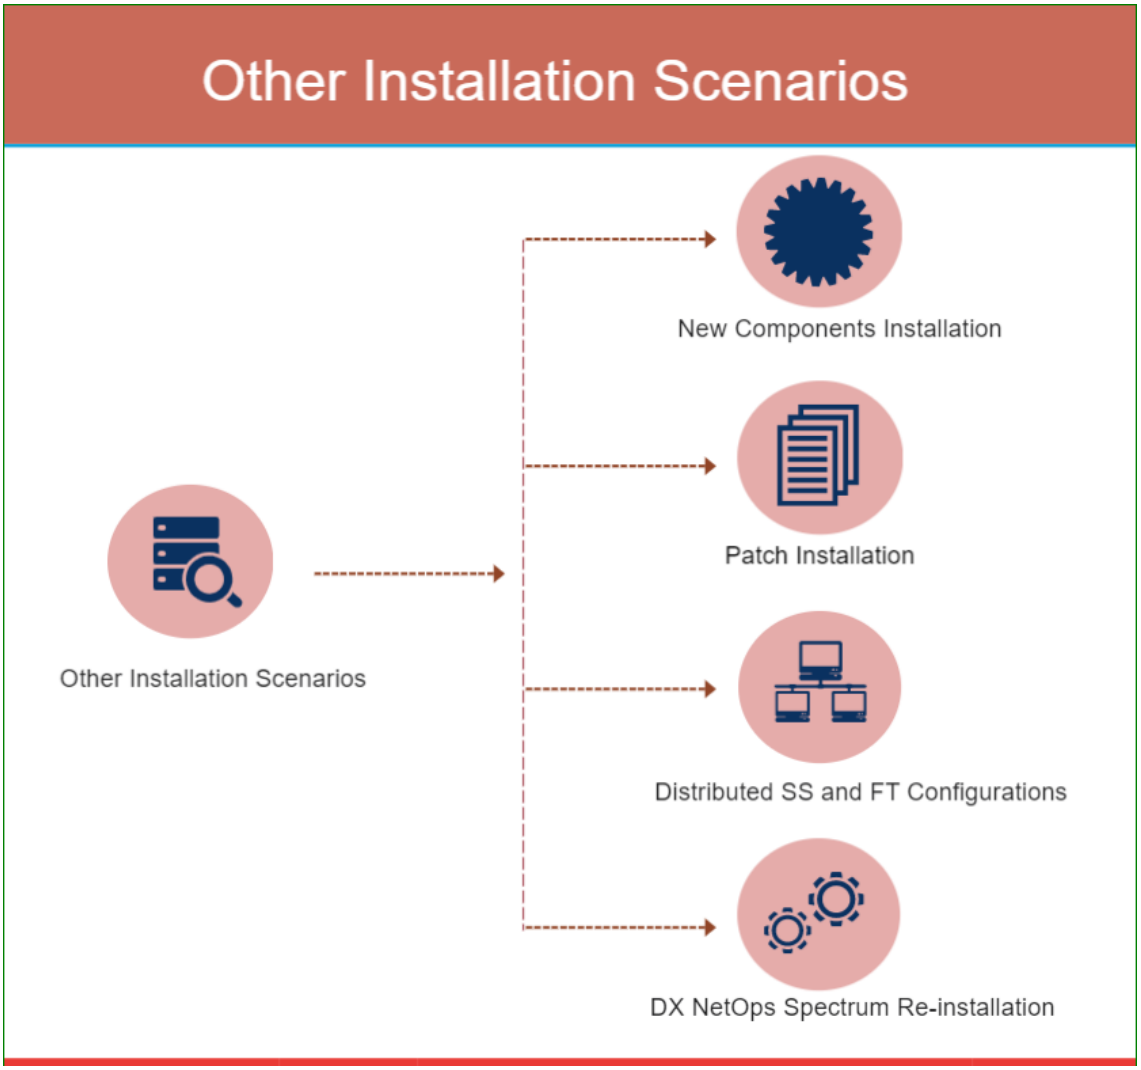
    From 10.3 onwards, you can load the catalog of the Legacy Landscape on a Huge Landscape and vice versa (using SSdbload -c option). However you will not see the landscape details displayed. For more information on the landscape details, see the Known Anomalies section.
18. After you enter a value on the dialog for the landscape handle, Click **Next.**
    The **Review Settings** dialog opens.
19. Scroll down to ensure all the settings are what you had selected and click **Install**.
    The **Installing DX NetOps Spectrum** dialog appears. After DX NetOps Spectrum is installed, the status changes to **Installation Successful** and the **Next** button is enabled. Click **Next**.

    NOTE
    During the installation process, the 'View Logs' button is enabled. Click the button to view the installation logs. The logs are helpful if there are installation failures or errors.
20. The **Installation Complete** dialog opens. Click **Done**.
    The configuration dialog appears for a brief moment and closes. DX NetOps Spectrum is configured for your system.
21. Click **Close** on the initial Install dialog. **Log out,** and **log back in**.
    DX NetOps Spectrum is installed.

    WARNING
    It is mandatory to reboot the server after you complete a fresh SpectroSERVER installation while installing DX NetOps Spectrum.

Other Installation Scenarios

The following diagram shows the additional installation scenarios:



How to Install New Components

If any components were not installed initially, you can add them using the following procedure.

Follow these steps:

1. Stop SpectroSERVER and all DX NetOps Spectrum applications.
2. Run the installation for the version of DX NetOps Spectrum you currently have installed. Note the following guidelines:
   - Retain the default directory on the Destination Location dialog because all components must be installed in the same directory. You cannot install OneClick and SpectroSERVER in different directories.
   - If the component you are adding is listed on the Select Options dialog, select it. Components from the same version that are already installed appear selected and disabled; these components are not reinstalled. If the component you are adding does not appear, verify that the component is installed in the Review Settings dialog. The Review Settings dialog displays all components that are installed.

NOTE
You cannot change the Installation Type when adding components. This option is available on the initial installation only.

The DX NetOps Spectrum installation installs the new components only.

3. After all of the components are installed, reinstall the latest DX NetOps Spectrum maintenance, if any.

Patch Installations

Updates or patches for existing versions of DX NetOps Spectrum are available for downloading at http://broadcom.com/support. Contact a technical support representative for available maintenance patches. Each patch includes a software release notice that provides step-by-step installation instructions.

Distributed SpectroSERVER and Fault-Tolerant Configurations

To install more than one SpectroSERVER to manage different portions of your network, see the Distributed Administrator section before starting the installation.

DX NetOps Spectrum also supports a fault-tolerant configuration so that one or more than one SpectroSERVER can function as standbys for a primary SpectroSERVER. In this scenario, a secondary SpectroSERVER is ready to take over management functions when the primary SpectroSERVER becomes unavailable. The special requirements for this configuration are explained in the Distributed Administration.

Upgrades with fault-tolerance are supported. For more information, see Upgrade Best Practices: Fault-Tolerant Deployments.

NOTE
For information about OneClick Web server fault tolerance, see OneClick Administration.

Reinstall DX NetOps Spectrum

If problems occur during installation, you can reinstall DX NetOps Spectrum. You cannot install new components and reinstall at the same time. Reinstall DX NetOps Spectrum first and then install the new components.

NOTE
If you want to change the installation owner for an existing installation, run the following program from a Windows bash shell before reinstalling DX NetOps Spectrum. This program removes the processd service so that the service is recreated during the reinstallation with the new installation owner:

```
<install dir>/lib/SDPM/processd.exe --remove
```

To reinstall DX NetOps Spectrum to change the installation owner, you must be reinstalling a full, major release; it cannot be a service pack or maintenance. For example, 9.3.x users must reinstall 9.3.0 first, then install 9.3.x again.

NOTE
The following procedure is for the GUI-based installation. If you are using the distributed installation, set *same=yes* in the host installation information file before reinstalling DX NetOps Spectrum.

Follow these steps:

1. Stop SpectroSERVER and all DX NetOps Spectrum applications.
2. Run the installation for the version of DX NetOps Spectrum you currently have installed. Note the following guidelines:
   - Retain the default path on the Destination Location dialog because all components must be installed in the same directory.
   - In the Select Options dialog, no new selections can be made. Components that can be reinstalled are selected and disabled.
   - In the Host Evaluation dialog, a message indicates that nothing was selected for installation.

3. Click Next on the Host Evaluation dialog.
4. Click Reinstall on the Reinstall Option dialog.
5. Click Preserve on the Preserve Files dialog.
   The existing user-modified files are preserved, and the Host Evaluation runs again to evaluate the new settings.
6. Click Next and modify the installation dialogs, as needed.
7. View the Review Settings dialog and ensure that all components are reinstalled. Click Next to proceed with the reinstallation.
   The reinstallation completes.

OneClick Web Server Upgrades and New OneClick Privileges

OneClick Web Server Upgrades

All OneClick clients must be shut down before upgrading the OneClick web server because Java Web Start applications cache application jar files on the client. These jar files are automatically updated when you restart the application. You can shut down all OneClick clients by selecting Client Details and clicking Log Off Clients.

For OneClick web server installations on a dedicated system (such as, <*OC install dir*>/WebApps), the OneClick web server is installed in the <*$SPECROOT*> directory. However, OneClick web server installation on the same system as DX NetOps Spectrum are installed in a different directory. In this case, the OneClick web server is installed in the directory you specified during the DX NetOps Spectrum upgrade (such as, <*OC install dir*>/WebApps).

NOTE
For more examples about how to use the <*$SPECROOT*>/custom directory, see OneClick Customization .

When you install the OneClick web server on a dedicated system, install it in the <*OC install dir*>/WebApps directory. Install DX NetOps Spectrum in the existing DX NetOps Spectrum directory when the system includes a current version of a SpectroSERVER and the OneClick web server. Do not install DX NetOps Spectrum in the OneClick directory. The existing DX NetOps Spectrum directory appears in the Destination Location dialog.

NOTE
Upgrading the OneClick web server typically archives the existing Apache Tomcat directory to <*$SPECROOT*>/Install-Tools/LOGS/<*version_date*>/SavedFiles/tomcat-<*time*>. Once you have successfully upgraded the OneClick web server and verified any OneClick customizations, we recommend that an administrator remove this directory. The directory uses available disk space unnecessarily.

New OneClick Privileges

A new version of DX NetOps Spectrum sometimes includes new privileges that are assigned, by default, to one or more of the default DX NetOps Spectrum roles. For example, DX NetOps Spectrum assigns these privileges to a default DX NetOps Spectrum role such as OperatorRW. Remember, users who are not assigned these default roles are not automatically granted these new privileges. To grant these new privileges, either explicitly assign them to the users, or assign the default roles to the users.

Additionally, consider assigning the new privileges to one or more custom roles that you have created. Therefore, users that are assigned to only those custom roles are also granted new privileges.

NOTE
For more information on working with users, roles, and privileges, see OneClick Administration .

Files Created During Installation

The DX NetOps Spectrum installation adds the following file types:

Services for Windows

The DX NetOps Spectrum installation adds the following services to Windows Services:

DX NetOps Spectrum Process Daemon Files for Linux

The DX NetOps Spectrum installation adds a process daemon (processd) file to the following startup areas on Linux:

- /etc/rc.d/init.d/processd (10.4.2) or /etc/systemd/system/processd.service (10.4.2.1)
- /etc/rc.d/rc0.d/K*processd
- /etc/rc.d/rc1.d/K*processd
- /etc/rc.d/rc2.d/K*processd
- /etc/rc.d/rc3.d/S*processd
- /etc/rc.d/rc4.d/K*processd
- /etc/rc.d/rc5.d/S*processd
- /etc/rc.d/rc6.d/K*processd

NOTE
Your operating system determines the number that is indicated by the symbol, *. For more information about processd, see the Distributed SpectroSERVER section.

WARNING
Do not remove these files because they are required for DX NetOps Spectrum operation.

DX NetOps Spectrum Remote Administration Daemon Files for Linux

The DX NetOps Spectrum installation adds the following DX NetOps Spectrum Remote Administration Daemon (sradmin) files that DX NetOps Spectrum requires for user authentication and distributed administration:

- /etc/systemd/system/sradmin.service (10.4.2.1 and later versions)
- /etc/init.d/sradmin (10.4.2)
- /etc/rc0.d/K*sradmin
- /etc/rc1.d/K*sradmin
- /etc/rc2.d/K*sradmin
- /etc/rc3.d/S*sradmin
- /etc/rc4.d/K*sradmin
- /etc/rc5.d/S*sradmin
- /etc/rc6.d/K*sradmin

NOTE
Your operating system determines the number that is indicated by *.

These files are added to /sw/SPECTRUM/SRAdmin/sradmin.exe or another path if SRAdmin was installed manually.

WARNING
Do not remove these files because they are required for DX NetOps Spectrum operation

Installation Database Savefiles

The installation automatically creates two savefiles in the <*$SPECROOT*>/SS directory. Each file contains a copy of the database modeling catalog that was installed. The first file is date-stamped, with the extension .after. A copy of the .after file is created and named legacy.SSdb (overwriting any previous legacy.SSdb file).

The legacy.SSdb file is used with the SSdbload utility to reinitialize the database with the most recently installed modeling catalog. Whereas, the .after files let you restore the catalog that is associated with any particular installation. A sequential

counter following the date portion of the file name lets you distinguish between multiple .after files generated on the same day. For example, if three of these files were generated on May 4, 2006, they would be labeled as follows:

- db_20060504,1.after.SSdb
- db_20060504,2.after.SSdb
- db_20060504,3.after.SSdb

Post-Installation Configurations

Set OneClick Client Restrictions

Client access to DX NetOps Spectrum includes access to OneClick web server installations. When the OneClick clients use the OneClick web server for connections, adding them to Host Security is not necessary.

> **NOTE**
> You can configure host security for the OneClick web server using Remote Address Filter and Remote Host Filter in Apache Tomcat. See http://tomcat.apache.org for details.

Follow these steps:

1. Navigate to <*$SPECROOT*>/tomcat/webapps/spectrum/META-INF.
2. Open the context.xml file in this directory, using an XML editor.
3. Locate the following line:
   ```
   <Context path="/spectrum" docBase="spectrum">
   ```
   Enter the following lines under this line:
   ```
   <Valve className="org.apache.catalina.valves.RemoteAddrValve"
   allow=""
   deny=""/>
   ```
4. Enter IP addresses as values for the deny parameter to specify users in which you want to restrict OneClick access. For example, you can allow all users for a given IP address range, but you can exclude one or more specific users.
5. Optionally, enter IP addresses as values for the allow parameter to specify specific IP addresses in which you want to give OneClick access. For example, you can enter 10.254.*.* to include all IP addresses in your network that are in the “10.254” IP address range.
6. Save and exit the file.
   OneClick client restrictions are set.

Set Up Client Access to DX NetOps Spectrum in a Distributed Environment

If you selected a Main Location Server other than the host system during installation, enter the name of the host system in the .hostrc file of the Main Location Server.

> **NOTE**
> The installation automatically enters the name of the Main Location Server in the .hostrc file of the host system.

Follow these steps:

1. Start the SPECTRUM Control Panel on the system that is designated as the Main Location Server.
2. Select Configure, Host Security.
3. Add the name of the host system to the Server List and click OK.
   The client access to DX NetOps Spectrum is set up.

Change the OneClick Web Server Port

Change the default server shutdown port for the OneClick web server when:

- Your OneClick web server contains multiple instances of Apache Tomcat.
- Those instances of Apache Tomcat are using the default server shutdown port (8005).

Apache Tomcat cannot start on a system with another instance running on it.

Follow these steps:

1. Navigate to the following directory:
   ```
   <$SPECROOT>/tomcat/conf
   ```
2. Open the server.xml file, using a text editor.
3. Navigate to the following line:
   ```
   - <Server port="8005" shutdown="SHUTDOWN" debug="0">
   ```
4. Change the server port value to the new server shutdown port number. For example, port="8099"
5. Restart Apache Tomcat, as follows:
   - On Windows:
     - Select All Programs, Administrative Tools, Services from the Start menu.
     - Select SpectrumTomcat from the list.
     - Click Restart the service in the left pane.
   - On Linux:
     - Navigate to the following path:
       ```
       <$SPECROOT>/tomcat/webapps/spectrum
       restart.sh
       ```
     - Enter the following command:

   The web server port is changed.

Configure the Windows Server Scheduled Tasks Service

You can configure the Windows Server 2012 (or later) Scheduled Tasks service to work with the DX NetOps Spectrum Scheduler.

Follow these steps:

1. Click Start, Administrative Tools.
2. Select Task Scheduler.
3. Select Action, AT Service Account Configuration.
4. Select the option Another user account and select Change user.
5. Enter a user name (including the domain, if applicable) of a valid DX NetOps Spectrum user (for example, WORKGROUP\jsmith).

   NOTE
   By default, this dialog contains the current user. If the default is the DX NetOps Spectrum user, no change is necessary. Scheduled tasks are run on behalf of the designated user.
6. Enter the user password in the Password and Confirm Password fields and click OK.
7. Click OK in the AT Service Configuration dialog.
   The Windows Scheduled Tasks service is configured.

Landscape Polling Interval Configuration in Fault-Tolerant Environments

In fault-tolerant DX NetOps Spectrum environments, OneClick checks the status of the SpectroSERVER by polling each landscape at 10-second intervals by default. Frequent polling shortens the failover time to the secondary SpectroSERVER when the primary SpectroSERVER goes down. This polling also avoids missing any SpectroSERVER restarts.

You can increase the landscape polling interval for better performance. You can configure the interval by editing the value of domainPollingInterval in the context.xml file on the OneClick web server. The value of domainPollingInterval is the seconds between polls to the SpectroSERVER to determine its status.

To increase the polling interval, edit the domainPollingInterval value in the context.xml file (located in the <*$SPECROOT*>/tomcat/webapps/spectrum/META-INF directory). For example, to change the landscape polling interval to 60 seconds, change the value of domainPollingInterval from 10 to 60.

NOTE
For the changes to take effect, stop and restart the OneClick web server.

Change the Model Type for a Single Device Type

Changing the Model Type for a Single Device Type

You can use the NewMM.pl post-installation script to change the model type for a single device type automatically. This script preserves many key attributes, relationships, and other elements.

This procedure changes the model type for all models that have the same specified system Object ID and the same specified starting model type.

WARNING
Do not perform this procedure until you modify the model type mapping for the device type in the Device Certification utility. If you do not perform this procedure with the Device Certification utility, your changes cannot be communicated to the SpectroSERVER database, causing unexpected alarms. For information about using the Device Certification utility, see the Certification section.

Follow these steps:

1. Verify that the SpectroSERVER is running.
2. Run the following command from the *$SPECROOT*/Install-Tools/PostInstall/ directory:
   ```
   NewMM.pl -m
   ```
   NOTE
   On Windows, all necessary scripts must be run from a bash shell. They do not run as expected from a DOS command prompt.
3. Enter the host name or IP of the VNM and press Enter.
4. Enter the SpectroSERVER landscape handle when prompted, and press Enter.
5. Enter the system Object ID of the model when prompted, and press Enter.
6. Enter the current model type of the model when prompted, and press Enter.
7. Enter the model type that you want to change to when prompted, and press Enter.
   The model type is changed.
   The log file, NewMM_Log_*DATE*, is created in the *$SPECROOT*/Install-Tools/PostInstall/ directory.
8. To confirm the model type conversion, verify the following log file:
   ```
   NewMM_Log_DATE
   ```
   Model type for a single device type is modified.

Starting OneClick Web Server

Prepare the SpectroSERVER to Communicate With the OneClick Web Server

Make sure that the SpectroSERVER and OneClick can communicate with one another.

NOTE
Some service packs require updates to the SpectroSERVER and the OneClick web server. See the DX NetOps Spectrum Software Release Notice for more information.

Follow these steps:

1. Verify if the DX NetOps Spectrum version installed on the SpectroSERVER host is the same as the DX NetOps Spectrum version you are installing on the OneClick web server.
   To verify, navigate to <*$SPECROOT*>/Install-Tools and view the .history file using a text editor. If the version is different, install the same version of DX NetOps Spectrum.

   WARNING
   For each SpectroSERVER, there must be an entry in the .hostrc file for the computer hosting the OneClick web server. For more information, see OneClick Administration.
2. Ensure that all associated SpectroSERVERs are running.
3. Ensure that the computer on which you are installing the OneClick web server has host access to all associated SpectroSERVER computers. On each SpectroSERVER host:
   a. Launch the DX NetOps Spectrum Control Panel.
   b. Select Configure, Host Security.
   c. Ensure that the Server List contains either:
      - The host name of the designated OneClick host (OneClick Web Server)
      - A plus (+) sign (meaning unrestricted access)

      NOTE
      See OneClick Administration for more information.
4. Verify that you are connected by pinging the designated DX NetOps Spectrum host using its host name.
5. Designate an existing user as the OneClick administrator or create a OneClick administrator. Verify that this user is a valid administrator, as follows:
   a. Launch the DX NetOps Spectrum Control Panel.
   b. Select Control, Users.
   c. Verify that the user model designated as the OneClick administrator exists.
   d. If the user does not exist, select Create.
   e. Enter the user name in the User Name field, enter a password in the New Password and Confirm New Password fields, and click OK.
      The user is created as a super user and has access to all models and privileges.
   f. Click Close to exit the Users window.

      NOTE
      In a distributed environment, this administrative user must exist in all landscapes. For more information, see Distributed SpectroSERVER Administration.
6. Ensure that the computer on which you are installing the OneClick web server has access to the SpectroSERVER.
7. For all Windows platforms, ensure that you can resolve the SpectroSERVER host name from the OneClick web server by editing the local hosts file:
   a. Navigate to the C:\Windows\system32\drivers\etc directory.
   b. Open the hosts file with a text editor.
   c. Add entries per the comments in the hosts file.
   d. Save the file.
8. On Linux, ensure that you have host name resolution to the SpectroSERVER from the OneClick web server by editing the local hosts file. If you are not using a name service, edit your local hosts file as follows:

a. To test host name resolution, ping the DX NetOps Spectrum host using only the host part of its fully qualified domain name.
For example, to ping host.company.com, enter shell> ping host. If the ping fails, edit the file /etc/hosts to reflect the IP and name of the DX NetOps Spectrum host. The SpectroSERVER is prepared to communicate with OneClick.

Start DX NetOps Spectrum on Windows

After you install DX NetOps Spectrum, you can start DX NetOps Spectrum on Windows.

Click Start, Programs, CA, SPECTRUM, Administrator, Control Panel.

DX NetOps Spectrum starts and the DX NetOps Spectrum Control Panel appears.

Start DX NetOps Spectrum on Linux

After you install DX NetOps Spectrum, you can start DX NetOps Spectrum on Linux.

Follow these steps:

1. Navigate to the directory path where you installed DX NetOps Spectrum (for example, /usr/SPECTRUM/).
2. Set up your remote display, if needed.
3. Navigate to the bin directory and run the following command:
   ```
   ./SCP
   ```
   DX NetOps Spectrum starts and the DX NetOps Spectrum Control Panel appears.

Initiate a Remote Display of DX NetOps Spectrum

You can set up a Windows system to display DX NetOps Spectrum remotely when DX NetOps Spectrum is running on a Linux system. The Linux system must be installed with the applications that you want to display remotely on Windows. Also, the Linux system must be configured to support Telnet services. The Windows system must be configured to support a Telnet client.

NOTE
DX NetOps Spectrum supports one remote display session open at a time on a client system.

Follow these steps:

1. Ensure that the DX NetOps Spectrum Control Panel and any applications that you want to display remotely are installed on the Linux system. Also, ensure that they are configured to support remote display.
2. Click Run from the Windows Start menu.
   The Run window appears.
3. Run the following command:
   ```
   Telnet <linux host name>
   ```
   The Linux login dialog appears.
4. Log in to the Linux system using your DX NetOps Spectrum user name and password.
   The system reports your last login, host name, and operating system version. The Linux prompt follows.
5. To set the remote display environment, run the following commands:
   - In the K (default) shell, enter:
     ```
     export DISPLAY=<remote display hostname>:0.0
     ```
   - In the C shell, enter:
     ```
     setenv DISPLAY <remote display hostname>:0.0
     ```
   - In the Bourne shell, enter:
     ```
     DISPLAY=<remote display hostname>:0.0 export display
     ```

NOTE
For frequent use of remote display, you can avoid repeating this task at each login by adding the DISPLAY environment to your profile.

6. Navigate to the <*$SPECROOT*>/bin directory.
7. Enter the following command:
   ```
   ./SCP
   ```
   The DX NetOps Spectrum Control Panel appears, providing you with access to all DX NetOps Spectrum Control Panel functions, including access to client DX NetOps Spectrum applications.

Terminate a Remote Display of DX NetOps Spectrum

You can terminate a remote display of DX NetOps Spectrum.

Follow these steps:

1. Exit all remotely displayed DX NetOps Spectrum applications properly.
2. Enter exit at the prompt in the Telnet terminal window.
   The Telnet session is ended.

Launch the OneClick Console

This article describes how you can set up and start the OneClick client (OneClick Console).

Prerequisites

Review the following prerequisites:

1. Verify that your workstation meets the minimum OneClick Client Requirements for Windows and Linux.
2. Install JRE.
3. If necessary, associate the JNLP files with Java Web Start.

Launch the OnceClick Client (OneClick Console)

After the JRE and required Java components are installed, you can launch the OneClick Console. You can launch the OneClick Console from a browser on your computer where it (OneClick Console) is installed.

Follow these steps:

1. Open the OneClick home page in a browser using the URL that your administrator has provided. The URL has the following format:
   ```
   http://<hostname>:<portnumber>/
   ```
   NOTE
   <*hostname*> is the name of the OneClick web server. Use:<*portnumber*> only if the OneClick web server does not use the default port 80 on Windows or 8080 on Linux. If you cannot access the OneClick web server, notify your administrator.
2. Enter your OneClick login credentials, if prompted.
   The OneClick home page opens.

   NOTE
   Any date and time information that is shown in OneClick is localized to reflect the time zone where the OneClick client is installed and running.
3. Install JRE and JCEUnlimited Strength Files and Java Web Start if you have not done so already on Windows or Linux.
4. Click Start Console.

5. Enter your OneClick user name and password again, if prompted.
   OneClick starts and the OneClick Console opens.

Troubleshooting Installation Problems

DX NetOps Spectrum Installation fails due to spaces in the path

Symptom: DX NetOps Spectrum installation fails due to spaces in the absolute path (location) where the installer exe is placed. **Resolution:** You need to ensure that the folder in which the installation kit is copied and extracted does not have any spaces. DX NetOps Spectrum installation will fail if the installer (.exe) file is in a location with spaces in its absolute / full path.

Installation Media Does Not Contain Installation Information

Symptom:

The following message appears:

```
The <sp> installation media does not contain the installation information for this platform.
```

Solution:

This message appears when you do not have the correct installation media for the host platform. Use the DX NetOps Spectrum installation media of the platform on which you are installing.

<index file name> Cannot Be Found

Symptom:

I received the following error:

```
Error: <index file name> not found!
```

Solution:

One of the following conditions caused this error:

- Extraction of the Installation record from the distribution medium was incomplete.
- The Installation record files were improperly removed or modified before the installation.

Retry the installation. If the failure persists, contact Technical Support.

Received a Landscape Handle Error

Symptom:

The following message appears:

```
** Error during Set Landscape Handle
```

Solution:

The installation is unable to set the SpectroSERVER landscape handle value, which is a serious problem. Contact Technical Support.

Received an InvocationTargetException Error

Symptom:

The following message appears:

```
Invocation of this Java Application has caused an InvocationTargetException. This application will now exit.
 (LAX)

This Application has Unexpectedly Quit: Invocation of this Java Application has caused an
 InvocationTargetException. This application will now exit. (LAX)
```

Solution:

Your DISPLAY environment variable is not set to the host name of the system on which you are running the installation software. Set the environment variable correctly.

Received a Database Initialization Error

Symptom:

I received the following message:

```
** Error during Database Initialization
```

Solution:

The installation is unable to create the SpectroSERVER database, which is a serious problem. Contact Technical Support.

Received a Database Saving Error

Symptom:

The following message appears:

```
** Error during Database save as db_<extension>
```

Solution:

The installation is unable to save the existing SpectroSERVER database. The most likely cause is that the SpectroSERVER database is write-protected or does not exist (for example, the database was deleted).

To make the SpectroSERVER database writable, use the chmod utility. Then, reinstall DX NetOps Spectrum. If this procedure does not work, contact Technical Support.

Received a VNMRC File Processing Error

Symptom:

The following message appears:

```
** Error during Processing of vnmrc file
```

Solution:

The installation is unable to set values properly in the SpectroSERVER defaults file, SS/.vnmrc. This problem cannot be resolved at the installation site. Contact Technical Support.

Installation Owner User Problems

Valid on Linux

Symptom:

I have installation owner user problems.

Solution:

Follow these steps:

1. Verify the name resolution (without the domain name) to the <*DX NetOps Spectrum host*>.
2. Select Users from the Control menu in the DX NetOps Spectrum Control Panel and verify that the installation owner appears in the Users dialog.
3. Verify that the same version of DX NetOps Spectrum is installed on the computers where OneClick and the SpectroSERVER are installed.

OneClick Web Server Error Message

Symptom:

The resource at http://<*server*>/spectrum/index.jsp was not found. Authorization could not be completed.

Solution:

You could have another Web services application running on the same port Apache Tomcat is attempting to use. Stop (and disable, if necessary) the other application and associated services and restart the Apache Tomcat service.

OneClick Web Server Shuts Down

Symptom:

I upgraded to VMware 2.0 and it runs an Apache Tomcat server of its own. After I install the OneClick web server, the OneClick web server shuts down when it attempts to bind to port 8005. Then, I receive the following error message:

```
- StandardServer.await: create[8005]:
java.net.BindException: Address already in use: JVM_Bind
```

Solution:

By default, Apache Tomcat uses port 80 on Windows platforms and port 8080 on Linux platforms. If SSL is configured, Apache Tomcat uses port 443. Apache Tomcat also uses the default server shutdown port 8005. When installing the OneClick web server, be sure that other applications on the same computer do not use these ports. Or, you can change the ports on the instance of Apache Tomcat that DX NetOps Spectrum uses.

NOTE
We recommend that you do *not* install the OneClick web server on a computer where an instance of Apache Tomcat is already running.

Troubleshooting OneClick Client Problems

This section lists troubleshooting information for some of the common problems encountered with respect to the OneClick Client.

Odd OneClick Behavior

Symptom:

After I upgrade DX NetOps Spectrum, I notice that the OneClick client is behaving oddly on one of my computers.

Solution:

Try to reproduce the problem on another computer where OneClick has not been used. If you cannot reproduce the problem on this computer, the Java cache most likely did not update during the DX NetOps Spectrum upgrade.

On the computer where the OneClick client exhibits this problem, clear the java cache:

1. Access the Java Control Panel:
   - On Windows platforms, click Start, Control Panel, and then double-click Java.
   - On Linux platforms, launch <*JRE install directory*>/bin/jcontrol.
2. Click the View button under Temporary Internet Files on the General tab.
3. Select the DX NetOps Spectrum OneClick Console Application and click the X button in the toolbar.
   The selected item is removed.

OneClick Client Fails to Launch

Symptom:

I tried to launch OneClick, but it failed to start.

Solution:

When installing the JRE, which includes Java Web Start, on Windows, the default cache directory is the installing home directory of the user. However, if any part of the full path of the home directory, including the username, includes the exclamation character (!), OneClick fails to launch properly.

Follow these steps:

1. Click Start, Control Panel, and then double-click Java.
2. Select the General tab and then click Settings.
3. Click Change to change the location where temporary files are located. Select a path that does not include the exclamation character.

Solution:

Your server already had a Java version installed when you tried to launch OneClick for the first time after installation. Each time OneClick is launched, a check for a minimum version of Java is performed. Typically, you see a prompt asking you to update the JRE when required. But sometimes, this update fails.

If your inability to launch the OneClick client is related to a failed update of the JRE, install the software by clicking "**Install JRE and JCEUnlimited Strength Files**" on the OneClick home page. This link calls up a page with a link to the required version of the JRE.

OneClick Console Does Not Open (Windows)

Valid on Windows

Symptom:

I tried to launch the OneClick Console. The Java splash screen appeared but vanished, and the OneClick Console did not open.

Solution:

The JRE is not installed correctly. The OneClick client server must have the correct JRE version. If you are upgrading from a previous release, an older version of Java is already installed in the default Windows location, C:\Program Files \Jave\jre6. That version is causing the problem.

Follow these steps:

1. Repeat the procedure that is outlined in Install JRE and JCEUnlimited Strength Files, and Java Web Start on Windows. However, when installing the JRE, select a location other than the default or the existing location.
2. After installation is complete, shut down any existing OneClick clients.
3. Clear the cache of old jar files to run the OneClick Console using the new version of Java:
   a. In the Windows Start, Run dialog, type **javaws -viewer** and click OK.
   The Java Control Panel and the Java Cache Viewer dialogs open.
   b. Review the applications in the cache on the Java Cache Viewer dialog, delete any existing OneClick applications in this view, and click Close.
   c. On the Java Control Panel dialog on the General tab, click Settings in the Temporary Internet Files section.
   The Temporary Files Settings dialog opens.
   d. Take one of the following steps:
      - If the option to 'Keep temporary files on my computer' is selected, click Delete Files. Verify that the Applications and Applets option on the Delete Temporary Files dialog is selected, and click OK.
      - If the option is cleared, manually delete the temporary files. Navigate to your <*Windows home directory*>\Local Settings\Temp folder and delete all 'jar_temp<number>' files.
4. Start a new OneClick Console.

Firefox Download Error Dialog (Linux)

Valid on Linux

Symptom:

I get the Firefox Download Error dialog when I attempt to start the OneClick Console.

Solution:

The Firefox Download Error dialog opens when you attempt to start the OneClick Console due to one of the following conditions:

- The correct JRE version is not installed on the Linux system.
- The correct JRE version is not configured properly.
- The .jnlp file type is not associated with the JavaWS application.

Follow these steps:

1. Verify that the correct JRE version is installed on the Linux OneClick Console system. If the JRE is installed, go to the next step. If it is not installed, follow the instructions in Install JRE, JCEUnlimited Strength Files, and Java Web Start on Linux to install the JRE and required Java components.
2. Configure the Firefox browser to associate .jnlp file types with the JavaWS application:
   a. In a Firefox browser window, click Edit, and Preferences.

The Preferences dialog opens.

b. Click Downloads.
c. Click View, and Edit in the Download Actions section.
The Download Actions dialog opens.
d. Locate the entry for the JNLP extension. Verify that the action associated with the file type is Open with JavaTM Web Start Launcher. This association is made when installing the JRE. If a different association is listed, click Change Action.
The Change Action dialog opens.
e. Select 'Open them with this application', and click Browse, if necessary.
The Select Helper Application dialog opens.
f. Select javaws from the location where you installed it, and click OK.
g. Click Close.

3. Click OK.

OneClick Fails to Start, Access Denied (Windows)

Valid on Windows

Symptom:

I tried to launch OneClick, but OneClick failed to start. I received the following error:

```
opening oneclick.jnlp...
Access to the specified device, path, or file is denied.
```

Solution:

The .jnlp file type is not associated with the javaws.application. Verify that the .jnlp file extension is mapped to the javaws.exe application.

Cannot Log In to OneClick Client

Symptom:

I am unable to log in either at the OneClick home page (that is, http://<*hostname*>/spectrum or *http://*<*hostname*>:<*portnumber*>/spectrum), or when launching the OneClick client.

Solution:

Check for these common problems:

1. Does the user name that is entered at login represent a valid user?
2. Does the user exist at the main location server?
3. Is the SpectroSERVER, or the secondary SpectroSERVER, running properly?
4. On the primary SpectroSERVER, does the user have either the administrator or operator role? To verify the user role, select the Users tab in the OneClick Console.
5. Is the password correct? To verify the user password, select the Users tab in the OneClick Console.

OneClick throws exceptions when spectrumgtw probe sends a large payload

Symptom:

When spectrumgtw probe sends large payload to SpectroSERVER during the Host server sync, the OneClick throws exceptions.

Solution:

From 10.4.1, you can customize the maximum size of the payload that you want to receive from spectrumgtw probe to SpectroSERVER during the Host server sync. Set the `org.apache.cxf.stax.maxInputSizeInMB` parameter to a desired value in the `Spectrum_HOME\tomcat\webapps\spectrum\WEB-INF\web.xml` file.
Default: 8 MB

Upgrading

> **NOTE**
>
> See, the DX NetOps Spectrum Patch General Information page for detailed steps on DX NetOps Spectrum patch installation.

Get Started and Upgrade to 10.4.2.2!

Upgrade Path 10.4.2.2

The DX NetOps Spectrum 10.4.2.2 version is the same as DX NetOps 20.2.5 release.

> **IMPORTANT**
> You must first install 10.4.2 as the base version to install DX NetOps Spectrum 10.4.2.2 release.

> **NOTE**
> For more information on the upgrade process, see Upgrade to 10.4.2

Features and Enhancements in Current Release

For more information about the new features and enhancements in the current release, see the Features and Enhancements page.

Get Started and Upgrade to 10.4.2.1!

Upgrade Path 10.4.2.1

> **IMPORTANT**
> You must first install 10.4.2 as the base version to install DX NetOps Spectrum 10.4.2.1 release.

> **NOTE**
> For more information on the upgrade process, see Upgrade to 10.4.2

Features and Enhancements in Current Release

For more information about the new features and enhancements in the current release, see the Features and Enhancements page.

Get Started and Upgrade to 10.4.2!

Considerations

- Before upgrading to 10.4.2, if **-loglevel debug** is enabled in sdm.config, you must remove it. Once SpectroSERVER and the corresponding Secure Domain Connector (SDC) are upgraded, you can add it back.
- For 10.4.2, ensure that SDC and Secure Domain Manager (SDM) have the same version.
- During an upgrade scenario, when SpectroSERVER is getting upgraded, stop the SDC services. Once SpectroSERVER is upgraded, you can then upgrade SDC to 10.4.2.
- While performing modeling gateway operations from 10.2.0 or 10.2.1 to 10.4.2, remove all entries of SNMPv3 profiles and import on 10.4.2. After upgrade, create SNMPv3 profiles manually.

Integration Compatibility Matrix

To know more about version compatibility of other integrated products with this release of DX NetOps Spectrum, see the Integration Compatibility chart.

Upgrade Path

10.4.2 is a full release. You can directly upgrade to 10.4.2 from 10.2.x, 10.3.x, and 10.4.x releases (for example, 10.2, 10.2.1, 10.2.2, 10.2.3, 10.3, 10.3.1, 10.3.2, 10.4, and 10.4.1). You do not need to install any other releases or patches.

Features and Enhancements in Current Release

For more information about the new features and enhancements in the current release, see the Features and Enhancements page.

Platform Updates

For third-party software updates in this release, see the third-party software page.

FAQs

Q: In a distributed SS (DSS) environment, what is the supported and best practice for upgrading servers?

A: Upgrade the Primary MLS (main location server) SpectroSERVER first, followed by the Primary OneClick server, followed by the remaining Primary SpectroSERVERs. It is important that you start the primary MLS first, before starting the other primary SpectroSERVERs. This allows all of the cross landscape and "MOM" (manager of managers) functions to process and complete. Once the primary MLS is running and active, you can start the rest of the primaries. Upgrade the Secondary SpectroSERVERs last (including all SpectroSERVER and non-primary OneClick servers). Once all SpectroSERVERs have been upgraded, be sure to stop and restart all DX NetOps Spectrum OneClick Tomcat processes again to update the Tomcat cache with the updated SS info. Not doing this will cause OneClick issues, such as landscapes not showing in the client.

> **NOTE**
> In a DSS setup, if you stop a primary SS to test your failover scenario without performing a successful database synchronization (via online backup) first, you may see the landscapes disappear in OneClick. To make sure this does not happen, manually start the online backup and allow the database synchronization to occur. Once complete, you can then test your failover scenario.

Upgrade to 10.4.2

This section provides information about how you can upgrade to this release.

Prerequisites

Before you upgrade to the latest version of DX NetOps Spectrum, perform the following tasks:

1. Review the best practices for upgrading in a fault-tolerant and non-fault tolerant environments. Also, preserve the customized support files.
2. Stop all running applications other than DX NetOps Spectrum.
3. Stop the following DX NetOps Spectrum applications:
   - Shut down all OneClick clients by logging off all users from OneClick on the Client Details web page in the OneClick home page.

     NOTE

     For more information about shutting down OneClick clients, see OneClick Administration.
   - Stop the SpectroSERVER and the Archive Manager by clicking Stop SpectroSERVER in the Spectrum Control Panel and then close the Spectrum Control Panel. Or you can stop the SpectroSERVER and Archive Manager from the command line by running the "<$SPECROOT>/bin/stopSS.pl" as DX NetOps Spectrum Owner at the command prompt.
   - Stop all VnmSh connections. For more information about stopping VnmSh connections, see Command Line Interface.
   - Close all Bash shells.
   - Ensure the 'Java' folder is not opened (under <$SPECROOT>) during the upgrade.
4. If you have installed DX NetOps Spectrum Report Manager, verify that free disk space on the system is at least twice the size of the largest MYD file under *$SPECROOT*/mysql/data/reporting.
5. Do not install third-party software that uses MySQL because the results can be unpredictable.

Upgrade Procedure

Upgrading from a previous version of DX NetOps Spectrum to the latest one can be complex, because each release promises higher quality with the latest technologies and services. Ensure that you go through the upgrade options that best suit your requirements.

1. You can perform either:
   - In Place Upgrade (With no fault-tolerant SpectroSERVERs configured in your deployment, a temporary fault-tolerant system is used during the upgrade. Once the temporary system is configured, the primary SpectroSERVER is disabled for an in-place upgrade. Meanwhile, the temporary, secondary SpectroSERVER system takes over core network management duties).
   - Upgrade Models to ensure compatibility between the SpectroSERVER database and a new version of DX NetOps Spectrum after upgrading.
2. Download the release.
   a. Sign in to the support portal.
   b. Click Enterprise Software.
   c. Click Product Downloads.
   d. Enter the product name in the search bar and click the search icon.
   e. Click the link that is displayed after the search is completed.
   f. Select the release to download.
3. Install DX NetOps Spectrum.
4. Review the post-installation configurations.

Post Upgrade Tasks

- Archive Manager Database (DDM Database) Tables Conversion: With the previous release, it is recommended that you convert your Archive Manager database tables from MyISAM to InnoDB for better performance. Refer to this section at the end of this page, for more information.
- Migration Upgrade (Best Practice - Preserve Customized Support Files)
- Upgrading Models to ensure compatibility between the SpectroSERVER database and a new version of DX NetOps Spectrum after upgrading.

Other Upgrade Tasks

- If you have configured OneClick to launch from Report Manager using SSL, configure this modification again. For more information about this modification, see OneClick Administration.
- If any models display Minor (yellow) alarms with a probable cause of DIFFERENT TYPE MODEL, clear the alarms. To convert all eligible models, run the NewMM.pl script from the Spectrum\Install-Tools\PostInstall directory. For more information, see Troubleshooting the Post-Upgrade Installation Script.

Get Started and Upgrade to 10.4.1!

Considerations

- Before upgrading to 10.4.1, if **-loglevel debug** is enabled in sdm.config, you must remove it. And, once SpectroSERVER and corresponding Secure Domain Connector (SDC) are upgraded, you can add it back.
- For 10.4.1, ensure that SDC and Secure Domain Manager (SDM) have the same version.
- During an upgrade scenario, when SpectroSERVER is getting upgraded, stop the SDC services. And, once SpectroSERVER is upgraded, you can then upgrade SDC to 10.4.1.
- While performing modeling gateway operations from 10.2.0 or 10.2.1 to 10.4.1, remove all entries of SNMPv3 profiles and import on 10.4.1. After upgrade, create SNMPv3 profiles manually.

Integration Compatibility Matrix

To know more about version compatibility of other integrated products with DX NetOps Spectrum 10.4.1, see the Integration Compatibility chart.

Upgrade Path

10.4.1 is a full release. You can directly upgrade to 10.4.1 from 10.2.x, 10.3.x, and 10.4 releases (for example, 10.2,10.2.1,10.2.2, 10.2.3, 10.3, 10.3.1, 10.3.2, 10.4). You do not need to install any other releases or patches.

FAQs

Q: In a distributed SS (DSS) environment, what is the supported and best practice for upgrading servers?

A: Upgrade the Primary MLS (main location server) SpectroSERVER first, followed by the Primary OneClick server, followed by the remaining Primary SpectroSERVERs. It is important that you start the primary MLS first, before starting the other primary SpectroSERVERs. This allows all of the cross landscape and "MOM" (manager of managers) functions to process and complete. Once the primary MLS is running and active, you can start the rest of the primaries. Upgrade the Secondary SpectroSERVERs last (including all SpectroSERVER and non-primary OneClick servers). Once all SpectroSERVERs have been upgraded, be sure to stop and restart all DX NetOps Spectrum OneClick Tomcat processes again to update the Tomcat cache with the updated SS info. Not doing this will cause OneClick issues, such as landscapes not showing in the client.

NOTE

In a DSS setup, if you stop a primary SS to test your failover scenario without performing a successful database synchronization (via online backup) first, you may see the landscapes disappear in OneClick. To make sure this does not happen, manually start the online backup and allow the database synchronization to occur. Once complete, you can then test your failover scenario.

Features and Enhancements in Current Release

For more information about the new features in the current release, see the Features and Enhancements page.

Platform Updates

For third-party software updates in this release, see the third-party software page.

Upgrade to 10.4.1

This section provides information about how you can upgrade to this release.

Prerequisites

Before you upgrade to the latest version of DX NetOps Spectrum, perform the following tasks:

1. Review the best practices for upgrading in a fault-tolerant and non-fault tolerant environments. Also, preserve the customized support files.
2. Stop all running applications other than DX NetOps Spectrum.
3. Stop the following DX NetOps Spectrum applications:
   - Shut down all OneClick clients by logging off all users from OneClick on the Client Details web page in the OneClick home page.

     NOTE

     For more information about shutting down OneClick clients, see OneClick Administration.
   - Stop the SpectroSERVER and the Archive Manager by clicking Stop SpectroSERVER in the Spectrum Control Panel and then close the Spectrum Control Panel. Or you can stop the SpectroSERVER and Archive Manager from the command line by running the "<$SPECROOT>/bin/stopSS.pl" as DX NetOps Spectrum Owner at the command prompt.
   - Stop all VnmSh connections. For more information about stopping VnmSh connections, see Command Line Interface.
   - Close all Bash shells.
   - Ensure the 'Java' folder is not opened (under <$SPECROOT>) during the upgrade.
4. If you have installed DX NetOps Spectrum Report Manager, verify that free disk space on the system is at least twice the size of the largest MYD file under *$SPECROOT*/mysql/data/reporting.
5. Do not install third-party software that uses MySQL because the results can be unpredictable.

Upgrade Procedure

Upgrading from a previous version of DX NetOps Spectrum to the latest one can be complex, because each release promises higher quality with the latest technologies and services. Ensure that you go through the upgrade options that best suit your requirements.

1. You can perform either:
   - In Place Upgrade (With no fault-tolerant SpectroSERVERs configured in your deployment, a temporary fault-tolerant system is used during the upgrade. Once the temporary system is configured, the primary SpectroSERVER

is disabled for an in-place upgrade. Meanwhile, the temporary, secondary SpectroSERVER system takes over core network management duties).
   - Upgrade Models to ensure compatibility between the SpectroSERVER database and a new version of DX NetOps Spectrum after upgrading.
2. Download the release.
   a. Sign in to the support portal.
   b. Click Enterprise Software.
   c. Click Product Downloads.
   d. Enter the product name in the search bar and click the search icon.
   e. Click the link that is displayed after the search is completed.
   f. Select the release to download.
3. Install DX NetOps Spectrum.
4. Refer to the post-installation configurations.

Post Upgrade Tasks

- Archive Manager Database (DDM Database) Tables Conversion: With the previous release, it is recommended that you convert your Archive Manager database tables from MyISAM to InnoDB for better performance. Refer to this section at the end of this page, for more information.
- Migration Upgrade (Best Practice - Preserve Customized Support Files)
- Upgrading Models to ensure compatibility between the SpectroSERVER database and a new version of DX NetOps Spectrum after upgrading.

Other Upgrade Tasks

- If you have configured OneClick to launch from Report Manager using SSL, configure this modification again. For more information about this modification, see OneClick Administration.
- If any models display Minor (yellow) alarms with a probable cause of DIFFERENT TYPE MODEL, clear the alarms. To convert all eligible models, run the NewMM.pl script from the Spectrum\Install-Tools\PostInstall directory. For more information, see Troubleshooting the Post-Upgrade Installation Script.

Get Started and Upgrade to 10.4!

Integration Compatibility Matrix

For more information about the integration of DX NetOps Spectrum with other CA products, see Integration Compatibility.

Upgrade Path

10.4 is a full release. You can directly upgrade to 10.4 from 10.0 or later releases (for example, 10.0, 10.1, 10.1.x, 10.2, 10.2.x, 10.3, 10.3.x). and so on. You do not need to install any other releases or patches.

FAQs

Q: In a distributed SS (DSS) environment, what is the supported and best practice for upgrading servers?

A: Upgrade the Primary MLS (main location server) SpectroSERVER first, followed by the Primary OneClick server, followed by the remaining Primary SpectroSERVERs. It is important that you start the primary MLS first, before starting the other primary SpectroSERVERs. This allows all of the cross landscape and "MOM" (manager of managers) functions to process and complete. Once the primary MLS is running and active, you can start the rest of the primaries. Upgrade the Secondary SpectroSERVERs last (including all SpectroSERVER and non-primary OneClick servers). Once all SpectroSERVERs have been upgraded, be sure to stop and restart all DX NetOps Spectrum OneClick tomcat

processes again to update the tomcat cache with the updated SS info. Not doing this will cause OneClick issues, such as landscapes not showing in the client.

> **NOTE**
>
> In a DSS setup, if you stop a primary SS to test your failover scenario without performing a successful database synchronization (via online backup) first, you may see the landscapes disappear in OneClick. To make sure this does not happen, manually start the online backup and allow the database synchronization to occur. Once complete, you can then test your failover scenario.

Features and Enhancements in 10.4

- Replaced Oracle JDK with AdoptOpenJDK Java (1.8.0.212)

Get Started and Upgrade to 10.3.2!

Integration Compatibility Matrix

To know more about version compatibility of other integrated products with 10.3.2, see the compatibility matrix chart.

Platform Updates

Third-party software updates for this release include:

- MySQL Workbench 8.0.15
- Apache Tomcat 9.0.14
- Struts 2.5.20
- WebSwing 2.5.10

FAQs

Q: In a distributed SS (DSS) environment, what is the supported and best practice for upgrading servers?

A: Upgrade the Primary MLS (main location server) SpectroSERVER first, followed by the Primary OneClick server, followed by the remaining Primary SpectroSERVERs. It is important that you start the primary MLS first, before starting the other primary SpectroSERVERs. This allows all of the cross landscape and "MOM" (manager of managers) functions to process and complete. Once the primary MLS is running and active, you can start the rest of the primaries.
Upgrade the Secondary SpectroSERVERs last (including all SpectroSERVER and non-primary OneClick servers).
Once all SpectroSERVERs have been upgraded, be sure to stop and restart all DX NetOps Spectrum OneClick tomcat processes again to update the tomcat cache with the updated SS info. Not doing this will cause OneClick issues, such as landscapes not showing in the client.

> **NOTE**
>
> In a DSS set up, if you stop a primary SS to test your failover scenario without performing a successful database synchronization (via online backup) first, you may see the landscapes disappear in OneClick. To make sure this does not happen, manually start the online backup and allow the database synchronization to occur. Once complete, you can then test your failover scenario.

Features and Enhancements in 10.3.2

- SSL support for the Overview Dashboard
- Enablement of TrapX in SDC – SNMPv3 support
- Cisco Meraki Support
- AWS Monitoring
- Quality Enhancements

Upgrade to 10.3.2 from 10.3.0

NOTE

To install 10.3.2, first install 10.3.0, as a base version.

NOTE

To install 10.3.2, first install 10.3.0, as a base version. DX NetOps Spectrum users who are on 10.0 or 10.1.x releases are advised to upgrade to the intermediary major release such as 10.2.0 and then directly upgrade to 10.3. to ensure a stable upgrade and migration process devoid of any loss of data or failure of any functionality.

Best Practices

- Best Practices for upgrading in a fault-tolerant and non-fault tolerant environments.
- Preserve Customized Support Files

Pre-Upgrade Tasks

Before you upgrade to the latest version of DX NetOps Spectrum, ensure you:

1. Are familiar with the best practices that are mentioned above.
2. Stop all running applications other than DX NetOps Spectrum.
3. Stop the following DX NetOps Spectrum applications:
   - Shut down all OneClick clients by logging off all users from OneClick on the Client Details web page in the OneClick home page.

     NOTE

     For more information about shutting down OneClick clients, see OneClick Administration.
   - Stop the SpectroSERVER and the Archive Manager by clicking Stop SpectroSERVER in the Spectrum Control Panel and then close the Spectrum Control Panel. Or you can stop the SpectroSERVER and Archive Manager from the command line by running the "<$SPECROOT>/bin/stopSS.pl" as DX NetOps Spectrum Owner at the command prompt.
   - Stop all VnmSh connections. For more information about stopping VnmSh connections, see Command Line Interface.
   - Close all Bash shells.
   - Ensure the 'Java' folder is not opened (under <$SPECROOT>) during the upgrade.
4. If you have installed DX NetOps Spectrum Report Manager, verify that free disk space on the system is at least twice the size of the largest MYD file under *$SPECROOT*/mysql/data/reporting.
5. Do not install third-party software that uses MySQL because the results can be unpredictable.

Upgrade Procedure from 10.3.0

Upgrading from a previous version of DX NetOps Spectrum to the latest one, can be complex, because each release promises higher quality with the latest technologies and services. Ensure that you go through the upgrade options that best suit your requirement.

1. You can perform either:
   - In Place Upgrade (With no fault-tolerant SpectroSERVERs configured in your deployment, a temporary fault-tolerant system is used during the upgrade. Once the temporary system is configured, the primary SpectroSERVER is disabled for an in-place upgrade. Meanwhile, the temporary, secondary SpectroSERVER system takes over core network management duties).
   - Upgrade Models to ensure compatibility between the SpectroSERVER database and a new version of DX NetOps Spectrum after upgrading.

2. Download the release.
   a. Sign in to the support portal.
   b. Click Enterprise Software.
   c. Click Product Downloads.
   d. Enter the product name in the search bar and click the search icon.
   e. Click the link that is displayed after the search is completed.
   f. Select the release to download.
3. Install DX NetOps Spectrum.
4. Refer to the post-installation configurations.

Post Upgrade Tasks

- Archive Manager Database (DDM Database) Tables Conversion: With the previous release of 10.3.0, it is recommended that you convert your Archive Manager database tables from MyISAM to InnoDB for better performance. Refer to this section at the end of this page, for more information.
- Migration Upgrade (Best Practice - Preserve Customized Support Files)
- Upgrading Models to ensure compatibility between the SpectroSERVER database and a new version of DX NetOps Spectrum after upgrading.

Other Upgrade Tasks

- If you have configured OneClick to launch from Report Manager using SSL, configure this modification again. For more information about this modification, see OneClick Administration.
- If any models display Minor (yellow) alarms with a probable cause of DIFFERENT TYPE MODEL, clear the alarms. To convert all eligible models, run the NewMM.pl script from the CA Spectrum\Install-Tools\PostInstall directory. For more information, see Troubleshooting the Post-Upgrade Installation Script.

Get started and upgrade to 10.3.1!

Special Considerations

NOTE

When upgrading from 10.3 to 10.3.1, ensure you reconfigure and perform a fresh 'Topology Store Configuration' integration on 10.3.1. Upgrading from 10.3 to 10.3.1 without reconfiguration, breaks the 'Topology Store Configuration" integration. To reconfigure, first, disable and then enable this integration by providing a username and password.

NOTE

When upgrading to 10.3.1 from 10.3 (directly) or 10.2.x (indirectly), if there were any alarms on the devices managed through Secure Domain Connector (SDC), those alarms will not be correlated to SDC lost alarm and only the newly generated alarms will be correlated, post-upgrade.

In SDC FT scenario if both SDCs are down then only device down alarms will be correlated to the "Secure Domain Lost" alarm.

- This release supports direct upgrades only from 10.3. If you are upgrading from 10.2.x ensure you first upgrade to 10.3 which is the base version to upgrade to 10.3.1.
- We recommend that you upgrade from 10.1.x versions to a supported version of DX NetOps Spectrum by **December 2018**, to avoid 'gold key' expiration issues. For more information and guidance contact CA Support.
- 10.0 is now end of support, we recommend that you upgrade to 10.2 or 10.2.x before upgrading to 10.3. and 10.3.1
- If you are on r9.2.x or older, upgrade to r9.4 before upgrading to 10.3. and then to 10.3.1

Integration Compatibility Matrix

To know more about version compatibility with other integrated products, see the compatibility matrix chart.

Platform Updates

Third-party Software updates for this release include:

- CAPKI 5.2.5
- Struts 2.3.36
- Apache httpd 2.4.35
- JRE 8.192
- WebSwing 2.5.5
- Cygwin 2.11.2
- Tomcat 9.0.8
- RHEL 7 Container - 7.4
- MYSQL backup - 4.1.2

FAQs

Q: In a distributed SS (DSS) environment, what is the supported and best practice for upgrading servers?

A: Upgrade the Primary MLS (main location server) SpectroSERVER first, followed by the Primary OneClick server, followed by the remaining Primary SpectroSERVERs. It is important that you start the primary MLS first, before starting the other primary SpectroSERVERs. This allows all of the cross landscape and "MOM" (manager of managers) functions to process and complete. Once the primary MLS is running and active, you can start the rest of the primaries.
Upgrade the Secondary SpectroSERVERs last (including all SpectroSERVER and non-primary OneClick servers). Once all SpectroSERVERs have been upgraded, be sure to stop and restart all DX NetOps Spectrum OneClick tomcat processes again to update the tomcat cache with the updated SS info. Not doing this will cause OneClick issues, such as landscapes not showing in the client.

> **NOTE**
>
> In a DSS setup, if you stop a primary SS to test your failover scenario without performing a successful database synchronization (via online backup) first, you may see the landscapes disappear in OneClick. To make sure this does not happen, manually start the online backup and allow the database synchronization to occur. Once complete, you can then test your failover scenario.

Features and Enhancements

DX NetOps Spectrum continues to delight its customers with new features and quality improvements. With the newly introduced release of 10.3.1, our customers can now benefit from the following features:

- About OneClick WebApp (Webswing)
- NCM Capture Using SSH Commands
- VNA Integration
- Monitoring SD-WAN for Viptela and Versa
- DX NetOps Spectrum integration with CA APM (SaaS)
- CA Remote Engineer Tool Enhancements
- Discover Connections Only toward Access Points
- Support for Dynamic VPN (DMVPN)
- SpectrumDataPublisher Enhancements
- DX NetOps Spectrum-CA UIM Integration Enhancements
- Dockerization Enhancements

NOTE

Find out how this release differs from the version you are currently on by referring to the release comparison chart.

Upgrade to 10.3.1 from 10.2.x or 10.3

NOTE
It is recommended that you first install 10.3.0 as a base version, to install 10.3.1. Direct upgrades to 10.3.1 from 10.2.x are also supported. DX NetOps Spectrum users who are on 10.0 or 10.1.x releases are advised to upgrade to the intermediary major release such as 10.2.0 and then directly upgrade to 10.3. to ensure a stable upgrade and migration process devoid of any loss of data or failure of any functionality.

Best Practices

- Best Practices for upgrading in a fault-tolerant and non-fault tolerant environments.
- Preserve Customized Support Files

Pre-Upgrade Tasks

Before you upgrade to the latest version of DX NetOps Spectrum, ensure you:

1. Are familiar with the best practices that are mentioned above.
2. Stop all running applications other than DX NetOps Spectrum.
3. Stop the following DX NetOps Spectrum applications:
   - Shut down all OneClick clients by logging off all users from OneClick on the Client Details web page on the OneClick home page.

     NOTE

     For more information about shutting down OneClick clients, see OneClick Administration.
   - Stop the SpectroSERVER and the Archive Manager by clicking Stop SpectroSERVER in the Spectrum Control Panel and then close the Spectrum Control Panel. Or you can stop the SpectroSERVER and Archive Manager from the command line by running the "<$SPECROOT>/bin/stopSS.pl" as CA Spectrum Owner at the command prompt.
   - Stop all VnmSh connections. For more information about stopping VnmSh connections, see Command Line Interface.
   - Close all Bash shells.
   - Ensure the 'Java' folder is not opened (under <$SPECROOT>) during the upgrade.
4. If you have installed DX NetOps Spectrum Report Manager, verify that free disk space on the system is at least twice the size of the largest MYD file under *$SPECROOT*/mysql/data/reporting.
5. Do not install third-party software that uses MySQL because the results can be unpredictable.

Upgrade Procedure from 10.2.x or 10.3.0

Upgrading from a previous version of DX NetOps Spectrum to the latest one, can be complex, because each release promises higher quality with the latest technologies and services. Ensure that you go through the upgrade options that best suit your requirement.

1. You can perform either:
   - In Place Upgrade (With no fault-tolerant SpectroSERVERs configured in your deployment, a temporary fault-tolerant system is used during the upgrade. Once the temporary system is configured, the primary SpectroSERVER is disabled for an in-place upgrade. Meanwhile, the temporary, secondary SpectroSERVER system takes over core network management duties).
   - Upgrade Models to ensure compatibility between the SpectroSERVER database and a new version of DX NetOps Spectrum after upgrading.

2. Download the release.
   a. Sign in to the support portal.
   b. Click Enterprise Software.
   c. Click Product Downloads.
   d. Enter the product name in the search bar and click the search icon.
   e. Click the link that is displayed after the search is completed.
   f. Select the release to download.
3. Install DX NetOps Spectrum.
4. Refer to the post-installation configurations.

Post Upgrade Tasks

- Archive Manager Database (DDM Database) Tables Conversion: With the previous release of 10.3.0, it is recommended that you convert your Archive Manager database tables from MyISAM to InnoDB for better performance. Refer to this section, at the end of this page, for more information.
- Migration Upgrade (Best Practice - Preserve Customized Support Files)
- Upgrading Models to ensure compatibility between the SpectroSERVER database and a new version of DX NetOps Spectrum after upgrading.

Other Upgrade Tasks

- If you have configured OneClick to launch from Report Manager using SSL, configure this modification again. For more information about this modification, see OneClick Administration.
- If any models display Minor (yellow) alarms with a probable cause of DIFFERENT TYPE MODEL, clear the alarms. To convert all eligible models, run the NewMM.pl script from the CA Spectrum\Install-Tools\PostInstall directory. For more information, see Troubleshooting the Post-Upgrade Installation Script.

Get Started and Upgrade to 10.3.0!

Special Considerations

- This release supports direct upgrades only from 10.2 and 10.2.x.
- We recommend that you upgrade from 10.1.x versions to a supported version of DX NetOps Spectrum by **December 2018**, to avoid 'gold key' expiration issues. For more information and guidance contact CA Support.
- 10.0 is now end of support, we recommend that you upgrade to 10.2 or 10.2.x before upgrading to 10.3.
- If you are on r9.2.x or older, upgrade to r9.4 before upgrading to 10.3.

Integration Compatibility Matrix

To know more about version compatibility with other integrated products, see the compatibility matrix chart.

Platform Support

- 10.3 is supported on Windows 2016. Installation of any component of DX NetOps Spectrum (OneClick, SpectroSERVER, SDC) is supported on this platform and functions as usual.
- 10.3 does not support the following platforms:
  – Solaris
  – BOXI
  – Windows 2008 and
  – RHEL 5.x platforms

Installation on these platforms fails and returns an error. Ensure that you upgrade to the recommended platforms.

Features and Enhancements

DX NetOps Spectrum continues to delight its customers with new features and quality improvements. With the newly introduced release of 10.3.0, our customers can now benefit from the following features:

- DX NetOps Spectrum Dockerization
- DX NetOps Spectrum and CA Digital Operational Intelligence Integration
- Multi-tenant-SRM with Jaspersoft®
- DDMDB Performance Improvements
- Filtering Interfaces
- Support for DHCP
- Enhanced CDP & LLDP Discoveries
- Co-existence of CA VNA and CA UIM Integration for VMWare® Entities
- DX NetOps Spectrum-CA UIM Integration Enhancements
- Modeling Gateway Enhancements
- Syslog Monitoring Enhancements
- Monitoring Profile Enhancements
- API Performance enhancement
- SCOM 2016 Support
- Platform and third-party product updates
- Device Certification Updates

Upgrade to 10.3.0 from 10.2 and 10.2.x

NOTE

DX NetOps Spectrum users who are on 10.0 or 10.1.x releases are advised to upgrade to the intermediary major release such as 10.2.0 and then directly upgrade to 10.3. to ensure a stable upgrade and migration process devoid of any loss of data or failure of any functionality.

Best Practices

- Best Practices for upgrading in a fault-tolerant and non-fault tolerant environments.
- Preserve Customized Support Files

Pre-Upgrade Tasks

Before you upgrade to the latest version of DX NetOps Spectrum, ensure you:

1. Are familiar with the best practices that are mentioned above.
2. Stop all running applications other than DX NetOps Spectrum.
3. Stop the following DX NetOps Spectrum applications:
   – Shut down all OneClick clients by logging off all users from OneClick in the Client Details web page in the OneClick home page.

   NOTE
   For more information about shutting down OneClick clients, see OneClick Administration.

- Stop the SpectroSERVER and the Archive Manager by clicking Stop SpectroSERVER in the Spectrum Control Panel and then close the Spectrum Control Panel. Or you can stop the SpectroSERVER and Archive Manager from the command line by running the "<$SPECROOT>/bin/stopSS.pl" as owner at the command prompt.
- Stop all VnmSh connections. For more information about stopping VnmSh connections, see Command Line Interface.
- Close all Bash shells.
- Ensure the 'Java' folder is not opened (under <$SPECROOT>) during the upgrade.

4. If you have installed DX NetOps Spectrum Report Manager, verify that free disk space on the system is at least twice the size of the largest MYD file under *$SPECROOT*/mysql/data/reporting.
5. Do not install third-party software that uses MySQL because the results can be unpredictable.

Upgrade Procedure from 10.2 or 10.2.x

Upgrading from a previous version of DX NetOps Spectrum to the latest one, can be complex, because each release promises higher quality with the latest technologies and services. Ensure that you go through the upgrade options that best suit your requirement.

1. You can perform either:
   - In Place Upgrade (With no fault-tolerant SpectroSERVERs configured in your deployment, a temporary fault-tolerant system is used during the upgrade. Once the temporary system is configured, the primary SpectroSERVER is disabled for an in-place upgrade. Meanwhile, the temporary, secondary SpectroSERVER system takes over core network management duties).
   - Upgrade Models to ensure compatibility between the SpectroSERVER database and a new version of DX NetOps Spectrum after upgrading.
2. Download the release.
   a. Sign in to the support portal.
   b. Click Enterprise Software.
   c. Click Product Downloads.
   d. Enter the product name in the search bar and click the search icon.
   e. Click the link that is displayed after the search is completed.
   f. Select the release to download.
3. Install DX NetOps Spectrum.
4. Refer to the post-installation configurations.

Post Upgrade Tasks

- Archive Manager Database (DDM Database) Tables Conversion: With the new 10.3.0 release, it is recommended that you convert your Archive Manager database tables from MyISAM to InnoDB for better performance.

  NOTE

  It is recommended that you perform the Archive Manager tables conversion as a post-upgrade task. While performing this post-upgrade task, the Archive Manager stops, to convert the tables. The conversion time depends on the size of the tables. Do not start the Archive Manager when executing the script.

  After conversion, the InnoDB tables occupy more space (approximately 30%-40%) compared to the MyISAM tables. MYSQL recommends InnoDB to be an efficient engine to work on large-scale tables. The InnoDB engine supports row-level locking and auto crash recovery features, which are not supported by MyISAM.

  The InnoDB engine allows for performance improvements with DX NetOps Spectrum's MYSQL; however, it has been observed that after converting the MYSQL DB from MyISAM to InnoDB, the MYSQL DB grew 40 percent in disk space.

Steps for Archive Manager Table Conversion:

Prerequisite:

1. a. a. Ensure that there is enough free disk space. The space that is required, is three times greater than the event table size. To convert the Archive Manager database tables from MyISAM to InnoDB, follow these steps:

Procedure:

1. a. a. Open any bash-shell and navigate to $SPECROOT/SS/DDM/scripts.

NOTE

- Before running the script, it is recommended to take a back-up of the Archive Manager database as a precaution against any potential loss of data.
- If your DDM database contains less than 10 days of data, refer to the KB000115500 article for instructions to perform a successful data conversion.

b. To convert the DDM database tables engine from MyISAM to InnoDB, run the following script:

```
convert_current_myisam_to_innodb.pl
```

c. After the conversion of tables, you are prompted to start the Archive Manager. Enter 'Y' to start the Archive Manager.

• Migration Upgrade (Best Practice - Preserve Customized Support Files)

• Upgrading Models to ensure compatibility between the SpectroSERVER database and a new version of DX NetOps Spectrum after upgrading.

Other Upgrade Tasks

- If you have configured OneClick to launch from Report Manager using SSL, configure this modification again. For more information about this modification, see OneClick Administration.
- If any models display Minor (yellow) alarms with a probable cause of DIFFERENT TYPE MODEL, clear the alarms. To convert all eligible models, run the NewMM.pl script from the CA Spectrum\Install-Tools\PostInstall directory. For more information, see Troubleshooting the Post-Upgrade Installation Script.

Upgrade Best Practices DSS Deployments without Fault Tolerance

NOTE

The topic titled Upgrade Best Practices Fault-Tolerant Deployments provides the steps to upgrade DX NetOps Spectrum in a fault-tolerant environment.

Upgrade Best Practices DSS Deployments without Fault Tolerance

With no fault-tolerant SpectroSERVERs configured in your deployment, a temporary fault-tolerant system is used during the upgrade. Once the temporary system is configured, the primary SpectroSERVER is disabled for an in-place upgrade. Meanwhile, the temporary, secondary SpectroSERVER system takes over core network management duties.

Some DX NetOps Spectrum applications do not support automatic failover and are disabled during the upgrade. For example, TL1, Southbound Gateway, Modeling Gateway, Alarm Notifier, and Event Notifier are temporarily disabled during the upgrade.

FAQs

Q: In a distributed SS (DSS) environment, what is the supported and best practice for upgrading servers?

A: Upgrade the Primary MLS (main location server) SpectroSERVER first, followed by the Primary OneClick server, followed by the remaining Primary SpectroSERVERs. It is important that you start the primary MLS first, before starting

the other primary SpectroSERVERs. This allows all of the cross landscape and "MOM" (manager of managers) functions to process and complete. Once the primary MLS is running and active, you can start the rest of the primaries. Upgrade the Secondary SpectroSERVERs last (including all SpectroSERVER and non-primary OneClick servers). Once all SpectroSERVERs have been upgraded, be sure to stop and restart all OneClick tomcat processes again to update the tomcat cache with the updated SS info. Not doing this will cause OneClick issues, such as landscapes not showing in the client.

NOTE

In a DSS setup, if you stop a primary SS to test your failover scenario without performing a successful database synchronization (via online backup) first, you may see the landscapes disappear in OneClick. To make sure this does not happen, manually start the online backup and allow the database synchronization to occur. Once complete, you can then test your failover scenario.

Upgrading SpectroSERVERs and OneClick Web Servers in a Non-Fault Tolerant Deployment

When you upgrade a DX NetOps Spectrum DSS environment that lacks a fault-tolerant configuration, deploy a temporary server to preserve network monitoring activities. This server is systematically configured as the Secondary, fault-tolerant server for each SpectroSERVER that is upgraded. Start the upgrade with the MLS, the main SpectroSERVER.

The procedure to perform an in-place upgrade with no network management loss is described below.

Follow these steps:

1. Designate a server to serve as the temporary Secondary SpectroSERVER.
2. Install a copy of your currently installed (that is, backlevel) DX NetOps Spectrum software on the temporary SpectroSERVER. Be sure to install all the required patches.

   WARNING
   Do not start the SpectroSERVER yet.
3. Edit the Host Security configuration on the temporary SpectroSERVER. The list of hostnames must be identical to that of the MLS in your current deployment.
4. Perform an online backup of the SpectroSERVER database on the MLS.

   WARNING
   Be sure to disable file compression and automatic backup features until the entire upgrade process has completed.
5. Copy the backup database to the *$SPECROOT*/SS directory on the temporary SpectroSERVER.
6. On the temporary SpectroSERVER host, navigate to the SS directory.
7. Load the database backup file by issuing the following command:

   ```
   ../SS-Tools/SSdbload -il -add precedence savefile
   ```

   – **precedence**
   A numeric value that is greater than the Primary SpectroSERVER (the MLS) default value.
   Default: 10 (20 is recommended).
   – **savefile**
   The name of the database backup file that you created previously.
8. Edit the .vnmrc file to increase the 'maximum event records' parameter on the temporary SpectroSERVER. For example, change the following parameter:

   ```
   max_event_records=20000
   ```

   to the following value:

   ```
   max_event_records=200000
   ```

   The new value ensures that no events are lost during the upgrade.
9. Disable the Archive Manager on the Secondary SpectroSERVER from starting automatically to avoid losing event and statistical data.

Taking this step ensures that all data is cached and returned to the Primary SpectroSERVER once the upgrade has completed and the Primary SpectroSERVER has been restarted.

a. On the temporary Secondary SpectroSERVER, launch a Spectrum Control Panel.
b. Click Control, and clear the box next to “Auto Start/Stop Archive Manager.”

NOTE
As a best practice, ensure that no events are lost during the upgrade. You can increase the maximum locally stored event record size. The default maximum locally stored log sizes for events and statistics are 20,000 and 5,000. In most cases, these default settings are sufficient.

10. Start the SpectroSERVER on the temporary SpectroSERVER host. The temporary SpectroSERVER is now the Secondary, fault-tolerant SpectroSERVER for the MLS.
    An orange alarm on the VNM indicates that the Archive Manager is not running. You can ignore it.
11. Verify the setup of the Secondary fault-tolerant SpectroSERVER by checking the Landscape Configuration view on the MLS:
    a. In OneClick, double-click the VNM icon in the Universe Topology view. The landscape container is displayed.
    b. In the Contents panel highlight the “LocalLscpe” model.
    c. In the Component Detail panel, select the Information tab.
    d. Locate and expand the “Loaded Landscapes” subview.
    e. Verify that the list contains both the Primary MLS, with a precedence of 10, and the temporary Secondary SpectroSERVER, with a precedence of 20 (or the precedence value that was specified with the “SSdbload” command).
12. Shut down the Primary SpectroSERVER (the MLS).
    The Secondary SpectroSERVER resumes management tasks while the MLS is upgraded.
13. Follow the steps that are listed in How to Perform In-Place Upgrades to upgrade the MLS.
14. Once the MLS has been successfully upgraded, manually start the Archive Manager on the Primary SpectroSERVER:
    a. Launch a Spectrum Control Panel.
    b. Select Control, and click Start Archive Manager.

NOTE
Starting the Archive Manager ensures that the events that are being stored locally on the Secondary SpectroSERVER are sent over to the Primary Archive Manager.

15. Start the SpectroSERVER.
    Primary management functions switch back to the MLS.
16. Configure the temporary SpectroSERVER host as a Secondary SpectroSERVER for the next SpectroSERVER that you plan to upgrade.
17. Repeat the above steps to back up, shut down, and upgrade each SpectroSERVER in turn.
18. Upgrade the OneClick Web Server last.
19. Review the post-installation steps in Post-Installation Configurations.

Migrating and Upgrading

WARNING

- For upgrade and migration scenarios, DX NetOps Spectrum automatically uses Legacy Landscape Handle type. All pre-10.2 landscape handles belong to Legacy Landscape Handle type.
- However, migration is supported for Huge Landscape Handle type within 10.2, that is, if you have selected Huge Landscape handle type during a fresh 10.2 installation and are migrating 10.2 SSdbs from one server to another.

Migrate and Upgrade on Windows

You can migrate the existing SpectroSERVER database and Archive Manager database and other upgradeable components to a different system, and then upgrade DX NetOps Spectrum. This way, you can continue to manage your network with the existing DX NetOps Spectrum version during the installation process.

> **NOTE**
> You cannot move a DX NetOps Spectrum installation from one system to another or from one directory to another. Instead, first, copy or move the DX NetOps Spectrum databases and then run the installation program to reinstall DX NetOps Spectrum over the relocated database.

> **WARNING**
> The C:\Program Files\CA directory is automatically created during a first-time installation of DX NetOps Spectrum. DX NetOps Spectrum components that are also common to other CA products are intentionally installed into this directory. This directory is automatically updated as needed during a DX NetOps Spectrum upgrade. Do not remove files from this directory.

Follow these steps:

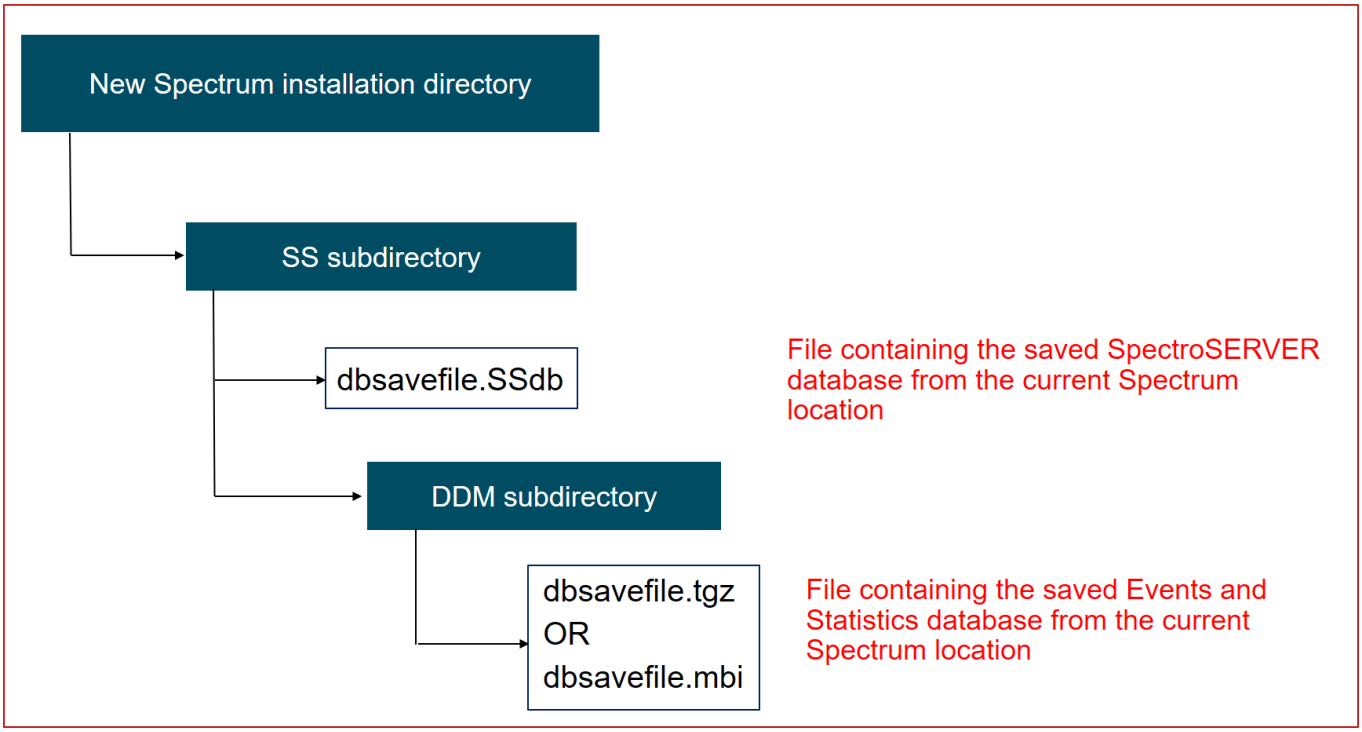
1. Create a user model from the OneClick Users tab. Name it the same name as the owner of the directory where you are installing the new DX NetOps Spectrum version.
2. Preserve the existing SpectroSERVER database (see the topic 'Preserve the existing SpectroSERVER database' on How to Perform In-Place Upgrades page).

   > **WARNING**
   > When backing up the SpectroSERVER database for migration, include both the modeling catalog and the models. A catalog-only or models-only migration is not supported.
3. Preserve the DX NetOps Spectrum Events and Statistics database (see the topic 'Preserve the DX NetOps Spectrum Events and Statistics database' on How to Perform In-Place Upgrades page).
4. Extract the dbsavefile.SSdb file from the dbsavefile.SSdb.gz file in the SS-DB-Backup directory.
5. Copy the saved SSdb file to the dbsavefile.SSdb file. If the SSdb file had backup compression that is enabled, uncompress the SSdb file by running gzip -d <*database_file.gz*> and then perform the copy. For example, cp db_20080105_1153.SSdb dbsavefile.SSdb.

   > **WARNING**
   > The dbsavefile.SSdb file must not be compressed. If dbsavefile.SSdb is compressed, the database is not migrated during installation.
6. Create an installation directory, <*$SPECROOT*>, for the new version of DX NetOps Spectrum.

   > **WARNING**
   > Ensure that the folder in which the installation kit is copied and extracted does not have any spaces. DX NetOps Spectrum installation fails if the installer (.exe) file is in a location with spaces in its absolute/full path. You cannot install DX NetOps Spectrum into a directory that contains a space anywhere in the path. Spaces within the directory path cause the installation to fail.
7. Create an SS subdirectory in *$SPECROOT*.
8. Copy the custom directory from the earlier DX NetOps Spectrum installation directory to the *$SPECROOT* directory of the upgraded DX NetOps Spectrum installation.
9. Copy or FTP (in binary mode) the dbsavefile.SSdb file to the *$SPECROOT*\SS subdirectory.

   > **NOTE**
   > Migrating an existing SpectroSERVER database migrates all of the existing models into the new SpectroSERVER database when you install a new version of DX NetOps Spectrum. This migration includes the models containing topology views including icon placement, groupings, and annotations.
10. Create a DDM subdirectory in the SS subdirectory.
11. Copy or FTP (in binary mode) dbsavefile.mbi or dbsavefile.tgz to the new *$SPECROOT*\SS\DDM directory.
    The directory structure now resembles the following structure:



12. (Optional) To migrate the OneClick web server, copy the contents of the <*$SPECROOT*>\custom directories from the computer with the old OneClick web server installation. Paste these contents into the <*$SPECROOT*>\custom directories on the computer with the new OneClick web server installation.

    WARNING
    Do *not* copy the <*$SPECROOT*>/custom/common/config/custom-jnlp-config.xml file to another computer when you migrate and upgrade DX NetOps Spectrum. This file can contain memory settings that are not compatible with the computer where you are copying the custom directories.

    NOTE
    The mapping of custom background images (<*$SPECROOT*>\custom\images\background) to topology views is maintained in the SpectroSERVER database. For more information about the <*$SPECROOT*>\custom directories, see the OneClick Customization .

DX NetOps Spectrum is migrated and upgraded.

Migrate and Upgrade on Linux

You can migrate existing DX NetOps Spectrum databases and other upgradeable components to a different system, and then upgrade DX NetOps Spectrum. This way, you can continue to manage your network with the existing DX NetOps Spectrum version during the installation process.

NOTE
Do not move a DX NetOps Spectrum installation from one system to another or from one directory to another. Instead, first, copy or move the DX NetOps Spectrum database and then run the installation program to reinstall DX NetOps Spectrum over the relocated database.

WARNING
The /opt/CA directory is automatically created during a first-time installation of DX NetOps Spectrum. DX NetOps Spectrum components that are also common to other CA products are intentionally installed into this directory. This directory is automatically updated as needed during a DX NetOps Spectrum upgrade. Do not remove files from this directory.

Follow these steps:

1. Create a user model from the OneClick Users tab. Name it the same name as the owner of the directory where you are installing the new DX NetOps Spectrum version.
2. Preserve the existing SpectroSERVER database (see the topic 'Preserve the existing SpectroSERVER database' on How to Perform In-Place Upgrades page).

   WARNING
   When backing up the SpectroSERVER database for migration, include both the modeling catalog and the models. A catalog-only or models-only migration is not supported.
3. Preserve the DX NetOps Spectrum Events and Statistics database (see the topic 'Preserve the DX NetOps Spectrum Events and Statistics database' on How to Perform In-Place Upgrades page).
4. Extract the dbsavefile.SSdb file from the dbsavefile.SSdb.gz file in the SS-DB-Backup directory.
5. Copy the saved SSdb file to the dbsavefile.SSdb file. If SSdb had backup compression that is enabled, first uncompress the SSdb by running gzip -d <*database_file.gz*> and then perform the copy. For example, cp db_20080105_1153.SSdb dbsavefile.SSdb.

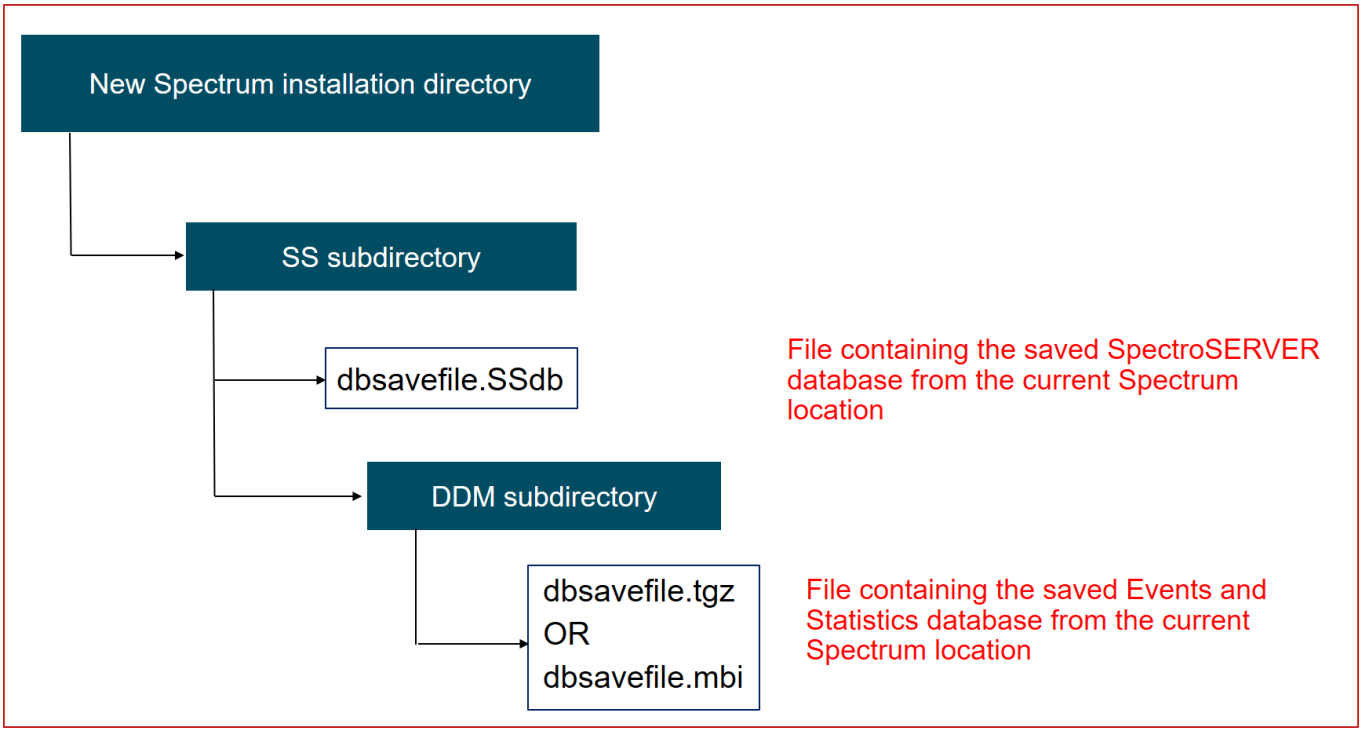
   WARNING
   The dbsavefile.SSdb file must not be compressed. If dbsavefile.SSdb is compressed, the database is not migrated during installation.
6. Create an installation directory, <*$SPECROOT*>, for the new version of DX NetOps Spectrum, with subdirectories for the two database files as follows:

   ```
   mkdir -p <$SPECROOT>/SS/DDM
   ```

   WARNING
   Do not use /opt/SPECTRUM as the installation directory name. This location is reserved for a directory that is automatically created during installation. Also, ensure that the directory owner name is the same name as the owner of the directory where you are installing the new DX NetOps Spectrum version.

   WARNING
   You cannot install DX NetOps Spectrum into a directory that contains a space anywhere in the path. Spaces within the directory path cause the installation to fail.
7. Copy or FTP (in binary mode) the dbsavefile.SSdb file to the <*$SPECROOT*>/SS directory.

   NOTE
   Migrating an existing SpectroSERVER database migrates all the existing models into the new SpectroSERVER database when you install a new version of DX NetOps Spectrum. This migration includes the models containing topology views including icon placement, groupings, and annotations.
8. Copy or FTP (in binary mode) the dbsavefile.mbi or dbsavefile.tgz file to the <*$SPECROOT*>/SS/DDM directory. The directory structure now resembles the following structure:



9. (Optional) To migrate the OneClick web server, copy the contents of the <*$SPECROOT*>/custom directories from the computer with the old OneClick web server installation. Paste these contents into the <*$SPECROOT*>/custom directories on the computer with the new OneClick web server installation.

   WARNING
   Do *not* copy the <*$SPECROOT*>/custom/common/config/custom-jnlp-config.xml file to another computer when you migrate and upgrade DX NetOps Spectrum. This file can contain memory settings that are not compatible with the computer where you are copying the custom directories.

   NOTE
   The mapping of custom background images (<*$SPECROOT*>/custom/images/background) to topology views is maintained in the SpectroSERVER database. For more information about the <*$SPECROOT*>/custom directories, see the OneClick Customization .

10. Fresh Install.

DX NetOps Spectrum is migrated and upgraded.

Post Migration Tasks

NOTE

It is recommended that you perform a DDM database table conversion as a post-migration task. However, ignore this task if the DDM database is already converted to InnoDB.

Archive Manager Table Conversion

While performing the post-migration task, the Archive Manager stops for some time because of the time taken by the script to convert the tables. This conversion time depends on the size of the tables. To improve the performance of Archive Manager it is recommended you convert the Archive Manager database tables MySQL engine from MyISAM to InnoDB. To enhance the performance of event retrieval, the event table is partitioned.

Prerequisite:

Ensure that there is a free disk space which is three times greater than the event table size.

Procedure:

1. Open any bash- shell and navigate to the **$specroot/SS/DDM/scripts** location.

   NOTE

   - Before running the script, it is recommended to take a back-up of the Archive Manager database as a precaution against any potential loss of data.
   - If your DDM database contains less than 10 days of data, refer to the KB000115500 article for instructions to perform a successful data conversion.
2. To convert the DDM database tables engine from MyISAM to InnoDB, run the following script:
   `convert_current_myisam_to_innodb.pl`
3. After the conversion of tables, you are prompted to start the Archive Manager. Enter 'Y' to start the Archive Manager.

Support for Migrating DDM .mbi File (InnoDB)

10.4.1 provides support for migrating the DDM .mbi file from a previous release to this release. With the availability of this support, we recommend that you use InnoDB for DDM and use ddm_load.pl and ddm_save.pl for backup and restore. The ddm_load.pl and ddm_save.pl (<SPECROOT>\SS\DDM) leverage mysqlbackup.exe, which is more efficient to take backups and restore.

Considerations

- Migration of DDM .mbi file is not supported from a Windows computer to a Linux computer.
- The ddm_load, ddm_save, and ddm_backup binaries coming with the previous releases have been deprecated in 10.4.1. You can now use ddm_load.pl instead of ddm_load and ddm_save.pl instead of ddm_save and ddm_backup.

Upgrade Best Practices Fault-Tolerant Deployments

Upgrade Best Practices Fault-Tolerant Deployments

Upgrades in a fault-tolerant environment are supported. However, follow the recommendations in this topic. All your Primary and Secondary SpectroSERVERs must be upgraded within a small window of a few hours.

Before conducting any upgrades, verify that all DX NetOps Spectrum components are up-to-date with current service packs. Also, consult the list of the communication ports and protocols that DX NetOps Spectrum uses. Your security parameters may require you to temporarily disable these ports and protocols during the upgrade. For more information about firewall ports and protocols, see Distributed SpectroSERVER Administration.

First, upgrade the OneClick Web Servers, after that upgrade the primary SpectroSERVERs, and finally upgrade the secondary SpectroSERVERs.

FAQs

Q: In a distributed SS (DSS) environment, what is the supported and best practice for upgrading servers?

A: Upgrade the Primary MLS (main location server) SpectroSERVER first, followed by the Primary OneClick server, followed by the remaining Primary SpectroSERVERs. It is important that you start the primary MLS first, before starting the other primary SpectroSERVERs. This allows all of the cross landscape and "MOM" (manager of managers) functions to process and complete. Once the primary MLS is running and active, you can start the rest of the primaries. Upgrade the Secondary SpectroSERVERs last (including all SpectroSERVER and non-primary OneClick servers). Once all SpectroSERVERs have been upgraded, be sure to stop and restart all OneClick tomcat processes again to update the tomcat cache with the updated SS info. Not doing this will cause OneClick issues, such as landscapes not showing in the client.

NOTE

In a DSS setup, if you stop a primary SS to test your failover scenario without performing a successful database synchronization (via online backup) first, you may see the landscapes disappear in OneClick. To make sure this does not happen, manually start the online backup and allow the database synchronization to occur. Once complete, you can then test your failover scenario.

Upgrade in a Fault-Tolerant Environment

The following procedure describes an upgrade in a fault-tolerant environment. Use the same procedure for a single-server or DSS upgrade. Upgrade the OneClick Web Servers first, and then upgrade primary SpectroSERVERs. Upgrade Secondary SpectroSERVERs at last.

NOTE
Alarms may display incorrectly in OneClick until the upgrade process is complete, including any post-upgrade steps that may be required. Avoid using DX NetOps Spectrum for management until you have completed all the steps.

Follow these steps:

1. Disable automatic online backups on the Primary SpectroSERVERs by taking the following steps:
   a. Highlight the VNM model in the Universe Topology view.
   b. In the Component Detail panel, select the Information tab.
   c. Locate and expand the Online Database Backup subview.
   d. Set Automatic Backups to “Disabled”.
2. Perform a manual online backup on every Primary SpectroSERVER to preserve the current database. Take the following steps:
   a. In the Online Database Backup subview, click Begin Backup Now.
   b. Verify that the online backup has succeeded.

      NOTE
      We recommend differentiating the databases by the version number. Set the “Prefix for Backup File Name” parameter from the default of “db_” to something like “db_*version*_” or another value that identifies the version.
3. Edit the .vnmrc file to increase the 'maximum event records' parameter on all Secondary SpectroSERVERs. For example, change the following parameter:

   ```
   max_event_records=20000
   ```

   to the following value:

   ```
   max_event_records=200000
   ```

   The new value prevents event loss during the upgrade.
4. Restart all Secondary SpectroSERVERs so that the change takes effect:
   a. Launch a Spectrum Control Panel.
   b. Click Stop SpectroSERVER.
   c. Once the Status changes to “INACTIVE,” click Start SpectroSERVER.
   d. Verify that the Status changes to “RUNNING”.
5. Instruct all OneClick users who are logged in to the OneClick Web Servers to close their clients.
6. Stop each of the Primary SpectroSERVERs:
   a. Launch a Spectrum Control Panel
   b. Click Stop SpectroSERVER.
   c. You are prompted to verify the action to stop the SpectroSERVER and Archive Manager.
   d. Verify that the Status changes to “INACTIVE”.
   e. Exit the Spectrum Control Panel.

7. On the OneClick clients, verify that the SpectroSERVERs have failed over to the Secondary SpectroSERVERs.
   The landscape icons in the Explorer hierarchy panel change from green to yellow
   Yellow borders appear around the Contents and Component Detail panels.
8. Stop all OneClick Web Servers using the following command:
   ```
   $SPECROOT/tomcat/bin/stopTomcat.sh
   ```
9. Upgrade all OneClick web servers.
10. Upgrade all the Primary SpectroSERVERs, and verify that the installations complete successfully.

    NOTE
    Wait for every installation to complete before continuing to the next step.

    NOTE
    It is no longer necessary to start the Archive Manager before the SpectroSERVER, the cached events from the secondary SpectroSERVER can be transferred at any time, even after the primary SpectroSERVER has started logging new events.
11. Start the SpectroSERVER on the Primary MLS:
    a. Launch a Spectrum Control Panel on the Primary MLS.
    b. Click Start SpectroSERVER.
    c. Verify that the Status changes to “RUNNING”.
12. Start the remaining Primary SpectroSERVERs.
13. Stop each of the secondary SpectroSERVERs.
14. Upgrade all the Secondary SpectroSERVERs, and verify that the installations complete successfully.

    NOTE
    Wait for every installation to complete before continuing to the next step.
15. Start the SpectroSERVER on every Secondary SpectroSERVER:
    a. Launch a Spectrum Control Panel on the SpectroSERVER.
    b. Click Start SpectroSERVER.
    c. Verify that the Status changes to “RUNNING”.
16. Verify that the clients open successfully and that the Connection Status all the Primary SpectroSERVERs are up and green.
17. Perform a manual online backup on every Primary SpectroSERVER to preserve the current database. Take the following steps:
    a. In the Online Database Backup subview, click Begin Backup Now.
    b. Verify that the online backup has succeeded.
    c. Verify that the re-synchronizing the Primary SpectroSERVER database with the Secondary SpectroSERVER is succeeded.

       NOTE
       We recommend differentiating the databases by the version number. Set the “Prefix for Backup File Name” parameter from the default of “db_” to something like “db_*version*_” or another value that identifies the version.

    To continue management activities during the upgrade process, do not upgrade all the OneClick web servers at one time. Retain few OneClick web servers, so that you can monitor your infrastructure using the secondary SpectroSERVERs until all the primary SpectroSERVERs are upgraded. When all primary SpectroSERVERs are upgraded, you can upgrade the retained OneClick web servers.

How to Perform In-Place Upgrades

If you have DX NetOps Spectrum data that you want to preserve, perform an *in-place* upgrade. An in-place upgrade installs a new version of DX NetOps Spectrum on an earlier version in the same system and directory. In-place upgrades do not require a database migration. For an upgrade that changes the server platform and requires data migration, see the topics 'Migrate and Upgrade on Windows and Linux' on Migrating and Upgrading DX NetOps Spectrum page.

To perform an in-place upgrade:

1. Complete all pre-upgrade tasks.
2. Preserve your existing SpectroSERVER database.
3. Preserve the DX NetOps Spectrum events and statistics database.
4. Install DX NetOps Spectrum on top of an earlier version of DX NetOps Spectrum.

This section provides procedures to upgrade from a previous version, to upgrade in a fault-tolerant environment, and to upgrade in an environment that lacks fault tolerance.

> **NOTE**
> Additional steps are required for preserving the DX NetOps Spectrum databases and upgradeable components that are part of the older version.

Complete pre-upgrade tasks

Complete the following tasks before the upgrade.
Stop the following DX NetOps Spectrum applications:

1. Shut down all OneClick clients by logging off all users from OneClick. This can be found under the Client Details web page in the OneClick home page.

   > **NOTE**
   > For more information about shutting down OneClick clients, see OneClick Administration.
2. Stop all VnmSh connections.

   > **NOTE**
   > For more information about stopping VnmSh connections, see Command Line Interface.
3. Close all Bash shells.

Preserve the Existing SpectroSERVER Database

You can preserve an existing SpectroSERVER database before performing an in-place upgrade.

Follow these steps:

1. Verify that the SpectroSERVER is running, and open the DX NetOps Spectrum Control Panel.
2. Make a copy of your current SpectroSERVER database by clicking Save Database in the Spectrum Control Panel.
   The Online Database Backup dialog opens.
3. Verify that the option to Use Backup Compression is selected.
4. Accept the default or enter a directory path in the Backup Directory field.
   The default directory path is as follows:
   - Windows -- C:/win32app/SPECTRUM/SS-DB-Backup
   - Linux -- /usr/SPECTRUM/SS-DB-Backup

   > **NOTE**
   > If you change the default, select a directory other than the DX NetOps Spectrum installation directory.
5. Accept the default of 20 for the Minimum Required Disk Space or enter an appropriate value.
6. Select Save to save all changes.
7. Click Begin Backup Now.
   The Status displays the progress of the backup.

DX NetOps Spectrum automatically assigns a name for the backup with .SSdb extension in the format db_YYYYMMDD_HHMM. The YYYYMMDD represents the year, month, and day, and HHMM represents the hour and minute when the backup started. For example, a backup that started at 10:42 on 10/06/06 is named db_20061006_1042.SSdb.

NOTE
Because compression was enabled, this file is compressed into a file with a .gz extension.

8. Click Save and Close.
   The database is backed up.
9. Move the database to an area outside the DX NetOps Spectrum installation directory.
   The existing SpectroSERVER database is preserved.

Preserve the DX NetOps Spectrum Events and Statistics Database

You can preserve the DX NetOps Spectrum events and statistics database before upgrading DX NetOps Spectrum.

Follow these steps:

1. Stop the SpectroSERVER and the Archive Manager by clicking Stop SpectroSERVER in the Spectrum Control Panel and then close the Spectrum Control Panel. Or you can stop the SpectroSERVER and Archive Manager from the command line by running the "<$SPECROOT>/bin/stopSS.pl" as Spectrum Owner at the command prompt.
2. Execute cd <*$SPECROOT*>\SS\DDM in the command prompt, where <*$SPECROOT*> is the directory where DX NetOps Spectrum was installed.
3. Enter the following command:
   ```
   ddm_save dbsavefile
   ```
   The file dbsavefile.tgz is created.
4. Move the dbsavefile.tgz to an area other than the DX NetOps Spectrum installation directory. The existing DX NetOps Spectrum events and statistics database is preserved.

Install DX NetOps Spectrum

For installation instructions, see Fresh Install.

NOTE

We recommend that you back up the new, upgraded SpectroSERVER database using the SSdbsave utility with the -cm option before starting SpectroSERVER. This utility is located in the SS-Tools directory. Backing up the new SpectroSERVER database ensures the integrity of the database, in case the new SpectroSERVER fails before you access the Online Database Backup.

Use the following command (navigate to the $SPECROOT/SS folder) to save the modeling catalog and models:

```
../SS-Tools/SSdbsave -cm <save_file>
```

The suggested naming scheme for saving files is to incorporate a date stamp and the flags for the save command. In this case, you are using both the “c” (catalog) and “m” (models) flags; therefore, assuming it is September 14, 2016, enter db_20160914_cm as the save file name.
A file named “db_20160914_cm.SSdb” is created. The “.SSdb” suffix is added automatically.

Upgrading Models

Database Compatibility After Upgrade

To ensure compatibility between the SpectroSERVER database and a new version of DX NetOps Spectrum after upgrading, complete these tasks:

- Convert existing models that are based on defunct model types to new models.
- Convert existing models to model types that are more appropriate.

These procedures are not required for first-time installations.

> **WARNING**
> If you do not run appropriate upgrade scripts after a DX NetOps Spectrum upgrade, system problems can occur.

In some cases, a model type can change, depending on vendor requirements or added functionality in DX NetOps Spectrum. In other cases, DX NetOps Spectrum no longer supports a device with a unique model type; therefore, convert these models to an alternative model type.

Contact a support representative if you have questions about the model conversion process or any errors you encounter during conversion.

> **NOTE**
> If you plan to set up a distributed SpectroSERVER configuration, convert all models before partitioning the database.

Preserved Model Attributes and Elements

The following model attributes are preserved when you use the listed scripts to upgrade the SpectroSERVER database:

- 0x1006e Model_Name
- 0x12d7f Network_Address
- 0x10024 Community_Name
- 0x10009 Security_String
- 0x11564 Notes (Notes are preserved for the device, interface, application, module, and port models.)
- 0x10071 Polling_Interval
- 0x10072 Poll_Log_Ratio
- 0x1154f Polling Status
- 0x110c4 Time Out
- 0x110c5 Try Count
- 0x1000c Value_When_Yellow
- 0x1000d Value_When_Orange
- 0x1000e Value_When_Red

The following details are also preserved:

- Inter-model relations, including device connectivity
- Connections to both physical and logical interfaces on all devices
- Model type-specific and model-specific NCM configurations

During remodeling, interfaces and applications are rediscovered and modeled. This remodeling results in new model handles for these child models.

> **NOTE**
> Watches are not preserved during the model and model type conversion and must be rebuilt on the new model type.

Model Type Editor and the Customized SpectroSERVER Database

If you customized your SpectroSERVER database using the Model Type Editor (MTE), make a record of all changes. Certain changes that are made with the MTE are not preserved when the SpectroSERVER database is upgraded to a later version of DX NetOps Spectrum.

If you changed relations, meta-rules, or attributes of DX NetOps Spectrum-supplied or other developer-supplied model types, those changes could be unrecognized during the database upgrade. Reapply the changes manually after you upgrade DX NetOps Spectrum.

Model types can be changed and improved in the upgraded version of DX NetOps Spectrum. For the new release of DX NetOps Spectrum to operate correctly, these changes might need to overwrite customized values.

NOTE
For more information about preserving database changes and the type of changes that can be preserved, see the Model Type Editor .

Using the Multicast Manager or VPN Manager After Installing a Patch or Upgrade

The NewMM.pl post-installation script affects the following model types:

- Rtr_Cisco
- Cisco_12000
- SwCat6xxx, SwCat35xx, and SwCat4xxx

Rerun Multicast and/or VPN discovery and reapply customizations after you run the post-installation scripts. This process helps ensure the correct modeling and management of the newly created device models within your environment.

Convert Existing Models to Newly-Supported Model Types

Use the NewMM.pl post-installation script to convert the existing models of various model types to the newly supported model types. This script preserves many key attributes, relationships, and other elements.

For example, you previously modeled Cisco Catalyst 4500 devices as GnSNMPDev in DX NetOps Spectrum. These models can be converted to use the Catalyst 4500 Certification functionality.

In addition, you can use the NewMM.pl script to convert various Cisco-specific model types to the appropriate supported model type. As Cisco introduces new devices, DX NetOps Spectrum adds support for these new devices using the appropriate model type available.

NOTE
If you update model types using the NewMM.pl script, a set of models is created in the Reporting Database with a new model type. Models with the previous model type are marked as destroyed. In addition, data is not migrated from the old model type to the new type.

Follow these steps:

1. Verify that the SpectroSERVER is running.
2. Run the following command from the *$SPECROOT*/Install-Tools/PostInstall/ directory:
   ```
   NewMM.pl
   ```
   NOTE
   On Windows, all necessary scripts must be run from a bash shell. They do not run as expected from a DOS command prompt.
3. Enter the host name or IP address of the VNM and press Enter.
4. Enter the SpectroSERVER landscape handle when prompted, and press Enter.
   The script analyzes the database to determine which models are eligible for conversion, if any. The script provides a complete list of models that correspond to each new model type before prompted for conversion.

NOTE
Models that are in maintenance or hibernation mode or that cannot be contacted are not candidates for conversion.

5. When prompted to convert eligible models of a specific model type, enter Yes. If you do not want to convert specific model types, enter No. The following log file is created in the *$SPECROOT*/Install-Tools/PostInstall/ directory:
   `NewMM_Log_DATE`
6. To confirm the model conversion, verify the following log file:
   `NewMM_Log_DATE`
   Existing models are converted to the newly supported model types.

Preserve Customized Support Files

Some custom support files of DX NetOps Spectrum can be overwritten when installing a new version of DX NetOps Spectrum. These support files include AlertMap, EventDisp, Event Format, Probable Cause, or GIB files.

For example, you can have customized event files that exist in the <*$SPECROOT*>/SG-Support/CsEvFormat directory. Before you upgrade the OneClick web server, move these files to <*$SPECROOT*>/custom/Events/CsEvFormat.

WARNING
Do *not* copy the <*$SPECROOT*>/custom/common/config/custom-jnlp-config.xml file to another computer when you migrate and upgrade DX NetOps Spectrum. This file can contain memory settings that are not compatible with the computer where you are copying the custom directories.

Troubleshooting Upgrade Installation Problems

Troubleshooting the Post Upgrade SDC Alarm Correlation

When upgrading to 10.3.1 from 10.3 (directly) or 10.2.x (indirectly), if there were any alarms on the devices managed through Secure Domain Connector (SDC), those alarms will not be correlated to SDC lost alarm and only the newly generated alarms will be correlated, post-upgrade. This is a known and expected behavior.

In an SDC FT scenario if both SDCs are down, then only the device down alarms are correlated to “Secure Domain Lost” alarm.

Troubleshooting the Post Upgrade Installation Script

NOTE
You can troubleshoot the post-upgrade installation script.

NOTE
Log files are in the <*$SPECROOT*>/Install-Tools/PostInstall/ directory. On Windows, run all scripts from a bash shell.

Follow these steps:

1. Start the SpectroSERVER, if it is not already running:
   – On Windows, click Start, Programs, CA, Spectrum Control Panel. The Spectrum Control Panel displays. Click the Start SpectroSERVER button.
   – On Linux, run the SCP command, which is located in <*$SPECROOT*>/bin/. The Spectrum Control Panel displays. Click the Start SpectroSERVER button.
   The SpectroSERVER begins to run.

2. Open the OneClick home page in your web browser, using the URL that your administrator provided. The URL has the following format: http://<*hostname*>:<*portnumber*>/.
3. Enter your OneClick login credentials when prompted.
   The OneClick home page opens.
4. Click Start Console.
   The OneClick Console opens.
5. Expand the SpectroSERVER that has been named the main location server and click Universe in the Navigation panel.
   A list of alarms, if any, appear in the Alarms tab of the Contents panel for the Universe topology. If any models display Minor (yellow) alarms with a probable cause of DIFFERENT TYPE MODEL, clear the alarms. To verify that the script converted all eligible models that it discovered, rerun the NewMM.pl script.
   The log file, NewMM_Log_<DATE>, is created in the <*$SPECROOT*>/Install-Tools/PostInstall/ directory.
6. To verify that all models converted successfully, check the log file, NewMM_Log_<*DATE*>.

   NOTE
   If DIFFERENT TYPE MODEL alarms recur, contact Technical Support.

   The troubleshooting is complete.

Unable to Proceed with DX NetOps Spectrum Upgrade Due to DDM Database Lock with Errors in Pre-Install Log

Symptom: When I am trying to install a patch on my existing DX NetOps Spectrum version, I am getting the following error message:

"This installation needs to access the DDM database, which is currently locked. Installation will automatically resume when the database is unlocked."

Solution: When you get this error, browse to the $SPECROOT/SS/DDM directory and then delete the .DDMDB.LOCK file.
Once you have done this, the install should continue to finish as expected.

Loading r9.2 SSdb models to r10.2

This release enables you to load the existing SpectroSERVER database models to a different system, and then upgrade DX NetOps Spectrum. This upgrade scenario only loads models from your r9.2 SSdb. All events and catalog customizations (watches, model type default changes, changes done in MTE etc) information will be lost. If you want to retain the custom configuration and data, please upgrade to 9.4 first, and then proceed to install 10.2.

NOTE

The r9.2.x to r10.2 upgrade (only DB Migration) is supported only for SSDB and not for DDMDB and SRM DB.

Before you initiate upgrading your setup from r9.2 to 10.2, we recommend you to familiarize yourself with the following procedures:

- Upgrading
- Migrating and Upgrading
- Database Backups
- Preserving the existing SpectroSERVER database.

NOTE

You can upgrade ISO-8859-1, ISO-8859-2, ISO-8859-5, ISO-8859-8 and ISO-8859-9 encoding types.

To initiate loading your r9.2 Ssdb to r10.2, follow these steps:

1. Preserve a copy of your r9.2 SpectroSERVER database by using one of the following methods:
   a. The SSdbsave utility

   b. DX NetOps Spectrum's Online Backup utility available from the VNM model.
   c. The Save Database button on the Spectrum Control Panel.
   d. Or use one of your previously saved SSdb files if you have already configured automatic backups with the Online Backup utility
2. Perform a fresh installation on a new machine using the r10.2 build.
3. Transport the save file from step 1 to the r10.2 machine and put it in the <SPECROOT>/SS-DB-Backup directory (If the directory is not there, create it).
4. Unzip the SSdb file if it is zipped into the SS-DB-Backup directory.

NOTE

During the r10.2 installation, ensure that you select the **Legacy Landscape Handle** in order to load your preserved model data/SSdb. If you select the **Huge Landscape Handle** option, the data load will fail.
The **Huge Landscape Handle** option is recommended to be used only for new DSS environments and single-server installations.

After a successful installation of r10.2, use the SSdbload utility to import the SSdb models you had saved from your previous setup following these steps.

1. Unzip your r9.2 SSdb file if it is zipped.
2. Launch a shell as your DX NetOps Spectrum install owner and navigate to the <SPECROOT>/SS directory
3. Run the following SSdbload command:

```
../SS-Tools/SSdbload -m -UpgradeFrom <ENCODING_NAME> ../SS-DB-Backup/
<9.2savefile>.SSdb

For example:
..SS-Tools/SSdbload -m -UpgradeFrom ISO-8859-1 ../SS-DB-Backup/db_20161101_1200.SSdb
```

4. Once complete, you can start the SpectroSERVER

NOTE

For <source encoding> select one of the following:

- ISO-8859-1
- ISO-8859-2
- ISO-8859-5
- ISO-8859-8
- ISO-8859-9

WARNING

For <9.2db_filename>, ensure that the filename and the destination folder are the same as you had saved.

Install Report Manager

DX NetOps Spectrum Report Manager generates reports in graphical and text-based formats. Reports related to DX NetOps Spectrum features are service management, performance management, response time statistics, VPLS reports,

and others. The on-demand reporting feature provides a custom report development tool that reports on multiple DX NetOps Spectrum data attributes.

You can access the BI Launch Pad application server from any compatible Web browser. BI Launch Pad is a web-based interface that lets you manage reports. You can generate custom reports and also one-time or periodic scheduled reports.

As an administrator, your responsibilities include installing, configuring, and maintaining Spectrum Report Manager application. In addition, you can schedule and manage reports for members of your organization.

DX NetOps Spectrum Report Manager uses CA Business Intelligence (CABI) to display and generate reports. CABI is a reporting and analytic software package that DX NetOps Spectrum and other CA products use to present information and support business decisions. DX NetOps Spectrum uses CABI to integrate, analyze, and present vital information that is required for effective enterprise IT management.

For the 10.4.1 release, refer the Integration Compatibility matrix for supported CA Business Intelligence JasperReports® Server versions for Windows and Linux platforms. For more information, see CA Business Intelligence JasperReports® Server - 6.4.2 / CA Business Intelligence JasperReports® Server - 6.4.3 documentation for more information.

Install OneClick with Report Manager

NOTE
This section describes how to install OneClick with Spectrum Report Manager. For more information, see the Installing section.

WARNING
We recommend that you back up the reporting data on the installation server before you upgrade from an earlier version of OneClick with Spectrum Report Manager.

Best Practices While Migrating SRM

Review the migration process is the best thing for your business needs. For example, if you only leave 30 days' worth of data in Spectrum Report Manager but leave 45 days worth in your Archive Manager DDMDB - moving the database is not recommended since Report Manager can process those 30 days from the DDM. Follow the migration process only if you keep more data in SRM than stored in the DDMDB.

The following are the best practices we recommend while migrating SRM:

- Anytime the Spectrum modeling database (SSdb) is backed up, the Archive Manager database (DDMDB) and Reporting databases should also be backed up to maintain the three database synchronization.
- If an SSdb is reloaded, the other two databases should also be reloaded. This is not always possible because the reporting database takes up so much space. However, migration is recommended.
- If the SSdb is reloaded but the others are not you will have an SSdb that does not have certain data that the Reporting database may have, like an outage or a newly created model.

Migrate Report Data from a Previous Report Manager During OneClick Installation

During the installation of OneClick with Spectrum Report Manager, you are prompted to migrate report data from a remote (source) reporting database to the new DX NetOps Spectrum reporting database. The prompt applies to upgrade situations where data from a previous installation is preserved. This migration is optional. Therefore, you can either accept or decline the migration.

If you prefer to migrate data, enable access to the source report database from the remote server as described in this section.

Follow these steps:

1. Launch a MySQL client session on the source server with root account credentials. For example:
   ```
   oscmdline> ./mysql -uroot -p<localrootpassword>;
   ```
2. Let data be extracted from the source database by a remote account. You can provide temporary access to a remote root account.
   For example, if the DX NetOps Spectrum target OneClick Linux server is named target-linux.ca.com, issue the following command at the MySQL command line:
   ```
   mysql> GRANT ALL PRIVILEGES ON *.* TO 'root'@'target-linux.ca.com' IDENTIFIED BY '<remoterootpassword>';
   ```
   NOTE
   Provide the fully qualified host name.
3. Verify that this new permission is available to all existing sessions by issuing the following command:
   ```
   mysql> FLUSH PRIVILEGES;
   ```
4. (Windows Only) Verify that Windows Firewall settings on the source server allow remote connections to MySQL.
   a. Click Start, Control Panel, and then Windows Firewall.
   b. Under the Exceptions tab, click Add Port and configure values as follows:
      - Enter **MySQL** for the name.
      - Enter **3306** for the Port Number.
      - Select **TCP**.
   c. (Optional) Click Change to restrict the scope of access to MySQL.
   d. Specify the location of your DX NetOps Spectrum server.
   e. Configure the option to allow remote connections to MySQL only from the migration destination server. For more information, see Windows Help and Support.

   Access to the report database on the Windows server is enabled.

Prepare for the Migration

Before you start migrating the data, verify the connection between the source and destination server databases. Verify that the data you plan to migrate is updated.

Follow these steps:

1. Verify the database connection to the remote host containing data that you plan to migrate. Issue the following command on the DX NetOps Spectrum server:
   ```
   telnet <remote-srm-host> 3306
   ```
   The following message indicates that the permissions have been set properly:
   ```
   Escape character is '^]'. 7
   4.1.11-nt î&#9786;  t#J0Mu'] ,&#9787;   #2p^giYa]0t{
   &#9644;  &#9786;&#9830;#08S01Bad handshakeConnection closed by foreign host.
   ```
   The following message indicates that the permissions have not been set correctly:
   ```
   Q   &#9830;#HY000Host 'user.com' is not allowed to connect to this MySQL server Connection closed by
    foreign host.
   ```
   If you are unable to connect to the MySQL server, verify that your MySQL permissions are configured correctly on your previous SRM MySQL database. Verify that the privileges are flushed before you reattempt to connect.
2. Stop all reporting processes on the remote, source server by removing all entries from the Spectrum Report Manager Admin Tools, DX NetOps Spectrum Status option.
3. Wait for 5 minutes to verify that any outstanding data changes are committed to the report database.
   The root database account on the remote destination server can extract report data on the source server.
   The connection is verified.

Post Migration

Perform the following tasks after migration:

- Enable the integration of DX NetOps Spectrum with CABI. For more information, see Business Objects Integration.

  NOTE
  If you have integrated DX NetOps Spectrum with CABI before migration, we recommend disabling the previous integrations.
- To ensure that the most recent reporting content (such as Crystal Reports) is available, update the existing content that is installed by DX NetOps Spectrum in Business Objects. For more information, see Manage Business Objects Content.

Initialization Considerations for InnoDB Storage

With 9.4, reporting data is now stored using only the InnoDB storage-engine based tables.

For new installations, Spectrum Report Manager automatically ensures that InnoDB is used for all of the reporting tables.

For upgrade installations, Spectrum Report Manager migrates all the reporting tables from MyISAM to InnoDB.

WARNING
Before you upgrade, verify that the amount of free disk space on the system is at least twice the size of the largest MYD file under *$SPECROOT*/mysql/data/reporting.

Calculating Disk Requirements for Event Storage

Use the following formula to estimate the amount of disk space that is required to support the reporting database for a specific amount of time.

```
Total Gigabytes Required = ((Number of Devices) * (Average Number of Events per Device per Day) * (Number of
 Days Storage Required) * (Average Size of Event in Kilobytes)) / 1048576
```

The following variables are used:

- Number of Devices - The number of devices at your site. Consider the future growth of your site when determining this value.
- Average Number of Events per Device per Day - The total number of events that are generated on a daily basis that are associated with a single device model. This number includes all events that would result from related application, port, and interface models. The easiest way to get an approximation is to look at the total number of events that were generated on a single SpectroSERVER in a single day and divide it by the number of devices that are modeled on that SpectroSERVER.
- Number of Days Storage Required - The number of days that your site requires storage.
- Average Size of Event in Kilobytes - An estimation of the amount of disk space a single event ends up consuming in the Reporting database.
- 1048576 - A conversion factor for gigabytes.

In addition to the number of devices and the number of days of storage, two variables are required to estimate the database size:

- **Average Number of Events per Device per Day**
  Query the DDMDB to see the average number of events that are generated on a given day.
  If you are a new DX NetOps Spectrum user and do not know the average number of events, use a default value. Three hundred events per day, per device for 500 devices would equate to 150,000 events a day. Therefore, 300 would be a reasonable default value.
- **Average Size of Each Event in Reporting DB**
  An appropriate amount of space to store your average event and corresponding records is 1 KB. This number can increase if most of the events that are being handled are large events that contain much data. Also the types of events

affect data size. Alarm events turn into multiple reporting table records. Network Configuration Manager (NCM) events only affect a single table (event).

Here are some examples:

Example A - User has 600 devices and wants to keep data for 4 years (1460 days).

The user does not know how many events per device, therefore consider 300 as the default value.

```
Total GBs required = (600 * 300 * 1460 * 1) / 1048576
Total GBs required = 262,800,000 / 1,048,576
Total GBs required = 250 GBs
```

Example B - User has 1900 devices across three servers and wants to keep data for 2 years (730 days).

The user seems to be averaging 400 events per device, per day. In this example, the three servers are not considered.

```
Total GBs required = (1900 * 400 * 730 * 1) / 1048576
Total GBs required = 554,800,000 / 1,048,576
Total GBs required = 530 GBs
```

How to Calculate Average Daily Event Rate per Device

To estimate the average daily number of events that generated per device, you first need to know how many events get generated each day. Use the following queries on the DDMDB database.

The following query returns the total event count for the last ten days:

```
SELECT date(from_unixtime(utime)) as x, count(*) as cnt
  FROM event GROUP BY x
  ORDER BY x DESC LIMIT 10;
```

The following query returns the 10 days with the highest event volume and the event volume for each day::

```
SELECT date(from_unixtime(utime)) as x, count(*) as cnt
  FROM event GROUP BY x
  ORDER BY cnt DESC LIMIT 10;
```

Use the result of these queries to come up with a reasonable event count. Once you know the event count, divide the number of events by the total number of modeled devices on the server to derive the average event count per device, per day.

Report Manager Installation

You can install OneClick with Spectrum Report Manager by specifying Spectrum Report Manager as a feature selection during the OneClick installation process. To install Spectrum Report Manager, you need OneClick, however, Spectrum Report Manager is not required to run OneClick. During installation, you can migrate the report data from a previous Spectrum Report Manager installation.

> **WARNING**
> The disk space that is required for a Spectrum Report Manager upgrade installation is two times the table size for each table that is converted to InnoDB. If enough space is not available, the installer displays a warning.
>
> **NOTE**
> Multiple Spectrum Report Manager installations using a common set of SpectroSERVERs can result in inconsistencies between the primary and secondary Spectrum Report Manager installations.

Follow these steps:

1. Select the Spectrum Report Manager option from the Select Features window during the installation.

2. When prompted during the installation, specify the names of the DX NetOps Spectrum servers from which you want Spectrum Report Manager to collect data.
   The Spectrum Report Manager Servers dialog lets you specify the names of more DX NetOps Spectrum servers, in addition to the primary server specified for OneClick. You can also modify the servers list after you have completed the installation using Spectrum Report Manager Admin Tools.

   NOTE
   Use DX NetOps Spectrum landscape names to specify servers.
3. Select to migrate historical report data associated with a previous release of OneClick with Spectrum Report Manager to the new reporting database.
   – If you select to migrate reporting data, specify the following options:
     a. Specify the host from which you want to migrate the data in the Source host name field.
     b. Enter the password to access the MySQL installation on the remote server in the Source Host 'root' Database Password and Verify Password fields. The default password is ‘root’.
     c. Click Next.
   – If you do not want to migrate reporting data, do not type any values in the window and click Next.
4. Follow the onscreen instructions, to continue the OneClick installation.
   OneClick with Spectrum Report Manager is installed successfully.

Spectrum Report Manager and Fault Tolerance

Support for fault tolerance exists for the DX NetOps Spectrum application, but does not extend to the Spectrum Report Manager component. Architectural limitations within the Spectrum Report Manager do not enable a Fault Tolerant configuration beyond standard database/file replications.

Multiple Spectrum Report Manager installations using a common set of SpectroSERVERs can result in inconsistencies between the primary and secondary Spectrum Report Manager installations. The inconsistencies occur due to the lack of an integrated fault tolerance architecture within the Spectrum Report Manager components.

Verify Installation by Testing Access Methods

Verify the Spectrum Report Manager environment after installing OneClick with Spectrum Report Manager. Verify that all of the SpectroSERVERs have started.

Follow these steps:

- Open BI Launch Pad from the OneClick web console and run several DX NetOps Spectrum reports.
  For more information, see the Report Manager section.

  NOTE
  If you do not install OneClick with Spectrum Report Manager correctly, then you cannot generate reports or notice any other application irregularities. For more information, see Troubleshooting.

Upgrade the Report Parameter Pages

If you update Spectrum Report Manager, run the spectrum-wkp-update.bat tool on the CABI server that is integrated with Spectrum Report Manager. The spectrum-wkp-update.bat tool downloads updated files from the DX NetOps Spectrum web server and deploys them on the CABI server.

Procedure for Windows

Follow these steps:

1. Open Command Prompt.
2. Run the following command (words in italics indicate installation-specific values):

```
% cd "C:/Program Files/CA/SC/CommonReporting3/spectrum"
```

```
% spectrum-wkp-update.bat -host http://spectrum-hostname:port -username admin_name -password
 admin_password
```

The -host flag can also specify an https URL, if SSL is configured on DX NetOps Spectrum.

3. Follow the onscreen instructions to upgrade the Report Parameter pages.
   Report Parameter pages are upgraded.

Procedure for Linux

Follow these steps:

1. Open Command Prompt.
2. Run the following command (words in italics indicate installation-specific values):

```
% cd /opt/CA/SharedComponents/CommonReporting3/spectrum
% spectrum-wkp-update.sh -host http://spectrum-hostname:port -username admin_name -password admin_password
```

The -host flag can also specify an https URL, if SSL is configured on DX NetOps Spectrum.

3. Restart the Tomcat server.
   The process to upgrade the Report Parameter pages is completed.

Migrate Report Data from a Previous Report Manager After OneClick Installation

As hardware updates become available, there may be times you need to move your software products from an older system to a newer one. To move the database ensure you meet the following requirements:

1. Landscape handles names MUST remain the same.
   Else SRM treats them as new landscapes and report them separately.
2. The new system MUST have ample disk space to handle the new database plus some for new data and in the event a repair needs to be done (2x the largest table - For example, 100GB table, 200GB free space is needed to repair).
3. The new system MUST have the exact version of DX NetOps Spectrum the old system had on it (including DX NetOps Spectrum patches),

Backup the Database

Follow these steps:

1. Shutdown Spectrum Tomcat Service (This will prevent any potential writes to the database while it's backed up).
2. Navigate a bash shell to the `$SPECROOT/mysql/bin` directory and run the following command:

```
mysqldump --defaults-file=../my-spectrum.cnf --opt --routines --ignore-table=reporting.v_active_user_model
 --ignore-table=reporting.v_alarm_activity --ignore-table=reporting.v_ncm_config_diff
 --ignore-table=reporting.v_security_string_accessibility_by_landscape--ignore-
table=reporting.v_user_report_security --compress -uroot -p<root_pw> --databases reporting > <dump_log>
```

NOTE
Backup process may take a while to complete based on the database size and system resources available. We recommended not run any other process till the backup is completed.

You can find the `dump_log` file in LOCATION. Compress the file using any compression tool like the zip to transfer the file to the new system.

3. Move the `dump_log` file to the $SPECROOT/mysql/bin directory.
4. Shutdown DX NetOps Spectrum Tomcat Service
5. Navigate a bash shell to `$SPECROOT/mysql/bin` directory and run the following command:

```
mysql --defaults-file=../my-spectrum.cnf -uroot -p<root_pw> reporting < <dump_log>
```

NOTE
For example: `mysql --defaults-file=../my-spectrum.cnf -uroot -proot reporting < reporting_db_backup_2012_10.sql`

NOTE
The database restore process may take a while to complete based on the database size and system resources available. We recommended not run any other process until the database is restored.

Set Up Report Manager to Process Data From a Migrated DDMDB

If you do not copy the database and want to set up a Report Manager to process data from a migrated DDMDB follow this process on the SRM host.

Follow these steps:

1. Navigate to `$SPECROOT/bin` directory.
2. Run the following command:

```
./RpmgrInitializeLandscape <username> <password> [-skipInitialHistory] [-initHist <#of days>] [-slm] [-all] [<landscape1> <landscape2> ...]
```

NOTE
For example: ./RpmgrInitializeLandscape root root -initHist 45 -all

NOTE
The command removes all SRM data currently existing in the SRM database and start processing new data from the DDMDBs.

CABI (JasperReports Server)

CA Business Intelligence JasperReports Server is a high-performance standalone and embedded Business Intelligence (BI) platform. CA Business Intelligence JasperReports Server provides rich reporting and integrates in-memory analysis capabilities.

DX NetOps Spectrum uses the latest version of CA Business Intelligence JasperReports® Server to integrate, analyze, and present the vital information through various reporting options that are required for an effective enterprise IT management.

CABI JasperReports Server installation runs independently and enables other CA products to share Business Intelligence services. You can activate the integration between CABI JasperReports Server and DX NetOps Spectrum Report Manager after installing CABI JasperReports Server on your system.

Install and Upgrade CABI JasperReports Server

Install CABI JasperReports Server

Click **here** to see the detailed information about Prerequisites, Installation Types, Installation, and Post Installation processes.

Set up MySQL as a Repository for CABI JasperReports Server

1. Create MySQL user and assign privileges. Create a database user who can create a new database. (applicable **only if you select MySQL that comes with DX NetOps Spectrum** as Jasper repository)
   You can use the DX NetOps Spectrum MYSQL database and login to MySQL from the command prompt. Use the following command to connect to MySQL instance of DX NetOps Spectrum from the command prompt:
   Navigate to $SPECROOT/mysql/bin directory and then from DX NetOps Spectrum bash shell run “./mysql --defaults-file=../my-spectrum.cnf -uroot -proot
   You can use the following queries to create JRS repository user and grant privileges:
   CREATE USER 'CR_user'@'jasperserverip' IDENTIFIED BY '0n3cl1Ck';

GRANT CREATE, DROP, INDEX, SELECT, DELETE, ALTER, INSERT, UPDATE, REFERENCES, LOCK TABLES on *.* to 'CR_user'@'jasperserverip' identified by '0n3cl1Ck';
Or
CREATE USER 'CR_user'@'trustednetwork/networkmask' IDENTIFIED BY '0n3cl1Ck';
GRANT CREATE, DROP, INDEX, SELECT, DELETE, ALTER, INSERT, UPDATE, REFERENCES, LOCK TABLES on *.* to 'CR_user'@'trustednetwork/networkmask' identified by '0n3cl1Ck';

2. Update the '**sample_mysql.properties**' file that is located in \ca_install with database and application settings.

   NOTE
   If you are using Oracle as a database, use sample_Oracle.properties file. Do not remove the other properties even if they are not being used.

3. Install JasperReports Server.
   Notes:
   - For silent installation, you can run the following command by navigating to the ca_install folder:
     install.bat -r sample_mysql.properties -l <<install.log>>
     Here -l specifies the log file. The log file extension should be .log. If you specify any other extensions, the installation fails.
     By default, if you do not specify the log file path, then it is stored in the current working directory(that is ca_install).
   - If installation fails, error messages are shown in the console with error codes. Refer to install.log specified during installation.
   - JasperReports Server needs DB repository (you can use MySQL that comes with DX NetOps Spectrum). JasperReports Server creates its own DB ('jaspersoft') in the MySQL instance. You can install DX NetOps Spectrum OneClick with SRM on a separate box even before attempting to install JasperReports Server and use that as a repository. If you plan to use JasperReports Server for other CA products also, then you can select a common repository.

Upgrade to CABI JasperReports Server 7.1.1

For more information on upgrading to CABI JasperReports Server 7.1.1, see Upgrading CA Business Intelligence JasperReports Server

Post-Upgrade Steps for CABI JasperReports Server 7.1.1

Perform the following steps after you upgrade to CABI JasperReports server 7.1.1 version:

1. Run SpectrumConfigInstaller.
2. If SSO was enabled before the upgrade, navigate to DX NetOps Spectrum Administration Page, Report Manager, Jasper Integration page.
3. **Click Disable** and click save.
4. Once it is disabled successfully, Click **Enable**, and click **Save**.

   NOTE
   DX NetOps Spectrum tomcat will be restarted while enabling or disabling the SSO.

Integration with CABI JasperReports Server

This section describes the steps to integrate DX NetOps Spectrum with CABI Jasper server.

After installing the JasperReports Server, you need to configure the integration between JasperReports Server and DX NetOps Spectrum Report Manager. To enable this integration, provide the Jasper Server connection details on the integration page.

NOTE

If you are using a JasperReports server that comes with a CA product other than DX NetOps Spectrum, then do the following before the integration:

Copy the SpectrumProxy.war file from the location $SPECROOT\Spectrum\Install-Tools\SRM-Tools\jasper\ to Japserserver\tomcat\webapps folder. Restart the Jasper Tomcat Server.

Follow these steps:

1. Open the OneClick Administration page.
2. Click the Report Manager tab.
3. Select the Jasper Integration option from the Report Manager Admin Tools.
4. Download and install the '**Integration Components**'. For installation instructions, see the Installing Integration Components section.

   NOTE
   Information! The 'Integration Components' is a JAR file, which consists of the necessary binaries to integrate the JasperReports Server with DX NetOps Spectrum and run reports. Installing the 'Integration Components' will deploy the binaries on the Jasper Server and helps you to generate reports.
5. Specify the parameters that are used to communicate with the JasperReports server:
   - **Jasper Server Host name**
   - Specify the host name of your CABI JasperReports Server instance if it is not the same server as DX NetOps Spectrum Tomcat.
   - **Jasper Tomcat Port**
     Specify the port where Jasper Tomcat is running. The default port value is 8080.

     NOTE
     The Tomcat port cannot be the same port that DX NetOps Spectrum Tomcat uses if Jasper and OneClick are on the same server.
   - **JasperServer Webapp Name**
     Specify the Jasper server webapp name that is given during the installation of Jasper server. Default is 'jasperserver-pro'.
   - **Jasper Admin User**
   - Specify the Jasper Admin User ID.
     The default User ID is 'superuser'.
   - **Jasper Admin Password**
     Enter the password for the Admin User ID in Jasper. The default password is 'superuser'.
   - **Jasper Integration**
     Select the Enable radio button.
     If Disable is selected and saved, DX NetOps Spectrum Tomcat no longer integrates with CABI Jasper instance.
   - **Enable SSO**
     Select this checkbox to enable single sign-on solution(SSO) from JasperReports Server, which establishes a session between the DX NetOps Spectrum Report Manager and Jasper console. If you enable the SSO, you can open Jasper console session from a OneClick web console without providing any login credentials.
   - **Use SSL with Jasper Server**
     Select this checkbox to integrate with Secure Sockets Layer (SSL) enabled JasperReports Server. To know more about Secure Sockets Layer (SSL) and how to enable it on JasperReports Server, see Using SSL in the Web Server. (Supported only when the JasperReports Server runs on Windows 2012).

     NOTE

     SSL and Single Sign-On can both be enabled with the JasperReports Server integration.
6. Click Save to enable the integration and refresh the page.
7. On the OneClick home page, click 'Jasper Console' to launch the JasperReports Server.

NOTE
This process can take some time. During this process, all the DX NetOps Spectrum Report Manager report content is exported from the OneClick server into CABI JasperReports Server. Therefore, do not cancel or navigate away from this page until you get a success message.

After you configure the integration, the DX NetOps Spectrum Report Manager report content is installed and can connect to the CABI JasperReports Server reporting database. The menubar 'JasperConsole' link now launches the CABI JasperReports Server web applications on the CABI instance that you specified.

NOTE

If you disable the integration, reporting and report administration capabilities are disabled. However, disabling the integration does not cause DX NetOps Spectrum Report Manager to stop collecting and managing data from the monitored SpectroSERVERs.

After successful integration, you can see the following DX NetOps Spectrum organization and default users in Jasper:

- jasperadmin/jasperadmin
  ROLE_ADMINISTRATOR
- joeuser/joeuser
  ROLE_USER
- spectrum/spectrum
  ROLE_ADMINISTRATOR
  ROLE_USER

Redeploy

Re-deploy the reports to repair the existing report or to update to a newer version. After upgrading to a new version of DX NetOps Spectrum, click the Re-deploy button to sync up the Jasper reports with DX NetOps Spectrum upgrade fixes, enhancements, and new reports.

Features not supported in this release

NOTE

A limited set of reports and custom reporting capabilities are supported in this release.

Available Out of the Box Reports and Domains

Following is the list of 'Out of the Box Reports' available for users:

Reports Details and Descriptions

Release Version	Reports	Report Name	Description
10.3.2	Service and SLA: SLA Status	SLA Detail by SLA Name	Reports SLA and guarantee status for one or more SLA periods. Includes sub-reports for guarantee details and service availability.

10.3.1	Service and SLA: Summarized Availability	Service Summary Variable Health Level	This report displays service health summary. User selects level of service health severity to display. An availability target can be specified, and an extended summary including initial and loss of management time is available.
10.3.1	Service and SLA: Summarized Availability	Service Summary by Service Name	This report displays the service availability reports specified by a service name. An optional extended summary is available, which shows initial time, loss of management time and table of outages.
10.3.1	Service and SLA: Health	Service or Resource Monitor Health by Name	This report displays service health reports specified by service or resource monitor name. Includes all outages and reports recalculated outage values.
10.3.1	Service and SLA: Outage	Top-N Worst Performing Services	This report displays top-n worst performing services over the specified period by total downtime. The user specifies how many services are included in the report.
10.3.1	Service and SLA: Detailed Availability	Service Availability Variable Health Level	This report displays the service availability report which allows the user to specify the service health level. An optional extended summary is available which shows initial time and loss of management time.
10.3.1	Service and SLA: Detailed Availability	Service Availability by Service Name	This report provides an optional extensive summary which displays initial time, loss of management time and table of outages.
10.3.1	Service and SLA: Inventory	Service Inventory	This report displays all currently modeled services and resource monitors listed alphabetically.
10.3	-	-	-
10.2.2	Alarm: Group	Alarm Activity By User: Group	This report displays the count of alarm activity performed by each user associated with all devices, models within a specified global collection. Entry in the list includes count of alarms cleared, acknowledged by user, assigned to troubleshooter.
10.2.2	Alarm: Individual	Alarm Activity By User: Selected Devices and Models	This report displays the count of alarm activities performed by each user associated with the selected device or models.

10.2.2	Alarm: All	Alarm Count Trend: All	This report displays the alarms count broken out per month - infrastructure wide and for the DX NetOps Spectrum server.
10.2.2	Assets: All	Current Assets (Customizable): All	This report displays the current attributed for selected devices. These attributes provide device and modeling information. User defined attributes provided by DX NetOps Spectrum are available. Information is grouped sorted by attributes and selected. Sub-report provides details for device selected.
10.2.2	Assets: All	Current Chassis-based Assets: All	This report displays all managed chassis based devices and linecards/modules. This list of devices is grouped by vendor. This report displays the model name, IP address and device type for each device.
10.2.2	Assets: All	Current Port Assets (Customizable): All	This report displays selected attributes for all currently managed ports. The attributes available provide port and modeling information. Furthermore the user defined attributes by DX NetOps Spectrum are also available for display.
10.2.2	Assets: All	Detailed Change Management: All	This report identifies devices created and deleted within a user specified time period. The following information is available for each device which is listed: device name, creator, created time, user who deleted and the deleted time.
10.2.2	Event: Group	Detailed Event Log: Group	This report displays a reverse chronological list of events for all devices and models within a specified global collection. Each entry in the list includes the IP address (if applicable), event text, event code and event creator.
10.2.2	Availability: Group	Outage Log: Group (Devices Only)	This report lists the outages for selected devices within the specified global collection. For each outage listed, the device name, device type, model class, vendor and location associated with the outage is displayed.

10.2.2	Availability : Group	Top-N Least Available: Group (Devices Only)	This report displays a list of devices from a specified global collection from with the lowest availability percentage within the specified time frame.
10.2 - 10.2.1	Event: Group	Top-N Most Common Events-Group	This report displays a list of the most frequently occurring event types for devices and models within a global collection. This reports presents an event log for each of the listed items.
10.2 - 10.2.1	Event: All	Top-N Most Common Events-All	This report displays a list of the most frequently occurring event types. This report presents an event log for each of the listed items.
10.2 - 10.2.1	Availability : Group	Top-N Least Available: Group	This report displays a list of devices from a specified global collection with the lowest availability percentage within the specified time frame.
10.2 - 10.2.1	Availability : All	Top-N Least Available: All Devices	This report displays a list of managed devices with the lowest availability percentage within the specified time frame.
10.2 - 10.2.1	Event : Group	Top-N Devices and Models with the Most Events: Group	This report displays a list of managed devices and models from a specified global collection with the most events. The report presents an event log for each of the listed items.
10.2 - 10.2.1	Event: All	Top-N Devices and Models with the Most Events: All	This report displays a list of managed devices and models with the most overall events. The report presents an event log for each of the listed items.
10.2 - 10.2.1	Service and SLA: Customer	SLA Summary by Customer	This report displays the SLA status for a specified customer in a specified time rage. SLA periods arranged by SLA status descending from violated.
10.2 - 10.2.1	Service and SLA: Customer	SLA Status Current and Recent by Customer	This report displays the current and recent status of SLAs for a specific customer or a set of customers.
10.2 - 10.2.1	Service and SLA: Customer	SLA Inventory by SLA Customer	This report displays currently modeled SLAs and the corresponding guarantees for selected customers.

10.2 - 10.2.1	Service and SLA: Customer	SLA Detail by Customer	This reports displays the SLA and the guarantee status for a specified customer over one or more SLA periods. It shows the status of each guarantee violated or compliant. Guarantee status values of unaffected, compliant and warned are all represented as compliant.
10.2 - 10.2.1	Service and SLA: Customer	Service Summary by Customer	This report summarizes service availability for a set of services used by specific service customers. It displays available time and down time. An availability target can be specified, and an extended summary including initial and loss of management time is included.
10.2 - 10.2.1	Service and SLA: Customer	Service Health by Customer	This report displays the service health reports specified by service customer.
10.2 - 10.2.1	Service and SLA: Customer	Service Availability by Service Customer	This report displays the service availability reports specified by service customer. An optional extended summary is available which shows initial time, loss of management, and a table of outages which is recalculated or exempted so no longer impact service availability.
10.2 - 10.2.1	Availability : Group	Outage Log: Group	This report lists the outages for all managed devices and models specified within the global collection. For each outage listed the device model name, device type (if applicable), model class, vendor and location associated, with the outage are displayed.
10.2 - 10.2.1	Availability : All	Outage Log: All Devices	This report lists the outages for all managed devices. For each outage listed, the device name, the device type, model class, vendor and location associated, with the outage are displayed.
10.2 - 10.2.1	Event: All	Detailed Event Log: ALL	This report displays a reverse chronological list of events for all devices and models. Each inventory in list includes the IP address (if applicable), event text, event code and the event creator.

10.2 - 10.2.1	Service and SLA: Customer	Customer SLA Summary	This report summarizes of customer's SLAs, and the status for up to the six most recent SLA periods.
10.2 - 10.2.1	Service and SLA: Customer	Customer Detail	This report displays the contact information and list of services for a specified customer.
10.2 - 10.2.1	Assets: All	Current Ports Summary:All	This report displays the ports associated with all the currently managed device(s). For each device, the total number of ports is displayed, along with an availability summary of these reports. A sub report provides details for a device selected from a report.
10.2 - 10.2.1	Assets : Individual	Current Ports Summary: Selected Devices	This report displays the ports associated with the currently managed device(s) selected. For each device, the total number of ports is displayed, along with an availability summary of these reports.
10.2 - 10.2.1	Assets: Group	Current Ports Summary: Group	This report displays the ports associated with the currently managed device(s) from a global collection. For each device, the total number of ports is displayed, along with an availability summary of these reports.
10.2 - 10.2.1	Assets : Group	Current Ports Detail:Group	This report displays the ports associated with the currently managed device(s) from a global collection.
10.2 - 10.2.1	Assets: Individual	Current Ports Detail: Selected Devices	This report displays the ports associated with the currently managed device(s) selected. For each device, individual ports are listed with its name, description, type, speed, and the current status along with the number of days the port has been idle.
10.2 - 10.2.1	Assets: Group	Current Assets: Group	This report displays a breakdown by model class of currently managed devices from a specified global collection. The report displays the model name, IP address, device type, firmware version and last reboot of each device listed.

10.2 - 10.2.1	Assets: All	Current Assets: All	This report displays a breakdown of currently managed devices by model class. The report displays the model name, IP address, device type, firmware version and last reboot of each device listed.
10.2 - 10.2.1	Assets: Individual	Current Asset Detail: Selected Devices	This report displays the ports associated with the currently managed device(s) selected. For each device the total number of ports is displayed along with an availability summary of these reports.
10.2 - 10.2.1	Availability : Individual	Availability: Selected Models	This report displays a detailed list of outages for each device and model specified by the user. It includes the total number of outages, total up time, total downtime and the availability percentage.
10.2 - 10.2.1	Availability : Individual	Availability: Selected Devices	This report displays a detailed list of outages for each device selected by the user.
10.2 - 10.2.1	Availability : Group	Availability: Group	This report displays availability information for each device and model within a specific global collection.
10.2 - 10.2.1	Availability : All	Availability by Class and Vendor: All Devices	This report presents the availibility of all devices broken down by vendor and grouped by class.
10.2 - 10.2.1	Alarm: All	Alarm Mean time to Respond statistics	This report displays the alarm mean time to respond to alarm statistics based on the severity.
10.2 - 10.2.1	Alarm: Individual	Alarm Log:Selected Devices and Models	This report lists of alarms for all devices and models that satisfy criteria of alarm creation and minimum duration threshold. Alarms are displayed in chronological order. Alarms are grouped by alarm condition and landscape.
10.2 - 10.2.1	Alarm: All	Alarm Log:All	This report lists alarms for all devices and models that satisfy criteria of alarm creation and minimum duration threshold. Alarms are displayed in chronological order. Alarms are grouped by alarm condition and landscape.

10.2 - 10.2.1	Alarm: Group	Alarm Log Group	This report lists alarms for all devices and models that satisfy criteria of alarm creation and minimum duration threshold. Alarms are displayed in chronological order. Alarms are grouped by alarm condition and landscape.
10.1.1	Alarm: All	Alarm Activity By user: All	This report presents the count of alarm activities performed by each user associated with all devices and models. Each entry includes a count of the number of alarms cleared, acknowledged, assigned and the number of alarms ticketed for a DX NetOps Spectrum user or a troubleshooter.
10.1.1	Alarm: All	Top N Devices and Models with Most alarms: All	This report displays a list of managed devices and models with the most overall alarms. A sub-report provides details for each of the alarms for a selected device or model.
10.1.1	Alarm: All	Top N Most common Alarms: All	This report displays the list of the most frequently occurring alarm types. A sub report provides details for each of the alarms for a selected alarm type.
10.1.1	Alarm: Group	Top N Devices and Models with Most alarms: Group	This report displays a list of managed devices and models with the most overall alarms. A sub-report provides details for each of the alarms for a selected device or model.
10.1.1	Alarm: Group	Top N Most common Alarms: Group	This report displays the list of the most frequently occurring alarm types. A sub report provides details for each of the alarms for a selected alarm type.
10.1.1	Alarm: Individual	Top N Most common Alarms: Selected Devices and Models	This report displays the list of the most frequently occurring alarm types. A sub report provides details for each of the alarms for a selected alarm type.

Domains

- NCM (from r10.2.3)

- Availability
- Event
- Asset

How to Run Reports Using the JasperReports Server

Important! You must log in to JasperReports Server to access reporting functionality.

Generate General Reports

Follow these steps:

1. Open the OneClick console.
2. Click the 'JasperConsole' link to open the CABI JasperReports Server web application login screen.
3. Log in to the CABI JasperReports Server.

   NOTE

   If you are logged in as a DX NetOps Spectrum user, then you can generate reports only for the devices for which you have the access. If you are logged in as a non-DX NetOps Spectrum user or as a Jasper Super User, reports might not fetch any data. To fetch data in the reports for these users, set the value to 'False' for the Enable Security option in the Report Manager Preferences.
4. Click View, Repository.
5. (till r10.2.1) In the Folders pane, expand root, Organizations, spectrum, capability, and reports.
   (from r10.2.2) In the Folders pane, expand root, Public, ca, Spectrum, and reports.

   NOTE

   From 10.2.2, all the DX NetOps Spectrum content in CABI JasperReports Server is saved under the 'Public' folder (root->Public), previously it was saved under the 'Organizations' folder (root->Organizations).

   For the 10.2.2 users, we recommend to keep the old content, which was saved under the Organizations folder. However, you can delete the old content manually (Manage->Organizations then select Spectrum folder and click Delete).
6. Click a report title to open 'Input Controls' and generate a report.
7. Specify the parameters in Input Controls dialog, Click Apply and OK.

   NOTE

   Do not copy or move the DX NetOps Spectrum reports from default folder to another folder. The Jasper reports should be run from the default folder. Running the reports from other folders will throw an error.

   Following is the default location for the reports folder in the Jasper repository:

   For r10.2.2: root -> Public -> ca -> Spectrum -> reports.
   Till r10.2.1: root -> Organizations -> Spectrum -> capability -> reports.

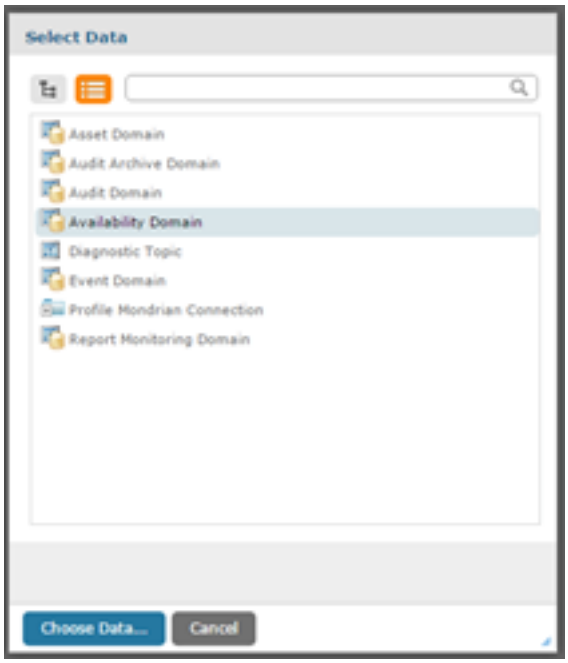
Generate Ad Hoc Reports

Domains available in Jasper help you to generate Ad Hoc or custom reports. For example, using the Availability domain, you can design the Ad Hoc reports on availability or outage information.

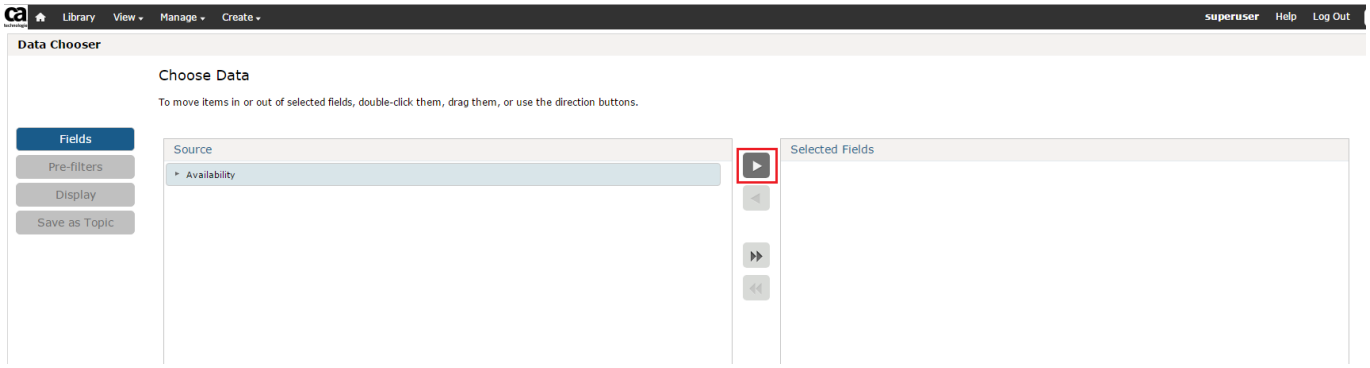
Follow these steps to generate Ad Hoc Reports:

1. Open the OneClick console.
2. Click the 'JasperConsole' link to open the CABI JasperReports Server web application login screen.
3. Log in to the CABI JasperReports Server.
   Important! If you are logged in as a Spectrum user, then you can generate reports only for the devices for which you have the access. If you are logged in as a non-Spectrum user or as a Jasper Super User, reports might not fetch any data. To fetch data in the reports for these users, set the value to 'False' for the Enable Security option in the Report Manager Preferences.
4. Click Create, Ad Hoc View.

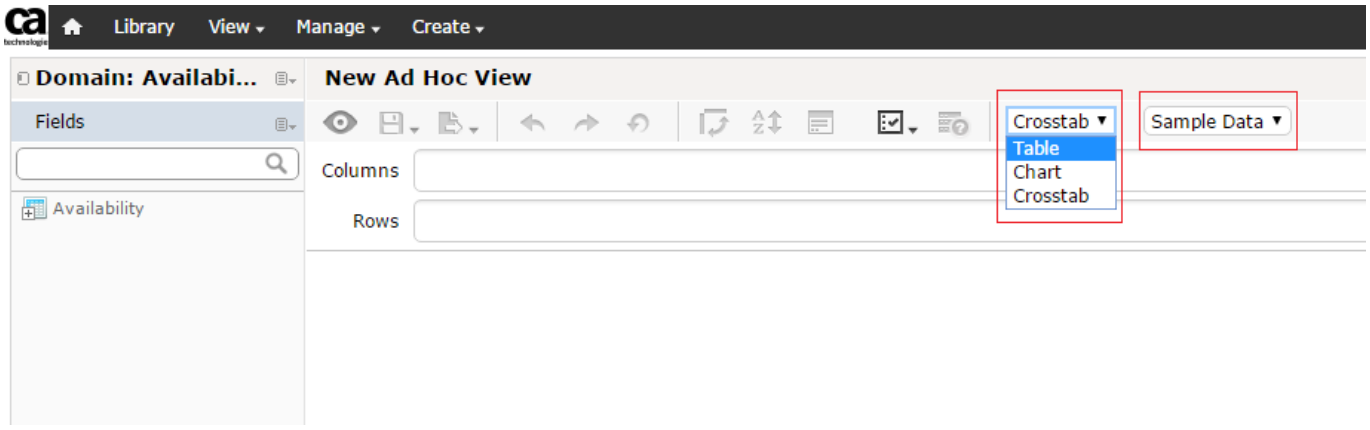
   The Select Data window appears.
5. Select any Spectrum related domain (for example, here it is Availability Domain) from the list, and click Choose Data.



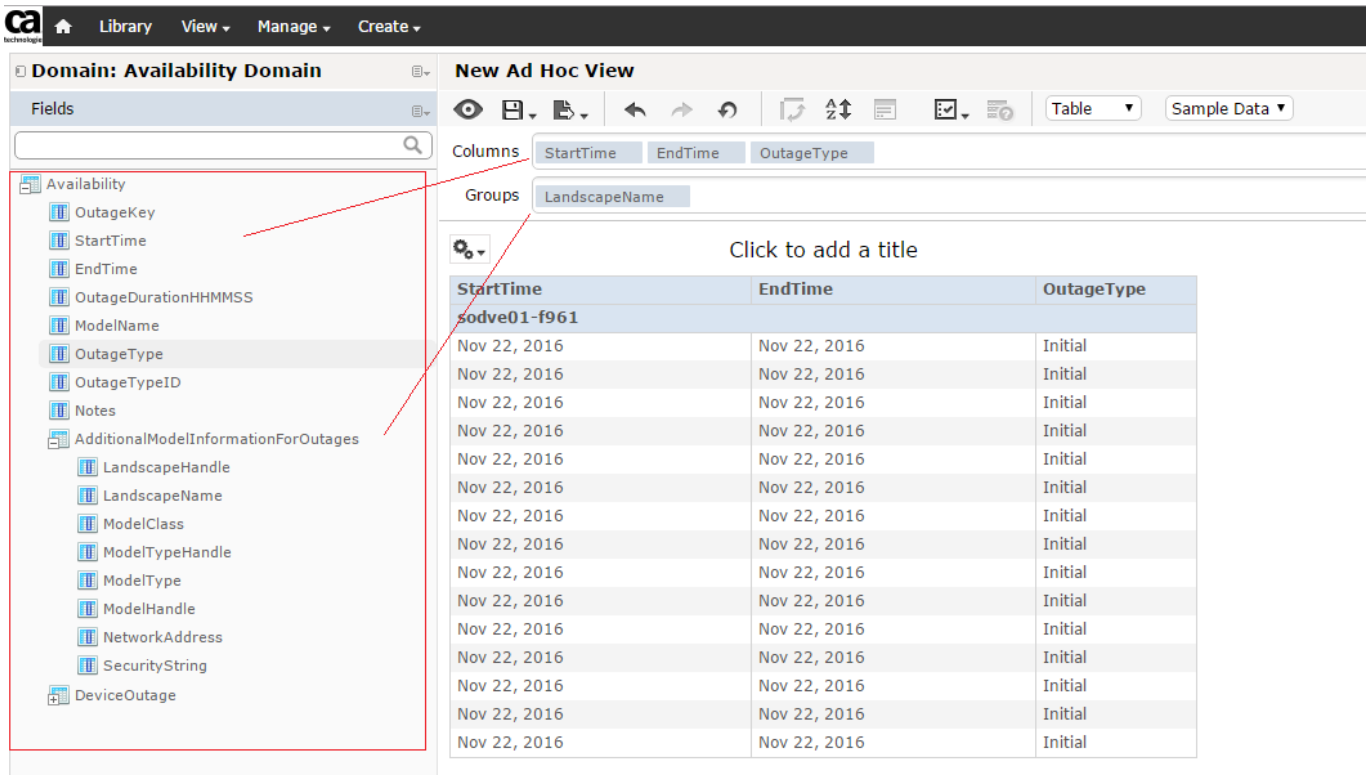
6. In the ‘Fields’ tab, select ‘Availability’ in the ‘Source’ box and click the  button to move it to ‘Selected Fields’ box and click OK.
You can see the Availability field in the Fields pane.



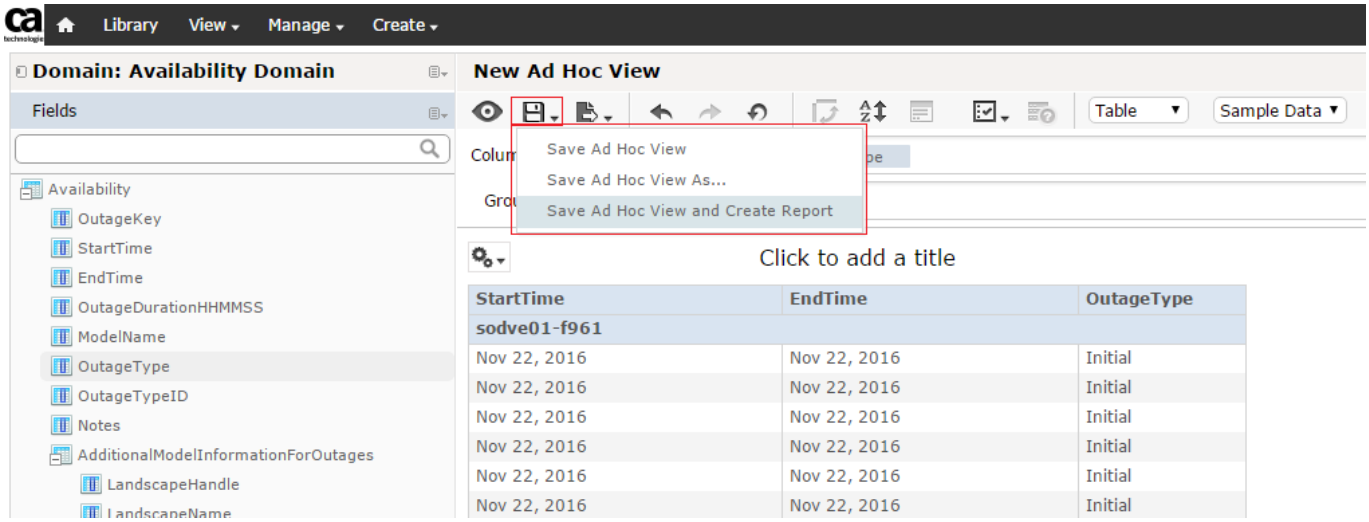
7. Select Table and Sample Data from the drop-down fields available on the toolbar.



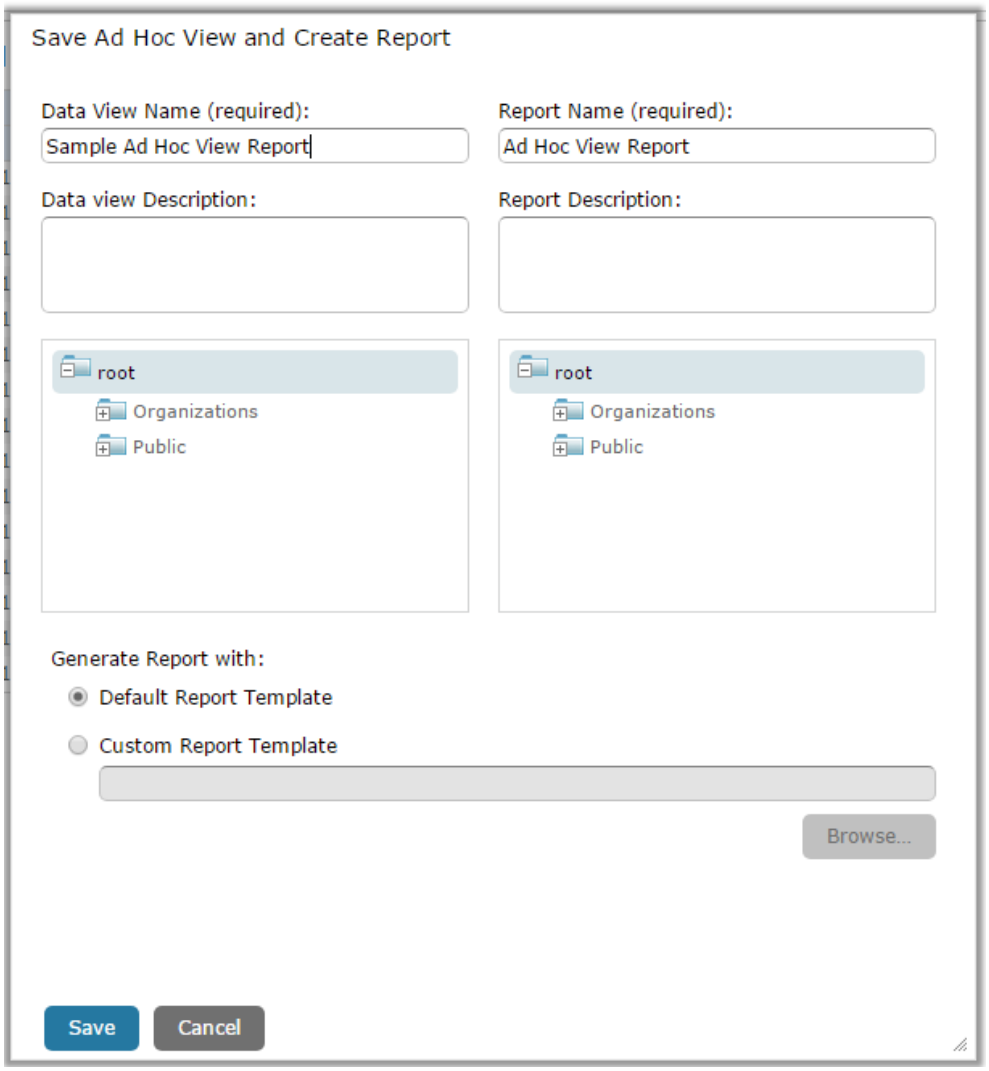
8. Expand the 'Availability' field in the left pane and add fields to Column and Group by drag and drop from the Availability field.
   For example: If you want to see StartTime, EndTime, and OutageType in the report, you can drag and drop these fields to Column. For Group, select fields from AdditionalModelInformation in Availability field.



9. To save the report, Click the Save button from the toolbar and then select Save Ad Hoc View and Create Report.



10. Provide information like Data View Name and Report Name in the Save Ad Hoc View and Create Report window and click Save.



The Ad Hoc View Report is saved in the selected location.

Scheduling Reports

You can schedule the reports to automate the generation and distribution of reports. Provide the details of the settings in JasperReports Server to schedule the reports.

For more information, see the Scheduling Reports section in the JasperReports Server documentation.

NOTE

Information! For scheduled reports, you receive emails with links to specific reports. The report links in the email may not work properly if they are referenced to 'http://localhost' instead of the real hostname (JasperReports Server). To set the real host name, update the 'report.scheduler.web.deployment.uri' attribute value in the 'js.quartz.properties' file, which is located at <jasperserver-pro>/WEB-INF/js.quartz.properties. The 'localhost' in the url should be replaced with server hostname, where the JasperReports Server is installed.

Example: report.scheduler.web.deployment.uri=http://localhost:8080/jasperserver-pro should be set to http://<jaser server hostname>/jasperserver-pro.

Managing Reports

You can save and export the reports in various formats. For more information, see the Exporting the Report section in the JasperReports Server documentation.

Enable Single Sign-On (SSO) Using Token-based Authentication in JasperSoft

Token-based authentication is a single sign-on solution from JasperReports Server that establishes a session between the Spectrum Report Manager and Jasper console. This solution allows you to open Jasper console session from a OneClick web console without being promoted for login credentials.

When you enable the SSO with JasperServer, a java keystore file is created. Using the java keystore file, Jasper generates a login token for login.

Follow these steps to achieve the SSO with token-based authentication in DX NetOps Spectrum-Jasper integration:

1. Navigate to OneClick, Administration tab, Report Manager, then select the Jasper Integration in the left panel.
2. Select the 'Enable SSO' checkbox, click Save.
   You can access the Jasper Console without providing any credentials. To verify, click the Jasper Console link on the OneClick toolbar. You are automatically logged in to the Jasper Console.

   NOTE
   Currently, the DX NetOps Spectrum and Jasper integration does not support enabling both SSO and LDAP together. Only either SSO or LDAP can be enabled.

Import and Export Data in JasperReports Server

Import and Export Through the Web UI

Import Data

1. Log in to the CABI JasperReports Server as a system administrator(for example, superuser).
2. Navigate to Manage, Server Settings, then click Import.
3. Select the content that you want to Import, then click Save.

Export Data

1. Log in to CABI JasperReports Server as a system administrator.
2. Navigate to Manage, Server Settings, then click Export.
3. Select the content that you want to export, then click Export.

Import and Export Through the Command Line

You can specify the required content to export or import in the command-line utility. Go to the folder *<jsinstall>*/buildomatic/*folder* and run the utility to export or import the content.

Import Data

To import resources from the *myExport.zip* catalog archive file, run the following command:

```
js-import --input-zip myExport.zip
```

Export Data

To export all resources in ca_samples (excluding users, roles, and job schedules) and their permissions to the *myExport.zip* file, run the following command:

NOTE

Depending on your environment, the following location (as shown in the example) changes:

"organization_1/ca_samples"

```
js-export --uris /organizations/organization_1/ca_samples --output-zip myExport.zip
```

Migrate CA Business Intelligence from Windows to Linux - DX NetOps Spectrum

Windows is unsupported with CA Business Intelligence 7.1.1. If you integrate with CA Business Intelligence on Windows, when you upgrade to 7.1.1, you must migrate your DX NetOps Spectrum and DX NetOps Spectrum content from the Windows CA Business Intelligence server to a Linux CA Business Intelligence server.

Follow these steps:

1. Export the content from the Windows CA Business Intelligence server:
   a. Log in to CA Business Intelligence on the Windows server as a system administrator (for example, superuser).
   b. Click **Manage**, **Server Settings**, and **Export**.
   c. Specify a file name for the export data.
   d. Select the content to export.
   e. Click **Export**
2. Install DX NetOps Spectrum content in Linux CABI server using the following command:
   ```
   java -jar spectumConfigInstaller.jar -install
   ```
3. Import the content to the Linux CA Business Intelligence server:
   a. Log in to CA Business Intelligence on the Linux server as a system administrator (for example, superuser).
   b. Click **Manage**, **Server Settings**, and **Import**.
   c. Select the content to import.
   d. Click **Import**
4. Perform DX NetOps Spectrum-Linux CABI integration.

Usernames and Passwords for CABI (JasperReports Server)

OneClick users are automatically added to CABI (JasperReports Server). The default JasperReports Server password is the username. You can change the default password using the 'Change password' option available on the login page.

If a default JasperReports Server password is set, contact the Spectrum Report Manager administrator to reset the password. For more information, see the Install Report Manager section.

The Administrator user (Ex: superuser) can add users in the JasperReports Server.

To add users, follow these steps:

1. Go to Manage, Users
2. Select the Organization from the left menu
3. Click Add User menu button

The Add User pop-up appears.

4. Enter details of the user such as User Name, User ID, Email and Password
5. Click Add User to <org name> button
   The user is added in the JasperReports Server
   The default role of the added user is 'ROLE_USER'. You can modify the user role using the 'Edit' button available in the Properties section for that user.

Troubleshooting for CABI JasperReports Server

Service Reports show incorrect down/ up percentage values

Symptom:

There are incorrect percentages values in the service reports when the 'Date Range' is chosen and when the end period value is the future date/time which is set under the Input Controls option.

Solution:
The end period value should always be set to a value which is less than or equal to the current date or time.

Jasper SSO access issue when Single Sign-On is enabled in both Jasper and DX NetOps Spectrum

Symptom: When Single Sign-On is enabled in Jasper Server and at the same time if you enable the Single Sign-On feature in DX NetOps Spectrum, you may face access issues for Jasper SSO.
Solution: To enable the Single Sign-On for both Jasper and DX NetOps Spectrum:

1. In the DX NetOps Spectrum machine, go to $Specroot\tomcat\webapps\spectrum\repmgr\admin folder
2. Copy the 'spectrum.jks' and 'spectrum.properties' files
3. In the Jasper machine, go to <<CABusinessIntelligenceINstalledDIR>>\apache-tomcat\webapps\jasperserver-pro\WEB-INF\config folder
4. Replace the existing 'spectrum.jks' and 'spectrum.properties' files with the copied files from DX NetOps Spectrum machine

Jasper report charts are not loading properly (going into processing)

Symptom: Jasper report which contains graphs such as pie chart or bar graph does not load and keeps on processing.
Solution: This issue is caused because of running Ad-Blocker within the Web browser like Firefox or Chrome.
We recommended you disable the extension for the JasperReports page, while running the reports to get the charts loaded properly in reports.

Unable to export report data (without Titles, Headers, Group Headers, Summary, Footers) to .csv format

Symptom: When I export the report data into CSV format, I want to filter out Title, Header, Group Header, Summary, and Footer information.
Solution:

1. On Jasper Server, navigate to :
   <<CA Business Intelligence Installed Directory>>\apache-tomcat\webapps\jasperserver-pro\WEB-INF\classes.
2. Open the jasperreports.properties file.
3. Add the following properties at the end of the file.

```
net.sf.jasperreports.export.csv.remove.empty.space.between.rows=true
net.sf.jasperreports.export.csv.remove.empty.space.between.columns=true
net.sf.jasperreports.export.csv.exclude.origin.band.1=pageHeader
```

```
net.sf.jasperreports.export.csv.exclude.origin.report.1=*
net.sf.jasperreports.export.csv.exclude.origin.band.2=pageFooter
net.sf.jasperreports.export.csv.exclude.origin.report.2=*
net.sf.jasperreports.export.csv.exclude.origin.band.3=columnHeader
net.sf.jasperreports.export.csv.exclude.origin.report.3=*
net.sf.jasperreports.export.csv.exclude.origin.band.4=columnFooter
net.sf.jasperreports.export.csv.exclude.origin.report.4=*
net.sf.jasperreports.export.csv.exclude.origin.band.5=lastPageHeader
net.sf.jasperreports.export.csv.exclude.origin.report.5=*
net.sf.jasperreports.export.csv.exclude.origin.band.6=summaryPageHeader
net.sf.jasperreports.export.csv.exclude.origin.band.7=groupHeader
net.sf.jasperreports.export.csv.exclude.origin.band.8=groupFooter
net.sf.jasperreports.export.csv.exclude.origin.band.9=reportHeader
net.sf.jasperreports.export.csv.exclude.origin.band.10=reportFooter
net.sf.jasperreports.export.csv.exclude.origin.band.11=lastPageFooter
net.sf.jasperreports.export.csv.exclude.origin.report.11=*
net.sf.jasperreports.export.csv.exclude.origin.band.12=summaryPageFooter
net.sf.jasperreports.export.csv.exclude.origin.band.13=summary
net.sf.jasperreports.export.csv.exclude.origin.report.13=*
net.sf.jasperreports.export.csv.exclude.origin.band.14=title
net.sf.jasperreports.export.csv.exclude.origin.report.14=*
net.sf.jasperreports.export.csv.parameters.override.IgnorePagination=true
```

4. Save the changes to the properties file and close.
5. Restart the Jasper Tomcat Server.

DX NetOps Spectrum logo stretches in the Jasper reports that are exported to Excel format

Symptom: While exporting the Jasper reports to Excel format, the DX NetOps Spectrum logo is stretched.
Solution: To prevent the DX NetOps Spectrum logo from stretching:

1. On the Jasper Server Machine
2. Open the file applicationContext,xml located at <Jasper Install Directory>\CA\SharedComponents\CA Business Intelligence\apache-tomcat\webapps\jasperserver-pro\WEB-INF.
3. Change the 'ignoreGraphics' property to 'false' and save the file.
4. Restart the Jasper Tomcat server.

'Install with default components such as Tomcat and Postgres option is grayed out while installing Jasper server

Symptom: While installing JasperReports Server 6.3 using GUI, the “Install with default components(Tomcat and Postgres….)” option grays out. The user is forced to select “Custom install”.
Solution:

1. Verify the host file entries in the '/etc/hosts' (for non-Windows platforms), %SystemRoot%\System32\drivers\etc\hosts (for Windows).
2. Correct the entries and save the file.
3. Restart the installation.

For more details, see the 'Host Name / IP Resolution' section in the CABI documentation.

JasperReports Server Integration fails

Symptom: JasperReports Server integration with DX NetOps Spectrum fails

Solution: To debug the integration fail issue, you must ensure that JasperReports Server parameters are given correctly in Jasper Integration page and also verify that the 'SRM - Core - Report Manager' Module is set to 'ON' in the Debug Controller to collect (To set this value go to OneClick, Administration, Debugging, and Web Module Debug Pages). Verify the OneClick Tomcat log file to identify the error.

Symptom: JasperReports Server integration with DX NetOps Spectrum fails
Solution: If you have installed the CABI jasper reports server that comes with any CA product other than DX NetOps Spectrum, then you must ensure that SpectrumProxy.war file is copied to $TOMCAT\webapps folder and the reportViewerMain.js file is copied to the folder.

JasperReports Server GUI Install screen shows that the product is already installed

Symptom: JasperReports Server GUI installation screen shows that the product is already installed
Solution: This happens when the uninstaller fails to clean up the registry entries of the jasper server. For windows, check the registry using regedt32 for CABI Jasper server entries. For Linux, check for the file $HOME/.cabijasper file and delete it if found.

A lot of postgres.exe processes even though I only started the server once

Symptom: You may see a number of postgres.exe processes running when started Postgres and tomcat of Jasper server (if Postgres is used as a repository of jasper server)
Solution: This is normal. PostgreSQL uses a multi-process architecture. In a fresh system with Postgres server, you may see anything from two to five processes. Once clients start to connect, the number of processes increases.

OC users don’t sync in jasper, some newly created users are missing

Symptom: Do not see all the DX NetOps Spectrum/OC users in jasper server
Solution: You can restart the OneClick server and verify it.

Hibernate errors appear when trying to run reports

Symptom: Getting hibernate error messages “Socket Write Error” and “Last Packet Not Finished” and unable to run reports.

```
Error Message:
org.springframework.transaction. CannotCreateTransactionException: Could not open Hibernate Session for
 transaction; nested exception is org.hibernate. TransactionException: JDBC being failed:
Error Message:
org.hibernate.TransactionException: JDBC begin failed:
OR
Error Message:
org.springframework.tranaction. CannotCreateTransactionException: Could not open Hibernate Session for
 transaction; nested exception is java.lang.AssertionError: Last packet not finished
Error Message:
java.lang.AssertionError: Last packet not finished
```

Reason: The c3p0 hibernation settings are not available

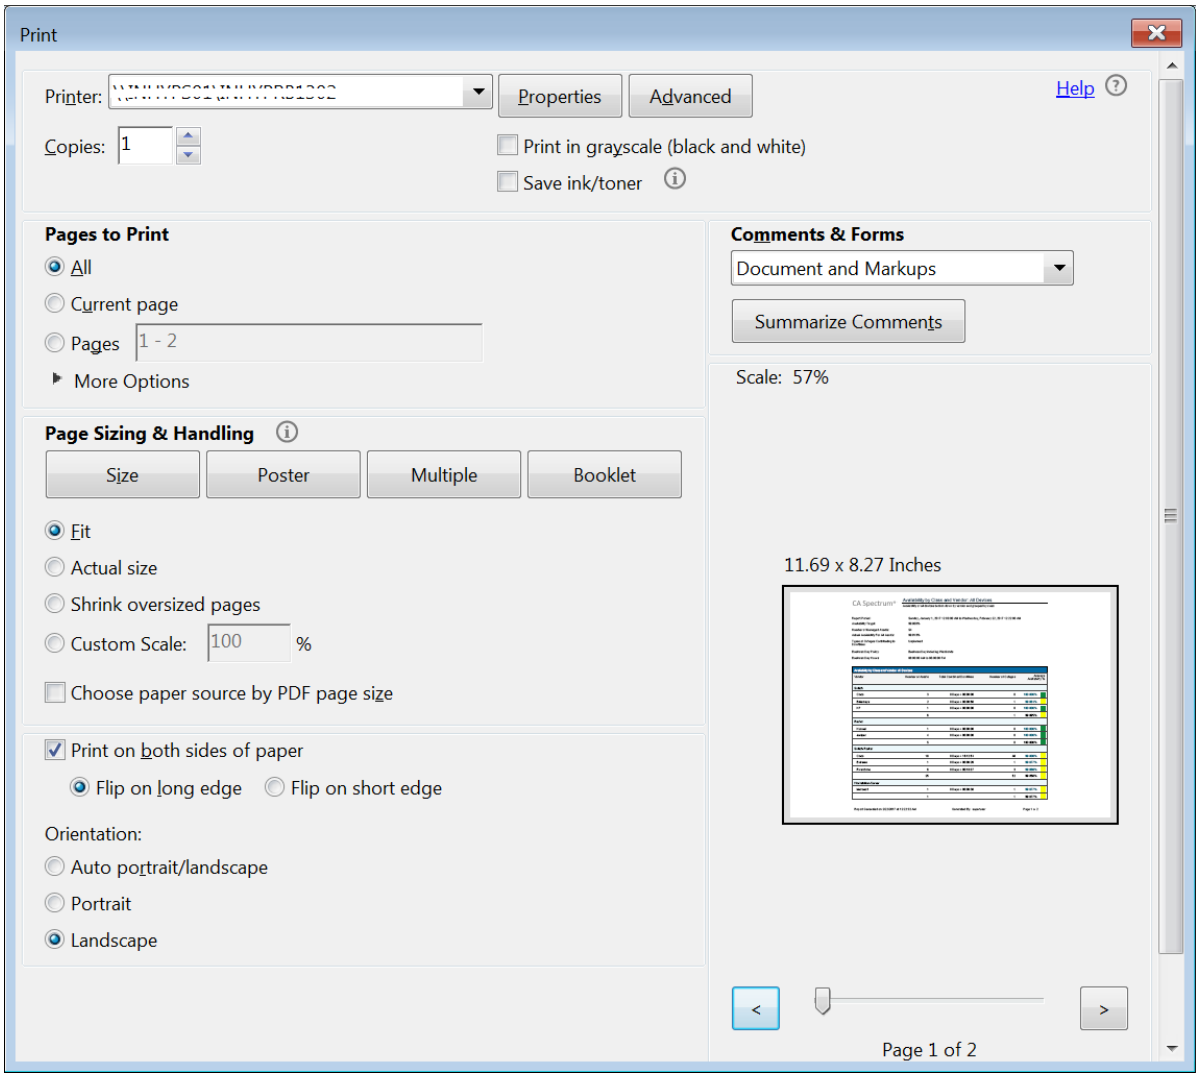
Solution: Add the following property key values (which are in bold letters) in the **hibernateProperties** in **<js-app>/jasperserver-pro/WEB-INF/applicationContext.xml** file and restart the CABI Tomcat to apply these changes. (Refer to the KB article for more information).

```
<property name="hibernateProperties">
      <props>
        <prop key="hibernate.dialect">${metadata.hibernate.dialect}</prop>
```

```
        <prop key="hibernate.show_sql">false</prop>
        <prop key="hibernate.generate_statistics">true</prop>
        <!--uncomment property below if a default schema should be specified such as for
 DB2-->
        <!--<prop key="hibernate.default_schema">${metadata.hibernate.default_schema}</
prop>-->
        <!--Cache Configurations-->
        <prop key="hibernate.cache.region.factory_class">
${hibernate.cache.region.factory_class}</prop>
        <prop key="net.sf.ehcache.configurationResourceName">/ehcache_hibernate.xml</
prop>
        <prop key="hibernate.cache.use_minimal_puts">false</prop>
        <prop key="hibernate.cache.use_query_cache">true</prop>
        <prop key="hibernate.jdbc.batch_size">20</prop>
        <prop key="hibernate.cache.use_second_level_cache">true</prop>
        <prop key="hibernate.cache.use_structured_entries">true</prop>
         <prop key="hibernate.c3p0.min_size">5</prop>
         <prop key="hibernate.c3p0.max_size">200</prop>
         <prop key="hibernate.c3p0.timeout">300</prop>
         <prop key="hibernate.c3p0.max_statements">500</prop>
         <prop key="hibernate.c3p0.idle_test_period">60</prop>
         <prop key="hibernate.c3p0.acquire_increment">2</prop>
         <prop key="hibernate.c3p0.testConnectionOnCheckin">true</prop>
      </props>
    </property>
```

Printed Jasper reports contain huge space above the header and below the footer

Symptom: Noticed huge space above the header and below the footer when printed the PDF report that is exported from Jasper.
Solution: To print the reports, you need to export/save the report as PDF and then use the print facility provided by the acrobat reader (do not try to print the report by opening it in the browser). You must select 'Fit To Page' option in the Print dialog and select the page orientation as “Landscape”. If you select 'Fit to Page', the acrobat reader scales the document to fit into a page and places it in the center. If you select 'Custom Scale' option and specify the same scale value - the document is scaled but placed at the page top. Refer to the following screenshot.



The JasperReports Server 6.3 login button is grayed out or the content page does not look correct in Internet Explorer 11

Symptom: When using IE 11 and Jasper Reports 6.3 either the login button is grayed out or if you are logged in, the page format looks incorrect.

Probable Cause: This is due to a setting on the Jasper server

Solution/Workaround:

Force the Edge mode for Internet Explorer by modifying the following section in the <Tomcat Install Directory>/WEBAPPS/JASPERSERVER-PRO/WEB-INF/decorators/decorator.jsp file on the JasperSoft Server:

<!--

<meta http-equiv="X-UA-Compatible" content="IE=8"/>

-->

Uncomment this section, and then set content to "IE=Edge" instead of "IE=8".

<meta http-equiv="X-UA-Compatible" content="IE=Edge"/>

SRM Multitenancy Support

NOTE

10.4.1 SRM Multitenancy is supported with CABI JasperReports Server 6.4.2, 6.4.3, and Unified CABI 7.1.1versions.

DX NetOps Spectrum includes SRM multitenancy support with Jaspersoft. This support enables modeling of multiple selected tenants to any number of devices or locators in a DSS environment. This modeling helps you effectively manage several devices in your network. Through SRM multitenancy, you can configure multiple tenants and can specify devices or locators to be mapped to, in the corresponding landscapes. Deploy a multitenant environment and aggregate, generate, and run reports for multiple tenants to manage and monitor the devices in your network.

Configure SRM Multitenancy

Prerequisites

1. Enable JasperServer Integration with DX NetOps Spectrum.

Following are the key functionalities and parameters of the SRM Multitenancy table:

- **Add Tenant:** Enable the checkbox for multitenancy support to add tenant/s.
- **Delete Tenant:** Select the checkbox in the field next to the tenant name and delete the tenant and its mapping.
- **Tenant Name:** Specifies the tenant name or organization name.
- **Locator:** Includes the routers, switches, pings you have specified in the XML file, which is used to filter out and map to the corresponding tenant name. These can be selected using the locator search drop-down.

  NOTE

  This locator search should be unique which you define in an XML file. The locator file name should not contain special characters ($,#,!%). It is permissible to have an underscore (_) in the file name. The user should create a folder 'SRMTenants' in the following path: <*SpectrumFolder*>*/tomcat/webapps/spectrum/WEB-INF/topo/Config* and then place the xml file inside the folder 'SRMTenants'. The locater search drop-down reads the xml placed in the 'SRMTenants' folder.
- **Landscapes**: Select either single or multiple DSS environments in which configuration should be enabled.
- **Save**: Save newly added tenant and locator searches in the corresponding landscapes.
- **Re-Map**: Refreshes or syncs the latest mappings of the tenants to locators based on any file changes related to mapping.

Follow these steps to deploy a Multitenant environment:

1. Open the OneClick Administration page.
2. Select the **Report Manager** tab on the top bar and select the **Jasper Multitenant Configuration** from the left panel.
3. Select the **Enable Multitenancy Support** checkbox to initiate multitenancy.
4. Select **Add Tenant** to add tenant and map it to the corresponding locator or device, router, switch, and so on, that you have specified in the XML file.
5. Select the respective landscape in a DSS environment.
6. After mapping the tenant to the locator, select **Save**. The multitenancy configurations are saved.

Generate Reports under the select Tenant Name:

1. Go to the **Jasper Console** on the top bar of the OneClick Administration page. The CA Business Intelligence login page appears.
2. Enter the **organization** details, which are the tenant name you have specified in the configuration table. Log in using DX NetOps Spectrum credentials.

NOTE

You cannot run reports using superuser credentials if you have enabled SRM Multitenancy.

The JasperServer home page appears.

3. Select **Repository** from the **View** tab on the top left bar of the page.
4. Select **Reports** from the left panel under capabilities that are found under the organization name.
5. You can now run and generate reports under the select Tenant Name. See How to run reports using the JasperReports Server for more information.

WARNING

Now with SRM Multitenancy ensure privacy and safety of your data! This feature restricts unwanted access to your schedule by preventing the schedule from being saved in a public folder.

Users/Admins cannot save their schedule in 'public/ca/Spectrum' folder and saving in such public folders is restricted through this enhancement. Users/Admins can save schedule in their own tenant folders **only**.

Upgrade Options from Jaspersoft 6.3.0 to 6.4.2/6.4.3

NOTE

When you upgrade from Jaspersoft 6.3.0 to 6.4.2/6.4.3 with CA Spectrum 10.3 (or later), the SSO, LDAP, and email functionalities get disrupted. To ensure a successful upgrade to Jaspersoft 6.4.2/6.4.3, you must reconfigure these settings.

To ensure a successful upgrade to Jaspersoft 6.4.2/6.4.3 with the features that are mentioned in the note, perform the following actions:

To ensure the SSO feature is functional in Jasper 6.4.2/6.4.3:

Copy the ‘config’ folder from the <<CA Business Intelligence Installed Directory>>/apache-tomcat-bkp/webapps/jasperserver-pro/WEB-INF/ location to <<CA Business Intelligence Installed Directory>>//apache-tomcat/webapps/jasperserver-pro/WEB-INF/

To ensure the LDAP feature is functional in Jasper 6.4.2/6.4.3:

Refer to the CABI 6.4.2/6.4.3 LDAP administration and configuration page**.** For further information, refer to the upgrade section in the Jasper communities page.

To ensure the email feature is functional in Jasper 6.4.2/6.4.3

Copy the js.quartz.properties file from the <<CA Business Intelligence Installed Directory>>/apache-tomcat-bkp/apache-tomcat-bkp\webapps\jasperserver-pro\WEB-INF\ location to <<CA Business Intelligence Installed Directory>>/apache-tomcat-bkp/apache-tomcat\webapps\jasperserver-pro\WEB-INF\

NOTE
For more information, see the configuring report schedular section on Jasper communities page.

DX NetOps Spectrum with Unified Dashboards and Reporting for Infrastructure Management

NOTE

To use the Unified Dashboards and Reporting for Infrastructure Management capabilities, you must upgrade to 10.2.2 OR upgrade to 10.2.1 and install the 10.02.01.PTF_10.2.117 on top of 10.2.1. You must have a new

installation of the CA Business Intelligence JasperReports Server for Unified Dashboards and Reporting for Infrastructure Management software. For more information, see the Prerequisites section.

The Unified Dashboards and Reporting for Infrastructure Management solution allows you to share a single CA Business Intelligence (CABI) server instance with multiple CA Agile Operations products. CABI is a powerful tool that allows users to get quick answers to their questions through self-service reports, dashboards, and analysis. For more information see Unified Dashboards and Reporting for Infrastructure Management.

By installing 10.2.2 or 10.2.1 (+ 10.02.01.PTF_10.2.117), you can share a single instance of CABI JasperReports Server for Unified Dashboards and Reporting with the following CA Agile Operations products.

- Service Operations Insight (SOI)
- Unified Infrastructure Management (UIM)
- DX NetOps Performance Management (DX NetOps PM)

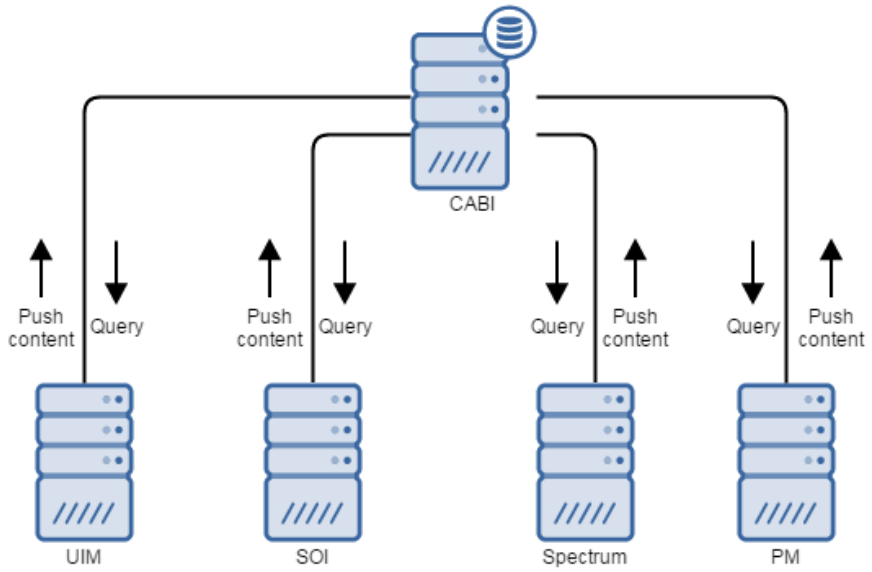
Following are the major benefits of shared CABI JasperReports Server deployment:

- Reduces the number of CABI instances, hardware footprint that you need to deploy and maintain for different CA products.
- Enables you to view dashboards and dashlets from multiple CA products, which provide you better insight into your business operations.

The CABI JasperReports Server installer is installed on a stand-alone CABI server and content from multiple CA products is uploaded.

Prior to this solution, CABI was limited to individual CA products, which each product using its own CA Business Intelligence JasperReports Server (CABI Server) to collect data and generate reports.

The following diagram shows an example of how the Unified Dashboards and Reporting for Infrastructure Management solution works with multiple CA products.



Prerequisites

- The CABI Server must have a new installation of the CA Business Intelligence JasperReports Server for Unified Dashboards and Reporting for Infrastructure Management software. You can download the **CABI JasperReports**

Server for Unified Dashboards and Reporting for Infrastructure Management from support.ca.com. A CA Support login is required to download the solution. For information about installation, see CA Business Intelligence JasperReports Server.

- Ensure that you are using 10.2.2 OR 10.2.1 (+ 10.02.01.PTF_10.2.117). You can download the 10.02.01.PTF_10.2.117 (CA Spectrum 10.2.1 PTF FOR UNIFIED DASHBOARDS AND REPORTING) from support.ca.com. A CA Support login is required to download the solution.

Integrate CABI JasperReports Server with DX NetOps Spectrum

The CABI JasperReports Server must be installed before integrating it with DX NetOps Spectrum. For detailed installation instructions, refer to the CA Business Intelligence JasperReports® Server documentation.

After installing the CABI JasperReports Server, you need to configure the integration between CABI JasperReports Server and Spectrum Report Manager.

Follow these steps to configure and activate the integration between CABI JasperReports Server and Spectrum Report Manager:

1. Log in to the computer where the CABI JasperReports Server is installed.
2. Launch the DX NetOps Spectrum OneClick web server on a Web browser.
3. In the DX NetOps Spectrum OneClick Web server, navigate to > Administration > Report Manager > Report Manager Admin Tools> Jasper Integration page.
4. Download and install the '**Integration Components**'.

   NOTE

   Information! The Integration Components is a JAR file, which consists of the necessary binaries to integrate the JasperReports Server with DX NetOps Spectrum and run reports. Installing the Integration Components deploys the binaries on the Jasper Server and help to generate the reports.
5. Specify and save the Jasper Server parameters in the Jasper Integration page.
   You have successfully configured and activated the integration between CABI JasperReports Server and Spectrum Report Manager.

For the detailed integration instructions, see DX NetOps Spectrum and CABI JasperReports Server Integration for Unified Dashboards and Reporting.

View Dashboards in CABI JasperReports Server

The CABI JasperReports Server displays multiple dashboards for DX NetOps Spectrum data. A dashboard is comprised of various dashlets, which are graphical representation of specific types of data. Following are the default dashboards that are displayed for DX NetOps Spectrum:

- Active Alarms Summary
- Alarm Summary
- Alarm Trends
- Assets Summary
- Device Availability Summary
- Events Summary
- NCM Dashboard
- Ports Summary and Chassis Assets
- Services and SLA Summary

For more information, see Dashboards in CABI JasperReports Server.

Out of the Box Reports and Domains

For the list of available out of the box reports, see Available Out of the Box Reports and Domains.

Run reports using the JasperReports Server

Important! You must log in to JasperReports Server to access reporting functionality.

Using the JasperReports Server you can generate general reports, ad-hoc reports. For more information, see How to run reports using the JasperReports Server.
You can also, schedule reports and manage reports such as save and export the reports to various formats. For details, see the Scheduling Reports section and Exporting the Report section in the JasperReports Server documentation.

Integration with CABI JasperReports Server for Unified Dashboards and Reporting

Instructions for 10.3 (or later)

After installing the JasperReports Server and Spectrum Report Manager (SRM), you need to enable the integration between JasperReports Server and SRM.

DX NetOps Spectrum and CABI JasperReports Server Integration

The Jasper Integration page in the DX NetOps Spectrum OneClick administration page allows you to enter the required parameters and enable the integration between DX NetOps Spectrum and CABI JasperReports Server.

Prerequisites for the Integration

Prior to integrating SRM with CABI JasperReports Server, you must download and install the 'Integration Components' on your CABI JasperReports Server. The 'Integration Components' lays down the DX NetOps Spectrum specific content in CABI JasperReports Server and helps to successfully enable the integration. If you do not install the integration components, the integration may not work properly.

Installing the Integration Components

Follow these steps to install and configure the Integration Components on CABI JasperReports Server:

1. Launch the DX NetOps Spectrum OneClick web console and click the Administration tab.
2. Click the Report Manager link.
3. Select the Jasper Integration option from the Report Manager Admin Tools.
   The Jasper Integration page appears.
4. Click the 'Integration Components' link on the Jasper Integration page.
   The spectrumConfigInstaller.jar file is downloaded to the Downloads folder in your computer.

   NOTE

   If the JasperReports server is on a Linux computer and it does not support GUI, then download the spectrumConfigInstaller.jar from a Windows computer as mentioned in Step 4. Place the downloaded spectrumConfigInstaller.jar file on the Jasper Linux computer and proceed with the following steps.
5. Using the command prompt, run the following command:
   <CABI Install folder path>\java\bin\java -jar <spectrumConfigInstaller.jar file path>\spectrumConfigInstaller.jar -install
   Example: <CABI Install folder path>\java\bin\java -jar C:\Users\Admin\Downloads\spectrumConfigInstaller.jar -install
   Enter the CABI Apache-Tomcat Home Location:
   Example: C:\Program Files\CA\SC\CA Business Intelligence\apache-tomcat

Enter the CABI Webapp Name (Default: jasperserver-pro):
Ex: jasperserver-pro
The setup progress takes some time. During this process, the following files are deployed at jasperTomcat on the JasperReports Server:
/webapps/jasperserver-pro/optimized-scripts/bower_components/jrs-ui/src/reportViewer/reportViewerMain.js
/webapps/SpectrumProxy.war
/webapps/jasperserver-pro/WEB-INF/applicationContext-WebServiceDataSource.xml
/webapps/jasperserver-pro/WEB-INF/bundles/webserviceds.properties
/webapps/jasperserver-pro/WEB-INF/lib/customDatasource_WebService_JRS_wrapper.jar
/webapps/jasperserver-pro/WEB-INF/lib/fluent-hc-4.2.1.jar
/webapps/jasperserver-pro/WEB-INF/lib/WebServiceDataAdapter.jar
/webapps/jasperserver-pro/WEB-INF/bundles/DashboardBundle.properties
/webapps/jasperserver-pro/WEB-INF/lib/spectrum_utils.jar
After the pre-Installation process is complete, restart the Jasper tomcat server to complete the configuration.

NOTE

Once Jasper server is up and running click on Re-deploy from the Jasper Integration page.

Uninstalling the Integration Components

Follow these steps to uninstall the Integration Components on CABI JasperReports Server:

1. Uninstall the changes in Jasper Server, using the following command:
   <CABI Install folder path>\java\bin\java -jar <spectrumConfigInstaller.jar file path>\spectrumConfigInstaller.jar -uninstall
2. Provide the information for prompted input fields for CABI such as Server Host name, Tomcat Protocol (http/https), Tomcat Port Number, Tomcat Server Location, Jasper Server Webapp Name and user password.
   After the successful uninstallation, the 'Done' message appears. You cannot see any DX NetOps Spectrum content (such as Dashboards, Reports, Repository etc.) in the CABI JasperReports Server.
   Following is an example to uninstall the 'Integration Components':
   C:\Program Files\CA\SharedComponents\CA Business Intelligence\java\bin\java -jar C:\Users\Admin\Downloads\spectrumConfigInstaller.jar -uninstall
   Are you sure you want to uninstall the spectrum content (y/n)? **y**
   CA Business Intelligence Server Hostname: **<host name>**
   CABI Tomcat Protocol (http/https): **http**
   CABI Tomcat Port Number: **8080**
   CABI Tomcat Server Location: **C:\Program Files\CA\SharedComponents\CA Business Intelligence2\apache-tomcat**
   Jasper Server Webapp Name (default: jasperserver-pro): **jasperser-pro**
   CABI Superuser Password: <**Superuser password**>
   Done

NOTE

After uninstalling the Integration Components, the integration between DX NetOps Spectrum and CABI JasperReports Server will not work. If you want to enable the integration, you must install the Integration Components again.

CABI JasperReports Server Integration

To enable integration between DX NetOps Spectrum and JasperReports Server, provide the Jasper Server connection details on the integration page.

NOTE

Before proceeding with the integration, ensure that you have installed the 'Integration Components' on your CABI JasperReports Server. If you do not install the integration components, the integration may not work properly. For more information, see the 'Prerequisites for the Integration' section.

Follow these steps:

1. Open the OneClick Administration page.
2. Click the Report Manager tab.
3. Select the Jasper Integration option from the Report Manager Admin Tools.
4. Specify the parameters that are used to communicate with the JasperReports server:
   - **Jasper Server Host name**
   - Specify the host name of your CABI JasperReports Server instance if it is not the same server as DX NetOps Spectrum Tomcat.
   - **Jasper Tomcat Port**
     Specify the port where Jasper Tomcat is running. The default port value is 8080.

     NOTE

     If the Jasper and OneClick are on the same server, the Tomcat port cannot be the same port that DX NetOps Spectrum Tomcat uses.
   - **JasperServer Webapp Name**
     Specify the Jasper server webapp name that is given during installation of Jasper server. Default is 'jasperserver-pro'.
   - **Jasper Admin User**
   - Specify the Jasper Admin User ID.
     The default User ID is 'superuser'.
   - **Jasper Admin Password**
     Enter the password for the Admin User ID in Jasper. The default password is 'superuser'.
   - **Jasper Integration**
     Select the Enable radio button.
     If Disable is selected and saved, DX NetOps Spectrum Tomcat no longer integrates with CABI Jasper instance.
   - **Enable SSO**
     Select this check box to enable single sign-on solution(SSO) from JasperReports Server, which establishes session between the Spectrum Report Manager and Jasper console. If you enable the SSO, you can open Jasper console session from a OneClick web console without providing any login credentials.

     NOTE

     The Single Sign-On solution does not work when you enable the option Use SSL with Jasper Server.
   - **Use SSL with Jasper Server**
     Select this check box to integrate with Secure Sockets Layer (SSL) enabled JasperReports Server.To know more about Secure Sockets Layer (SSL) and how to enable it on JasperReports Server, see Using SSL in the Web Server. (Supported only when the JasperReports Server runs on Windows 2012)
5. Click Save to enable the integration.
6. On the OneClick home page, click 'Jasper Console' to launch the JasperReports Server.

   NOTE

   This process can take some time. During this process, all the Spectrum Report Manager report content is exported from the OneClick server into CABI JasperReports Server. Therefore, do not cancel or navigate away from this page until you get a success message.

After you configure the integration, the Spectrum Report Manager report content is installed and can connect to the CABI JasperReports Server reporting database. The menubar 'JasperConsole' link now launches the CABI JasperReports Server web applications on the CABI instance that you specified.

NOTE

If you disable the integration, reporting and report administration capabilities are disabled. However, disabling the integration does not cause Spectrum Report Manager to stop collecting and managing data from the monitored SpectroSERVERs.

After successful integration, you can see the following DX NetOps Spectrum organization and default users in Jasper:

- jasperadmin/jasperadmin
  ROLE_ADMINISTRATOR
- joeuser/joeuser
  ROLE_USER
- spectrum/spectrum
  ROLE_ADMINISTRATOR
  ROLE_USER

Redeploy

Re-deploy the reports to repair the existing report or to update to a newer version. After upgrading to a new version of DX NetOps Spectrum, click the Re-deploy button to sync up the Jasper reports with DX NetOps Spectrum upgrade fixes, enhancements, and new reports.

Migrate Data to Unified Dashboards and Reporting for Infrastructure Management

NOTE

To use the Unified Dashboards and Reporting for the infrastructure management capabilities, upgrade to 10.3 (or later) or 10.2.x OR upgrade to 10.2.1 and install the 10.02.01.PTF_10.2.117 patch on top of 10.2.1 (for example, if upgraded to 10.2.1). You can download the patch 10.02.01.PTF_10.2.117 (CA SPECTRUM 10.2.1 PTF FOR UNIFIED DASHBOARDS AND REPORTING) from support.broadcom.com. A Support login is required to download the patch.

After installing 10.3 (or later) or 10.2.x (+ 10.02.01.PTF_10.2.117), you can share a single instance of CABI JasperReports Server with multiple CA Agile Operations products. For more information, see DX NetOps Spectrum with Unified Dashboards and Reporting for Infrastructure Management.

If you previously configured DX NetOps Spectrum to work with CA Business Intelligence (CABI) server, you can migrate data from the standalone CABI to a shared CABI instance. Use the following process to migrate data from a standalone CABI JasperReports Server to a shared CABI Server.

NOTE

The standalone CABI instance version must match the version of the shared CABI instance.

Follow these steps:

1. Export data from the standalone CABI server.
   a. Log in to the standalone CABI instance as a system administrator (for example, superuser).
   b. Navigate to Manage, Server Settings, and click Export.
   c. Specify the Export Data File Name.
   d. Select the content that you want to export, and then click Export.

2. Import the exported report data into the shared CABI server.
   a. Log in to the shared CABI server as a system administrator.
   b. Navigate to Manage, Server Settings, then click Import.
   c. Select the file to import, then click Import.

Dashboards in CABI JasperReports Server

NOTE

To use the Unified Dashboards and Reporting for Infrastructure Management capabilities, upgrade to 10.3 (or later) or 10.2.x OR upgrade to 10.2.1 and install the 10.02.01.PTF_10.2.117 on top of 10.2.1.

After the successful integration of DX NetOps Spectrum with CABI JasperReports Server, user can view dashboards on DX NetOps Spectrum data. A dashboard is comprised of various dashlets, which are a graphical representation of specific types of data.

Following are the default dashboards that are available for DX NetOps Spectrum:

- Alarm Distribution Summary
- Alarm Summary
- Alarm Trends
- Assets Summary
- Device Availability Summary
- Events Summary
- NCM Dashboard
- Ports Summary and Chassis Assets
- Services and SLA Summary
- DX NetOps Spectrum Monitoring Status
- DX NetOps Spectrum – Product Usage
- DX NetOps Spectrum Overview

NOTE

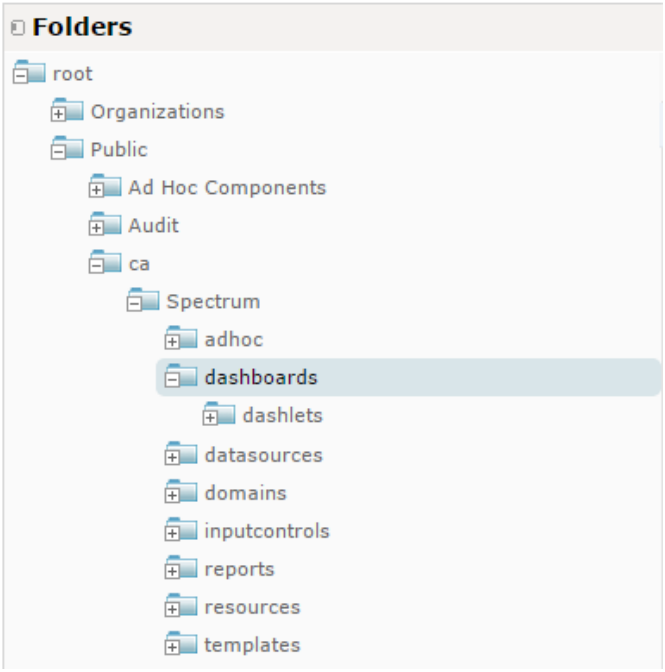
10.3.2 offers SSL support for the DX NetOps Spectrum Overview Dashboard. To know more about enabling this feature, see the SSL support for the DX NetOps Spectrum Overview Dashboard page.

DX NetOps Spectrum Content Folder Structure:

The DX NetOps Spectrum product content such as ad-hoc, dashboards, data sources, domains, input controls, reports, and resources is now located in the public folder in CABI JasperReports Server. For example, the new folder structure for the DX NetOps Spectrum content is Public > ca > Spectrum > dashboards (see the following image).

NOTE

After installing the 10.2.2 Service Pack OR 10.2.1 (+ 10.02.01.PTF_10.2.117), for Unified Dashboards, all the DX NetOps Spectrum content in CABI JasperReports Server is saved under the 'Public' folder, previously it was saved under the 'root' folder. For example, now the Jasper reports are saved to Public > ca > Spectrum > reports. The old folder structure (root > Organizations > spectrum > capability > and reports) remains but no new content is saved under it after the upgrade and for future releases.



The following table displays a list of DX NetOps Spectrum dashboards, dashlets with screenshots:

Dashboard	Dashlets	Screenshot
Name: **Alarm Distribution Summary** Path: /public/ca/spectrum/dashboards/alarm_distribution_summary Description: DX NetOps Spectrum dashboard to show current active alarms and alarm distributions among users.	The Alarm Distribution Summary dashboard consists of the following dashlets: • Assigned Alarms • Alarm Distribution	Name: **Alarm Summary** Path: /public/ca/spectrum/dashboards/alarm_summary Description: DX NetOps Spectrum dashboard to show the top alarming devices, global collection and most common alarm types.	The Alarm Summary Summary dashboard consists of the following dashlets: • Top Most Common Alarms • Top Alarming Devices • Top Alarming Global Collections	Name: **Alarm Trends** Path: /public/ca/spectrum/dashboards/alarm_trends Description: DX NetOps Spectrum dashboard to show alarms histogram and alarms distribution based on severity.	The Alarm Trends dashboard consists of the following dashlets: • Alarm Count Per Day • Alarm Severity Vs Status	Name: **Assets Summary** Path: /public/ca/spectrum/dashboards/assets_summary Description: DX NetOps Spectrum dashboard to show assets based on device class and vendor information.	The Assets Summary dashboard consists of the following dashlets: • Assets by Model Class • Assets by Vendor Type	
Name: **Device Availability Summary** Path: /public/ca/spectrum/dashboards/device_availability_summary Description: DX NetOps Spectrum dashboard to show devices availability information including devices with most number of outages and least available devices.	The Device Availability Summary dashboard consists of the following dashlets: • Least Available Devices (Top N) • Availability by Class and Vendor • Devices with Most Outages	
Name: **Events Summary** Path: /public/ca/spectrum/dashboards/events_summary Description: DX NetOps Spectrum dashboard to show top event generating models information and most common event types information. **Note:** To know more about Events Summary Dashboards, see Sample Performance Test Results for Event Summary Dashboard section.	The Events Summary dashboard consists of the following dashlets: • Top Event Count by Model • Top Most Common Events	
Name: **NCM Dashboard** Path: /public/ca/spectrum/dashboards/NCM_dashboard Description: DX NetOps Spectrum dashboard to show devices having most number of configuration changes.	The NCM Dashboard consists of the following dashlets: • Devices with Most Configuration Changes	Name: **Ports Summary and Chassis Assets** Path: /public/ca/spectrum/dashboards/ports_summary_and_chassis_assets Description: DX NetOps Spectrum dashboard to show ports and chassis based assets summary information.	The Ports Summary and Chassis Assets dashboard consists of the following dashlets: • Devices and Ports Summary • Chassis-based Assets	Name: **Services and SLA Summary** Path: /public/ca/spectrum/dashboards/services_and_SLA_summary Description: DX NetOps Spectrum dashboard to show SLA summary by customer and under performing services information.	The Services and SLA Summary dashboard consists of the following dashlets: • Customer SLA Summary • Underperforming Services (Top N)	Name: **DX NetOps Spectrum Monitoring Status** Path: /public/ca/spectrum/dashboards/CA_Spectrum_Monitoring_Status Description: DX NetOps Spectrum dashboard to show running status of SpectroSERVER and Archive Manager on each domain. The number of models being discovered in DX NetOps Spectrum and alarms raised for the last 30 days.	The DX NetOps Spectrum Monitoring Status dashboard consists of the following dashlets: • DX NetOps Spectrum Status Information • Model Creation Tren • Alarm Trend per Landscape	
Name: **DX NetOps Spectrum – Product Usage** Path: /public/ca/spectrum/dashboards/CA_Spectrum_–_Product_Usage Description: DX NetOps Spectrum dashboard to show the number of accountable models being modeled and monitored.	The DX NetOps Spectrum Product Usage dashboard consists of the following dashlets: • DX NetOps Spectrum: Number of Accountable Models • Accountable Models per Class	Name: **DX NetOps Spectrum Overview** Path: /public/ca/spectrum/dashboards/spectrum_overview Description: DX NetOps Spectrum real-time dashboard to show current assets/alarms/availability of devices being managed by DX NetOps Spectrum.	The DX NetOps Spectrum Product Usage dashboard consists of the following dashlets: • Number of Devices with Ongoing Outages • Total Number of Alarms • Number of Devices with Critical Alarms • Number of Devices • Current Alarms based on Severity • Current Assets • Availability based on Model Class	
Sample Performance Test Results for Event Summary Dashboard

Following are the two examples for the Event Summary Dashboard with tested configuration and results.

Test Result 1

SRM and Jasper machine details:

	Ram	**OS**	**Machine Type**
SRM Machine	16 GB	Windows 2012	Virtual
Jasper Machine	8 GB	Windows 2012	Virtual

Events details:

Event Count	**Able to load events in Jasper**	Result
500,000	Yes	Able to view the dashboard
> 500,000	No	Unable to load the dashboard

NOTE
Recommended space for Japser machine is 16 GB with minimum 8 GB free space.

Test Result 2

SRM and Jasper machine details:

	Ram	**OS**	**Machine Type**
SRM Machine	64 GB	Linux	Physical
Jasper Machine	12 GB	Windows 2008	Virtual

Event Details:

Events Count	Able to load events in Jasper	Comments
10,000,000	Yes	Able to view the dashboard
> 10,000,000	No	Observed Inconsistent performance

Dashboard Actions:

The following actions are available in a dashboard:

- **Chart or Graph Legend:** Select items in the chart or graph legend to hide a specific group of data.
- **Export (Export icon):** Click to export the content to the selected output.
- **Hover:** Hover your mouse over dashboard charts and graphs to view specific data points.
- **Maximize (Maximize icon):** Click to open the dashlet in a larger view.
- **Minimize (Minimize icon):** Click to return to the dashboard view.
- **Refresh (Refresh icon):** Click to refresh the dashlet contents.
- **Detailed Report (Detailed Report link):** Click to view more detailed information.

SSL Support for the DX NetOps Spectrum Overview Dashboard

10.3.2 introduces support for secure communication between DX NetOps Spectrum Overview Dashboard to the SRM Server allowing DX NetOps Spectrum users to have an HTTPS option for the DX NetOps Spectrum Overview dashboard.

Steps to Enable SSL support for the DX NetOps Spectrum Overview Dashboard

Following are the prerequisites and the procedure to use an encrypted communication (HTTPS protocol) between DX NetOps Spectrum and the SRM by importing the SSL/HTTPS certificate to achieve the SSL support for the DX NetOps Spectrum Overview Dashboard.

Prerequisites:

For first time integration, once the HTTPS configuration is complete, enable the DX NetOps Spectrum and CABI JasperReports Server Integration for Unified Dashboards and Reporting and the **Single Sign-On** (SSO) option, to make REST calls from the DX NetOps Spectrum overview dashboard. Ensure that you perform **SpectrumConfigInstaller.jar** to run on the Jasper machine.

For an existing integration, once the HTTPS configuration is complete, select the **Re-deploy** option, for the integration enhancements to sync, and follow the steps to export and import the self-signed certificate.

Procedure to Export and Import the Certificate:

1. Export the self-signed certificate from DX NetOps Spectrum OneClick machine where the HTTPS is enabled and then import it to the Jasper machine, to run the DX NetOps Spectrum overview dashboard. To export the self-signed certificate:
   a. On the OneClick web server host, open a bash login and make the following changes to the **$SPECROOT/Java/bin directory**.
   b. Run the following command.
   ```
   keytool -export -alias tomcatssl -keystore c:/win32app/Spectrum/custom/keystore/cacerts -file
    tomcat.cer
   ```
   c. Enter keystore password: <Enter the password as "changeit"> , the certificate is stored in the file <tomcat.cer>
   d. A certfile is created on **$SPECROOT/Java/bin directory**.
   e. Copy the exported .cer file certificate to the Jasper machine location **C:\Program Files\CA\SC\CA Business Intelligence\java\bin .** This is the directory where the keytool exists in Jasper.

2. Import this certificate to Jasper cacert by opening a cmd prompt or bash -login in the JasperServer and redirect to **C:\Program Files\CA\SC\CA Business Intelligence\java\bin** folder to run the following command:
   ```
   keytool.exe -import -alias tomcatssl -keystore "C:\Program Files\CA\SC\CA Business Intelligence\java\lib\security\cacerts" -file tomcat.cer
   ```
   a. Enter keystore password:<use the password "changeit">
3. Restart the Jasper Tomcat server and launch the Jasper console from the DX NetOps Spectrum administration page and run the DX NetOps Spectrum overview dashboard.

(Optional) Log in Using Non-Fully Qualified Domain Name

SSL security forces you to use the fully qualified domain name of your OneClick server for login. For example: `https://oneclick.ca.com/spectrum` . To log into the non-fully qualified domain name (for example: `https://oneclick/spectrum`), or a DNS entry that is different than the local OneClick server name, use a SAN (Subject Alternate Name) with the -ext option:

```
./keytool -genkey -alias tomcatssl -keyalg RSA -keysize 2048 -ext SAN=dns:oneclick -keystore c:/win32app/Spectrum/custom/keystore/cacerts
```

Troubleshooting CABI JasperReports Server Integration

Unified JasperSoft reports integrate successfully with DX NetOps Spectrum, but shows no reports in the repository.

Symptom:

CABI and DX NetOps Spectrum integrates successfully, but then shows no reports in the repository.

Solution:

To avoid performance problems of the default values, add the following changes to the mySQL parameters:

1. Change the mySQL configuration at \my.cnf (Linux) or my.ini / my-spectrum.cnf (Windows).
2. Search for “max_allowed_packet”.
   Before change : max_allowed_packet=1M
   After Change : max_allowed_packet=16M
3. Save the file and re-start the mySQL server. Once it is up, perform the integration step, on the OC web administration page "Jasper integration" once more. Once it completes successfully, log into Jaspersoft and check for the reports.

For more information refer to CABI JasperReports Server and DX NetOps Spectrum integration related support article.

Clicking on the 'Name' link in JasperReports Server results in a Bad Request.

Symptom:

If DX NetOps Spectrum OneClick is in the https mode and the user cross launches DX NetOps Spectrum from JasperReports Server, that results in a bad request exception.

Solution:

To avoid the bad request exception:

1. Navigate to the Administrator > Report manager > Preferences page.
2. Update the OneClick server entry to https.

After updating the OneClick server entry to https, the bad request exception is not seen. Once the entries are updated, under 'Preferences' page, the values are saved in the registry table.

Configure Data Retention

The Report Data Retention functionality lets you archive or purge the following types of report data:

- Alarm
- Event
- Asset
- Availability
- SPM test result

You can specify the retention period in days for the data you want to save in the reporting database. Archive Expert provides table capacity and disk space consumption statistics for key, rapidly accumulating report data tables and suggests a retention period applicable to all database tables based on consumption trends.

The difference between the archiving and purging options is that archiving moves the data out of the operational reporting database into a separate archival database. By contrast, purging removes the data altogether from the installation. Therefore, verify that any data that you specify to purge is no longer required.

The archived data cannot be imported back to Report Manager to generate reports. Therefore, archive the data to move it to the archiving database for time periods that fall outside the retention period. For example, if you only want to generate reports from the last 90 days, specify a retention period of 90 days. All data that is accumulated in the reporting database outside the 90-day window is automatically archived on a daily basis.

The SRM reports use only the data of transformed tables/event tables to generate reports. The archived data is not available for generating reports. For example, an alarm report, which pulls data from transformed tables runs the report for number of days set in the retention period specified for the transformed tables. Similarly, an event report runs a report for the number of days set in the retention period specified for the event table.

> **NOTE**
> You can use any third-party application to access and use the archived data. However, CA does not provide any support for the use of archived data.

By archiving or purging older data, you provide more room in the reporting database for current and more recent historical data. You can generate reports more quickly and can prevent problems that occur if the report database capacity is reached.

Enable archiving or purging if your organization requires historical report data only for the retention period you specify. Ensure that you understand your organization's reporting requirements before you set a retention period. If you set it longer than required, you retain unnecessary data. Conversely, if you do not set it long enough, data that you want to view is unavailable. To save the disk space, you can purge rather than archive reporting data.

Note: The Deployment Capacity and Optimization Best Practices section provides detailed sizing guidance for the Spectrum Report Manager database.

Follow these steps:

1. Access the Spectrum Report Manager Admin Tools.
2. Select the Archive Expert option.
   The Archive Expert panel is displayed.
3. Review the following field values.
   You can change the field values. For more information, see Preferences.
   - **Data Retention Period (days) - Transformed Tables**
     (Default = 90 days) Displays the retention period (in days) for transformed tables. 'Transformed tables' refers to all rapidly accumulating tables that contain information that is derived from events (for example, alarms, and outages). The Transformed tables are the tables that participate in the Archiving and Purging activity. The event table retention period is set independently. Data older than the retention period is archived at 12:30 AM daily.

NOTE
Uncleared alarms and ongoing outages that fall within the retention period are not archived or purged. The alarm or outage data is archived or purged, if the alarm is cleared or the outage ends outside of the retention period (before the beginning of the retention period).

– **Data Retention Policy**
  - All Data -- (Default) Retains all data in the SRM reporting database for reporting purposes. No archival or purging of SRM data occurs.
  - Archive -- Moves data from the reporting database to the archival database.
  - Purge -- Purges data older than the specified ‘retention period’. Data is permanently removed from the Spectrum Report Manager database.

– **Data Retention Period (days) - Event Table**
Displays the retention period for the event table specifically. This event table is one of the fastest-growing tables, you can set the retention period individually.
For example, you can keep 60 days of event data, but 365 days (1 year) for the transformed tables data. The event retention period is much smaller than the transformed retention period because the event table grows much faster than the other tables.

NOTE

The Service Manager tables are not participated/involved in Archiving or Purging process. So, the tables are not affected by the set Retention Period/Policy.

Data Table Utilization Statistics

Archive Expert lists report data table utilization statistics for the high-growth types of report data that you select to archive. The statistics that are associated with the tables determine the recommended retention period. The tables provide you with at-a-glance indication of the current utilization and capacity and trends for both. This information helps you make informed decisions about archiving. The following image is an example data capacity table:

EVENT Table	
Available Capacity (GB)	92.85
Current Size (GB)	< 10 MB
Average Daily Growth (MB)	0.03
History (Days)	1
Earliest Record Time	May 23, 2008 1:12:59 PM
Latest Record Time	May 23, 2008 1:18:38 PM
Days until Full	> 365

The following statistical definitions are presented within the EVENT Table:

- **Availability Capacity (GB)**
  The remaining capacity available for extra record storage. The capacity value is constrained by the MySQL table capacity or physical disk space available (whichever is smaller).
- **Current Size (GB)**
  Defines the current table size as reported by MySQL.
- **Average Daily Growth (MB)**

Defines the ‘Current Size (GB)’ divided by ‘History (Days)’ converted to Megabytes.

- **History (Days)**
  Displays the number of days between the ‘Earliest Record Time’ and ‘Latest Record Time’ values.
- **Earliest Record Time**
  Displays the timestamp that is associated with the earliest record in table.
- **Latest Record Time**
  Displays the timestamp that is associated with the latest record in table.
- **Days until Full**
  Calculates the estimated number of days it takes to consume ‘Available Capacity (GB)’ given a straight-line growth estimate that is based on the ‘Current Size (GB)’ and ‘Average Daily Growth (MB)’.

Back Up Landscape

The Database Maintenance option lets you back up and restore landscape-specific data from the reporting database. Available backup lets you revert to an earlier version of the reporting database when a landscape server database backup is restored and you want to align reporting data with SpectroSERVER data. The Database Maintenance option enables you to manage the number of backups you want to retain by allowing you to remove the backup that you no longer require.

WARNING
The amount of data in the reporting database for all landscapes is dependent on the retention period (default = 90 days) specified by the Archive Expert option. Coordinate your database, and archive management settings to institute a data-storage and data-backup strategy that meets your data management requirements.

Follow these steps:

1. Access the Spectrum Report Manager Admin Tools
2. Select the Backup Landscape option.
   The Backup Reporting Landscape panel appears.
3. Select a landscape from the 'Select a Landscape to Backup' drop-down list.
4. (Optional) Enter a description of the backup.
5. Click Start to begin the backup.
   Spectrum Report Manager displays the backup progress and notifies you when it is complete. Date and time are used to identify each backup version.

Recover Landscape

When you recover landscape data, it replaces the current data for the landscape in the reporting database.

NOTE
If you attempt to recover an older version of the reporting database than the version currently in use, a warning message appears. The message recommends you to contact CA Support for more information.

Follow these steps:

1. Access the Spectrum Report Manager Admin Tools.
2. Select the Recover Landscape option.
   The Recover Reporting Landscape panel appears.
3. Select the landscape to recover from the 'Select the Landscape to Recover' drop-down list.
4. Select the backup version to recover from the 'Select a Backup Database to Use' drop-down list.
5. Click Start to begin the restoration.
   DX NetOps Spectrum Reporting displays the recovery progress and notifies you when it is complete.

Manage Backups

You can update the descriptions for backups or remove backups you no longer require. Manage your backup files in the Admin Tools section.

Follow these steps:

1. Access the Spectrum Report Manager Admin Tools.
2. Select the Manage Backups option.
   The Manage Landscape Backups panel appears.
3. Select the landscape for which you want to update or remove backups from the 'Select a Landscape' drop-down list.
4. Select the backups that you want to update or remove from the Existing Landscapes list.
5. (Optional) Modify the description text for backups if you want to update backups.
6. Click Update to save modifications, or click Remove to delete selected backups.
   The Backup files are managed.

Outage Editor

The Outage Editor lets you edit the outage records for all managed assets. You can retrieve outage records for particular models or for particular devices and interfaces, change the status of an outage in a record, annotate an outage record, and suspend an ongoing outage status for an asset that is available. Also, if you modify an asset outage that has caused an outage for a service model (because the asset is a service resource), you can modify the outage status for that service model.

> **NOTE**
> If Spectrum Report Manager model-based security is enabled, the user who is logged on to OneClick can only review and edit outages that are associated with the models that this user can access. For more information, see the Report Manager section.

About Outages and Availability Reports

DX NetOps Spectrum Reporting calculates availability for managed assets by comparing their actual availability to their expected availability. Actual availability is derived from DX NetOps Spectrum event data. This comparison provides the basis for the availability percentage that is used in Reporting Availability Reports.

For any given time period, you specify an availability percentage objective when you configure an Availability Report, and DX NetOps Spectrum Reporting calculates the actual availability percentage. The difference between the two is the interval during which an asset is presumed to be unexpectedly unavailable. DX NetOps Spectrum Reporting does not include planned outages (downtime) from assets in *maintenance mode* when it calculates availability. For example, if a device is in maintenance mode, all the outages from that device are planned outages which are not considered in availability reports.

An unplanned outage can result from asset malfunction or from other events that are unrelated to asset performance. For example, availability is affected by a power outage, inadvertent shutdowns, or instances where an off-line asset model was not put in maintenance mode. Outages that are caused by the latter events misrepresent the actual availability of an asset. These are the types of outages you would typically want to redefine as exempt or planned outages.

> **NOTE**
> Spectrum Report Manager does not support cluster-specific availability reports. Therefore, you cannot generate the Availability Reports for Clusters.

Outage Editing Status Report

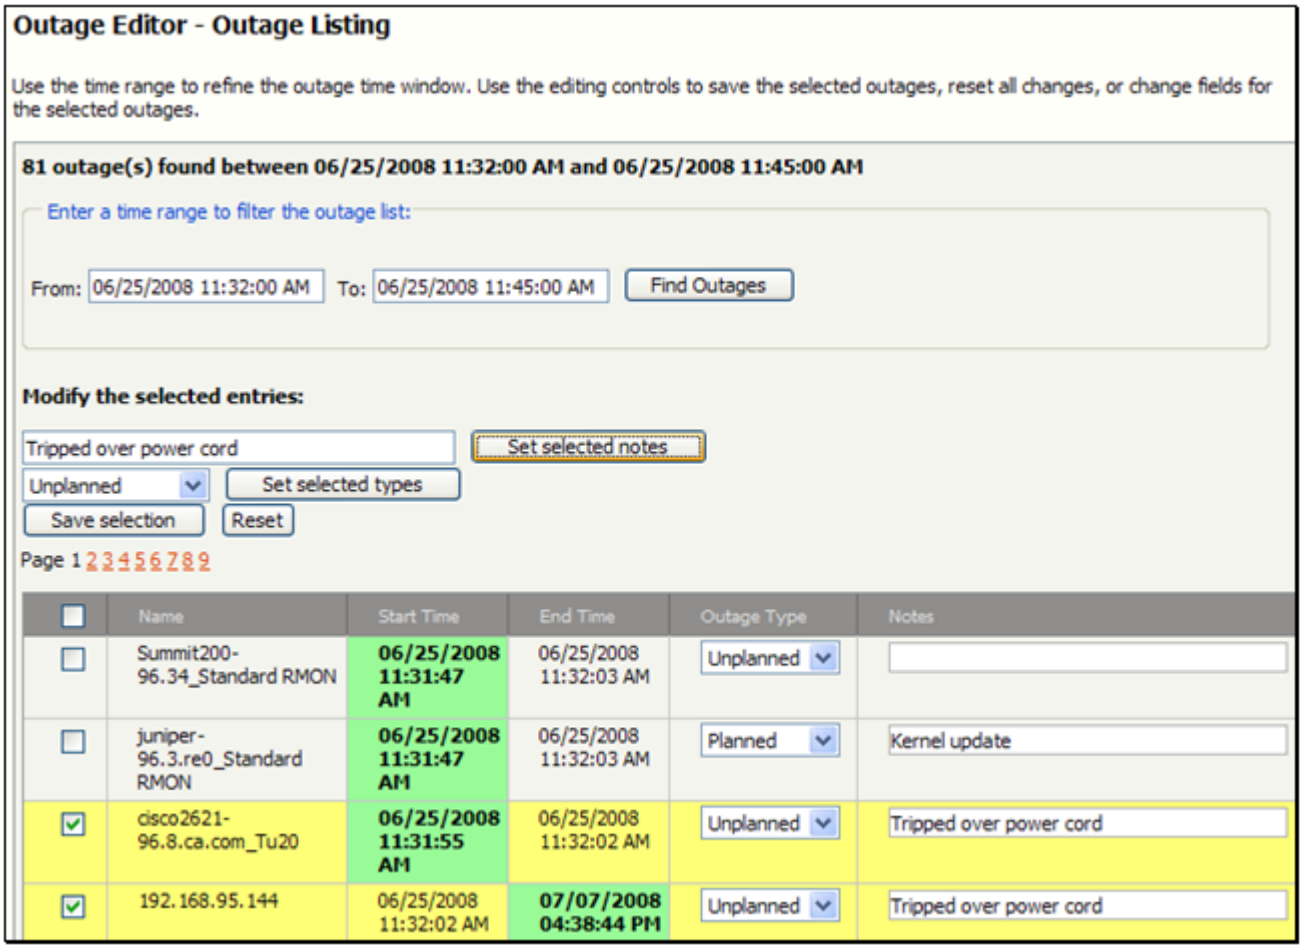
You receive an Outage Editing Status Report after editing the outage records. The results of an Outage Editor search list all outages that match your selection criteria. Each entry in the table contains the name of the model that experienced the outage, and notes, the outage start time, end time, and type. You can edit the outage type and notes. If no end time is available for an outage, it is listed as 'Ongoing' with an option to manually end the outage. Each entry in the table is preceded by a checkbox that lets you select the corresponding outage for mass editing.

In addition, the page contains *master controls* that annotate multiple outages simultaneously. Any outages that have been selected are modified by these controls. When changes have been made to any entry, 'Save selection' is enabled. Click it to save all selected entries. The 'Reset' button restores the listing to the state it was in after the most recent save.

If no outages are available in the selected period, only '0 Outage(s) Found' is displayed - the master controls and table do not appear.

If more than 500 outages are detected, the results are split up into 'pages'. Each page displays up to 500 outages and the master controls affect only the displayed outages.

The following image highlights the result of an 'Outage Editor - Search by Timespan' search. With multiple rows selected, it shows an example of mass editing. Selected entries are highlighted yellow, and times outside of the chosen range are highlighted green.



Modify Outage Records

The Outage Editor lets you modify Outage Records. When you edit an outage record, you can change its outage status and enter comments to it that describe why the record was edited or any other pertinent information. You can also end an ongoing outage status for a record that does not accurately indicate the actual availability of the asset referenced by the record.

Follow these steps:

1. Select Admin Tools, Outage Editor.
   Two options appear: Model Outages and Device/Interface Outages.
2. Select one of the options.
3. Enter a filter term to display the models or devices/interfaces that have had outages you want to view, and then click Find (Models or Devices). For example, to display a list of Cisco devices or interfaces or Cisco models that have had outages, simply enter Cisco.
   The editor displays a list of assets that match your filter term.
4. Select the asset whose outage records you want to retrieve.
   - If you are working with a model list and you want to edit outage records for a model, select the model.
   - If you are working with a device/interface list and you want to edit device outage records, select the device.
   - If you are working with a device/interface list and you want to edit outage records for a particular device interface, click Show Interfaces for the device. An interface list appears. It includes a filtering field that you can use to locate the interfaces you want to work with.

   At the bottom of the asset list, the Outage Editor indicates the number of outage records that it found for the selected asset. A date range filter lets you narrow the outage record list.
5. Accept the default date range, which extends to the current date from the date of the earliest outage known by Spectrum Report Manager, or restrict the range as required, and then click Find Outages.
   The Outage Editor displays a list of outage records for the asset. An outage record indicates when an outage began and ended, the outage type, and any notes that have been entered to the record. Instead of indicating an end time, a record may indicate that an outage is ongoing (because Spectrum Report Manager has not yet received an end outage event).
6. Update the records you want to change. You can change the outage status for particular records in their Outage Type fields or you can change the status for all listed outages in the Set all outage types to field. The following outage status types are available:
   - **Unplanned**
     An unplanned outage is an unexpected outage. Availability reports designate time that an asset was in an unplanned outage state as time the asset was unavailable. Unplanned outages are typically the result of a hardware failure (broken cable) or software failure (bad configuration, incompatible protocols) or any situation where an asset is off-line while not in maintenance mode in DX NetOps Spectrum.
   - **Planned**
     A planned outage is an outage that was intended, when an asset model in DX NetOps Spectrum was put into maintenance mode. DX NetOps Spectrum does not generate alarms on assets in maintain mode. Planned outages do not count against availability in Availability reports.

     NOTE
     For more information about maintenance mode, see the Using OneClick section.
   - **Exempt**
     An outage that evidence indicates was not unplanned, typically a situation where an asset that was taken off-line for maintenance but its model in DX NetOps Spectrum was not put into maintenance mode. You can designate any outage as exempt. Exempt outages do not count against availability.

     NOTE
     If you change the status of an outage for an asset that is a resource of a service model and is also the cause of a service outage, the Affected Services Editor window appears. It lists the service outages that are caused

by the asset outage enables you to change the status of the service outages. For more information, see the Service Manager section.

7. (Optional) You can (annotate outage records) add new notes or can overwrite existing ones for particular records in their Notes fields. You can also use the ‘Set Selected Notes’ field if you want to enter a note, edit a note, or clear notes from all records. When users generate Availability reports, they can specify Notes text as a filtering criterion.
8. (Optional) Click End Outage in the End Time field. You can end an ongoing outage immediately. For example, end an ongoing outage for an asset when you know that it is available and you do not require an availability report to misrepresent the asset availability.
9. Click Update to save your edits.
   The outage status is updated and saved.

Outage Editor - Search by Model

Outage Editor-Search by Model helps you to locate models for outage editing. Model name or model class is used to locate a model.

Follow these steps:

1. Access the Spectrum Report Manager Admin Tools.
2. Select the 'Outage Editor - Search by Model' option.
   The Outage Editor - Model Listing panel appears.
3. Enter the Filter for a model name or model class.
4. Click Find Models.
   The model names with their outages are displayed for editing.

Outage Editor - Search by Device

Outage Editor-Search by Device is used to locate devices for outage editing with the device names.

Follow these steps:

1. Access the Spectrum Report Manager Admin Tools.
2. Select the 'Outage Editor - Search by Device' option.
   The Outage Editor - Device Listing panel appears.
3. Enter the Filter to match the device names.
4. Click Find Devices.
   The device name with their outages is displayed for editing.

Outage Editor - Search by Timespan

Outage Editor - Search by Timespan displays any outage that begins before the selected end time and finishes after the selected start time.

Follow these steps:

1. Access the Spectrum Report Manager Admin Tools.
2. Select the 'Outage Editor - Search by Timespan' option.
   The Outage Editor - Time Span Search panel appears.
3. Enter the time and date range filters in the From and To fields.

   NOTE
   Leave the end time blank to search up to the current time.
4. Click Find Outages.
   The outages during the selected timespan are displayed for editing.

Set Report Manager Preferences

The Preferences option enables you to configure multiple Spectrum Report Manager options.

The purge process for the event table is enhanced to use the truncate command instead of the delete command to expedite the purge process. To streamline the partition life cycle, DX NetOps Spectrum now uses Partition Handler which uses MySQL information schema to determine the creation/deletion of partitions. SRM, now processes the other landscapes sync, even if one landscape is in an Error state. You can remove the stale buckets of any landscape using the `./RpmgrlnitializeLandscape.bat root -remStaleBuckets <landscape name>` command.

Follow these steps:

1. Access the Spectrum Report Manager Administration tab.
2. Select the Reporting Manager, Preferences option.
   The Preferences panel appears.
3. Specify the following information:
   - **Data Retention Period (days) - Transformed Tables**
     (Default = 90 days) Specifies the retention period by entering the number of days in the Retention Period (days) field. Archive Expert provides a suggested retention period estimate that is based on disk space consumption trends for the alarm, asset, availability, event, and SPM test result data tables.
     Data older than the retention period is archived at 12:30 AM daily.

     NOTE
     Uncleared alarms and ongoing outages that fall within the retention period are neither archived nor purged. The alarm or outage data is archived or purged if the alarm is cleared or the outage ends outside of the retention period (for example, before the beginning of the retention period).
   - **Data Retention Policy**
     - All Data -- (Default) Retains all data in Spectrum Report Manager reporting database for reporting purposes. No archival or purging of Spectrum Report Manager data occurs.
     - Archive -- Moves data from the reporting database to the archival database.
     - Purge -- Purges data older than the specified ‘retention period’. Data is permanently removed from Spectrum Report Manager database.
   - **Monitor SRM using a DX NetOps Spectrum model**
     DX NetOps Spectrum creates a Spectrum Report Manager Application model that is associated with the local VNM on the installation server when Spectrum Report Manager is first started after installation. By default, the model serves as a destination for events and alarms that are generated by Spectrum Report Manager. This means you can monitor the status of Spectrum Report Manager from the OneClick Console. You can, however, select the destination for event and alarm information. If you disable monitoring, event information is written to the Tomcat log files.
     Spectrum Report Manager monitors its own status. It sends events to Spectrum Report Manager application model when the following indications occur:
     DX NetOps Spectrum generates (non-persistent) alarms for some of these events and clears them when they are rectified.
     If Spectrum Report Manager Tomcat server is not connected to the model domain that contains the SRM Application model, events are sent to a log file.

     - Spectrum Report Manager loses and regains contact with a landscape, is not monitoring any landscapes, landscapes are added and removed from the list of monitored landscapes.
     - Spectrum Report Manager loses and regains contact with DX NetOps Spectrum Archive Manager.
     - Spectrum Report Manager has an event processing failure and the event processing is resumed.
   - **OneClick server**
     This field represents the OneClick server URL used for model-based contextual report launches. For example, asset links within reports are launched to that model in OneClick. By default, the OneClick Console opens from the

OneClick server installed with DX NetOps Spectrum Reporting. You can specify another server in the OneClick Server field.
DX NetOps Spectrum opens a default OneClick Console view when you click Start OneClick in the option menu. It also opens a OneClick Console topology view of an asset when you click an asset link in a report. By default, the OneClick Console opens from the OneClick server installed with DX NetOps Spectrum Reporting. You can specify another server in the OneClick Server field.
If you plan to access OneClick from a domain that is different from the domain in which the OneClick is located, enter the fully qualified server name. Enter the port number of the OneClick server you want to access *only* if the OneClick server was installed using a port number other than 80.

- If the port number HTTP default 80, enter:
  http://<*servername or fully qualified servername*>
- If the port number is not default 80, enter:
  http://<*servername or fully qualified servername*>:<*portnumber*

– **Ignore Event Poll Task Older than (milliseconds)**
This configuration helps you to ignore polling tasks that are taking long time. Specify the time (in milliseconds) to ignore the polling task that is older than the specified time. The default time is set to 750 milliseconds. Contact CA Support to know more about the recommended time settings.

– **Custom Report Logo Image File Path (on the BOXI server's file system)**
To see your custom logo in the report, provide the custom logo file (.bmp file) location details on the BOXI server, where it is saved.

– **Data Retention Period (days) - Event Table**
Enter the retention period for the event table specifically. As this is one of the fastest-growing tables, you can set this retention period individually. The data retention amounts are saved through Archive Expert.

> **NOTE**
> You can set the retention period maximum to 365 days only for Event Table. Even if you set the retention period greater than 365 days, the data that is older than 365 days is automatically deleted from the Event Table.

4. **instant_event_poller_processing_interval**
The parameter lets the SRM process only the model create/destroy events and alarm events at five minutes of interval. However, you can configure the polling interval. All other events are processed at 60 minutes of interval. The configuration helps you get the updated inventory and alarms data in the report based on the configuration interval rather than the regular 60 minutes time frame.
5. **MySQL Performance Monitor Enabled**
Enable this option to capture the MySQL configuration variables at the time of tomcat restart (every time). The captured data helps to troubleshoot MySQL related issues.
6. **Enable Security**
Enables model-based security in DX NetOps Spectrum Reporting environment. By default, security is not enabled. For more information, see the Report Manager section.
7. **Jasper User Sync**
Use the **Jasper User Sync** option to control the synchronization of the DX NetOps Spectrum users with the Jasper server. The default value is True. Users are synchronized every hour during the event polling. During the synchronization, Spectrum Report Manager checks whether the user exists or not in Jasper. Spectrum Report Manager creates users with the default roles equivalent to the DX NetOps Spectrum user roles. The default password is the same as the username. Once the user is created, the roles and passwords of the users are not modified or synchronized by the Spectrum Report Manager. Users can now customize the roles and change the password.
8. Click Update Preferences to save preference settings.
Spectrum Report Manager preference settings are saved.

Configure Monitoring Status

The DX NetOps Spectrum Status option lists all SpectroSERVERs known by the OneClick Server to which Spectrum Report Manager is connected. It indicates whether the servers are up (green) and Archive Managers are running (green). This option lets you select the SpectroSERVERs that Spectrum Report Manager monitors according to your Spectrum Report Manager license agreement and configures Spectrum Report Manager polling options.

> **WARNING**
> Event processing is required for most reports. Turning off event processing results in reporting data not being updated, such as model creation/deletion, global collection membership updates, alarm information, outage information, and SPM test information. Reports that are generated for time periods after event processing has been turned off may not be accurate.

Follow these steps:

1. Access the Spectrum Report Manager Admin Tools.
2. Select the DX NetOps Spectrum Status option.
   The DX NetOps Spectrum Status panel appears with the following fields displayed
   Landscape, SpectroSERVER Status, Archive Manager Status, and Last Event Field.
3. Select the following boxes:
   a. **Monitor?**
   Specifies that Spectrum Report Manager actively collect data from the selected SpectroSERVER. If monitoring is disabled, reports are generated from historical data in the Spectrum Report Manager database.
   To synchronize data for the test ids to be generated:

   Scenario 1: If Monitor option is Unchecked for the landscape then:

   1. Check the option and click on "Update Monitored Servers"

   Scenario 2: If Monitor Option is Checked then:

   1. Uncheck the Monitor option

   2. Click on "Update Monitored Servers"

   3. Check the Monitor Option again

   4. Click on "Update Monitored Servers"

   This will initiate the synchronization and then the details will be populated.
   b. **Asset Polling?**
   – Specifies that Spectrum Report Manager maintain daily polling of models on the SpectroSERVER for asset change data. This means that asset data in the Spectrum Report Manager database is kept up to date. If asset polling is disabled, reports are generated from historical data in the Spectrum Report Manager database.
   c. **Event Processing?**
   Specifies that Spectrum Report Manager maintain hourly polling of the SpectroSERVER for event data. This means that event data in the Spectrum Report Manager database is kept up to date. If event processing is disabled, event, availability, and alarm reports are generated from historical data in the Spectrum Report Manager database.
4. Click Update Monitored Servers to assert your selections.

NOTE
If you select not to monitor a server, you can remove landscape data from the server that remains in the reporting database by running the RpmgrInitializeLandscape.bat utility. For more information, see Initialize the Database for Specific Landscapes.

Maintenance and Troubleshooting

This chapter describes the Spectrum Report Manager maintenance procedures and troubleshooting issues and solutions.

General Application Maintenance Issues

This section describes typical issues with application maintenance for DX NetOps Spectrum Spectrum Report Manager. The topics in this section provide the procedures to follow for customizing the application and resolving issues.

End Ongoing Outages

In some cases, Spectrum Report Manager does not receive the event indicating that a given outage has ended, and thus the outage is incorrectly reported as ongoing. You can use the Outage Editor to end the ongoing outage.

Synchronize Report Data

If you reinitialize the SpectroSERVER database for a landscape that is reported by Spectrum Report Manager, then you must reinitialize that landscape in the reporting database. Otherwise the data cannot be synchronized with the data in the SpectroSERVER.

No Tests Available in a Response Time Report

You can discover that no tests are available for the time period that you specify when configuring a Response Time report. At the same time, OneClick indicates that tests do exist for the time period from which you want to generate a report. This contradiction is caused by the circumstances under which the tests were discovered in DX NetOps Spectrum Service Performance Manager. For more information, see the Service Performance Manager section.

Change the Report Logo

You can replace the default DX NetOps Spectrum logo on reports with another. The replacement logo must be a bitmap (.bmp) file with 200 pixels in width and 75 pixels in height.

Follow these steps:

1. Save the logo that you want to use to a location on the CABI server file system. You can save the file to a location outside of the CABI installation folders. Note the file path.
2. Navigate to the Spectrum Report Manager Administration Tools page and select Preferences.
3. For the 'Custom report logo image file path' entry, set the file path from the CABI server filesystem.
4. Click Update Preferences.
5. (Linux only) Verify that the logo file has at least read permissions for owner, group, and other.
   The default logo.bmp file is replaced.

Change Vendor Names in Reports

You can change a vendor name in reports that is associated with a specific enterprise number in the Spectrum Report Manager database. You can verify the following reasons to change a vendor name in Spectrum Report Manager:

- Abbreviating a lengthy name.
- Renaming a vendor when the vendor name is changed.

WARNING
Verify that this change is performed on the OneClick Tomcat server, but not on the CABI Tomcat server.

Follow these steps:

1. Shut down the Tomcat server.
2. Copy the vendor.xml file to the custom Spectrum Report Manager configuration directory.
   ```
   cp
   <$SPECROOT>/tomcat/webapps/spectrum/WEB-INF/repmgr/config/vendor.xml <$SPECROOT>/custom/repmgr/config/
   vendor.xml
   ```
3. Edit the <*$SPECROOT*>/custom/repmgr/config/vendor.xml file.
   For each vendor name you want to change, create a <vendor></vendor> entry. In the <vendor_ID></vendor_ID> field, specify the vendor number in hexadecimal or decimal format, and the vendor name within the <vendor_name></vendor_name> field.
   For example, the following file format shows two vendor name changes:
   ```
   <?xml version="1.0" encoding="UTF-8"?>
   <root>
   <vendor>
   <!-- Changes the first vendor name -->
   <vendor_ID>Enterprise #</vendor_ID>
   <vendor_name>Some new name</vendor_name>
   </vendor>
   <vendor>
   <!-- Changes the second vendor name -->
   <vendor_ID>Enterprise #</vendor_ID>
   <vendor_name>Some new name</vendor_name>
   </vendor>
   </root>
   ```
   Definitions:
   - *Enterprise #* - The enterprise number for a vendor product that is referenced in the report.
   - *Some new name* - The new name that is associated with the enterprise number.
4. Save your changes.
5. Restart the Tomcat server.
   The vendor names are changed.

Change Event Names in Reports

You can supply custom names for events that appear in event reports. Overriding default event names lets you clarify specific items for event report recipients.

Follow these steps:

1. Shut down the Tomcat server.
2. Copy the eventtitle.xml file to the custom Spectrum Report Manager configuration directory.
   ```
   cp
   <$SPECROOT>/tomcat/webapps/spectrum/WEB-INF/repmgr/config/eventtitle.xml <$SPECROOT>/custom/repmgr/config/
   eventtitle.xml
   ```
3. Edit the <*$SPECROOT*>/custom/repmgr/config/eventtitle.xml file.
   For each event name you want to change, create an <event></event> entry. Specify the event type code in hexadecimal or decimal format in the <event_type></event_type> field and the event name in the <event_title></event_title> field.
   ```
   <?xml version="1.0" encoding="ISO-8859-1" standalone="yes"?>
   <root>
   ```

```
<event>
<!-- Identifies the event type code-->
<event_type>An event type code</event_type>
<!-- Specifies the custom event name-->
<event_title>A custom event name</event_title>
</event>
</root>
```

4. Save your changes.
5. Restart the Tomcat server.

NOTE
The event name is changed.

Change Probable Cause Names in Reports

You can supply custom names for probable causes that appear in alarm reports. Overriding default probable cause names lets you clarify specific items for alarm report recipients.

Follow these steps:

1. Shut down the Tomcat server.
2. Copy the pcausetitle.xml file to the custom Spectrum Report Manager configuration directory.

```
cp
<$SPECROOT>\tomcat\webapps\spectrum\WEB-INF\repmgr\config\pcausetitle.xml <$SPECROOT>\custom\repmgr\config
\pcausetitle.xml
```

3. Edit the <*$SPECROOT*>\custom\repmgr\config\pcausetitle.xml file.
   For each pcause name you want to change, create an <pcause></pcause> entry. Specify the pcause ID in the <pcause_type></pcause_type> field and the pcause name in the <pcause_title></pcause_title> field.

```
<?xml version="1.0" encoding="ISO-8859-1" standalone="yes"?>
<root>
<pcause>
<!-- Identifies the probable cause ID-->
<pcause_type>A pcause ID</pcause_type>
<!-- Specifies the custom probable cause name-->
<pcause_title>A custom pcause title</pcause_title>
</pcause>
</root>
```

4. Save your changes.
5. Restart the Tomcat server.
   The probable cause name is changed.

Change the OC_user MySQL Password

When DX NetOps Spectrum Reporting connects to the database, you can use a user ID and a password to authenticate against the database. In previous DX NetOps Spectrum releases, one password was used for authentication. However OneClick usernames are now used for background processing (OC_user and OC_admin) to add events and data in the database.

In addition, Crystal Report users need a CR_user password for on-demand reports. WEBI Report users need a WEBI_user for adhoc reports.

Analyze Table

Analyze Table is a command that can be executed on the MySQL command-line tool to update database statistics and improve the overall query performance. MySQL uses the table statistics to determine the order in which tables can be joined. In addition, table statistics can be used to select indexes to use for a specific table within a query.

If multiple modifications (such as INSERT or DELETE) are performed on a database table over time, the table statistics can become out of order. The MySQL Query optimizer which uses the table statistics can produce inefficient query execution plans and can cause MySQL performance degradation. Therefore, we recommend using Analyze Table to update table statistics.

The Analyze Table operation reads the entire database table and rebuilds the table statistics with the information about the distribution of key values. You can run this command on MyISAM and InnoDB tables. During the analysis, the table is locked with a read lock. When locked, the table cannot be accessed for other operations.

How to Run Analyze Table

To improve the performance of the database, run the Analyze Table command. You can run the Analyze Table on any of the following tables:

- event
- modeloutage
- model
- devicemodel
- alarminfo
- alarmactivity

Follow these steps:

1. From the OneClick menu bar, select the Administration tab.
   The Administration Pages panel appears on the left side.
2. From the Administration Pages menu bar, select Spectrum Report Manager.
   The Spectrum Report Manager Admin Tools panel appears on the left side.
3. Select Spectrum Status.
   The Spectrum Status page opens.
4. Clear all Monitor check boxes to stop all landscape monitoring.
5. Close all other reports (scheduled or on-demand) that are running.
6. Invoke a MySQL command prompt, and run the following command:
   ```
   ANALYZE TABLE table_name
   ```
   The task to run Analyze Table is complete.

   NOTE
   Before running Analyze Table stop event and asset polling. Set the data retention policy to 'all data' to disable the reporting database archiving. Restart event and asset polling after running the analyze table and set the data retention policy to its default value. For more information, see Configure DX NetOps Spectrum Monitoring Status and Set Spectrum Report Manager Preferences.

Define Events Types for Availability Processing

You can manage the volume and scope of outages to include in availability reports. You can specify the events that the Spectrum Report Manager availability handler uses to determine the beginning and end of planned and unplanned outages. You can designate events as UP, DOWN, IN MAINT MODE, and OUT OF MAINT MODE event types in the

availability.xml file. You can override default event type designations and can assign types to new events. You can also specify that the availability handler ignores and does not process particular event types. A copy of the file is located in the following directory:

```
<$SPECROOT>/tomcat/webapps/spectrum/WEB-INF/repmgr/config
```

The availability.xml file is formatted as follows:

```
<root>
  <up_event></up_event>
  <down_event></down_event>
  <in_mm_event></in_mm_event>
  <out_mm_event></out_mm_event>
  <ignore></ignore>
</root>
```

You can designate an event as a particular type by entering the event code in decimal or hexadecimal format.

NOTE

For hexadecimal format, make sure you mention '0x' before the event type.

Follow these steps:

1. Make a copy of the availability.xml file.
2. Configure event designations using the tags included in the availability.xml file. All event type tags must be nested within the root tags.
   The following example shows the cluster model type, assuming that the IBM cluster resource group with model type as 0x621000d, 1234 is designated as the DOWN event, 5678 is designated as the UP event, and 0x4567 is designated as an ignored event type:
   ```
   <root>
     <down_event>0x1111</down_event>
     <up_event>0x3333</up_event>
     <down_event>0x5555<down_event>
     <ignore>0xabcd</ignore>
     <down_event type='1234'>
     <model_type>0x621000d</model_type>
     <down_event>
     <up_event type='15678'>
     <model_type>0x621000d</model_type>
     </up_event>
     <ignore>04567</ignore>
   </root>
   ```
3. Save and copy the customized availability.xml file to the following directory:
   ```
   $SPECROOT/custom/repmgr/config
   ```
   The content of the file is written to the AvailabilityEvent database table and is read by the availability handler when it compiles availability statistics for the availability reports.
4. Restart the OneClick Tomcat server to enable the event designations that you specified.

Filtering Event Processing

Event processing filters are defined by an XML file that can exclude certain events from being loaded into the Spectrum Report Manager database. Specifically, events that are associated with the event types or model handles that are listed in the event-processing-filter.xml filter file are not loaded into the Spectrum Report Manager database.

Before you modify the supplied event-processing-filter.xml file, you can determine the event types and model handles for which event activity can be excluded. Excluded events are not available in Spectrum Report Manager for historical reporting purposes.

Follow these steps:

1. Copy the event-processing-filter.xml and event-processing-filter-schema.xsd files to the 'custom' directory. For example, see the following syntax:

```
cp
<$SPECROOT>/tomcat/webapps/spectrum/WEB-INF/repmgr/config/event-processing-filter-schema.xsd
<$SPECROOT>/custom/repmgr/config/
cp
<$SPECROOT>/tomcat/webapps/spectrum/WEB-INF/repmgr/config/event-processing-filter.xml
<$SPECROOT>/custom/repmgr/config/
```

2. Edit the event-processing-filter.xml to reflect your selected filtering strategy.
   For example, see the following syntax:

```
<ignore>
    <event-type>0x1245</event-type>
    <event-type>0xffa0004</event-type>
    <model>0x00d40010</model>
    <model>0xff0100d1</model>
</ignore>
```

   NOTE
   You can only ignore events that are associated with specific models or event types.

3. Restart Tomcat.
   The specified event processing filters are now in effect.

Define Event Filters for Event Reports

Event filters are uniquely named sets of predefined event codes. When you configure an event report, you can select event types to include or exclude data in the report from events in a particular event filter.

An event filter is defined by an XML file that specifies the event codes. You can create new event filter files and can copy or modify the event filter files that are included with Spectrum Report Manager. Before you create or modify event filters, determine the types of events that are important in your deployment.

Set Up Event Filtering

To set up event filtering, copy the XML schema and predefined configuration events file that are provided by Spectrum Report Manager to the custom directory (*$SPECROOT/*custom/repmgr/config/events).

Follow these steps:

1. Copy the following schema file:

```
cp
$SPECROOT/tomcat/webapps/spectrum/WEB-INF/repmgr/config/events/event-filter.xsd
$SPECROOT/custom/repmgr/config/events
```

2. Copy the following predefined configuration events file:

```
cp
$SPECROOT/tomcat/webapps/spectrum/WEB-INF/repmgr/config/events/event_filter_file.xml $SPECROOT/custom/
repmgr/config/events
```

The possible values for the *event_filter_file* variable are as follows:

- **ADES-events-filter.xml**
  Contains the most significant Active Directory and Exchange Server (ADES) event codes to create a basic report.
- **ncm.xml**
  Specifies event codes for Network Configuration manager (NCM) activities in DX NetOps Spectrum.
- **vhm.xml**
  Contains the most significant Virtual Host Manager (VHM) event codes to create a basic report.
- **vhmtrap.xml**
  Contains a large list of all the potential Virtual Host Manager (VHM) traps to create a comprehensive report.
- **Cluster.xml**
  Contains all cluster events, including IBM and Microsoft.
- **IBM-Cluster-all.xml**
  Contains all of the IBM cluster events.
- **IBM-run-status.xml**
  Contains all of the IBM cluster events that are related to Status (such as up, down, offline).
- **MS-Cluster-all.xml**
  Contains all of the Microsoft cluster events.
- **MS-run-status.xml**
  Contains the Microsoft cluster events that are related to Status (such as up, down, offline).
- **ClusterTrap.xml**
  Contains only the trap events from IBM and Microsoft clusters.
- **Cluster-spectrum-managing.xml**
  Contains the DX NetOps Spectrum management events, such as cluster proxy events, management events, and polling events

The files are copied to the custom directory and event filtering setup is complete.

Create an Event Filter File

You can create event filter files and can copy or modify the event filter files that are included with Spectrum Report Manager.

Follow these steps:

1. Define an XML file that includes any number of event type codes in either hexadecimal or decimal format. For example, see the following filter format:

```
<?xml version="1.0" encoding="ISO-8859-1"?>
<filter xmlns="http://www.aprisma.com"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:schemaLocation="http://www.aprisma.com ./event-filter.xsd">
<event_type>event type code</event_type>
<event_type>event type code</event_type>
</filter>
```

2. Save the file under a name that suggests the types of events to the custom directory. For example, see the following format:

```
<$SPECROOT>/custom/repmgr/config/events
```

   An event filter file is created.

Exempt All Unplanned Outages for a Particular Day

You can use the exemptOutagesForDay command-line utility to exclude data from the Availability reports for all unplanned outages that have occurred on a non-working, or non-SLA day (for example, a holiday or a planned shutdown day). The

utility also includes a parameter that lets you exempt any service outages that are caused by the device/interface outages. You can unexempt planned outages.

NOTE
You can exempt only those device/interface outages that have occurred for a single day and not a range of days. If you want to exempt outages for multiple days, you can run the utility for each day.

NOTE
For more information, see How the Exempt Outage Utility Handles Particular Outage Scenarios.

The utility is located in the /spectrum/bin directory.

Syntax:

```
exemptOutagesForDay <mysql username> <mysql password>
<exempt service outages> [-undo <YYYY-MM-DD>] YYYY-MM-DD day
```

Examples:

The following example exempts device/interface outages from January 1, 2006 and all service outages resulting from the device/interface outages:

```
exemptOutagesForDay root root yes 2006-01-01 New Year's Day
```

The following example exempts device/interface outages from January 1, 2006 but not service outages resulting from the device/interface outages:

```
exemptOutagesForDay root root no 2006-01-01 New Year's Day
```

The following example unexempts device/interface outages from January 1, 2006 and all service outages resulting from the device/interface outages:

```
exemptOutagesForDay root root yes -undo 2006-01-01 New Year's Day
```

The following example unexempts device/interface outages from January 1, 2006 but not service outages resulting from the device/interface outages:

```
exemptOutagesForDay root root no -undo 2006-01-01 New Year's Day
```

How the Exempt Outage Utility Handles Particular Outage Scenarios

Not all outages begin and end during the exempt period. The exemptOutagesForDay utility responds to outages that begin or end outside the exempt day period in various ways. You can verify the following outage scenarios that are handled by the exemptOutagesForDay utility:

- The outage begins before the exempt day and ends during it.
  The utility ends the existing outage at the start of the exempt day. A new exempt outage from the start of it to the end of the original outage is created.
- The outage begins before the exempt day and ends after it.
  The utility ends the existing outage at the start of the exempt day. A new exempt outage during the exempt day, and a new unplanned outage from the end of the exempt day to the end of the original outage is created.
- The outage begins during the exempt day and ends after it.
  The utility ends the existing outage at the end of the exempt day. The utility converts the outage to an exempt outage, and then creates a new unplanned outage from the end of the exempt day to the end of the original outage.
- The service outage begins before or during the exempt day and ends during or after it.
  The entire service outage is exempted.

Configure User-Defined Device Attribute Polling

The Spectrum Report Manager historical device management feature polls devices for well-known attributes, such as device name and network address. However, you can pull more data from devices, such as vendor-specific data, or settings that are applicable to a business environment. Therefore, Spectrum Report Manager enables you to tailor the device polling behavior.

Custom device polling is organized by model type, and then by attributes within the model type. The polling supports a maximum of ten (10) additional attributes per model type, in three attribute type areas. You can verify the following list for the attribute type and the associated DX NetOps Spectrum type mappings.

Type	Supported DX NetOps Spectrum Type Mapping	Maximum Number of Attributes (per type)
Varchar-based	All character-based and numeric types	4
Integer-based	Numeric, scalar types	4
Date/Time	Timestamp, time period types	2

Mapping Polled Attributes to Storage

If you are interested in storing the additional device attributes, you can determine the attributes to store. You can accomplish this task in the OneClick Attribute Editor view of a given device. Locate the desired attributes, and note the hexa-based attribute IDs (for example, 0x1006e) and the corresponding Type (for example, Integer, Text String).

You can select the attributes and can assign them to one of the open storage locations. The mapping occurs in an XML file, which is at:

```
<SPECROOT>/tomcat/webapps/
    spectrum/WEB-INF/repmgr/config/devicemodel-polling.xml
```

For a model type, each attribute id is mapped to a storage location. Consider the following example, for the model type 'Rtr_Cisco', that maps the attribute ID '0x118b8' to string storage location '1':

```
<devicemodel-polling ...>
    <user-defined-poll modelType="Rtr_Cisco">
        <!-- Company name attribute -->
        <poll-attribute attrId="0x118b8">
            <varchar-storage id="1"/>
        </poll-attribute>
    </user-defined-poll>
</devicemodel-polling>
```

Next, consider the following example that maps several attributes, across several model types:

```
<devicemodel-polling ...>
    <user-defined-poll modelType="Rtr_Cisco">
        <!-- Company name attribute -->
        <poll-attribute attrId="0x118b8">
            <varchar-storage id="1"/>
        </poll-attribute>
        <!-- Disposable precedence attribute -->
        <poll-attribute attrId="0x114e2">
            <int-storage id="4"/>
        </poll-attribute>
```

```
    </user-defined-poll>
    <user-defined-poll modelType="JuniperJUNOSRtr">
        <!-- Company name attribute -->
        <poll-attribute attrId="0x118b8">
            <varchar-storage id="2"/>
        </poll-attribute>
        <!-- Create time now attribute -->
        <poll-attribute attrId="0x11b41">
            <datetime-storage id="1"/>
        </poll-attribute>
    </user-defined-poll>
</devicemodel-polling>
```

In the previous example, two model types are configured for custom attribute polling. For 'Rtr_Cisco' devices, the company name attribute is stored at string storage '1' and the disposable precedence attribute is stored at long storage '4'. For 'JuniperJUNOSRtr' devices, the company name attribute is storage at string storage '2' (note the difference from the 'Rtr_Cisco' configuration) and the create time attribute is stored at date/time storage '1'.

A full example XML file can be found at:

```
<SPECROOT>/tomcat/webapps/
    spectrum/WEB-INF/repmgr/config/devicemodel-polling-example.xml
```

NOTE

The newly created attributes are updated in Spectrum Report Manager database during device polling which is scheduled for every 24 hours.

Reporting Labels

You can retrieve the attributes that are stored in the database, and can identify the attributes that are stored in 'varchar storage 1' for the 'Rtr_Cisco' model type. The reporting label lets you describe the purpose of an attribute and user-oriented interfaces.

The reporting label is configured in the following example:

```
<devicemodel-polling ...>
    <user-defined-poll modelType="Rtr_Cisco">
        <!-- Company name attribute -->
        <poll-attribute attrId="0x118b8">
            <varchar-storage id="1"/>
        <reports label="Company Name" />
        </poll-attribute>
    </user-defined-poll>
</devicemodel-polling>
```

If you require to display the user-defined device attribute, the label text can be used to identify the attributes purpose.

Displaying Attributes in Reports

You can display the user-defined attributes as part of a Business Objects WEBI document using the DX NetOps Spectrum Universe. You can browse for subfolders that are prefixed with 'User Specified Device Attributes', while selecting result objects for the WEBI Document query.

For example, consider the following location:

Asset/Additional Device Information/User Specified Device Attributes - Asset.

For each polled attribute, the following objects and their source location are available in the folder:

- Attribute ID - configured in .xml file
- Label - configured in .xml file
- Value - polled from device

You can drag the desired result objects to the relevant WEBI panel to incorporate the objects into the query.

Polling Behavior:

When a device is polled, only the current user-defined polling configuration is applied. Therefore, if a configuration change is made, a device is polled again. The attributes and storage locations reflect the current configuration. Attributes of the devices that are polled before the configuration change and the old storage locations are cleared before storing the current attribute values.

CABI Installation and Operation Errors

This section describes typical CABI installation and operation errors. You can access the log files that are generated during CABI installation and in many cases, you can troubleshoot the errors that you find there. For more information, see the CA Business Intelligence Implementation section.

Failed to Open the Connection Error

Symptom:

The following error message appears when you try to run a report after integrating the newly installed CABI with DX NetOps Spectrum:

```
Failed to open the connection
```

Solution:

You can encounter this issue if MySQL drivers are not set correctly in your system. To resolve the issue, take the following steps:

1. From the CABI installer, navigate to the patch folder, and copy the CA_NVM_EXE folder to any drive.
   For example, copy the patch folder from C:\cabi\Windows\Disk1\cabi\patch\CA_NVM_EXE to E:\ drive.
2. From the CLI window, run the following batch file:
   ```
   E:\CA_NVM_EXE\nvm_cabi_post_install_windows.exe
   ```
   nvm_post_install log files are created.

   NOTE
   Rewritable permissions are required before making any changes to the NVM_EXE folder and the mysql.jar file, which is at C:\Program Files (x86)\CA\SC\CommonReporting3\common/4.0/java/lib/external.

LDAP User Scheduled Reports Failed to Work

Symptom:

When I am logged in as an LDAP user, I am unable to view the Reports folder hierarchy in BI Launch Pad. In addition, reports that are scheduled by LDAP users are not working.

Solution:

This issue occurs if the cabi_default_groups.xml file of the CABI 4.1 SP3 installer does not contain the updated scripts.

Update the cabi_default_groups.xml file and verify the updated information is available in the cabi_default_groups.xml file. Take the following steps to verify the updated content:

1. From the CABI 4.1 SP3 installer, navigate to the following path:
   ```
   Disk1/cabi/content/
   ```
2. Search for the following file:
   ```
   cabi_default_groups.xml
   ```
3. Verify for the following information in the .xml file:
   ```
   <?xml version="1.0"?>
   <biconfig version="1.0">
   </biconfig>
   ```

Windows Script Error

Symptom:

During the CABI installation on Windows, the following error message appears several times:

```
Windows Script Host: There is no script engine for file extension ".js".
```

The CABI installation requires access to a JavaScript engine. This problem is caused due to the following reasons:

Windows does not have a program that is associated with the .js file extension.

- Microsoft Windows Script is not installed.

Solution:

Install the latest version of Microsoft Windows Script, which can be downloaded from Microsoft. Once the download is installed, you can reinstall CABI.

Maximum Records Error (Windows)

Symptom:

The following message appears when you try to run a report:

```
Maximum processing time or maximum records limit reached.
```

Solution:

The CABI record limit is set too low. After a first-time installation of CABI, this value is defaults to 20,000.

To set the record limit to unlimited, perform the following steps:

1. Open CMC, and click Servers.
2. Find the server labeled 'Crystal Reports Processing Server' (formerly known as the Page Server).
3. Right click 'Crystal Reports Processing Server', and select Properties.
4. Find the field labeled 'Database Records Read When Previewing or Refreshing'.
5. Enter 0, and click Save and Close.
6. Right click the server and select Restart Server.

> **NOTE**
> This procedure temporarily prevents users from generating reports. Once the Processing Server restarts, report generation can resume.

SQL Server Memory Usage (Windows)

Symptom:

If you are still using Microsoft SQL Server as the CMS database server, you can observe that when the CABI SQL server activity is low, its memory usage continues to increase on the host server. This behavior is considered normal and expected. Microsoft attributes this behavior to the SQL Server buffer pool, which is designed to release memory as it is required by other processes. For more information, see the *Microsoft Knowledge Base Article 321363*.

Solution:

Not applicable.

Reporting Troubleshooting Topics

This section describes the following reporting errors and the suggested solutions to fix these errors.

Failed to open the connection while generating reports

Symptom: After installing and integrating CABI BOXI with DX NetOps Spectrum, you may get the following error, while running the reports:

“The viewer could not process an event. Failed to open the connection”

Cause: The Open Database Connectivity (ODBC) drivers are not configured properly during post installation phase.

Resolution: Run the post installation steps - Configure the Database Driver.

1. Navigate to the CABI BOXI computer.
2. Copy the CA_NVM_EXE folder from <CABI VCD>\utilities folder to the local disk.
3. If you are on UNIX environment, set the CASHCOMP variable to the folder where CABI BOXI is installed. Example: /opt/cabi41
4. Run the following command as **CABI install user**:
   Windows: nvm_boxi_post_install_windows.exe
   Linux: nvm_boxi_post_install_unix.sh
   Log files (nvm_boxi_post_install.log, nvm_boxi_post_install.java.log) for this utility can be found in system temp path (in windows: %temp% and in Linux: /var/tmp/).

Failed to open the connection error in Tomcat log

Symptom: “Failed to open connection” exception in SRM tomcat log.

Cause: Due to incorrect MySQL driver paths, or due to permissions not granted to SRM server for that user.

Resolution: Grant privileges to SRM MySQL server and verify/correct the drivers path in CABI BOXI computer.

To grant privileges for SRM MySQL server, follow these steps:

1. Navigate to $SPECROOT/mysql/bin in bash or command prompt.
2. Log in to MySQL in DX NetOps Spectrum OneClick using the following command:
   ./mysql –uroot –proot reporting
3. Execute the following command:
   GRANT ALL PRIVILEGES ON *.* TO 'root'@'cabi hostname' IDENTIFIED BY 'root';
4. Execute the following command:
   GRANT ALL PRIVILEGES ON *.* to 'CR_user'@'<cabi hostname>' identified by '0n3cl1Ck';
   For WEBI user:
   GRANT ALL PRIVILEGES ON *.* to 'WEBI_user'@'<IP address of the host>' identified by '0n3cl1Ck'
5. FLUSH PRIVILEGES;

Verify/Correct the MySQL driver path in CABI BOXI computer:

1. Navigate to the following directory:
   C:\Program Files (x86)\CA\SC\CommonReporting4\SAP BusinessObjects Enterprise XI 4.0\java\lib\external
2. Verify if the file mysql-connector-java.jar is present.
3. Verify if the path of this JAR file is correct in the following files:
   C:\Program Files (x86)\CA\SC\CommonReporting4\SAP BusinessObjects Enterprise XI 4.0/dataAccess/connectionServer/jdbc/mysql.sbo
   C:\Program Files (x86)\CA\SC\CommonReporting4\SAP BusinessObjects Enterprise XI 4.0/dataAccess/connectionServer/jdbc/jdbc.sbo
   C:\Program Files (x86)\CA\SC\CommonReporting4\SAP BusinessObjects Enterprise XI 4.0/java/CRConfig.xml
4. If you modify any of the above files, then you must restart the BOXI tomcat using Central Configuration Manager (CCM).

No records found ‘or’ no data in reports

Symptom: No records found or failed to open connection error while running report. The well-known parameters (WKP_ProxyUserSecurity) value is NULL!!!.

This issue can be verified by right-clicking the SRM parameters page for any report and going to "View Source". Search for "WKP_ProxyUserSecurity"

Looks like this:

<input type="hidden" name="WKP_CustomLogo" value="NULL!!!">
<input type="hidden" name="WKP_ProxyUserSecurity" value="NULL!!!">

Cause: The Reports login credentials are not updated and Open Database Connectivity ODBC drivers are not configured properly.

Resolution: Run the post installation steps – Configure the Database Driver and then run the following steps.

1. Go to the OneClick web page.
2. Navigate to Administration -> Report Manager -> Manage Business Objects Content.
3. Click "Update Content" and let it complete.
4. Verify if the wkp parameters are set properly like below:
   <input type="hidden" name="WKP_CustomLogo" value="C:\win32app\Spectrum\custom\repmgr\logo.bmp">
   <input type="hidden" name="WKP_ProxyUserSecurity" value="Administrator">

No records found ‘or’ no data in reports due to security strings

Symptom: The global collections list is not populated in group report and “No Record Found” while running the other reports.

Cause/Hyposthesis: The security strings for the user might not be updated. Log in to SRM server MySQL then run the following query to check the security strings:
Select * from v_security_string_accessibility_by_landscape;

Or, to check for a user:
Select * from v_security_string_accessibility_by_landscape where user_name= “<USER_NAME>” . The result should contain at least (ADMIN, *UNKNOWN* and blank) otherwise it is indication that security strings are not updated for user.

Resolution: Restart the SRM OneClick server/tomcat so that all the security strings for each user get updated.

Maximum report processing limit reached

Symptom: Error in tomcat log while running the report – “The maximum report processing jobs limit configured by your system administrator has been reached”.

Cause: The limit of number of jobs running on CABI BOXI server has been reached.

Resolution: Increase the limit of the CABI BOXI server using the following steps:

1. Log in to Central Management Console (CMC) as an "Administrator".
2. Select "Servers" from the drop-down list.
3. Go to Service Categories -->Crystal Reports Services.
4. In Server Name, right-click on "<hostname>.AdaptiveJobServer" and select "Properties"
5. In Crystal Reports 2013 Scheduling Service, change the Maximum Concurrent Jobs value from "5" to a higher number.
6. Click "Save and Close".
7. Right-click on the server and select Restart to restart the server.
8. If you still see the error, then increase the limit to a higher number.

Unable to compile class for JSP while running the report

Symptom: Error while running the reports in a fresh install or after upgrade: “Unable to compile class for JSP: an error occurred in the JSP file: /jsp/runReport.jsp or /jsp/listParameters.jsp”

Cause: The deployed jars and JSP files in DX NetOps Spectrum and CABI are not in sync.

Resolution: Run the following steps.

1. Run only the SpectrumUpdate command as mentioned in the documentation.
2. Stop the CABI tomcat server.
3. Delete "localhost" folder in CABI tomcat's work\Catalina folder.
4. Back up UdmCAFApp.jar at
   C:\Program Files(x86)\CA\SC\CommonReporting4\tomcat\webapps\BOE\WEB-INF\eclipse\plugins
   \webpath.UdmCAFApp\web\WEB-INF\lib
   where C:\Program Files (x86)\CA\SC\CommonReporting4\ is the CABI 4.x installation directory.
5. Copy the NEW_UdmCAFApp.jar file as UdmCAFApp.jar which got downloaded into SpectrumUpdate utility folder to the following location:
   C:\Program Files (x86)\CA\SC\CommonReporting4\tomcat\webapps\BOE\WEB-INF\eclipse\plugins
   \webpath.UdmCAFApp\web\WEB-INF\lib
6. Copy the listParameters.jsp and runReport.jsp files from DX NetOps Spectrum <SPEC_Home>/tomcat/webapps/spectrum/repmgr/admin/ to the following location:
   C:\Program Files (x86)\CA\SC\CommonReporting4\tomcat\webapps\BOE\WEB-INF\eclipse\plugins
   \webpath.UdmCAFApp\web\jsp
7. Start the CABI BOXI tomcat server.

HTTP 404, when right-click the report and select view

Symptom: HTTP 404 error, when you right-click on any report and select View in the BI Launch Pad.

Cause: The web.xml file present in CABI BOXI is not getting updated properly.

Resolution: Run the following steps to configure/correct the web.xml.

1. Navigate to $BO_INST_PATH/CommonReporting4/tomcat/webapps/BOE/WEB-INF/eclipse/plugins/webpath.CustomParams/web/WEB-INF/
2. Open the web.xml file in a text editor.
3. Find the following section:
   <context-param>
   <param-name>xmlFilePath</param-name>
   <param-value>/opt/CA/SharedComponents/CommonReporting4cacaf</param-value>
   </context-param>

Note that the "CommonReporting4cacaf" should be separated with a forward slash.

4. Update the line as below:
   <param-value>/opt/CA/SharedComponents/CommonReporting4/cacaf</param-value>
5. Save the file and exit.
6. Shut down the CABI Tomcat.
   On Windows, you utilize the Central Configuration Manager.
   On Linux, go to $BO_INST_PATH/CommonReporting4/sap_bobj/
   Execute: ./tomcatshutdown
7. Go to $BO_INST_PATH/CommonReporting4/tomcat/work/Catalina/
8. Delete the localhost folder.
9. Start the CABI Tomcat.
   Windows use Central Configuration Manager again.
   Linux: ./tomcatstartup (from the same sap_bobj) directory as above.

"NoSuchMethodError" in Tomcat log

Symptom: Unable to run any reports due to the NoSuchMethodError error in tomcat log –"java.lang.NoSuchMethodError: com.crystaldecisions.sdk.occa.report.application.ReportAppSession.setReportEngineTypeValue(I)V at com.crystaldecisions.sdk.occa.managedreports.ras.internal.RASReportAppFactory.getReportAppSession(RASReportAppFactory.j com.crystaldecisions.sdk.occa.managedreports.ras.internal.RASReportAppFactory.openDocument(RASReportAppFactory.java:51

Cause: The Integration or "Update Content" failed to update the database log in credentials for the reports due to stale old CABI jars in DX NetOps Spectrum tomcat.

Resolution:

1. Stop the OneClick/tomcat SRM server.
2. Navigate to $SPECROOT/tomcat/lib directory.
3. Remove the rasapp.jar, rascore.jar, and Serialization.jar from $SPECROOT/tomcat/lib directory.
4. Start the OneClick/tomcat SRM server.
5. Wait for the tomcat to start and then go to DX NetOps Spectrum OneClick page ->Administration->Manage Business Objects Content and click "Update Content".

File I/O error while running reports

Symptom: Error while running few reports in CABI BOXI: "Error in the file xxxxx: File I/O error"

Cause: Report is unable to fetch the large number for data present in SRM database.

Resolution: Increase timeout, Cache & the records limit using the following steps.

1. Log in to the Central Management Console (CMC).
2. Click Servers.
3. Right-click on Crystal Reports Cache Server and select properties.
4. Set the Idle Connection Timeout (minutes) value to **60**.
5. Set the Maximum Cache Size (KB) value **to 1028000.**
6. Click Save & Close.
7. Right-click on Crystal Reports Processing Server 2013 and select Properties.
8. Ensure that the field Database Records Read When Previewing or Refreshing is set to **0** (for unlimited).
9. Set the Idle Job Timeout (minutes) value to **60**.
10. Click Save & Close.
11. Restart both the Cache and Processing Servers. (this step is not necessary if you are going to restart the SIA).

Report Generation Takes Long Time

Symptom: The parameter page opens slow or Report is running slow or MySQL queries are running slow.

Cause: Probably because of large database/records.

Resolution: Increase the performance of SRM MySQL server using the following recommended settings.

1. Stop the DX NetOps Spectrum Processd using `systemctl stop processd` command.
2. Stop DX NetOps Spectrum tomcat.
3. Navigate to $specroot/mysql.
4. Take back-up of existing my-spectrum.cnf.
5. Update the my-spectrum.cnf with the following parameters:
   key_buffer = 512M
   table_cache = 1000
   wait_timeout = 300
   max_allowed_packet = 32M
   query_cache_size = 64M
   query_cache_type = 1
   sort_buffer = 64M
   myisam_sort_buffer_size = 64M
   read_buffer_size = 64M
   read_rnd_buffer_size = 6M
   thread_concurrency=4
6. Restart the Processd and tomcat

> **NOTE**
>
> The above settings can be increased depending on the hardware resources available in the environment/ machine.

Unable to export report data (without Titles, Headers, Group Headers, Summary, Footers) to .csv format.

Symptom:

When I export the report data into CSV format, I want to filter out Title, Header, Group Header, Summary, and Footer information.

Solution:

1. On the server where you have installed JasperReports Server, navigate to:
   <<CA Business Intelligence Installed Directory>>\apache-tomcat\webapps\jasperserver-pro\WEB-INF\classes.
2. Open the jasperreports.properties file in Edit mode.
3. Add the following properties at the end of the file.

```
net.sf.jasperreports.export.csv.remove.empty.space.between.rows=true
net.sf.jasperreports.export.csv.remove.empty.space.between.columns=true
net.sf.jasperreports.export.csv.exclude.origin.band.1=pageHeader
net.sf.jasperreports.export.csv.exclude.origin.report.1=*
net.sf.jasperreports.export.csv.exclude.origin.band.2=pageFooter
net.sf.jasperreports.export.csv.exclude.origin.report.2=*
net.sf.jasperreports.export.csv.exclude.origin.band.3=columnHeader
net.sf.jasperreports.export.csv.exclude.origin.report.3=*
net.sf.jasperreports.export.csv.exclude.origin.band.4=columnFooter
net.sf.jasperreports.export.csv.exclude.origin.report.4=*
net.sf.jasperreports.export.csv.exclude.origin.band.5=lastPageHeader
net.sf.jasperreports.export.csv.exclude.origin.report.5=*
net.sf.jasperreports.export.csv.exclude.origin.band.6=summaryPageHeader
```

```
net.sf.jasperreports.export.csv.exclude.origin.band.7=groupHeader
net.sf.jasperreports.export.csv.exclude.origin.band.8=groupFooter
net.sf.jasperreports.export.csv.exclude.origin.band.9=reportHeader
net.sf.jasperreports.export.csv.exclude.origin.band.10=reportFooter
net.sf.jasperreports.export.csv.exclude.origin.band.11=lastPageFooter
net.sf.jasperreports.export.csv.exclude.origin.report.11=*
net.sf.jasperreports.export.csv.exclude.origin.band.12=summaryPageFooter
net.sf.jasperreports.export.csv.exclude.origin.band.13=summary
net.sf.jasperreports.export.csv.exclude.origin.report.13=*
net.sf.jasperreports.export.csv.exclude.origin.band.14=title
net.sf.jasperreports.export.csv.exclude.origin.report.14=*
net.sf.jasperreports.export.csv.parameters.override.IgnorePagination=true
```

4. Save the changes to the properties file and exit.
5. Restart the JasperReports Tomcat Server.
   After you have restarted the JasperReports Tomcat Server, run the reports you want to export, again.
6. Export the report data into .csv format.The report data should be exported without the following information:

- Title
- Header
- Group Header
- Summary
- Footer

View the Modification History of Custom Configuration Files

Symptom:

You are interested in monitoring Spectrum Report Manager customization changes that are made through the configuration files. These files are located under *$SPECROOT*/custom/repmgr/config.

Solution:

Log in to the MySQL client as ‘root’ and run the following command to see the chronology of changes for all the custom configuration files:

```
SELECT filename, FROM_UNIXTIME(last_modified/1000) as time
FROM reporting.configchangelog
ORDER BY filename, time;
```

Missing Outage Data Error

Symptom:

DX NetOps Spectrum Reporting is missing outage data. The Tomcat log includes a message similar to the following message:

```
<$SPECROOT>\tomcat\logs\stdout.log:
    Jul 29, 2009 10:00:34 AM - SRMAvailabilityHandler:
    WARNING: Historical update has failed for domain = 0x400000 due to error = Connection to event domain
 timed out.
```

Solution:

The outage data indicates one of the following situations:

The DX NetOps Spectrum Archive Manager for the domain that is specified in the message is not running.

- A network connectivity issue between the OneClick web server and the Archive Manager on the domain that is specified in the message.

To resolve this issue, start the Archive Manager or resolve any network connectivity issues.

When Spectrum Report Manager determines that the Archive Manager is running again, it automatically retrieves all the historical availability event data that it requires to update the reporting database.

When Archive Manager is not running, the SpectroSERVER caches the event data. When the Archive Manager is running again, the SpectroSERVER sends it to the cached event data. However, the SpectroSERVER event cache is limited in size. If the Archive Manager is down for a prolonged period, event data can be lost. For more information, see the Database Management section.

Invalid Security Credentials Error

Symptom:

The following message appears when you try to run a report:

```
An error occurred at the server: The Page Server cannot logon to the CMS. This is due to invalid security
 credentials. Please verify your user ID and password.
```

Solution:

The session has timed out. To resolve the issue, perform the following steps:

1. Exit Spectrum Report Manager.
2. Re-establish the DX NetOps Spectrum Reporting session, and try running the report again.

Reset Report Manager Application Model

Symptom:

If the Main Location Server (MLS) is removed from a Distributed SpectroSERVER environment, Spectrum Report Manager can no longer assert events on the SRMApplication model. As a result, monitoring of Spectrum Report Manager status through the SRMApplication model cannot occur.

Solution:

Remove the model handle entry for the SRMApplication model from the registry table using the following MySQL command (logged on as ‘root’):

```
mysql>USE reporting;
mysql>UPDATE registry SET SRM_Model = 0;
```

Resolving Java Error in Report Manager Sample (WEBI) Reports

Symptom:

A Java error is observed in the Spectrum Report Manager Sample (WEBI) Reports. When a sample report is opened, following error message is displayed:

```
Java has discovered application components that could indicate a security concern -- Block potentially unsafe
 components (recommended).
```

If yes is selected, java blocks the result of the report from being displayed.

Solution:

This issue occurs when running the browser on Windows with versions higher than Java 6 Update 17. To resolve this issue, perform the following steps:

1. Open Java from Control Panel.
2. Select the Advanced Tab
3. Expand the Security option.
4. Expand the Mixed Code option.
5. Select 'Enable - hide warning and run with protections'.

This setting recovers the original format and allows you to use the most recent version of the JRE instead of rolling back to a previous version.

DX NetOps Spectrum Report Manager uses too much disk space, how can we limit the size of this database?

Symptom: The $SPECROOT/mysql/data/reporting directory is very large and taking up a major part of the disk space.

Resolution: CA suggests having a large enough hard space drive dedicated to Report Manager to store all the data required for your business needs.

DX NetOps Spectrum Report Manager also has an archiving utility. This utility is located under the Admin Tools tab of the Report Manager UI. This utility has three features: Purge, Archive, and All data.
Purge: Removes all data based on retention period days chosen.
Archive: Archives the data into the archive database based on the retention period days chosen.
All data: Keep all data in the reporting database and do not remove anything. All data basically means the archive will not run each night.

Purge is the recommended setting for users with disk space problems.
Purge removes all the data after the retention period chosen. For example, if you set the retention days to 90, then anything older than 90 days is removed on a nightly basis.

Archive can be used but this does not save space. Archive simply moves the data from one database to another. However, the archive database can be dropped. This action would make that amount of space available and upon restarting DX NetOps Spectrum tomcat, the database will be rebuilt with 0 data.

To drop the archive database:

1. Navigate to the $SPECROOT/mysql/bin directory.
2. Type: ./mysql --defaults-file=my-spectrum.cnf -uroot -proot
3. At the Mysql> prompt type: drop database archive;
4. Restart DX NetOps Spectrum Tomcat service.

DX NetOps Spectrum Report Manager does not start up due to errors relating to 'directory'

Symptom: Errors are seen in the $SPECROOT/tomcat/logs/stdout.log (catalina.out *nix) relating to parameter directory is not a 'directory'.

Full error:

<date and time> (SRM/Startup/Container) (com.aprisma.spectrum.app.repmgr.web.servlet.SRMBootstrapServlet) - (ERROR) - Error occurred while initializing SRM components
com.aprisma.spectrum.app.repmgr.exceptions.SRMException: Error occurred while logging custom configuration changes

Caused by: java.lang.IllegalArgumentException: Parameter 'directory' is not a directory

at org.apache.commons.io.FileUtils.listFiles(FileUtils.java:207)
at com.aprisma.spectrum.app.repmgr.common.CustomConfigLogger.logChanges(CustomConfigLogger.java:70)
at
com.aprisma.spectrum.app.repmgr.dc.db.ReportManagerInitializer.logConfigurationChanges(ReportManagerInitializer.java:180)

Resolution: The reason for this error is because the ReportManagerInitializer code is looking for the directory $SPECROOT and then the custom/repmgr/config directory. If this error is seen, it means that directory does not exist.

To resolve, simply create the directory structure $SPECROOT/custom/repmgr/config/events

The config directory is the most important part, but the events directory is also needed. Once this is created, restart the DX NetOps Spectrum Tomcat Service.

Windows:

Go to Services and restart DX NetOps Spectrum Tomcat

*nix:

Go to $SPECROOT/tomcat/bin as the DX NetOps Spectrum install owner
Type - ./stopTomcat.sh
Once stopped type - ./startTomcat.sh

Once restarted, view the log to confirm Report Manager starts and there are no errors in the log file.

Commands for CABI Management on Linux

This section describes basic commands for managing CABI servers and the CABI-related MySQL daemon. You can issue commands from the *CABI Install Directory/bobje directory*.

View CABI-Related Processes

You can view the CABI-related processes to verify the status of all processes. To view CABI-related processes, use the following commands:

To view all processes:

```
ps -ef | grep bobje
```

To view all processes except MySQL processes:

```
ps -ef | grep bobje | grep -v mysql
```

Start and Stop CABI Servers

In certain instances, you can start and stop the CABI servers to fix the CABI-related issues. The following commands can be used to start and stop all the CABI-related servers.

To start all servers:

```
./startservers
```

To start a specific server, use CMC.

To stop all servers:

```
./stopservers
```

To stop a specific server, use CMC.

Start and Stop the CABI-Related SQL Anywhere Daemon

You can start and stop the CABI-related SQL Anywhere daemon while working on DX NetOps Spectrum reporting. Use the following commands:

To start the SQL Anywhere daemon:

```
./sqlanywhere_startup.sh
```

To stop the SQL Anywhere daemon:

```
./sqlanywhere_shutdown.sh
```

Start and Stop CABI Tomcat

When working on processes related to DX NetOps Spectrum reporting (for example, backup or restore reporting data), we recommend you to stop and start the CABI Tomcat process. Use the following commands:

To start the Tomcat process:

```
./tomcatstartup.sh
```

To stop the Tomcat process:

```
./tomcatshutdown.sh
```

How to Manually Purge Reporting Data from the Reporting Database

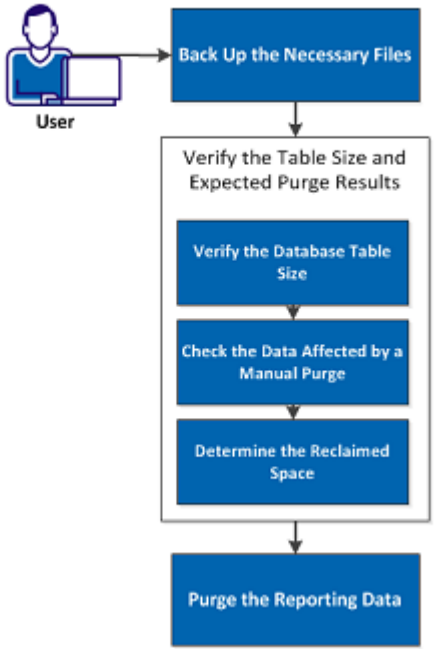
The performance of the database is affected when the tables in the reporting database grow too large. To improve database performance, you can purge the data manually from the reporting database. The following tables affect the database performance in the reporting database:

- modeloutage
- alarminfo
- alarmactivity
- spmbasictestresults
- spmhttpfulltestresults
- spmjittertestresults

Event Tables are also considered as major volume drivers in the reporting database. You can configure the data retention period that is available for Event Tables and can improve the database performance.

The following diagram illustrates the process to manually purge reporting data from the reporting database:

How to Manually Purge Reporting Data from the Reporting Database



Perform the following tasks to manually purge reporting data:

1. Back Up the Necessary Files
2. Verify the Table Size and Expected Purge Results
   - Verify the Database Table Size
   - Check the Data Affected by a Manual Purge
   - Determine the Reclaimed Space
3. Purge the Reporting Data

Back Up the Necessary Files

Back up the database or at least the tables that are affected before purging data from the existing database. MySQL database tables are stored as a set of files. You can back up the database using the following methods:

- Use the mysqldump utility, as described in Back Up DX NetOps Spectrum Reporting and Archive Data.
- Create backup copies of selected files, as described in the following procedure.

Follow these steps:

1. Stop the DX NetOps Spectrum Tomcat service.
2. Stop the DX NetOps Spectrum MYSQL Database Server.
3. Stop the Archive Manager if it is running on this server.
4. Perform one of the following steps to copy the necessary files:
   - To back up the entire reporting database, copy the <*$SPECROOT*>/mysql/data/reporting directory to a newly named directory (for example, reporting_backup) within the <*$SPECROOT*>/mysql/data directory.

NOTE
By creating the backup directory in this location you can easily switch between the reporting database and the reporting_backup database within the MySQL console window.

- To back up only those tables that are purged, copy the following files from the <*$SPECROOT*>/mysql/data/reporting directory to a newly named directory (for example, reporting_backup) within the <*$SPECROOT*>/mysql/data directory:

```
alarmactivity.*
alarminfo.*
modeloutage.*
```

- If you use SPM, copy the following files too:

```
spmbasictestresults.*
spmhttpfulltestresults.*
spmjittertestresults.*
```

NOTE
Typically, MySQL creates three different file types for each database table: .frm, .MYD, and .MYI. Copy all the three files. If these files are copied, renamed and stored within the reporting directory, then MySQL treats them as additional database tables.

5. Restart the DX NetOps Spectrum MySQL Database Server service.
   The file backup is complete.

Verify the Table Size and Expected Purge Results

You can evaluate the amount of data that is affected before you start purging the data. You can use a few SQL commands to examine the current volume and capacity of the tables.

WARNING
In the SQL sample syntax that we have provided, a value of "2007-04-01" (April 1st, 2007) is used as an example cutoff date. This sample syntax indicates that records that are created before this date are deleted. Substitute an appropriate date. However, once you have selected a date, use the same date across all tables to maintain the data integrity.

Take the following steps to verify the table size and expected purge results:

1. Verify the Database Table Size
2. Check the Data Affected by a Manual Purge
3. Determine the Reclaimed Space

Verify the Database Table Size

You can use the SHOW TABLE STATUS command to verify the size of a database table.

Follow these steps:

1. Open a command prompt, and execute the following command in <*$SPECROOT*>/mysql/bin:

```
mysql -uroot -proot reporting
```

2. At the mysql> prompt, execute the following SQL commands:

```
SHOW TABLE STATUS LIKE "modeloutage";
SHOW TABLE STATUS LIKE "alarminfo";
SHOW TABLE STATUS LIKE "alarmactivity";
```

   Table statistics appear.
3. Verify the following fields:

- rows - the total number of rows
- avg_row_length - average length (in bytes) of each row
- data_length - current size (in bytes) of the table
- max_data_length - maximum size (in bytes) that the table can grow to

4. If you are using SPM, execute the following commands:

```
SHOW TABLE STATUS LIKE "spmbasictestresults";
SHOW TABLE STATUS LIKE "spmjittertestresults";
SHOW TABLE STATUS LIKE "spmhttpfulltestresults";
```

Table size verification is complete.

Check the Data Affected by a Manual Purge

You can use the SELECT COUNT(*) command to find the number of rows that are affected by the data purge.

Follow these steps:

1. At the mysql> prompt, execute the following SQL commands:

```
SELECT COUNT(*) FROM modeloutage
WHERE end_time < "2007-04-01" AND outage_type > 0;
SELECT COUNT(*) FROM alarminfo
WHERE clear_time < "2007-04-01";
SELECT COUNT(*) FROM alarminfo, alarmactivity
WHERE alarminfo.alarm_key = alarmactivity.alarm_key
AND alarminfo.clear_time < "2007-04-01";
```

2. If you are using SPM, run the following commands:

```
SELECT COUNT(*) FROM spmbasictestresults
WHERE timestamp < "2007-04-01";
SELECT COUNT(*) FROM spmjittertestresults
WHERE timestamp < "2007-04-01";
SELECT COUNT(*) FROM spmhttpfulltestresults
WHERE timestamp < "2007-04-01";
```

The affected data identification is complete.

Determine the Reclaimed Space

You can use results from the SHOW TABLE STATUS and SELECT COUNT(*) statements in the previous procedures to find the amount of space that is freed after the purge.

Follow these steps:

1. Execute the following command to get the table size:

```
SHOW TABLE STATUS LIKE "modeloutage";
```

From the results, it is determined that the average row length (avg_row_length) is 121 bytes.

2. Execute the following command to find the number of rows that are affected:

```
SELECT COUNT(*) FROM modeloutage
WHERE end_time < "2007-04-01" AND outage_type > 0;
```

From the results, the count value is 4851.

3. Perform the following calculation to determine the amount of space that would be freed for this table:

```
Avg_row_length * (number of rows Affected) = freed space
121 bytes * 4851 = 586,971 bytes.
```

The amount of space reclaimed is determined.

NOTE
After you delete the data, you can optimize the table to reclaim unused space.

Purge the Reporting Data

A series of DELETE commands are used to delete data. After data is deleted, it is important to optimize the tables to reclaim unused space.

WARNING
In the SQL sample syntax that we have provided, a value of "2007-04-01" (April 1st, 2007) is used as an example cutoff date. This sample syntax indicates that records that are created before this date are deleted. Substitute an appropriate date. However, once you have selected a date, use the same date across all tables to maintain the data integrity.

Follow these steps:

WARNING
The order in which the data is deleted must be strictly followed to avoid database corruption.

1. At the mysql> prompt, enter the following SQL commands:
```
DELETE FROM modeloutage
  WHERE end_time < "2007-04-01" AND outage_type > 0;
DELETE alarmactivity FROM alarmactivity, alarminfo
  WHERE alarminfo.alarm_key = alarmactivity.alarm_key
  AND alarminfo.clear_time < "2007-04-01";
DELETE FROM alarminfo
  WHERE alarminfo.clear_time < "2007-04-01";
```
NOTE
Execution time of these commands depends on the number of records that are effected.
2. If you are using SPM, run the following commands:
```
DELETE FROM spmbasictestresults
  WHERE timestamp < "2007-04-01";
DELETE FROM spmjittertestresults
  WHERE timestamp < "2007-04-01";
DELETE FROM FROM spmhttpfulltestresults
  WHERE timestamp < "2007-04-01";
```
3. After the data is deleted, enter the following command to reclaim unused space:
```
OPTIMIZE TABLE modeloutage, alarmactivity, alarminfo;
```
NOTE
Execution time of this command depends on the size of the tables.
4. If you are using SPM, run the following command:
```
OPTIMIZE TABLE spmbasictestresults, spmjittertestresults,
  spmhttpfulltestresults;
```
5. (optional) Run the following commands to verify space savings:
```
SHOW TABLE STATUS LIKE "modeloutage";
SHOW TABLE STATUS LIKE "alarminfo";
SHOW TABLE STATUS LIKE "alarmactivity";
```
6. (optional) If you are using SPM, run the following commands:
```
SHOW TABLE STATUS LIKE "spmbasictestresults";
SHOW TABLE STATUS LIKE "spmjittertestresults";
SHOW TABLE STATUS LIKE "spmhttpfulltestresults";
```
7. Restart Spectrum Tomcat service and Archive Manager (if previously stopped on this server).

Data purging is complete.

Reporting Database Management

Spectrum Report Manager uses a MySQL database named reporting to store data. As with any database, you can maintain this database to help it function efficiently. This section describes utilities and procedures that you can use to manage the reporting database.

Initialize the Database for Specific Landscapes

This section describes a utility that you can use to optimize and initialize the database for a specific landscape. Perform several actions before initializing the database.

Follow these steps:

1. Navigate to the /spectrum/bin directory.
2. Use the following default MySQL administrator login credentials:
   username:root
   password:root

   NOTE
   Use a bash shell or command prompt to run the utility. Do not run it from a MySQL prompt.
3. Run the following command-line utility to remove all data for one or more or all landscapes from the reporting database:

   ```
   RpmgrInitializeLandscape
   RpmgrInitializeLandscape username password
   -skipInitialHistory -initHist # of days -all
   ```

   – **Usage:**

   ```
   landscape1 landscape2 ...
   ```

   – **Definitions:**
   – **- skipInitialHistory**
   Spectrum Report Manager does not retrieve or store events during event processing that have occurred before the utility is run. This flag overrides -initHist *# of days* if it is also included in the command line.
   – **- initHist # *of days***
   Spectrum Report Manager processes initial historical events from the past number of days that are specified before the utility is run.
   – **- all**
   Spectrum Report Manager removes data for all landscapes in the reporting database.
   – ***landscape1 landscapeN***
   Spectrum Report Manager removes data for each specified landscape.

Back Up DX NetOps Spectrum Reporting and Archive Data

Backing up reporting and archive data lets you maintain the reporting continuity. If you lose data (for example, during an upgrade installation), you can recover the data by restoring the backups.

Procedure for Windows

Follow these steps:

1. Select Control Panel, Administrative Tools, Services, and then Spectrum Tomcat.
   The Spectrum Tomcat Properties dialog opens.
2. Click Stop to stop Tomcat.

3. Navigate to the *$SPECROOT*/mysql/bin directory.
4. Using the mysqldump utility, back up the reporting and archive databases using this command:
   ```
   mysqldump --routines --databases -uroot -proot reporting archive > backup_filename.sql
   ```
5. Start Tomcat.

Procedure for Linux

Follow these steps:

1. Stop Tomcat.
   ```
   $SPECROOT/tomcat/bin/stopTomcat.sh
   ```
2. Navigate to the *$SPECROOT*/mysql/bin directory.
3. Using the mysqldump utility, back up the reporting and archive databases using this command:
   ```
   mysqldump --defaults-file=../my-spectrum.cnf -uroot -proot --routines --database reporting archive >
    backup_filename.sql
   ```
4. Start Tomcat.
   ```
   $SPECROOT/tomcat/bin/startTomcat.sh
   ```
   The reporting and archive data backup is complete.

Restore DX NetOps Spectrum Reporting and Archive Data

You can restore the reporting and archive data from a backup copy. Stop Tomcat before restoring the data from a backup copy.

Procedure for Windows

Follow these steps:

1. To stop Tomcat, select Control Panel, Administrative Tools, Services, Spectrum Tomcat, and click Stop in the Spectrum Tomcat Properties box.
2. Navigate to the *$SPECROOT*/mysql/bin directory.
3. Load the reporting and archive data from a backup copy using this command:
   ```
   mysql -uroot  - p root_pw reporting < backup_filename.sql
   ```
4. Start Tomcat.

Procedure for Linux

Follow these steps:

1. Stop Tomcat.
   ```
   $SPECROOT/tomcat/bin/stopTomcat.sh
   ```
2. Navigate to the *$SPECROOT*/mysql/bin directory.
3. Load the reporting and archive data from a backup copy using this command:
   ```
   mysql --defaults-file=../my-spectrum.cnf -uroot  - p root_pw reporting < backup_filename.sql
   ```
4. Start Tomcat.
   ```
   $SPECROOT/tomcat/bin/startTomcat.sh
   ```
   The reporting and archive data is restored from a backup copy.

   NOTE
   The mysql restore commands (for Windows or Linux) restore both reporting and archive data even though only reporting database name is mentioned in these commands. The reason is that the backup of both the databases is taken to same file.

Reconcile DX NetOps Spectrum Report Data

The reporting database needs to be re-initialized whenever the SpectroSERVER Database is restored.

The reporting data re-initialization process flushes the historical data and re-polls the SRM data from the beginning (available in the archive manager), which may cause some data loss, and it also consumes time to re-poll.

To avoid the re-initialization, run the reconcile_reporting_db script. The reconcile_reporting_db script reads the SSdbLoadTime (ID: 0x13373) attribute on VNM model of the domain, which specifies the SSDB save time. The script cleans the reporting data (related to devices/models), which is discovered after the SSDB save time. It helps to avoid duplication of data when the devices are re-discovered in SSDB.

Following is the tool to clean Report Manager database after loading historical SSDB:

```
bash-3.2$ ./reconcile_reporting_db.sh -h
```

Script usage:

```
reconcile_reporting_db.sh -s <server> -p <port> -u <user> -w <password> -l <landscape name> [-n <No Of Days
 From Now>] [-d] [-h]
```

Where:

-s <server name>
OneClick Tomcat Server Host name
-p <port>
OneClick Tomcat Server Web port
-u <user>
OneClick Web User name
-w <password>
OneClick Web User password
-l <landscape name>
Landscape name to poll
-n <No Of Days>
(Optional) Number of days from now. (Use when the 'SSdbLoadTime' parameter is not available on the VNM model)
-d
(Optional) Enables debugging
-h
(Optional) Prints the usage help

Report Manager Utility Scripts

The Spectrum Report Manager utility scripts are used to perform a specific task in the reporting database. For example, the backup utility gathers information that is specific to a landscape and dumps it into another database schema. Each database backup has an entry that is stored in its MySQL table for later reference.

The recovery utility initializes the landscape (using RpmgrInitializeLandscape) and copies all the table entries from the backup database into the current database.

> **NOTE**
> We recommend performing these operations when Tomcat is offline to avoid populating tables in the reporting database.

> **NOTE**
> The following Spectrum Report Manager utility scripts are commonly used in the reporting database:

BackupReportingDBLandscape

The BackupReportingDBLandscape utility script captures a landscape data to a backup database. Use the following format to execute this command:

```
BackupReportingDBLandscape user password domain name [description]
```

user

Indicates MySQL username.

- **password**
  Indicates MySQL password.
- **domain name**
  Indicates the SpectroSERVER domain name.
- **description**
  Describes the backup comments.

DisplayReportingDBBackups

The DisplayReportingDBBackups script displays the backups that exist on the system. You can use this script, if you are removing backups by database name from CLI.

Use the following format to execute this command:

```
DisplayReportingDBBackups mysql user password domain name
```

mysql user

Indicates MySQL username.

- **password**
  Indicates MySQL password.
- **domain name**
  Indicates the SpectroSERVER domain name.

exemptOutagesForDay

The ExemptOutagesForDay script converts unplanned outages to exempt outages when the outages coincide with an exemption period (for example, a bank Holiday).

Use the following format to execute this command:

```
exemptOutagesForDay mysql username mysql password exempt service outages [-undo YYYY-MM-DD] YYYY-MM-DD day
```

mysql username

Indicates MySQL username.

- **mysql password**
  Indicates MySQL password.
- **exempt service outages**
  Exempts the service outages.

Example:

```
exemptOutagesForDay user pass yes 2010-01-01 New Year\'s Day
```

RecoverReportingDBLandscape

The RecoverReportingDBLandscape script recovers a single landscape in the reporting database from a backup database.

Use the following format to execute this command:

```
RecoverReportingDBLandscape user password backup database name
```

user

Indicates MySQL username.

- **password**
  Indicates MySQL password.
- **backup database name**
  Indicates the name of the backup database.

RemoveReportingDBBackups

The RemoveReportingDBBackups script removes a backup database that is created for a landscape in Spectrum Report Manager. Use the following format to execute this command:

```
RemoveReportingDBBackups user password backup database name
```

user

Indicates MySQL username.

- **password**
  Indicates MySQL password.
- **backup database name**
  Indicates the name of the backup database.

Appendix A. DX NetOps Spectrum Events Used by Report Manager

This appendix lists DX NetOps Spectrum events that Spectrum Report Manager uses to start and stop calculating outage time for devices and interfaces. It also lists Service Performance Manager events.

Outage Events

This section lists events that mark the beginning and end of either a planned or unplanned model outage.

DOWN events indicate that an unplanned outage has begun.

- CONTACT LOST (0x10302)
- PORT BAD (0x10d11)
- PORT DISABLED (0x10d12)
- PORT UNREACHABLE (0x10d14)
- PORT LOWER LAYER DOWN (0x10d16)
- PORT CONNECTED TO DOWN PORT OR DEVICE (0x10d18)
- PORT BAD BUT CONNECTED TO WALINK EVENT (0x10d2d)
- PORT LOST (0x10d66)
- APPLICATION LOST (0x10d09)
- DEVICE UNRESPONSIVE (0x10d35)

UP events indicate that an unplanned outage has ended.

- CONTACT ESTABLISHED (0x10301)
- PORT GOOD (0x10d10)
- PORT REACTIVATED (0x10d66)
- PORT UP BUT LINKED WITH DOWN PORT (0x10d17)
- APPLICATION REACTIVATED (0x10d0b)
- DEVICE RESPONSIVE EVENT (0x10d30)

IN MAINT MODE events indicate that a planned outage has begun. If a model is in an unplanned outage state when the model enters maintenance mode, the unplanned outage ends immediately.

- DEVICE INTO HIBERNATE (0x10226)
- DEVICE INTO MAINTENANCE (0x10222)
- PORT INTO MAINTENANCE (0x10224)

OUT OF MAINT MODE events indicate that a planned outage has ended.

- DEVICE OUT OF HIBERNATE (0x10227)
- DEVICE OUT OF MAINTENANCE (0x10223)
- PORT OUT OF MAINTENANCE (0x10225)

Additional events that are of interest to Availability reporting:

- VNM STARTED (0x10101)
- VNM STOPPED (0x10102)
- MODEL DESTROYED (0x10202)

The following list of events is used for the calculation of availability reports for Clusters. Standard events that are mentioned earlier are ignored if Cluster availability events exist.

List of UP and DOWN events for Microsoft (MS) Clusters:

MS Clusters

UP event

- CONTACT_LOST_EVENT (0x10302)
- DEVICE_UNRESPONSIVE (0x10d35)

DOWN event

- CONTACT_ESTABLISHED_EVENT (0x10301)
- DEVICE_RESPONSIVE (0x10d30)

MS Node

UP event

- MSCS_NODE_STATE_UNKNOWN_EVENT (0x0621002b)

DOWN event

- MSCS_NODE_STATE_UP_EVENT (0x06210029)
- MSCS_NODE_STATE_DOWN_EVENT (0x0621002a)

MS Resource Group

UP event

- MSCS_RESOURCE_GROUP_STATE_ONLINE_EVENT (0x0621002e)

DOWN event

- MSCS_RESOURCE_GROUP_STATE_OFFLINE_EVENT (0x0621002f)
- MSCS_RESOURCE_GROUP_STATE_FAILED_EVENT (0x06210030)
- MSCS_RESOURCE_GROUP_STATE_UNKNOWN_EVENT (0x0621002d)

MS Resources

UP event

- MSCS_RESOURCE_STATE_ONLINE_EVENT (0x06210034)

DOWN event

- MSCS_RESOURCE_STATE_UNKNOWN_EVENT (0x06210033)
- MSCS_RESOURCE_STATE_OFFLINE_EVENT (0x06210035)
- MSCS_RESOURCE_STATE_FAILED_EVENT (0x06210036)

List of UP and Down events for IBM clusters:

IBM Cluster

UP event

- IBM_CLUSTER_STATE_UP_EVENT (0x06210014)

DOWN event

- IBM_CLUSTER_STATE_DOWN_EVENT (0x06210015)
- IBM_CLUSTER_STATE_UNKNOWN_EVENT (0x06210016)
- IBM_CLUSTER_STATE_NOTCONFIGURED_EVENT (0x06210017)

IBM Node

UP event

- IBM_NODE_STATE_UP_EVENT (0x0621001a)

DOWN event

- IBM_NODE_STATE_DOWN_EVENT (0x0621001b)
- IBM_NODE_STATE_UNKNOWN_EVENT (0x0621001c)

IBM Resource Group

UP event

- IBM_RESOURCE_GROUP_STATE_ONLINE_EVENT (0x0621001e)

DOWN event

- IBM_RESOURCE_GROUP_STATE_OFFLINE_EVENT (0x0621001f)
- IBM_RESOURCE_GROUP_STATE_UNKNOWN_EVENT (0x06210020)
- IBM_RESOURCE_GROUP_STATE_ERROR_EVENT (0x06210021)

> **NOTE**
> For IBM Resources, events are not defined by IBM.

Alarm Events

ALARM events are events that affect alarms.

- ALARM SET(0x10701)
- ALARM CLEARED (0x10702)
- USER CLEARED ALARM (0x10706)
- ALARM UPDATED (0x10707)
- SECONDARY ALARM SET EVENT (0x10714)
- SECONDARY ALARM CLEAR EVENT (0x10715)

Additional events that are of interest to Alarm reporting:

- VNM STARTED (0x10101)
- VNM STOPPED (0x10102)
- MODEL DESTROYED (0x10202)

Model Name Changes

Model name change events are used to update and track name changes for DX NetOps Spectrum models:

- MODEL NAME CHANGE (0x1a100)

Appendix B. DX NetOps Spectrum Reporting Application Model Events and Alarms

This appendix describes the events and alarms that you can monitor from the DX NetOps Spectrum Reporting Application model.

Application Events

DX NetOps Spectrum Reporting generates the following events on the DX NetOps Spectrum Reporting Application model:

- Spectrum Report Manager is not monitoring any landscapes.
  Asserts alarm - Spectrum Report Manager: NO LANDSCAPES MONITORED
- Landscape X has been added to Spectrum Report Manager list of monitored landscapes.
  Clears alarm- Spectrum Report Manager: NO LANDSCAPES MONITORED
- Landscape X has been removed from the Spectrum Report Manager list of monitored landscapes.
  Clears alarms- Spectrum Report Manager: LANDSCAPE CONTACT LOST and Spectrum Report Manager: ARCHIVE MANAGER CONTACT LOST
- Spectrum Report Manager has lost contact with the X landscape.
  Asserts alarm - Spectrum Report Manager: LANDSCAPE CONTACT LOST
- Spectrum Report Manager has regained contact with the X landscape.
  Clears alarm - Spectrum Report Manager: LANDSCAPE CONTACT LOST
- Spectrum Report Manager has lost contact with the X Archive Manager.
  Asserts alarm - Spectrum Report Manager: ARCHIVE MANAGER CONTACT LOST
- Spectrum Report Manager has regained contact with the X archive manager.
  Clears alarm - Spectrum Report Manager: ARCHIVE MANAGER CONTACT LOST
- Spectrum Report Manager has encountered an error while processing events. (for more information, see the *OneClick log file*)
  Asserts alarm - Spectrum Report Manager: EVENT PROCESSING FAILURE
- The Spectrum Report Manager server is stopping. Alarms that are based on landscape {S 1} are cleared and reasserted at startup, if needed.
  Clears alarms - Spectrum Report Manager: LANDSCAPE CONTACT LOST and Spectrum Report Manager: ARCHIVE MANAGER CONTACT LOST for each landscape that SRM is monitoring.
- The Spectrum Report Manager server is stopping. Event processing failure alarms are cleared and reasserted at startup, if needed.
  Clears alarm - Spectrum Report Manager: EVENT PROCESSING FAILURE

Application Alarms

DX NetOps Spectrum Reporting generates the following alarms from DX NetOps Spectrum Reporting Application model events:

- Spectrum Report Manager: NO LANDSCAPES MONITORED, Alarm Severity - Yellow
- Spectrum Report Manager: LANDSCAPE CONTACT LOST, Alarm Severity - Orange
- Spectrum Report Manager: ARCHIVE MANAGER CONTACT LOST, Alarm Severity - Orange
- Spectrum Report Manager: EVENT PROCESSING FAILURE, Alarm Severity - Red

Appendix C. DX NetOps Spectrum Attributes Used by Spectrum Reporting

This appendix lists DX NetOps Spectrum attributed that DX NetOps Spectrum Reporting uses in Asset, Availability, and Change Management reports. DX NetOps Spectrum Reporting polls DX NetOps Spectrum for these attribute values every 24 hours.

Device Attributes

0x1006e: MODEL_NAME_ATTR_ID

0x11ee8: MODEL_CLASS_ATTR_ID

0x11b41: CREATE_TIME_ATTR_ID

0x11026: MODEL_CREATOR_ATTR_ID

0x10001: MODEL_TYPE_ATTR_ID

0x10009: SECURITY_STRING_ATTR_ID

0x1027f: IP_ATTR_ID

0x110df: MAC_ATTR_ID

0x10030: SERIAL_NUMBER_ATTR_ID

0x10052: SYS_DESC_ATTR_ID

0x10053: SYS_OID_ATTR_ID

0x1102e: LOCATION_ATTR_ID

0x10b5a: CONTACT_PERSON_ATTR_ID

0x10245: SYS_UPTIME_ATTR_ID

0x23000e: DEVICE_TYPE

0x110ed:CONTACT_STATUS_ID

0x12a6d:NRM_LINE_CARD_DATA_ATTR_ID

Interface Attributes

0x1006e: MODEL_NAME_ATTR_ID

0x11ee8: MODEL_CLASS_ATTR_ID

0x11b41: CREATE_TIME_ATTR_ID

0x10001: MODEL_TYPE_ATTR_ID

0x10009: SECURITY_STRING_ATTR_ID

0x129ed: PORT_TYPE_ATTR_ID

0x129e0: PORT_DESC_ATTR_ID

0x11ee3: IF_SPEED_ATTR_ID

0x1027f: IP_ATTR_ID

0x10e43: PORT_IP_ATTR_ID

0x110df: MAC_ATTR_ID

0x10f1b: PORT_LINK_STATUS

0x12980: IF_LAST_CHANGE_ATTR_ID

0x10e41: IF_IN_OCTETS_ATTR_ID

0x11f82: IF_ALIAS

0x1006a: COMPONENT_OID

0x10000: MODEL_TYPE_NAME_ATTR_ID

User Defined Attributes

0x12bfb: USER_AssetTag

0x12bfc: USER_AssetID

0x12bfd: USER_AssetOwner

0x12bfe: USER_AssetOrganization

0x12bff: USER_AssetOffice

0x12c00: USER_AssetContractNumber

0x12c01: USER_AssetContractStartDate

0x12c02: USER_AssetContractEndDate

0x12c03: USER_AssetDescription

Appendix D. DX NetOps Spectrum Report Manager Database API (SRMDBAPI)

The DX NetOps Spectrum Spectrum Report Manager Database API (SRMDBAPI) provides a fully documented set of read-only database objects to support your custom data analysis requirements. Specifically, the SRMDBAPI consists of a set of database views that are contained within a dedicated multidimensional schema in the MySQL instance that is used by Spectrum Report Manager.

The SRMDBAPI contains the following basic content areas:

- Asset
- Alarm
- Outage/Availability
- Event

The following add-ons are part of the SRMDBAPI but require additional license purchase for usage:

- SPM
- NCM

> **NOTE**
> The SRMDBAPI is a read-only API. Data modification is not supported.

Design Methodology

The SRMDBAPI has been implemented using a multidimensional modeling approach. The multidimensional model is selected due to its inherently flexible design. This model is not driven by the requirements of a specific report or set of reports. Rather, the multidimensional schema is optimized for the analysis of facts (for example, event, outage) across any number of related dimensions (for example, model, time). The multidimensional model is ideally suited for reports. However, this particular schema design does not preclude you in extracting data from the supplied views into other repositories.

How to Establish Remote Access

At installation, the SRMDBAPI database objects are available to a pre-established 'srmapi' MySQL database user. If more user(s) require access to the dedicated API schema, you can establish them manually.

For more information, see How to Create Additional SRMDBAPI Users

> **NOTE**
> If you are connecting from a remote server using the 'srmapi' database user, additional grants need to be performed.

Follow these steps:

1. On the Spectrum Report Manager server, log in to mysql as 'root'.
2. To provide remote access to the ‘srmapi’ database user, issue the following grants:

```
mysql>GRANT SELECT, EXECUTE ON srmdbapi.* TO 'srmapi'@'%';
mysql>GRANT SELECT ON reporting.* TO 'srmapi'@'%';
mysql>FLUSH PRIVILEGES;
```

3. Logout of mysql.
   Remote Access is established.

Example Use Cases

The SRMDBAPI feature is enabled to provide access to mission critical Spectrum Report Manager data. We published our SRMDBAPI to point your Business Intelligence (BI) tools to valuable DX NetOps Spectrum data. Some of the possible use cases are as follows:

- Query this critical data using the BI tool in which your company has already invested.
- Extract the Spectrum Report Manager data and place it within another data repository.
- Incorporate Spectrum Report Manager data into a separate CMDB or financial database.

Inventory of SRMDBAPI Views

Each view that is contained in the SRMDBAPI includes the data type and description.

> **NOTE**
> For the Key column, the following legend applies:

UNQ - unique

PK - primary key

- FK - foreign key

The following views are presented:

- v_dim_alarm_condition
- v_dim_alarm_title
- v_dim_alarm_user
- v_dim_device_model
- v_dim_device_module
- v_dim_event
- v_dim_event_creator
- v_dim_global_collection_member
- v_dim_interface_model
- v_dim_landscape
- v_dim_model
- v_dim_ncm_event
- v_dim_spm_test
- v_dim_time
- v_fact_alarm_activity
- v_fact_alarm_info
- v_fact_event
- v_fact_model_outage
- v_fact_spm_basic_test_results
- v_fact_spm_http_full_test_results
- v_fact_spm_jitter_test_results

v_dim_alarm_condition

This view enumerates the various alarm conditions (for example, Minor, Major) and associated criticality values.

Field	Key	Type	Length	Description
condition_id	PK	int(unsigned)	10	Internal ID/Key that uniquely identifies a record in this view
condition_name		varchar	11	Condition Name
criticality	UNQ	tinyint	2	Criticality (1=Maintenance, 2=Minor, 3=Major, 4=Critical)

v_dim_alarm_title

This view enumerates the various alarm titles and associated probable causes that have occurred in the reporting database.

Field	Key	Type	Length	Description
alarm_title_id	PK	int(unsigned)	10	Internal ID/Key that uniquely identifies a record in this view
alarm_title		varchar	255	Alarm Title
pcause_id_hex		varchar	24	Probable Cause Code (hexadecimal form)

pcause_id_dec		int(unsigned)	10	Probable Cause Code (decimal form)
pcause_title		varchar	100	Probable Cause Title

v_dim_alarm_user

This view enumerates the various usernames that are associated with alarm activity captured in the reporting database.

Field	Key	Type	Length	Description
alarm_user_key	PK	int(unsigned)	10	Internal ID/Key that uniquely identifies a record in this view
alarm_user_name	UNQ	char	255	Username

v_dim_device_model

This view enumerates all devices (active and destroyed) that are captured historically in the reporting database.

Field	Key	Type	Length	Description
model_key	PK	int(unsigned)	10	Internal ID/Key that uniquely identifies a record in this view
model_h_dec		int(unsigned)	10	Model handle (decimal form)
model_h_hex		varchar	24	Model handle (hexadecimal form)
landscape_h_dec	FK	int(unsigned)	10	Landscape handle (decimal form); join to v_dim_landscape for additional landscape information.
landscape_h_hex		varchar	24	Landscape handle (hexadecimal form)
model_name		varchar	4000	Device Name
create_time		datetime		Creation Time
model_creator		varchar	255	Model Creator
security_string		varchar	255	Security String
destroy_time		datetime		Destroy Time
device_type		varchar	255	Device Type
ip		varchar	255	Network Address
mac		varchar	32	MAC Address
serial_nbr		varchar	255	Serial Number
sys_desc		varchar	255	System Descriptor
fw_rev		varchar	255	Firmware Version
sys_oid		varchar	255	System Object ID
location		varchar	255	Location

contact_person		varchar	255	Contact Person
last_reboot		datetime		Last reboot time
last_reboot_text		varchar	19	Last reboot time (text form)
last_successful_poll		datetime		Last successful poll time
model_destroyer		varchar	255	Model Destroyer
cust_asset_tag		varchar	255	Asset Tag
cust_asset_id		varchar	255	Asset ID
cust_asset_owner		varchar	255	Asset Owner
cust_asset_organization		varchar	255	Asset Organization
cust_asset_office		varchar	255	Asset Office
cust_asset_contract number		varchar	255	Asset Contract Number
cust_asset_contract startdate		varchar	255	Asset Contract Start Date
cust_asset_contract enddate		varchar	255	Asset Contract End Date
cust_asset_description		varchar	255	Asset Description
sdm_host_address		varchar	255	SDM Host Address
mclass_name		varchar	32	Model Class Name
mtype_h_dec		int(unsigned)	10	Model Type Handle (decimal form)
mtype_h_hex		varchar	24	Model Type Handle (hexadecimal form)
mtype_name		varchar	128	Model Type
vendor_name		varchar	32	Vendor Name
topology_model_name_string		varchar	4000	Topology Model Name String; this field can be used to support container-based reporting capabilities.
varchar_1_attrid_hex		varchar	24	Custom Attribute ID (Varchar1)
varchar_2_attrid_hex		varchar	24	Custom Attribute ID (Varchar2)
varchar_3_attrid_hex		varchar	24	Custom Attribute ID (Varchar3)
varchar_4_attrid_hex		varchar	24	Custom Attribute ID (Varchar4)
integer_1_attrid_hex		varchar	24	Custom Attribute ID (Integer1)
integer_2_attrid_hex		varchar	24	Custom Attribute ID (Integer2)
integer_3_attrid_hex		varchar	24	Custom Attribute ID (Integer3)

integer_4_attrid_hex		varchar	24	Custom Attribute ID (Integer4)
datetime_1_attrid_hex		varchar	24	Custom Attribute ID (Datetime1)
datetime_2_attrid_hex		varchar	24	Custom Attribute ID (Datetime2)
varchar_1_label		varchar	255	Custom Attribute Label (Varchar1)
varchar_2_label		varchar	255	Custom Attribute Label (Varchar2)
varchar_3_label		varchar	255	Custom Attribute Label (Varchar3)
varchar_4_label		varchar	255	Custom Attribute Label (Varchar4)
integer_1_label		varchar	255	Custom Attribute Label (Integer1)
integer_2_label		varchar	255	Custom Attribute Label (Integer2)
integer_3_label		varchar	255	Custom Attribute Label (Integer3)
integer_4_label		varchar	255	Custom Attribute Label (Integer4)
datetime_1_label		varchar	255	Custom Attribute Label (Datetime1)
datetime_2_label		varchar	255	Custom Attribute Label (Datetime2)
varchar_1_value		varchar	4000	Custom Attribute Value (Varchar1)
varchar_2_value		varchar	4000	Custom Attribute Value (Varchar2)
varchar_3_value		varchar	4000	Custom Attribute Value (Varchar3)
varchar_4_value		varchar	4000	Custom Attribute Value (Varchar4)
integer_1_value		bigint	20	Custom Attribute Value (Integer1)
integer_2_value		bigint	20	Custom Attribute Value (Integer2)
integer_3_value		bigint	20	Custom Attribute Value (Integer3)
integer_4_value		bigint	20	Custom Attribute Value (Integer4)
datetime_1_value		datetime		Custom Attribute Value (Datetime1)
datetime_2_value		datetime		Custom Attribute Value (Datetime2)

v_dim_device_module

This view enumerates more information at the slot level for chassis-based devices.

Field	Key	Type	Length	Description
module_id	PK	int(unsigned)	10	Internal ID/Key that uniquely identifies a record in this view
model_key	FK	int(unsigned)	10	Model Key associated with the parent device recorded in v_dim_device_model view; use this field to join to v_dim_device_model for additional device information.
module_index		int	10	Module Index (Slot)
module_name		varchar	255	Module Name (Description)
serial_nbr		varchar	255	Serial Number
software_rev		varchar	255	Software Version

v_dim_event

This view enumerates all of the Event Types encountered while processing events for reporting purposes.

Field	Key	Type	Length	Description
type_dec	PK	int(unsigned)	10	Event Type (decimal form); this field also uniquely identifies a record in this view.
type_hex		varchar	24	Event Type (hexadecimal form)
title		varchar	255	Event Title

v_dim_event_creator

This view enumerates all the event creators that are encountered while processing events for reporting purposes.

Field	Key	Type	Length	Description
creator_id	PK	int(unsigned)	10	Internal ID/Key that uniquely identifies a record in this view
creator_name		varchar	255	Creator Name

v_dim_global_collection_member

This view enumerates all global collection members in the reporting database. You have a separate record for every global collection/model pairing.

Field	Key	Type	Length	Description
gc_rec_ID	PK	int(unsigned)	10	Internal ID/Key that uniquely identifies a record in this view
gc_name		varchar	255	Global Collection Name
model_key	FK	int(unsigned)	10	Foreign key that uniquely identifies a member model. This field can be used to join to v_dim_model, v_dim_device_model, or v_dim_interface_model for additional member model information.

v_dim_interface_model

This view enumerates all interfaces captured in the reporting database.

Field	Key	Type	Length	Description
model_key	PK	int(unsigned)	10	Internal ID/Key that uniquely identifies a record in this view
model_h_dec		int(unsigned)	10	Model handle (decimal form)
model_h_hex		varchar	24	Model handle (hexadecimal form)
landscape_h_dec	FK	int(unsigned)	10	Landscape handle (decimal form) associated with this model; this field can be used to join to v_dim_landscape for additional landscape information.
landscape_h_hex		varchar	24	Landscape handle (hexadecimal form)
model_name		varchar	4000	Interface Name
create_time		datetime		Creation Time
security_string		varchar	255	Security String
destroy_time		datetime		Destroy Time
port_type		varchar	255	Port Type
port_desc		varchar	255	Port Description (raw value)
port_desc_text		longtext		Port Description (transformed value)
if_speed		Bigint (unsigned)	20	interface speed in Bytes/sec
ip		varchar	255	Network Address
mac		varchar	32	MAC Address
port_link_status		int(unsigned)	10	Port Link Status (raw value)
port_link_status_text		varchar	32	Port Link Status (transformed value)

iflastchange		bigint (unsigned)	20	Last Change
ifinoctets		bigint (unsigned)	20	If In Octets
Datelastsignificant traffic		datetime		Date Last Significant Traffic
hours_idle		bigint	21	Hours Idle
days_idle		bigint	21	Days Idle
ifalias		varchar	4000	If Alias
component_oid		varchar	255	Component OID
device_model_key	FK	int(unsigned)	10	Foreign Key that uniquely identifies the parent device for this interface. Use this field to join to v_dim_device_model.model_key for additional, parent device information.
device_model_name		varchar	4000	Parent Device Name
port_status		varchar	32	Port Status
mclass_name		varchar	32	Model Class
mtype_h_dec		int(unsigned)	10	Model Type Handle (decimal form)
mtype_h_hex		varchar	24	Model Type Handle (hexadecimal form)
mtype_name		varchar	128	Model Type
connected_model_h_dec	FK	int(unsigned)	10	Model Handle of Connected Device (decimal form); this will be NULL if no device is connected. Use this field to join to v_dim_device_model.model_h for additional connected device information.
connected_model_h_hex		varchar	24	Model Handle of Connected Device (hexadecimal form); this will be NULL if no device is connected.
is_connected		int	1	1 indicates that there is a connected device, 0 indicates no connected device
duplex_status		varchar	255	Duplex Status

v_dim_landscape

This view enumerates all of the landscapes that have been encountered during processing reporting data.

Field	Key	Type	Length	Description
landscape_h_dec	PK	int(unsigned)	10	Landscape handle (decimal form)
landscape_h_hex		varchar	24	Landscape handle (hexadecimal form)
landscape_name		varchar	255	Landscape(Domain) Name

v_dim_model

This view enumerates all of the models that are encountered in the course of processing reporting data.

Field	Key	Type	Length	Description
model_key	PK	int(unsigned)	10	Internal ID/Key that uniquely identifies a record in this view
model_h_dec		int(unsigned)	10	Model handle (decimal form)
model_h_hex		varchar	24	Model handle (hexadecimal form)
model_name		varchar	4000	Model Name
network_address		varchar	255	Network Address
landscape_h_dec	FK	int(unsigned)	10	Landscape Handle (decimal form); join to v_dim_landscape for additional landscape information.
landscape_h_hex		varchar	24	Landscape Handle (hexadecimal form)
mclass_name		varchar	32	Model Class
mtype_h_dec		int(unsigned)	10	Model Type Handle (decimal form)
mtype_h_hex		varchar	24	Model Type Handle (hexadecimal form)
mtype_name		varchar	128	Model Type Name
security_string		varchar	255	Security String
destroy_time		datetime		Destroy Time (if applicable)

v_dim_ncm_event

This view enumerates all event codes that are associated with Network Configuration Management (NCM).

Field	Key	Type	Length	Description
type_dec	PK	int(unsigned)	10	Event Type (decimal form); this field also uniquely identifies a record in this view.
type_hex		varchar	22	Event Type (hexadecimal form)
title		varchar	255	Event Title

v_dim_spm_test

This view enumerates all the SPM Tests that are created in the course of processing.

Field	Key	Type	Length	Description
test_id	PK	int(unsigned)	11	Internal ID/Key that uniquely identifies a record in this view
test_name		varchar	64	SPM Test Name
model_key	FK	int(unsigned)	10	Internal Key that uniquely identifies the SPM Test Model in v_dim_model.
model_h_dec		int(unsigned)	10	Model Handle of the SPM Test Model (decimal form)
model_h_hex		varchar	24	Model Handle of the SPM Test Model (hexadecimal form)
model_name		varchar	255	Model Name of the SPM Test Model
source_address		varchar	64	Source Address
dest_address		varchar	255	Destination Address
port		mediumint (unsigned)	8	Port
lookup_string		varchar	255	Lookup String
filename		varchar	255	Filename
packet_size		int	10	Packet Size
test_host_position		tinyint (unsigned)	3	Test Host Position
username		varchar	64	Username
proxy		varchar	255	Proxy
tos		int(unsigned)	10	Type of Service
alt_packet_addr		varchar	64	Alternate Packet Address
alt_packet_port		mediumint (unsigned)	8	Alternate Packet Port
landscape_h_dec	FK	int(unsigned)	10	Landscape Handle (decimal form); join to v_dim_landscape for additional landscape information.
landscape_h_hex		varchar	24	Landscape Handle (hexadecimal form)
effective_start		datetime		Effective start time of the test
effective_end		datetime		Effective end time of the test (if applicable)

v_dim_time

This view enumerates a separate record for every day in the calendar.

Field	Key	Type	Length	Description
time_id	PK	int(unsigned)	10	Internal ID/Key that uniquely identifies a record in this view
calendar_date	UNQ	date		Calendar Date
day_name		varchar	9	Day Name (e.g. Wednesday)
day_number_in_week		tinyint (unsigned)	3	Day Number in Week (Sunday=1, Saturday=7)
day_number_in_month		tinyint (unsigned)	3	Day Number in Month
day_number_in_year		smallint (unsigned)	5	Day Number in Year
week_number_in_year		tinyint (unsigned)	3	Week Number in Year
month_name		varchar	9	Month Name (e.g. January)
month_number_in_year		tinyint (unsigned)	3	Month Number in Year (January = 1, December = 12)
year_number		smallint (unsigned)	5	Year Number
weekend_flag		char	1	Weekend Flag (Y, if Saturday or Sunday)
last_day_in_month_flag		char	1	Last Day in Month Flag (Y, if last day of month)

v_fact_alarm_activity

This view enumerates alarm activities (for example, sets, clears, acknowledgements) that are processed in reporting database.

Field	Key	Type	Length	Description
alarm_key		int(unsigned)	10	Internal ID/Key that uniquely identifies a record in this view
activity		int(unsigned)	10	Internal Code used to identify various activities (1=Set, 2=Ack, 3=Assigned By, 33=Assigned To, 4 or 5=Clear, 6=Ticketed)
activity_title		varchar	17	Activity Title (for example, Set, Acknowledged, and so on)
time		datetime		Time at which activity occurred

username_text		varchar	50	Username associated with activity
set_count		int	1	Set Count
ack_count		int	1	Acknowledgment Count
assign_by_count		int	1	Assign By Count
assign_to_count		int	1	Assign To Count
clear_count		int	1	Clear Count
ticketed_count		int	1	Ticketed Count
data		char	255	Additional details

v_fact_alarm_info

This view enumerates a separate record for every alarm that is processed in reporting database.

Field	Key	Type	Length	Description
alarm_key	PK	int(unsigned)	11	Internal ID/Key that uniquely identifies a record in this view
landscape_h_dec	FK	int(unsigned)	10	Landscape Handle (Decimal Form); join to v_dim_landscape for additional landscape information.
landscape_h_hex		varchar	24	Landscape Handle (Hexadecimal Form)
orig_event_key	FK	bigint (unsigned)	20	Originating Event Key; join to v_fact_event.event_key to capture additional event details.
condition_id	FK	int	11	Condition ID; join to v_dim_alarm_condition for additional condition information.
cause_id		int(unsigned)	10	Cause ID
set_time		datetime		Set Time
clear_time		datetime		Clear Time (if applicable)
duration_seconds		bigint	21	Duration in Seconds
duration_label		varchar	24	Duration Label (HH:MM:SS)
clear_user_key	FK	int(unsigned)	10	Uniquely identifies user who cleared this alarm; join to v_dim_alarm_user.alarm_user_key for more information.
alarm_title_id	FK	int(unsigned)	10	Uniquely identifies an alarm title; join to v_dim_alarm_title for more information.
model_key	FK	int(unsigned)	10	Uniquely identifies the model associated with this alarm; join to v_dim_model for more information.
ack_time		datetime		Acknowledgment Time
time_to_ack_seconds		bigint	21	Time to Acknowledge (Seconds)
time_to_ack_duration_ label		varchar	23	Time to Acknowledge (HH:MM:SS)

ack_user_key	FK	int(unsigned)	10	Uniquely identifies the acknowledging user in v_dim_alarm_user; join to v_dim_alarm_user.alarm_user_key for more information.
first_assigned_time		datetime		Time at which alarm was first assigned
time_to_first_assign_ seconds		bigint	21	Difference in time between set time and time to first assignment (Seconds)
time_to_first_assign_ duration_label		varchar	23	Difference in time between set time and time to first assignment (HH:MM:SS)
first_assigned_user_key	FK	int(unsigned)	10	Uniquely identifies the first assigned user in v_dim_alarm_user; join to v_dim_alarm_user.alarm_user_key for more information.
first_assigning_user_ key	FK	int(unsigned)	10	Uniquely identifies the first assigning user in v_dim_alarm_user; join to v_dim_alarm_user.alarm_user_key for more information.
last_assigned_time		datetime		Time at which alarm was last assigned.
time_to_last_assign_ seconds		bigint	21	Difference in time between set time and time to last assignment (Seconds)
time_to_last_assign_ duration_label		varchar	23	Difference in time between set time and time to last assignment (HH:MM:SS)
last_assigned_user_key	FK	int(unsigned)	10	Uniquely identifies the last assigned user in v_dim_alarm_user; join to v_dim_alarm_user.alarm_user_key for more information.
last_assigning_user_key	FK	int(unsigned)	10	Uniquely identifies the last assigning user in v_dim_alarm_user; join to v_dim_alarm_user.alarm_user_key for more information.
set_troubleticket_time		datetime		Troubleticket Time
time_to_trouble_ticket_ seconds		bigint	21	Difference in time between set time and trouble ticket time (Seconds)
time_to_trouble_ticket_ duration_label		varchar	23	Difference in time between set time and trouble ticket time (HH:MM:SS)
set_troubleticket_user_ key	FK	int(unsigned)	10	Uniquely identifies the trouble ticket user in v_dim_alarm_user; join to v_dim_alarm_user.alarm_user_key for more information.
set_troubleticket_id		char	255	Trouble Ticket ID
assignment_duration_ seconds		bigint	21	Difference in time between last assigned time and clear time (Seconds)

assignment_duration_ label		varchar	24	Difference in time between last assigned time and clear time (HH:MM:SS)

v_fact_event

This view enumerates every event record that is processed in the reporting database.

Field	Key	Type	Length	Description
event_key	PK	bigint (unsigned)	20	Internal ID/Key that uniquely identifies a record in this view
landscape_h_dec	FK	int(unsigned)	10	Uniquely identifies a landscape associated with the model on which this event occurred (decimal form); join to v_dim_landscape for additional landscape information.
landscape_h_hex		varchar	24	Uniquely identifies a landscape associated with the model on which this event occurred (hexadecimal form)
model_key	FK	int(unsigned)	10	Uniquely identifies the model associated with this event; join to v_dim_model for more information.
time		datetime		Time at which event occurred.
type_dec	FK	int(unsigned)	10	Event Type (decimal form); join to v_dim_event for more information.
type_hex		varchar	24	Event Type (hexadecimal form)
creator_id	FK	int(unsigned)	10	Uniquely identifies the creator for this event; join to v_dim_creator for more information.
event_msg		text		Fully constituted event message associated with this event.

v_fact_model_outage

This view enumerates all outages that are processed in reporting database.

Field	Key	Type	Length	Description
model_outage_id	PK	bigint (unsigned)	20	Internal ID/Key that uniquely identifies a record in this view
model_key	FK	int(unsigned)	10	Uniquely identifies the model associated with this outage; join to v_dim_model for more information.
landscape_h_dec	FK	int(unsigned)	10	Uniquely identifies a landscape associated with the model on which this event occurred (decimal form)
landscape_h_hex		varchar	24	Uniquely identifies a landscape associated with the model on which this event occurred (hexadecimal form)
start_time		datetime		Start Time of Outage
end_time		datetime		End Time of Outage (if applicable)
duration_seconds		bigint	21	Outage Duration (seconds)
duration_label		varchar	24	Outage Duration (HH:MM:SS)
start_event_key	FK	bigint (unsigned)	20	Uniquely identifies the event that started this outage; join to v_fact_event on event_key for more information.
end_event_key	FK	bigint (unsigned)	20	Uniquely identifies the event that ended this outage; join to v_fact_event on event_key for more information.
notes		char	250	Outage Notes
outage_type		int(unsigned)	10	Outage Type (0=Initial, 1=Unplanned, 2=Planned, 3=Exempt)
outage_desc		varchar	NO	Outage Description

v_fact_spm_basic_test_results

This view enumerates test results for the following Service Performance Manager (SPM) test types: ICMP Ping, UDP, Path Echo, TCP, DNS Lookup, POP3, DHCP, FTP, SMTP, and HTTP (total time only).

Field	Key	Type	Length	Description
test_id	PK	int(unsigned)	11	Combination of Test ID and Timestamp uniquely identifies a record in this view. Timestamp corresponds with time at which result occurred.
timestamp	PK	datetime	11	Combination of Test ID and Timestamp uniquely identifies a record in this view. Timestamp corresponds with time at which result occurred.
time_id	FK	int(unsigned)	11	Uniquely identifies a day in v_dim_time; join to v_dim_time for more information.
hh		tinyint (unsigned)	3	Hours field of "timestamp" field.
mm		tinyint (unsigned)	3	Minutes field of "timestamp" field.
ss		tinyint (unsigned)	3	Seconds field of "timestamp" field.
latency		int(unsigned)	10	Latency in milliseconds
packet_loss		double	53,29	Packet Loss
timeout		tinyint	2	1=timeout occurred, 0=no timeout occurred

v_fact_spm_http_full_test_results

This view enumerates historical results that are associated with Service Performance Manager (SPM) HTTP tests.

Field	Key	Type	Length	Description
test_id	PK	int(unsigned)	11	Combination of Test ID and Timestamp uniquely identifies a record in this view. Timestamp corresponds with time at which result occurred.
timestamp	PK	datetime	11	Combination of Test ID and Timestamp uniquely identifies a record in this view. Timestamp corresponds with time at which result occurred.

time_id	FK	int(unsigned)	11	Uniquely identifies a day in v_dim_time; join to v_dim_time for more information.
hh		tinyint (unsigned)	3	Hours field of "timestamp" field.
mm		tinyint (unsigned)	3	Minutes field of "timestamp" field.
ss		tinyint (unsigned)	3	Seconds field of "timestamp" field.
http_response_time		int(unsigned)	10	Overall HTTP response time
dns_resolution_time		int(unsigned)	10	Portion of HTTP response time for DNS resolution
tcp_connect_time		int(unsigned)	10	Portion of HTTP response time for TCP connection
http_download_time		int(unsigned)	10	Portion of HTTP response time for HTTP Download
timeout		tinyint(2)	2	1=timeout occurred, 0=no timeout occurred

v_fact_spm_jitter_test_results

This view enumerates historical results that are associated with Service Performance Manager (SPM) Jitter tests.

Field	Key	Type	Length	Description
test_id	PK	int(unsigned)	11	Combination of Test ID and Timestamp uniquely identifies a record in this view. Timestamp corresponds with time at which result occurred.
timestamp	PK	datetime	11	Combination of Test ID and Timestamp uniquely identifies a record in this view. Timestamp corresponds with time at which result occurred.
time_id	FK	int(unsigned)	11	Uniquely identifies a day in v_dim_time; join to v_dim_time for more information.
hh		tinyint (unsigned)	4	Hours field of "timestamp" field.
mm		tinyint (unsigned)	4	Minutes field of "timestamp" field.
ss		tinyint (unsigned)	4	Seconds field of "timestamp" field.

response_time		int(unsigned)	10	Latency
src_to_dest_pl		double	53,29	Source to Destination Packet Loss
dest_to_src_pl		double	53,29	Destination to Source Packet Loss
mia		double	53,29	Missing in Action - Packet Loss with Unknown Direction
late_arrival		double	53,29	Late Arrival
busies		double	53,29	Busies
pos_src_to_dest_jitter		int(unsigned)	10	Positive Source to Destination Jitter
neg_src_to_dest_jitter		int(unsigned)	10	Negative Source to Destination Jitter
pos_dest_to_src_jitter		int(unsigned)	10	Positive Destination to Source Jitter
neg_dest_to_src_jitter		int(unsigned)	10	Negative Destination to Source Jitter
timeout		tinyint	2	1=timeout occurred, 0=no timeout occurred

How to Create Additional SRMDBAPI Users

Administration is not required if the 'srmapi' MySQL user is used to interact with the SRMDBAPI. However, if more accounts are required, you can establish them using the MySQL client application.

For example, you can create a user, srmdbapi_user, with a capability to read all view data from the SRMDBAPI.

Follow these steps:

1. On the SRM server, log in to mysql as 'root'.
2. Establish the new username and password combination in the MySQL database instance and access to both the srmdbapi and reporting schemas:

```
mysql>GRANT SELECT, EXECUTE ON srmdbapi.* TO 'srmdbapi_user'@'%' IDENTIFIED BY 'somepassword';
mysql>GRANT SELECT ON reporting.* TO 'srmdbapi_user'@'%';
mysql>FLUSH PRIVILEGES;
```

3. Logout of mysql.
   srmdbapi_user is created.

> **NOTE**
> The previous 'GRANT' statements lets 'srmdbapi_user' connect to the SRM server from the local or any remote server. The 'srmdbapi_user' only have read-only access to the 'srmdbapi' schema which represents the database implementation of the SRMDBAPI.

How to Access Views

The primary way to access the reporting data in the MySQL database is using the MySQL client. For more information, see http://dev.mysql.com.

For important login information, the user ID is 'srmdbapi' and the password is 'srmdbapi'.

Procedure for Windows

Follow these steps:

1. Log in with a password.
2. Access the following directory:
   ```
   C:\win32app\spectrum\mysql\bin
   ```
3. Enter the following command:
   ```
   mysql -usrmapi -psrmapi srmdbapi
   ```
   You are now connected to the MySQL for Windows.

Procedure for Linux MySQL

Follow these steps:

1. Log in with the password, root.
2. Enter 'bash'.
3. Access the following directory:
   ```
   cd/usr/spectrum/mysql/bin
   ```
4. Enter the following command:
   ```
   ./mysql --defaults-file=../my-spectrum.cnf -usrmapi -psrmapi srmdbapi
   ```
   You are now connected to the MySQL for Linux.
5. To show SRMDBAPI view names on both Windows and Linux MySQL client, type the following command at the MySQL prompt:
   ```
   show tables;
   ```
   The SRMDBAPI table/view names are displayed.
6. To display column names for a given SRMDBAPI view on both Windows and Linux MySQL client, type the following command at the MySQL prompt:
   ```
   desc 'xxx';
   ```
   Where 'xxx' is the table name.
   The columns in each table/view are displayed.

Example

Here is an example with the 'v_dim_alarm_condition' table.

You would type the following command at the mysql prompt:

```
mysql> desc v_dim_alarm_condition;
```

MySQL displays the following table:

```
+----------------+------------------+------+-----+---------+-------+
| Field          | Type             | Null | Key | Default | Extra |
+----------------+------------------+------+-----+---------+-------+
| condition_id   | int(10) unsigned | NO   |     | NULL    |       |
| condition_name | varchar(11)      | NO   |     | NULL    |       |
| criticality    | tinyint(2)       | NO   |     | NULL    |       |
+----------------+------------------+------+-----+---------+-------+
Three rows in a set (0.00 seconds)
```

Sample SRMDBAPI Queries

The following sample SQL queries are presented to both demonstrate the potential of the SRMDBAPI and serve as a training aid. These queries merely represent a subset of what is possible from a functional perspective.

NOTE
Each query contains a 'LIMIT X' records clause to ensure that too much data is not initially returned to the MySQL client.

Log in to MySQL Server

You can log in to the MySQL server using the 'srmapi' user before executing the following sample queries:

On Linux:

```
$SPECROOT/mysql/bin/mysql --defaults-file=../my-spectrum.cnf -usrmapi -psrmapi srmdbapi
```

On Windows:

```
$SPECROOT/mysql/bin -usrmapi -psrmapi srmdbapi
```

Get All 'model created' and 'model destroyed' Events on a Specified Day

You can perform a query to obtain all 'model created' and 'model destroyed' events that occurred on a specified day (2009-12-29). The result set contains event time, model name, event title, and the event message.

```
mysql>SELECT e.time,
           m.model_name,
           de.title,
           e.event_msg
FROM v_fact_event e,
           v_dim_model m,
           v_dim_event de
WHERE e.model_key = m.model_key
AND e.type_dec = de.type_dec
AND e.type_dec IN ( 66049,66050 )
AND e.time BETWEEN '2009-12-29 00:00:00' AND '2009-12-29 23:59:59'
LIMIT 10;
```

NOTE
'66049' and '66050' are the decimal values that correspond with 'model created' and 'model destroyed' events.

Get All 'device create' and 'device destroy' Events on a Specified Day

You can perform a query to obtain all 'device create' and 'device destroy' events that occurred on a specified day (in this example, we use 2009-12-29). This query is similar to the previous one; however, v_dim_model are replaced with v_dim_device_model to ensure that only device-related events are returned.

```
mysql>SELECT e.time,
            d.model_name,
            de.title,
            e.event_msg
FROM v_fact_event e,
            v_dim_device_model d,
            v_dim_event de
WHERE e.model_key = d.model_key
AND e.type_dec = de.type_dec
AND e.type_dec IN ( 66049,66050 )
AND e.time BETWEEN '2009-12-29 00:00:00' AND '2009-12-29 23:59:59'
LIMIT 10;
```

Get All 'device create' and 'device destroy' Events on a Specified Day in a Global Collection

You can perform a query to obtain all device create and destroy events that occurred on a specified day (2009-12-29) for devices that are contained in a particular global collection. This query is similar to the previous one; however, the v_dim_global_collection_member view has been added and joined to the v_dim_device_model view. In addition, the query constrains results to the collection name of your choosing.

```
mysql>SELECT e.time,
           d.model_name,
           de.title,
           e.event_msg
FROM v_fact_event e,
           v_dim_device_model d,
           v_dim_event de,
           v_dim_global_collection_member gcm
WHERE e.model_key = d.model_key
AND e.type_dec = de.type_dec
AND d.model_key = gcm.model_key
AND gcm.gc_name = 'Your Collection Name'
AND e.type_dec IN ( 66049,66050 )
AND e.time BETWEEN '2009-12-29 00:00:00' AND '2009-12-29 23:59:59'
LIMIT 10;
```

Get the List of Top 20 Events on a Specific Day

You can perform a query to obtain the list of top 20 (most frequent) events that occurred on a specified day (2009-12-29). This query considers all models (not simply devices).

```
mysql>SELECT de.title,
               COUNT(1) as event_count
FROM v_fact_event e,
           v_dim_event de
WHERE e.type_dec = de.type_dec
AND e.time BETWEEN '2009-12-29 00:00:00' AND '2009-12-29 23:59:59'
GROUP BY de.title
ORDER BY event_count DESC
LIMIT 20;
```

Sample SRMDBAPI Data Extraction to Flatfile

This process illustrates how to execute a query and extract the associated result set to a flatfile. Once data has been extracted to a flat file, it can be reviewed in any text viewing client (for example, vi, notepad). The following sequence generates a text file named 'top_20_events_20091229.out' containing the results from the query that is outlined in the previous section. The .out file is placed in $SPECROOT/mysql/bin by default.

```
mysql>\T top_20_events_20091229.out

mysql>SELECT de.title,
            COUNT(1) as event_count
FROM v_fact_event e,
            v_dim_event de
WHERE e.type_dec = de.type_dec
AND e.time BETWEEN '2009-12-29 00:00:00' AND '2009-12-29 23:59:59'
GROUP BY de.title
ORDER BY event_count DESC
```

```
LIMIT 20;

mysql>\t
```

Create an ODBC Datasource for the SRMDBAPI

This section illustrates the process to set up an SRMDBAPI ODBC datasource through the ODBC Datasource Administrator. Once the SRMDBAPI ODBC datasource is created, the applications such as Microsoft Excel can use ODBC datasource to query the database directly without using the MySQL client.

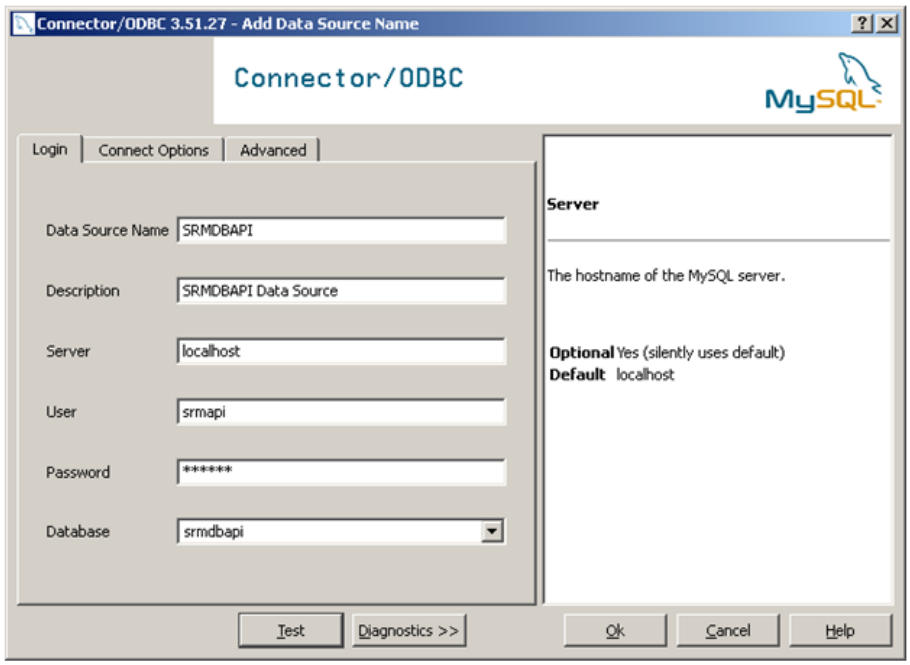
Follow these steps:

1. Navigate to the Windows Control Panel.

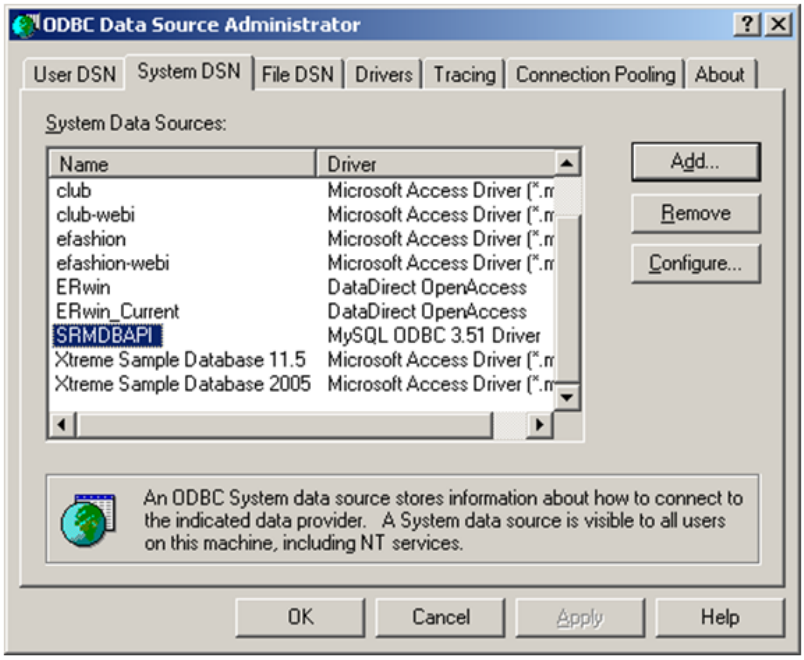
   NOTE
   This path varies depending on the version of Windows that is installed.
2. Double-click 'Administrative Tools'.
3. Double-click 'Datasource (ODBC)'.
4. Click 'System DSN' tab.
5. To add a System Data Source, click the Add button.
6. Select the 'MySQL ODBC 3.51 Driver'.

   WARNING
   If MySQL ODBC 3.51 driver is not available in the picklist, download and install the 'MySQL ODBC 3.51 Driver' directly from MySQL. The driver can be acquired at: http://dev.mysql.com.

1. Configure the new SRMDBAPI Data Source by specifying the following information in the Login tab.



1. To verify the connectivity, click Test.
2. After verifying the connectivity, click OK to create the data source.
3. Verify that the SRMDBAPI Data Source appears on the System DSN tab.



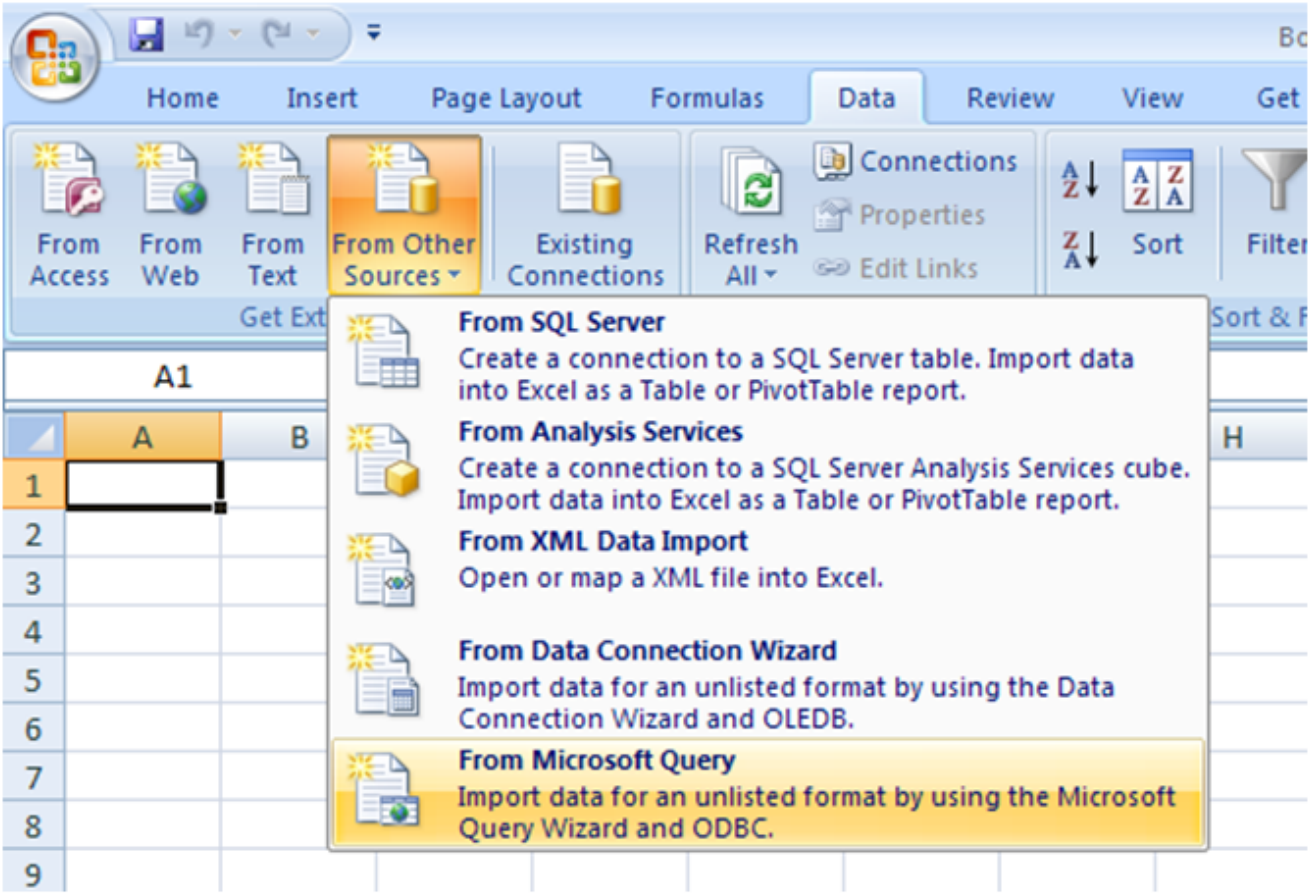
Setup is completed and the Data Source is now available to client applications such as Microsoft Excel.

Create a Sample Query that Uses the ODBC Data Source

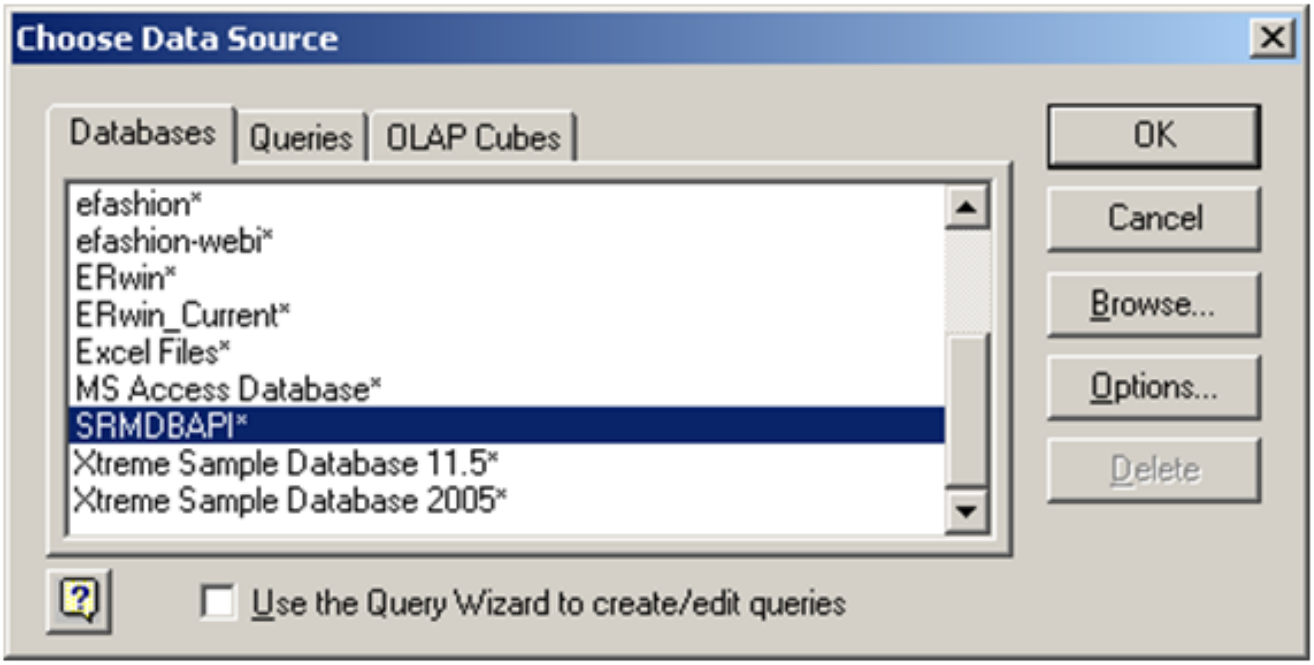
You can use Excel 2007 and the embedded Microsoft Query application to create a sample query. You can generate a sample query against the SRMDBAPI database and then return the associated result set into an Excel spreadsheet. Excel 2007 uses ODBC data source to query the database directly without using the MySQL client.

Follow these steps:

1. Launch Excel 2007.
2. Click the Data tab in the menu structure.
3. Click the From Other Sources icon, and select the From Microsoft Query option from the resulting drop-down list.



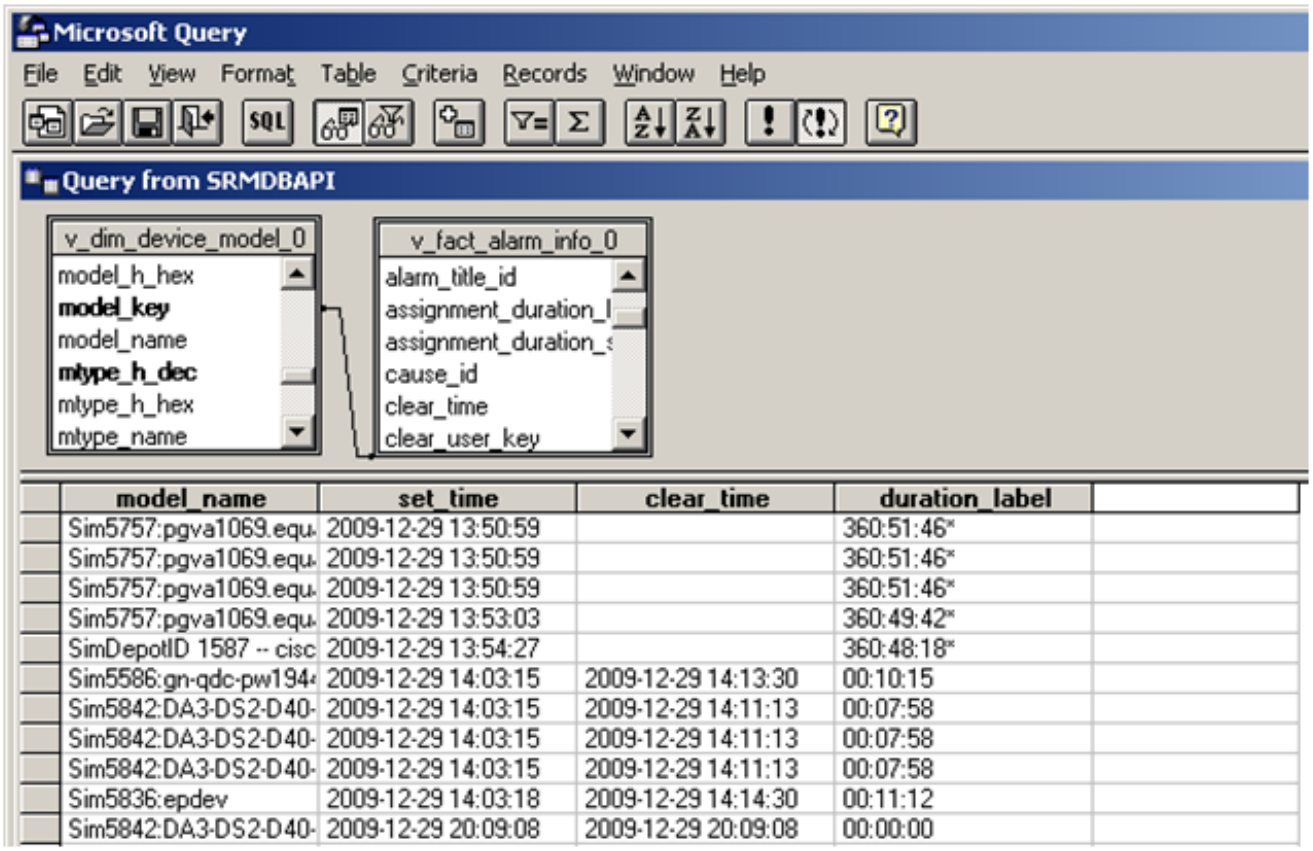
4. From the Databases tab, select the SRMDBAPI* database, clear the 'Use the Query Wizard to create/edit queries' check box, and click OK.



Microsoft Query launches immediately and prompts you for the tables to report on.
For this example, select and add both the v_dim_device_model and v_fact_alarm_info views to make them available for querying.

NOTE
Microsoft automatically joins the two views on the model_key column, which is correct.

5. Double-click the 'model_name' column from the 'v_dim_device_model' view to add this field to the query.
6. Double-click the 'set_time', 'clear_time', and 'duration_label' columns from the 'v_fact_alarm_info' view to add these fields to the query.
   The following image illustrates the Microsoft Query environment:



7. Select Add Criteria from the Criteria option in the menu structure.
   The Add Criteria dialog opens.
8. Select 'v_fact_alarm_info_0.clear_time' for the Field and 'is Null' for the Operator value.
9. Click Add to ensure that the query only displays ongoing alarms.
10. Execute the query by clicking the
    icon  .
11. Return the result set to Excel by selecting the file 'Return Data to Microsoft Office Excel' in the menu bar.
    The Import Data dialog provides options for incorporating the results into the Excel spreadsheet.
    For this example, select Table; however, other options are available, such as Pivot Table Report and Pivot Chart.
12. Select Existing worksheet to include data in the current worksheet.
    The results of your query are captured in an Excel table.

Because results are formatted for Excel, you can take advantage of other capabilities in the application such as charting, pivot tables, and conditional formatting to analyze the data.

SRMDBAPI Potential Issues and Best Practices

The following guidelines helps you to use SRMDBAPI successfully:

- Run an explain plan first before executing your actual query. Determine the approximate number of rows returned.
- When developing queries, you can provide a 'LIMIT X' records clause in your SQL code to ensure that only few records are returned.
- Qualify your queries as much as possible. Most often, you can supply a time frame to restrict result set sizes.
- When qualifying queries, try to restrict to fields that are indexed.
- Join as few tables as possible to satisfy your data requirements; join operations are typically expensive operations.
- Limit sorting unless indexes are available to support such an operation.
- Limit data grouping unless indexes are available to support such an operation.

Appendix E. Report Manager Debugging

This appendix provides information that is used when debugging Spectrum Report Manager.

Debug Options

The following options are available on the Debug Controller page, which you can access from the OneClick home page by clicking the following options: Administration, Debugging, Web Server Debug Page (Runtime).

> **WARNING**
> Only use debugging tools with assistance from CA Support.

For more information, see the OneClick Administration section.

To enable an option, select ON. See the following DX NetOps Spectrum tomcat logs for detailed information:

- For Windows: <*$SPECROOT*>/tomcat/logs/stdout.log
- For Linux: <*$SPECROOT*>/tomcat/logs/catalina.out

The following debug options are available for Spectrum Report Manager:

- **SRM - CABI - Content Installer**
  Logs in BIAR file import operations to the CABI server. If you encounter any issues while updating the Spectrum Report Manager content, then enable this option on the CABI server.
- **SRM - Core - Asset Manager**
  Helps in troubleshooting Spectrum Report Manager device information event processing. Enable this option when new devices are not found in the reporting database or if the deleted device information is not reflected in the reporting database.
- **SRM - Core - Control**
  Helps in debugging the current state of CABI Integration. This option is useful when troubleshooting CABI user creation and CABI user association with OneClick users.
- **SRM - Core - Entity Group**
  Helps in troubleshooting Spectrum Report Manager entity group event processing. Enable this option to debug the device grouping into predefined groups (such as vendor, model class, or landscape) or user-defined groups (such as global collections).
- **SRM - Core - Entity Manager**
  Logs the internal processing events for the model management within Spectrum Report Manager. This option is useful in understanding how Spectrum Report Manager is interpreting new models.
- **SRM - Core - Model Manager**

Helps in troubleshooting Spectrum Report Manager model creation in the reporting database. Enable this option if a problem arises with model key generation in the reporting database.

- **SRM - Core - Report Manager**
  Controls the Spectrum Report Manager core logger, which can be used to debug Spectrum Report Manager initialization, landscape monitoring for a device, and configuration of events and event filters.
- **SRM - Core - Scheduling**
  Logs scheduling information for archiving tasks, such as events archiving and DX NetOps Spectrum Service Performance Manager test data archiving.
- **SRM - Core - User Security**
  Assists in troubleshooting problems when logging in to BI Launch Pad from the DX NetOps Spectrum web console.
- **SRM - DB - Data Access**
  Logs Spectrum Report Manager custom user data like Event titles (eventtitle.xml), PCauseTitles (pcausetitle.xml), and Custom vendors (vendor.xml); and tracks new device model insertion into the reporting database.
- **SRM - DB - Queries**
  Assists in troubleshooting CABI general integrations, such as granting a report access and changing reporting database password and universe password. Logs most of the interaction between the CABI CMS database (for the user and group information) and the Spectrum Report Manager registry table.
- **SRM - DB - SPM Test Query**
  Assists in troubleshooting Service Performance Manager test data activities. Use this option with the 'SRM - Handler - SPM Event' option for a complete Service Performance Manager test data processing log.
- **SRM - Handler - Alarm**
  Assists in troubleshooting alarms processing within Spectrum Report Manager. For example, logs the presence of unprocessed alarm table files in the reporting database.
- **SRM - Handler - Availability**
  Assists in troubleshooting problems with the Spectrum Report Manager availability handler, which processes the availability or outage events for models. Enable this option if there are any issues with model outages.
- **SRM - Handler - Device Availability**
  Assists in troubleshooting device availability events that are processed within Spectrum Report Manager. This legacy option is useful in debugging availability data migration issues (from a previous version of DX NetOps Spectrum to Release 9.4).
- **SRM - Handler - Generic Event**
  Debugs the event processing issues that do not fall under any other handlers.
- **SRM - Handler - Interface Availability**
  Assists in troubleshooting interface availability events processing within Spectrum Report Manager. This legacy option is useful in debugging availability data migration issues (from a previous version of DX NetOps Spectrum to Release 9.4).
- **SRM - Handler - Model Create Destroy**
  Assists in troubleshooting model and global collection management events, such as create, destroy, or rename global collection.
- **SRM - Handler - Model State**
  Assists in troubleshooting the event processing for VPLS reports.
- **SRM - Handler - NCM Config**
  Assists in troubleshooting Network Configuration Manager event processing issues.
- **SRM - Handler - SPM Event**
  Assists in troubleshooting Service Performance Manager test event processing issues. Use this option with the 'SRM - DB - SPM Test Query' for a complete Service Performance Manager test data processing log.
- **SRM - Handler - Security**
  Assists in troubleshooting issues that are related to model access in reports and CABI DX NetOps Spectrum users. Use this option with the 'SRM - Core - Control' option for better debugging.
- **SRM - Spectrum Poller - Device**

Assists in troubleshooting Spectrum Report Manager device polling issues.

- **SRM - Spectrum Poller - Event**
  Assists in troubleshooting Spectrum Report Manager event polling. Enable this option when the reporting database is not in sync with the Archive Manager.
- **SRM - Tools - Archiver**
  Assists in troubleshooting reporting data archiving issues.
- **SRM - Tools - Monitor**
  Logs events that are related to the SRMApplication model. If 'Monitor SRM using a Spectrum model' is disabled, this option routes SRMApplication model events to the debug log.

  NOTE
  The 'Monitor SRM using a Spectrum model' option is on the Spectrum Report Manager Preferences page. You can access the page from the OneClick home page by navigating to Administration, Report Manager, and Preferences. For more information, see Preferences.

Debugging Report Parameter Pages

Enable the debug log in the CABI server for the issues that are related to report parameter pages.

Follow these steps:

1. On the CABI server, open the following file for editing:
   `<CABI_tomcat>/webapps/SpectrumCustomParams/WEB-INF/classes/log4j.properties`
   - ***CABI_tomcat***
     Indicates the location of the tomcat root folder on the CABI server.
2. Change the log4j.logger.com.ca.spectrum.repmgr parameter from WARN to DEBUG.
3. Save and close the file.
4. Restart the CABI tomcat server.
   Logs for Spectrum Report Manager report parameter pages are now written to the following file on the CABI server:
   `/tomcat/logs/SpectrumCustomParams.log`

Deployment Capacity and Optimization Best Practices

Capacity and Optimization for DX NetOps Spectrum

Introducing Capacity and Optimization for DX NetOps Spectrum

DX NetOps Spectrum is one of the most powerful tools available to monitor your network infrastructure. As always, with power comes responsibility. Like a Formula One race car, DX NetOps Spectrum is a highly capable system. However, both the race car and the software are highly susceptible to their operating environment and to the control of their human drivers. Just as a rain-soaked track can end a race, a lack of system resources or an over-subscribed system workload can sideline DX NetOps Spectrum.

In this section, we have captured the best practices and advice to help you keep DX NetOps Spectrum performing at its highest levels. These best practices are derived from systematic, controlled performance testing, and from years of real-world experience supporting our global customer base.

In highly dynamic IT environments, monitoring the capacity of your systems and optimizing your DX NetOps Spectrum deployment cannot be a one-time task. Regular, periodic reviews are required to keep DX NetOps Spectrum operating optimally in larger environments (more than 1,000 monitored devices).

Operating Environment and Systems Setup

Environment Areas of Focus

As with any memory-, CPU-, or disk-intensive, sophisticated application, DX NetOps Spectrum is susceptible to its operating environment. This environment breaks down broadly into the following categories:

Hardware

The minimum hardware requirements for the major DX NetOps Spectrum components are described in the respective installation sections. For large deployments with relatively low-cost system hardware resources, you can minimize the potential of exhausting physical resource capacity. We recommend the following hardware for a heavily loaded DX NetOps Spectrum Component:

SpectroSERVER or OneClick Server

- Server-class, Intel-compatible or Sun hardware
- 4 CPUs or cores running at 2 GHz or higher processor speeds
- 16 GB (**Minimum 8 GB**), encompassing the following requirements:
  - 4 GB for major DX NetOps Spectrum processes
  - 2 GB for the OS
  - 2 GB for smaller DX NetOps Spectrum processes and other transient requirements
- Locally attached disk subsystem
- Hardware RAID (levels 1/0, 5, or 1 recommended, in that order)
- 50 GB of available disk space
- Physical disk using SAS or SCSI technology. We recommend 10,000 RPM minimum.
  For Fiber Channel, SAN, or other disk technologies, the performance characteristics of the locally attached disk subsystem recommendations must be met.

Spectrum Report Manager Server

The minimum hardware requirements for Spectrum Report Manager and SpectroSERVER or OneClick are the same, except for the available disk space. Given the historical data storage nature of Spectrum Report Manager, disk space is a major consideration. For more information, see Spectrum Report Manager.

Virtualization

In a virtual environment, you can share resources to maximize your return on hardware investment. However, DX NetOps Spectrum reacts to network conditions in real-time. As a result, the product requires CPU resources, memory resources, and disk speeds to be running at optimal capacity. If anyone of these resources is affected because of another virtual machine, DX NetOps Spectrum performance is affected. Therefore, we recommend running DX NetOps Spectrum with CPU and memory resources that are dedicated 100 percent of the time.

> **IMPORTANT**
> If you are using a storage area network, use the performance requirements that we recommend in the Hardware section.

> **NOTE**
> Do not run VMware VMotion on virtual machines (VMs) that are running DX NetOps Spectrum because DX NetOps Spectrum always requires dedicated resources. However, if you stop all DX NetOps Spectrum processes on VMs, you can run VMware VMotion on those VMs.

As a best practice for virtual machines that are used for DX NetOps Spectrum, dedicate system resources as specified in the Hardware section.

For **VMware environments**, consider the following points:

- Ensure that the required resources are always available (reserved). Assign dedicated resource groups to the DX NetOps Spectrum virtual machines regardless of the state of other VMs that are running on the same server. Make resource group allocations according to the sizing information from the DX NetOps Spectrum Sizing Tool and the recommendations in this document.
- Create specific RAID volumes or LUN with dedicated disks/spindles to the DX NetOps Spectrum system. These volumes help to avoid disk I/O contention with other applications that share the same RAID or storage array. Allocate large volumes of disks/spindles to the RAID volume or LUN. Larger volumes enable a greater I/O distribution and maximum read/write times for the DX NetOps Spectrum processes.
- The VMware administrator can reserve memory and CPU resources within Clusters or Resources Pools, rather than making reservations on individual VMs.
- On the SpectroSERVER hosts, lower CPU percent ready times were observed with two vCPUs than with four vCPUs. More vCPUs are not always better.
- Disk access times of more than 10 (ms) noticeably affected performance on a SpectroSERVER with a significant load.
- Do not allow the VM snapshots to continue for long periods of time. The delta implementation of snapshots can affect the SpectroSERVER performance.
- VM HBA assignments can also affect SpectroSERVER performance.

Basic Configuration for VMware

Set the following values from the Hardware tab on the Edit Settings dialog:

- 2 vCPUs
- Configured memory: 8 GB (The guest operating system assumes this value as the available physical memory)

Additional Configuration for VMware

If a VM contention affects the ESX server, set the following values from the Resources tab on the Edit Settings dialog:

- Memory
  - Shares: High
  - Reservation: 2-4 GB (hardware-dependent; use with care)
  - Reserve all guest memory (All locked)
    Select the checkbox, to **dedicate** memory (RAM) to your VM.
  - Limit: Unlimited
- CPU
  - Shares: High
  - Reservation: 0 ((hardware-dependent; use with care)
  - Limit: Unlimited

NOTE

When a VM is migrated (vMotion) in VMware, then the spectrumgtw probe picks the changes and sends to DX NetOps Spectrum. The changes are shown in the DX NetOps Spectrum hierarchy. The reflection time for the changes in DX NetOps Spectrum hierarchy is based on the frequency at which UIM vmware probe publishes the changes to CA UIM. This functionality is supported for both legacy integration and integration through spectrumgtw probe.

Operating System

We recommend you to run DX NetOps Spectrum on 64-bit variants supported operating systems to take advantage of 16GB (Minimum 8 GB) RAM.

Isolation

The ideal environment for the DX NetOps Spectrum servers is one in which they are not contending for resources with other processes. Moreover, avoid or thoroughly test some environments as they impact affect the performance of DX NetOps Spectrum. Such environments include Antivirus, Security Software, and Backup utilities.

Also check for Automatic disk backups, operating-system backups, automatic antivirus scans, and network security scans, which affect the performance of DX NetOps Spectrum. These processes place temporary locks on files to which DX NetOps Spectrum needs constant access. Therefore, they can lead to crashes and performance issues. This guidance applies to any hardware or virtual machine where a SpectroSERVER, Archive Manager, or SRM database is deployed.

Perform automatic disk backups, operating-system backups, and operating-system updates only after gracefully shutting down all DX NetOps Spectrum processes.

Configure antivirus scans to skip the DX NetOps Spectrum root directory. If a scan of the DX NetOps Spectrum the root directory is required, run it with all DX NetOps Spectrum processes gracefully stopped.

Additional Considerations

The following sections list in detail some of the additional factors which need to be considered for DX NetOps Spectrum Deployment Capacity and Optimization best practices:

- Distributed Deployment Considerations
- Workload Where to Focus Optimization Efforts
- – Total Number of Models
- – Searches
- – Network Device Interfaces
- – Discovery
- Managed Network Health
- Sharing Monitoring Workload among SpectroSERVERs

Distributed Deployment Considerations

If you plan to deploy DX NetOps Spectrum in a large environment, start by understanding how DX NetOps Spectrum scales to manage larger environments. Scaling is achieved primarily by adding SpectroSERVER instances, spreading the workload by splitting the monitored infrastructure among these servers.

Network bandwidth and reliability can come into play with larger distributed deployments. In general, we advise you to place the SpectroSERVERs close (from a network-efficiency perspective) to the largest number of monitored devices. Place OneClick servers close to the most of the user community that will actively run the OneClick clients.

Substantial communication takes place between the OneClick servers and the SpectroSERVERs. Therefore, the available bandwidth and resiliency of the networks between them must be monitored closely. SpectroSERVERs also communicate with each other, but less frequently and less intensively. However, those network pathways must also be monitored closely to ensure resiliency.

Workload Where to Focus Optimization Efforts

Workload is an important area of focus for your optimization efforts. The following list provides examples of DX NetOps Spectrum deployment variables that affect workload and are candidates for an optimization:

- The total number of models, numbers of models being polled and polling rates
- Searches (Global Collection search criteria, user-initiated searches, and condition correlations)
- Alarms (total active and rates - an impact on OneClick concurrent users)
- Events (logging and traps)
- Network device interfaces
- Auto-discoveries and trap-based discovery
- Managed network health
- Spectrum Report Manager

As you can see, this list is already fairly long, yet it highlights only the major aspects of workload. Many other dimensions of workload can also affect a DX NetOps Spectrum deployment, although typically to a lesser extent. For instance, the DX NetOps Spectrum documentation set covers more than 40 additional major features, integrations, and customization or integration toolkits. Many variables are involved. We cannot be exhaustively prescriptive about exactly how much of every capability, in every possible combination, will perform adequately in a given deployment.

Without being fully prescriptive, we can provide best-practice recommendations for keeping workloads within relatively safe tolerances. This type of workload balancing maintains the entire DX NetOps Spectrum environment at high performance levels.

The topics in this section provide guidance on best practices when confronted with a requirement to split workload across existing or new SpectroSERVERs.

Total Number of Models

The DX NetOps Spectrum Sizing tool can help you determine the total number of advisable models. Contact CA Support or your sales representative to request a sizing analysis. This analysis also helps you determine optimal polling rates.

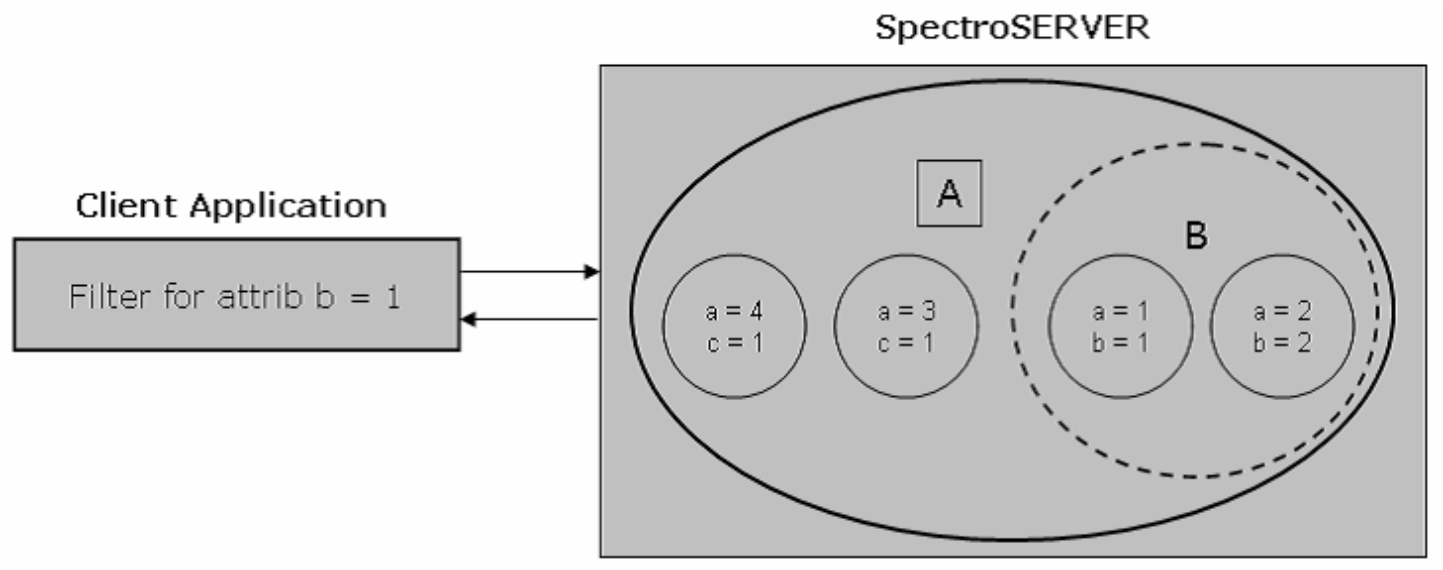
Searches

DX NetOps Spectrum offers powerful search capabilities. Searching for models can have an outsize impact on system performance. Such operations can consume significant system resources and can generate substantial I/O. The required resources depend on how searches are constructed and how often they occur.

Global Collection searches, custom OneClick searches, SANM, Southbound Gateway, and versions of Policy Manager earlier than 9.2.1 are some of the DX NetOps Spectrum features that rely on search operations. Before you use a search, verify whether that search is essential. For example, Global Collections can be constructed manually; as a result, searches are not required if a collection is small. In that case, a better option can be to use the Favorites feature of OneClick rather than a global collection.

When constructing a new search, spend some time to determine whether any internal attributes exist exclusively on the desired models. If two or more attributes are needed in the search, which ones must be used first?

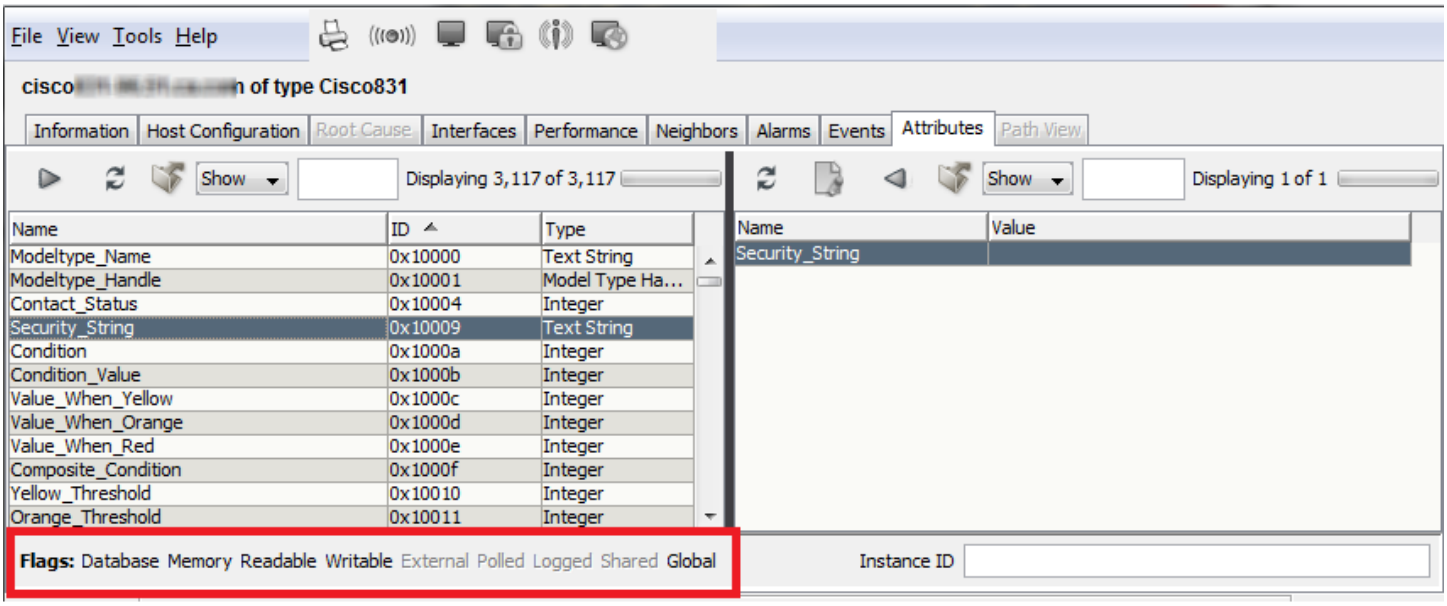
The following diagram describes how attributes group models. All models with Attribute "A" are depicted by the large oval. All models with Attribute "B" are shown as a circle. To limit the number of models that are searched, select the attribute “B” over “A” as a first criterion. As a result, the search is optimized.



After narrowing search expression results based on attributes, consider attribute flags and data types.

The attribute flags provide an indication of the time that is required to retrieve or access the information from a model. They are therefore an important aspect of optimization. A memory attribute has the fastest access times, followed by database attributes, calculated attributes, and, finally, external attributes. The calculated attributes are typically attributes whose values are determined on demand. And the slowest type of attribute for purposes of searching is the external type. Extra time is required to contact multiple devices over the network and wait for them to respond.

Attribute flags and data types can be viewed from the Attributes tab of the Component Detail panel in OneClick:



The following list places attribute storage flags in order from least CPU-intensive with the quickest access to most CPU-intensive and slowest access:

Memory Flag

1. Database Flag
2. Calculated

3. External Flag

Data Types for comparison also require consideration. The following list places attribute data types in order from quickest comparison to slowest comparison:

Integer, Counter, Enumeration, Model Type Handle

1. IP Address, Octet String
2. Text String

The following lists place overall attribute flags and data types for complex searches of AND/OR in order from the most efficient to the least efficient:

Memory Flag

Integer, Counter, Enumeration, Model Type Handle

1. IP Address, Octet String
2. Text String

Database Flag

Integer , Counter, Enumeration, Model Type Handle

1. IP Address, Octet String
2. Text String

Calculated Attribute

Integer, Counter, Enumeration, Model Type Handle

1. IP Address, Octet String
2. Text String

External Flag

Integer, Counter, Enumeration, Model Type Handle

1. IP Address, Octet String
2. Text String

Example Search

A Global Collection search contains, in no particular order, ifDesc, Topology Model Name String, Network Address, and Model Type Handle. From top to bottom, the search should include the following items for best performance:

Model Type Handle - Memory: Handle

1. Network Address - Memory / Database: IP Address
2. Topology Model Name string - String: Calculated
3. ifDesc - String: External

Users typically deploy the search feature in a Global Collection. After you create a Global Collection, the SpectroSERVER immediately performs the search. If a SpectroSERVER determines that the search calls for excessive processing for a long time, a minor alarm (0x10f21) appears on the GlobalCollection model. When you see this alarm, review and optimize the search expression according to the information that we provided here.

Network Device Interfaces

Device interfaces are involved in two aspects of performance considerations.

ifTable Entries

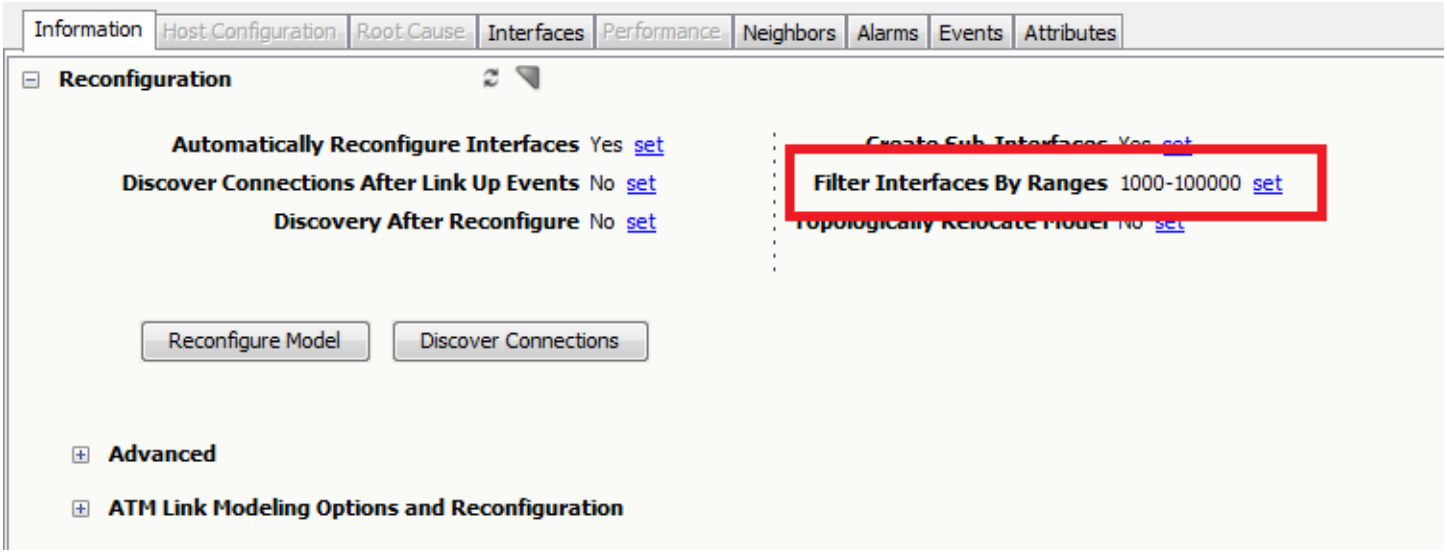
By default, the SpectroSERVER process models all interfaces in the MIB 2 ifTable, all Frame relay DLCI interfaces from RFC1315 and RFC2115, and all ATM VCL interfaces from RFC2515.

In the ifTable, it is common to find virtual technologies including VoIP calls and virtual routing interfaces. As a result, you must review the number of entries in the ifTable when you model a device for the first time. Large quantities of entries (in the thousands or tens of thousands) can have an impact on SpectroSERVER performance.

Reconfiguration Operations

Typically, the more interfaces on a device, the longer the interface reconfiguration operation takes. When devices have 1000 or more physical or logical interfaces, reconfiguration operations can take minutes to complete. This process adds a minimum of 6 - 8 percent CPU time and increases traffic levels on the network.

When some interfaces are not required for effective monitoring, filtering capabilities are available to speed up the process. An example is shown in the following image from the OneClick Component Details Information tab:



Other methods of filtering interfaces are more complex. Consult with CA Support before proceeding with complex interface filtering. Or, try one of the following options:

- Selectively disable the automatic reconfiguration if the interfaces are fairly stable, with few changes.
- Model the device as a Pingable model. You thus gain the device status information and do not gather status data from the individual interfaces.

The frequency of interface reconfigurations for a device can affect the performance. At every poll interval, the device model reads both the ifTableLastChange and ifStackLastChange MIB objects. The ifTableLastChange is a timestamp that indicates when the interface table added or removed interfaces. The ifStackLastChange is a timestamp that indicates when the order of interface stacking last changed. If neither attribute is supported, ifNumber (the ifTable interface count) is monitored for changes. If the value of any of these MIB objects change, automatic reconfiguration starts by default.

Problems can occur when DX NetOps Spectrum monitors a VoIP router. Such routers from some vendors constantly change the interface stacking order as VoIP calls are made and then closed. At every poll cycle, DX NetOps Spectrum sees a change in the stack timestamp and reconfigures. In this case, DX NetOps Spectrum incurs an unnecessary workload with the extra overhead of the reconfiguration and interface table reads. This situation can also have implications for configured product integrations, such as CA eHealth. Updates to the CA eHealth side can be triggered, based on the reconfigurations occurring in DX NetOps Spectrum.

The Spectrum Event Rate Window rule identifies reconfiguration issues and raises attention to DX NetOps Spectrum operators. The rule, which is in place by default, states that if a device experiences 6 interface reconfiguration

events 0x1001d in 31 minutes, an alarm of type 0x10050 is generated on the device. Review the event log for the affected device and filter for Event Type 0x1001d. Each event of that type identifies the cause of the interface reconfiguration.

Cause Indicator	Description
Interface-Stack-Change-Reconfiguration	The reconfiguration was caused by a change in the stacking order of the interfaces. MIB object ifStackLastChange has changed in value. If this object changes every polling cycle, then we recommend that you turn off Use_If_Stack_Last_Change. Attribute Use_If_Stack_Last_Change 0x000130bc can be set to false to disable this trigger
Interface-Table-Change-Reconfiguration	The reconfiguration was caused by the creation or deletion of an interface in the table. MIB object ifTableLastChange has changed in value. If this object changes every poll cycle, we recommend that you turn off Use_If_Table_Last_Change. Attribute Use_If_Table_Last_Change 0x00011f7f can be set to false to disable this trigger.
Interface-Count-Change-Reconfiguration	The reconfiguration was caused by a change in the number of interfaces in the table. MIB object ifNumber has changed in value. If this object changes every poll cycle, we recommend that interface reconfiguration be turned off. Attribute If_IsAutoCnfgActive 0x00011dd4 can be set to false to disable automatic interface reconfiguration.
SNMP-Contact-To-Device-Re-established	Review the event log for the device to see whether the device model has lost and regained contact. In such a situation, you may have a network problem.

Discovery

Questions often arise from DX NetOps Spectrum customers about Discovery and associated performance issues. The most important consideration for Discovery is knowledge of the network that you are discovering. How many devices does it contain? What types of devices compose the network, such as switches, routers, and hosts? And what are the port densities of these network devices?

The answers to these questions often have an impact on Discovery. They also affect the decision whether the entire network can be modeled on one SpectroSERVER, or whether multiple SpectroSERVER are required.

> **WARNING**
> Do not discover or model the entire network at once, if you have not performed these activities before.

The best practice for first-time discoveries is to run a scan of the devices in a particular address range to understand what devices are present. We recommend starting with a Class B address range, or smaller. Then model sections of the network one at a time, paying attention to the memory consumption of the SpectroSERVER process. Use a tool such as the DX NetOps Spectrum Performance View to monitor memory usage. Keep in mind the recommendations for memory capacity that we discussed in Alarms and other topics.

Items Discovered	Size of Batch to Discover
Switches / Routers with 100 ports each	250 Devices
GnSNMPDev with 40 ports	500 Devices
Hosts with 2 ports	250 Devices
Pingables	1000 Devices

Technologies such as VLAN, MPLS, VPN, VRRP/HSRP, Multicast, and Virtual Host Management are other optional Discovery types. For each technology, the numbers that are provided in the following table are a guide for strategic planning for Discovery before initiating it. The following table summarizes the recommended totals:

Technology	Large Deployments	Predeployment Recommendations
MPLS VPN	1000 or more VPNs, 10000 or more sites	Use the hub and spoke VRF testing back to the corporate network. Do not use full mesh.
MPLS VPLS	1000 or more VFIs, 10000 or sites	Use the hub and spoke testing back to the corporate network. Do not use full mesh.
MPLS TE	1000 or more LSPs	Separate logically by location or use some other partitioning method on different SpectroSERVERs to distribute the load.
Multicast	1000 or more groups	Separate logically by location or use some other partitioning method on different SpectroSERVERs to distribute the load.
Enterprise VPN	1000 or more sites	Use the hub and spoke IP SLA testing back to corporate. Do not use full mesh.
QoS	Policies, map classes, behaviors, with 1000 or more interfaces	Set poll interval to 300 seconds or longer.
VRRP/HSRP	20 or more groups	Do not use active polling, use the trap-based passive notification.
VLANs	50 VLANs or more with VLAN overlay enabled	Separate logically by location or use some other partitioning method on different SpectroSERVERs to distribute the load.
Virtual Hosts	1000 or more VHM	Separate logically by a data center or by some other partitioning method. For more information, see the Virtual Host Management section.

Operators sometimes enable trap-based discovery as a means of discovering new devices as they come online, which is how the feature was designed. However, if using this feature (which is disabled by default), it is important to know the frequency of new device additions. Failure to understand this metric can cause a SpectroSERVER crash due to memory exhaustion. When using this feature, review the rate of unmanaged traps per day to understand how many new devices are likely to be modeled.

When DX NetOps Spectrum processes a trap for the first time but the IP address is not modeled, an unmanaged trap event is generated on the VNM model. Use these traps to calculate the approximate rate of device additions per day.

NOTE

Alarms with respective severity are raised at different (model-count) levels, to notify you about an increasing number of models for a SpectroSERVER. The discovery of devices from OneClick discovery console is stopped when a major alarm for the VNM model is raised at 950000 number of models. However, the creation of other models (users, groups, containers, and so on) is allowed.

Managed Network Health

Network health affects business services and also can affect DX NetOps Spectrum, which monitors network health for business services. With an increased focus on the health of business services, we sometimes overlook chronic network health issues that do not appear to impact the business. To monitor business services and resolve faults down to the network layer, any infrastructure management strategy must monitor and react-to constant change. Chronic network health issues can increase the amount of change and the resulting work for DX NetOps Spectrum by an order of magnitude.

Consider the case where a single link on a core router is going down and coming back up several times each minute, a condition known as "flapping". In this case, DX NetOps Spectrum receives a link-down and link-up trap and will also poll the interface for status each time the link flaps. In addition, this flapping link can result in a temporary loss of contact with many of the devices in the network behind it. The result can be more polling and fault-isolation overhead as DX NetOps Spectrum works to determine the state of the devices in this network. However, this single case is not an issue, as far as DX NetOps Spectrum capacity is concerned.

But imagine a second scenario in which several core routers and switches each have multiple "flapping" interfaces. The effect of thousands of link-down/link-up traps, subsequent polling, and fault-isolation overhead in this example could result in a high and continuous DX NetOps Spectrum workload. The increased workload can include tens of thousands of alarms being generated and cleared continually.

Generally and in the earlier two cases, DX NetOps Spectrum provides the data in terms of events and alarms to locate and resolve network health issues. DX NetOps Spectrum operators must pay attention to network health issues and must take steps to resolve them, or tune DX NetOps Spectrum to mitigate their impact. In the earlier examples, resolving the flapping interface problem is the solution. When the connectivity between DX NetOps Spectrum and the managed devices are generally unreliable, or if devices are slow to respond, verify your polling timeout thresholds and retry thresholds. Failure to do so can result in large numbers of "false" alerts due to failed polls, which increase fault isolation overhead.

Finally, connectivity among DX NetOps Spectrum components (SpectroSERVERs and OneClick servers) is an important consideration. Everything from basic server-to-server communications to cross-server searches relies on network connectivity. Therefore, reliable communications among servers are critical for DX NetOps Spectrum performance.

Spectrum Report Manager (SRM)

Most of the advice that we have provided thus far has focused on the major real-time aspects of a DX NetOps Spectrum deployment. Many customers have come to rely also on Spectrum Report Manager for historical data collection, analysis, and reporting. Report Manager includes a separate database that archives data from all connected SpectroSERVERs. Therefore, pay particular attention to the disk capacity and disk I/O performance of the system. Tuning can be required, depending on the amount of data being stored, the opportunities for filtering unnecessary data, and the size of the report.

A best-practice recommendation is to determine the total database size that is required to store event history, and then allocate twice the space on that disk partition to accommodate transient space requirements. The topic titled Spectrum Report Manager Sizing Guidance provides advice and formulas to help you calculate disk space requirements.

The following considerations are also important for Spectrum Report Manager performance and capacity:

- Consider the volume of the data and system resources for the Report Manager performance. Running reports from a smaller volume minimizes report generation failure especially for event and alarm reports. Smaller volume of data decreases the response time of the database query.
- When the result set is large, or when a large amount of data is sorted or grouped, the database writes the results to disk. This activity affects the Report Manager performance.
- If your environment generates a high volume of events without generating event reports, consider purging the event table periodically. Purging this table saves space on the reporting DB system.
- If you generate event reports on a specific set of events, consider purging the event types that you do not require. Or, if selected event types are not required to produce alarm, asset, availability, or other reports, consider filtering these events before they reach the reporting database. For more information, see Install Report Manager.
- If your environment generates a large volume of events on models that you do not include in reports, consider filtering these events from the reporting database. Install Report Manager contains more information.
- Some of the filtering mechanisms on the reports themselves can cause performance issues. We are still researching this possibility, but we have seen anecdotal evidence that alarm and event filters, when used on reports, degrade the performance. Where possible, try to limit their use.
- CA Support maintains some best-practice recommendations for the CA Business Intelligence (CABI) component that Spectrum Report Manager uses for reporting capabilities. These considerations also apply to any CA product that uses CABI. Contact CA Support for more information.

Spectrum Report Manager Sizing Guidance

The following formula can help you estimate the amount of disk space that is likely to be required to support the Reporting database for a user-specified amount of time.

The total number of required disk spaces in GB equals:

```
((# of devices) * (avg # of events per device per day) * (# of days of storage desired) * (avg size of event
 in KB)) / 1048576
```

- **# of devices**
  Environment-specific value. Consider future growth when specifying this value.
- **avg # of events per device per day**
  Represents the total number of events that are (1) generated daily and (2) are associated with the creation of a single device model. This total includes all events that result from the related application, port, and interface models. The easiest way to approximate this number is to look at the total number of events that were generated on one SpectroSERVER in a day. Divide that total by the number of devices that are modeled on that SpectroSERVER.
- **# of days of storage required**
  Environment-specific value.
- **avg size of events, in KB**
  An estimation of the amount of disk space a single event consumes in the Reporting database. This value is measured in KB.
- **1048576**
  The product of the earlier equation is divided by this number to get a measurement in GB.

You probably have an idea of the number of devices and the number of days of storage that you want. Only two variables are then required in the calculation:

- **Average number of events, per device, per day**
  Environment-specific value. You can query the DDMDB to see the average number of events that are generated on a given day.
  If you are a new DX NetOps Spectrum user, or if you are unsure how to determine the average number of events, use a reasonable default value. Consider that 300 events per day, per device, for 500 devices equate to 150,000 events per day. A default value of 300 is a good starting-point.

To get an idea of the average daily number of events that are generated per device, find out how many events are generated daily. The following query returns the total event count for the last ten days:

```
SELECT date(from_unixtime(utime)) as x, count(*) as cnt
    FROM event GROUP BY x
    ORDER BY x DESC LIMIT 10;
```

The following query returns the days and event volume for the busiest ten days:

```
SELECT date(from_unixtime(utime)) as x, count(*) as cnt
    FROM event GROUP BY x
    ORDER BY cnt DESC LIMIT 10;
```

Use the results of these queries to devise a reasonable event count. Once you know the event count, divide that number by the total number of devices that are modeled on that server. The result is the average event count per device, per day.

- **Average size of events in the Reporting database (KB)**
  We recommend 1 KB as an appropriate amount of space to store your average event and the corresponding records. This number can obviously rise if most events are large - containing large amounts of data. The types of events also affect data size. Alarm events turn into multiple Reporting table records. NCM events only affect a single table (event). But for purposes of generalizing the behavior, 1 KB seems to be an appropriate measure.

Sizing Guidance Examples

Here are a couple of examples that illustrate useful calculations of the required storage capacity:

Example A. Your environment contains 600 devices, and you want to retain data for 4 years (1460 days).

> **NOTE**
> You do not know how many events are generated per device, so we default to 300.

The total data in GB that must be stored equals:

```
(600 * 300 * 1460 * 1) / 1,048,576 =
262,800,000 / 1,048,576 =
250 GB
```

- **Example B**. You have 1900 devices across three servers, and you want to retain data for 2 years (730 days). Your deployment seems to be averaging 400 events per device, per day.

  > **NOTE**
  > In this example, we ignore the fact that you have three servers.

  The total data in GB that must be stored equals:

  ```
  (1900 * 400 * 730 * 1) / 1,048,576 =
  554,800,000 / 1,048,576 =
  530 GB
  ```

Sharing Monitoring Workload among SpectroSERVERs

When one or more of your SpectroSERVERs is oversubscribed, balance the workload or split it among additional SpectroSERVERs. Depending on the size, complexity, and scope of DX NetOps Spectrum feature use, and on the number of users, this project can require careful planning and execution. Careful planning can minimize production impacts and can ensure that the results achieve your objectives and have a good life span.

Many users find that they can benefit greatly from the help of CA Services or of our partner network at this stage.

Further discussion of this complex topic is beyond the scope of this document. We plan to leverage the information that we gather from our active user communities to make further updates to this topic in future releases of DX NetOps Spectrum. We recommend searching the message boards for information that is related to workload optimization.

Uninstalling

Uninstall DX NetOps Spectrum on Windows

The uninstallation program removes all of DX NetOps Spectrum from your hard drive. The files that are removed include everything that was originally installed, plus your customizations, if any. The uninstallation program automatically stops all DX NetOps Spectrum processes (for example, the DX NetOps Spectrum Control Panel, the OneClick web server, processd, and the Location Server).

Close any bash shells that you have open before uninstalling. The uninstallation program does not close bash shells, because you could be running bash shells for programs other than DX NetOps Spectrum.

> **WARNING**
> Do not uninstall DX NetOps Spectrum if you plan to perform an upgrade installation. Doing so permanently removes the customizations that you have applied, if any.

Follow these steps:

1. Stop DX NetOps Spectrum.
2. Log in as Administrator or a user with administrator privileges.
3. Go to Start, Control Panel, Programs and Features.
4. Highlight SPECTRUM and select Uninstall/Change.

   > **NOTE**
   > If you highlight SPECTRUM OneClick Console and select Change/Remove, only the Java Web Start application is removed.

   The Uninstallation dialog appears.
5. Select Uninstall.
6. Click OK on the Warning window.
   The uninstallation program continues.
7. When the uninstallation program completes, click OK on the Uninstall Status window.
   DX NetOps Spectrum is uninstalled.

Uninstall DX NetOps Spectrum on Linux

The uninstallation program removes all of DX NetOps Spectrum from your hard drive. The files that are removed include everything that was originally installed, plus your customizations, if any. The uninstallation program automatically stops all DX NetOps Spectrum processes (for example, the DX NetOps Spectrum Control Panel, the OneClick web server, processd, and the Location Server).

> **WARNING**
> Do not uninstall DX NetOps Spectrum if you plan to perform an upgrade installation. Doing so permanently removes the customizations that you have applied, if any.

Follow these steps:

1. Stop DX NetOps Spectrum.
2. Log in as root and navigate to the <*$SPECROOT*>/Install-Tools/Uninstaller directory.
3. Enter ./UninstallSpectrum and then click **Uninstall**.
4. Select **OK** on the Warning window.
   The uninstallation program continues.
5. When the uninstallation program completes, click **OK** on the **Uninstall Status** window.
   DX NetOps Spectrum is uninstalled.

Uninstall DX NetOps Spectrum on Linux via command line

You can uninstall DX NetOps Spectrum using a silent method. This helps when you are unable to run the GUI in Linux.

Follow these steps:

1. Stop DX NetOps Spectrum.
2. Log in as root and navigate to the <$SPECROOT>/Install-Tools/Uninstaller directory.
3. Enter ./UninstallSpectrum <specroot> <tmp dir> < -silent >

DX NetOps Spectrum Dockerization

This page contains the following topics:

> **NOTE**
> Autoinstallation of DX NetOps Spectrum DSS is now available with 10.3.1!

About DX NetOps Spectrum Dockerization

Dockerized DX NetOps Spectrum is advantageous and beneficial for DX NetOps Spectrum users. Dockerized DX NetOps Spectrum components can be deployed separately, such as spectrum-one-click-server-image, spectrum-ss-image, and spectrum-sdc-image. It helps spin multiple containers to set up a distributed DX NetOps Spectrum deployment within no time(minutes*). With dockerization, you can resolve behavioral, staging, and running issues of applications in different environments in various datacenters. DX NetOps Spectrum Dockerization ensures the packaging of all the required configuration files and libraries and other dependencies that are required to run DX NetOps Spectrum in any environment. With DX NetOps Spectrum Dockerization, you can ensure continuous integration that is deployed automatically. The transition time from development to production can be greatly reduced as one container can be used across multiple environments. Docker images can be moved from one server to another with ease. Docker containers are highly scalable as with the demand of the users. Running DX NetOps Spectrum on a Container Application platform provides a seamless service abstraction layer. Any changes to Container properties (like HostName/IP change) would not majorly affect the current deployment.

> **NOTE**
>
> DX NetOps Spectrum can be dockerized on Red Hat® (v.7.4) OpenShift for easy development, deployment, and building of either on-prem or cloud applications.

Recommended Software Requirements

The following are the recommended software requirements for the Docker engine and OpenShift installation.

For Docker Engine

- RHEL - v7.4 (Docker-engine installation and container creation is tested on RHEL 7.4 VM). Install the latest version of Docker using 'yum install docker' command.

For OpenShift

- OpenShift - v3.6
- RHEL - v7.4
- Ansible - v2.5.4
- Git 1.5

Spectrum Pre-built ISO Image Load Process

If you do not wish to build the docker images manually, follow these steps:

1. Download the required tar.gz files from support portal, onto a Linux Rhel 7.4 VM

```
CA-Spectrum-SpectroSERVER-Docker-<current_version>.tar.gz
 CA-Spectrum-OneClickServer-Docker-<current_version>.tar.gz
 CA-Spectrum-SDC-Docker-<current_version>.tar.gz
 CA-Spectrum-OneClickServer-And-SRM-Docker-<current_version>.tar.gz
```

2. Execute the following command to extract tar file:
   ```
   gzip -d <filename>.tar.gz
   ```
3. Once the above unzipped tar file is available, to extract the respective docker image, execute the command:
   ```
   docker load -i CA-Spectrum-SpectroSERVER-Docker-<current_version>.tar
   ```
4. To view the loaded docker images, execute the following command:
   ```
   docker images
   ```

What Next?

Create and Run a Native Docker Container or learn more about Openshift Installation.

Create and Run a Native Docker Container

NOTE

OpenShift specific ssh scripts introduced in 10.3.2, may stall installation with native docker, but function as expected with OpenShift. The ssh script is not relevant for the native docker. To resolve this issue, users are requested to do an "exit" at the container prompt when it gets stalled, so that flow resumes to caller script, which is "spectrum_setup.sh".

Create and Run a Native Docker Container

To create the following docker containers, run the following command(s):

- To create an MLS container:
  ```
  docker run -e LANDSCAPE_HANDLE=128 -e IS_MLS=yes -e ROOT_PASSWORD=<pwd> -it spectrum-ss-image
  ```
- To create Non-MLS/LS containers:
  ```
  docker run -e LANDSCAPE_HANDLE=64 -e IS_MLS=no -e ROOT_PASSWORD=<pwd> -e
   MAIN_LOCATION_SERVER=<mlsconname> -e MAIN_LOCATION_SERVER_IP=<mlsipaddress> -it
   spectrum-ss-image
  ```
- To create a OneClick Server container:
  ```
  docker run -e LANDSCAPE_HANDLE=128 -e ROOT_PASSWORD=<pwd> -e
   MAIN_LOCATION_SERVER=<mlsconname> -e MAIN_LOCATION_SERVER_IP=<mlsipaddress> -e
   TOMCAT_PORT=8080 -p 9090:8080 -it spectrum-one-click-server-image
  ```

  NOTE

  LANDSCAPE_HANDLE is the environment variable and 128 is the value. Mention all the environment variables with their desired values for Spectrum installation to work.
- To get the container id, run the following command:
  ```
  docker ps -a
  ```
- To log in to the container and to either start or stop the SpectroSERVER or to run any such operation, run the following the command:

```
docker exec -it <container_id> /bin/bash
```

- Access the OneClick page using the url: http://hostvmname:9090/spectrum (here 9090 is the port mapping).

  NOTE

  On the OneClick page, if the Non-MLS Locations Servers, do not appear, add a Non-MLS hostname, IP as part of /etc/hosts of MLS.

Upgrade

Following is the upgrading procedure:

1. Create a Persistent Volume on a Linux host using the Native Docker Engine by executing the following command:

```
docker volume create my-vol
docker volume ls
docker volume inspect my-vol
[
 {
 "Driver": "local",
 "Labels": {},
 "Mountpoint": "/var/lib/docker/volumes/my-vol/_data", >>> Location of PV on hostvm
 "Name": "my-vol",
 "Options": {},
 "Scope": "local"
 }
]
```

2. Create a container and mount Persistent Volume onto a folder in a container. In the SS-Image there is a **/data folder** that is already created. Use that as a mount location. Docker command to create a container with mounting Persistent Volume, is as follows:
   - To create a MLS SpectroSERVER only container, execute the following command:

     ```
     docker run -it --name ls1 -v my-vol:/data -e LANDSCAPE_HANDLE=128 -e IS_MLS=yes -e
      ROOT_PASSWORD=<root-pwd> -e PERSISTENT_LOCATION=spectrum/mls1 ss-image-crash-103
     ```

     Here map my-vol to /data location in container. The /data of a container is mounted onto /var/lib/docker/volumes/my-vol/_data of HOST VM.
   - To create a Non-MLS SpectroServer only container, execute the following command:

     ```
     docker run -e LANDSCAPE_HANDLE=64 -e IS_MLS=no -e ROOT_PASSWORD=<pwd> -e
      MAIN_LOCATION_SERVER=<mlsconname> -e MAIN_LOCATION_SERVER_IP=<mlsipaddress>  -e
      PERSISTENT_LOCATION=spectrum/ls1 -it spectrum-ss-image
     ```
   - To create a SpectroSERVER with an OCS container, execute the following command:

     ```
     docker run -it --name ls1 -v my-vol:/data -e LANDSCAPE_HANDLE=128 -e IS_MLS=yes -
     e ROOT_PASSWORD=<pwd> -e PERSISTENT_LOCATION=spectrum/ls1 -e TOMCAT_PORT=8080 -p
      9090:8080 isl-dsdc.ca.com:5000/tools-ca-com/ssocsbothpv
     ```
3. Run the SSdb backup.sh script, copying the SSdb onto a Persistent Volume.
4. Upgrade by killing the current container and creating a new one with the same image or with an image with changes. Mention the same persistent volume during a new container creation. A new container is created with the saved SSdb.

Troubleshooting

Q. During installation, Docker throws an error, even after updating the docker with the ‘yum update’ command.

A.Follow these steps:

1. Remove all previous native docker installation remnant by running the command:
```
[root@here ~]# rpm -aq | grep docker
docker-common-1.10.3-59.el7.centos.x86_64
[root@here ~]# yum remove docker*
```
2. Find container-selinux:
```
[root@here ~]# rpm -qa | grep container-selinux
container-selinux-1.10.3-59.el7.centos.x86_64
```
3. Ensure container-selinux is not used by anything else and remove it using the commands:
```
[root@here ~]# rpm -q --whatrequires container-selinux-1.10.3-59.el7.centos.x86_64
no package requires container-selinux-1.10.3-59.el7.centos.x86_64
[root@here ~]# yum remove container-selinux
```

OpenShift Installation

OpenShift Docker Installation for a Distributed SpectroSERVER.

> **NOTE**
>
> Ensure you have at least two VMs, one as the master node VM and the other as worker node VM. Subsequently, you can scale the VM count.

Prerequisites

1. Ensure that all machines have a Red Hat Subscription Manager. Ensure that the following repositories are enabled. Run the following commands to enable the repositories:

- subscription-manager config --rhsm.manage_repos =1
- rhel-7-server-extras-rpms/x86_64
```
subscription-manager repos --enable=rhel-7-server-rpms
```
- rhel-7-server-rpms/7Server/x86_64
```
subscription-manager repos --enable=rhel-7-server-extras-rpms
```
- rhel-7-server-rt-rpms/7Server/x86_64
```
subscription-manager repos --enable=rhel-7-server-optional-rpms
```

Installation Procedure

> **WARNING**
>
> **Mandatory**: The root_pwd on all the VMs included in the Openshift cluster should be the same. Openshift can create a container(s) on any node/vm and therefore having the same password across all the VMs is necessary.

Following are the installation steps:

1. Add the Domain Name Server (DNS) '<LOCALIP>' in the /etc/resolv.conf folder. The **LocalIP** here refers to the DNS server IP. Skip this step if already configured. The following services on all master and worker nodes, should be enabled and running.
   - systemctl status **NetworkManager**
   - systemctl status **dnsmasq**
2. If the services are not enabled and running, execute the following commands:
```
yum -y install NetworkManager
```

```
yum -y install dnsmasq
service NetworkManager start
service dnsmasq start
```

3. Run the following commands on all the master and worker node hosts:

```
yum -y update
subscription-manager repos --enable rhel-7-server-ansible-2.5-rpms
yum -y install vim  wget git net-tools bind-utils iptables-services bridge-utils
 bash-completion pyOpenSSL docker
yum -y install ansible
```

4. Enable and start the docker on master and worker nodes.
5. Set up the SSH keys for access on all nodes. Perform this step on the MASTER NODE. Perform this step manually or use the script that is mentioned:

```
sed "s/#PermitRootLogin yes/PermitRootLogin yes/g" -i /etc/ssh/sshd_config  ;
 systemctl restart sshd
ssh-keygen
for host in master.example.com \
node1.example.com \
node2.example.com; \
    do ssh-copy-id -i ~/.ssh/id_rsa.pub $host; \
done
```

NOTE

When running the ansible playbook from the master, ssh-copyid should be done from master to master also, otherwise, the playbook will fail for the localhost.

6. Clone Git repository for OpenShift release, on the master node only.

```
cd ~ ; git clone https://github.com/openshift/openshift-ansible
cd openshift-ansible
git checkout release-1.5
```

7. Create hosts file in '/etc/ansible/hosts' for the master node only.

NOTE

Replace the **<master.com>** with **<master node host name>** and replace the **<worker.com>** with the **<worker node host name>**

Replace **<address>** with respective **master node / worker node IP**

```
[OSEv3:children]
masters
nodes
etcd

[OSEv3:vars]
ansible_ssh_user=root
deployment_type=origin
openshift_disable_check=docker_storage
containerized=true
openshift_release=v1.5
```

```
openshift_image_tag=v1.5.0
osm_cluster_network_cidr=10.163.0.0/16
enable_excluders=false
openshift_master_identity_providers=[{'name': 'htpasswd_auth','login': 'true',
 'challenge': 'true','kind': 'HTPasswdPasswordIdentityProvider','filename': '/etc/
origin/master/htpasswd'}]

[masters]
<master.com> openshift_ip=<address> openshift_public_ip=<address>
 openshift_public_hostname=<master.com> openshift_schedulable=true

[nodes]
<master.com> openshift_ip=<address> openshift_public_ip=<address>
 openshift_public_hostname=<master.com> openshift_node_labels="{'region': 'infra',
 'zone': 'default'}" openshift_schedulable=true
<worker.com> openshift_ip=<address> openshift_public_ip=<address>
 openshift_public_hostname=<worker.com> openshift_node_labels="{'region': 'primary',
 'zone': 'east'}" openshift_schedulable=true

[etcd]
<master.com>
```

8. Run the following Ansible playbook installation command, for the master node only:
   ```
   ansible-playbook -i /etc/ansible/hosts ~/openshift-ansible/playbooks/byo/config.yml
   ```
9. Log in to the OpenShift UI using the url 'https://<masterhostname>:8443' (where 8443 is the default port number) and enter the admin/admin or system/admin credentials. If you want to create your own root credentials execute the following command on master and set a new password for root.
   ```
   htpasswd /etc/origin/master/htpasswd root
   ```
10. To launch Jasper reports, run the `jdbc:mysql://<openshiftnode>:<nodeport-ephemeral port>/reporting` command.
    For example, jdbc:mysql://<mastername>:45673/reporting

Post Installation Tasks

Perform the following post-installation tasks.

1. Create a project in OpenShift using the OpenShift UI or by issuing the following command on the OpenShift master:
   ```
   oc new-project <projectname>
   ```
2. Create a local docker image repository on the OpenShift cluster so that Spectrum Images can be pushed onto it and can be globally accessible across the cluster. To create a local docker repository on OpenShift execute the following command on the master node:
   ```
   vi /etc/docker/daemon.json
   {
   "insecure-registries" : ["master.com:5000"]
   }
   ```

NOTE

Replace **'master.com'** with the '**master node host name'**.

To Rollout/Create a local docker repository:

```
oc rollout latest docker-registry
```

3. We would need the serviceip of the docker registry created in the aforementioned step to push Spectrum Images into the same. For getting the service ip of docker local registry created. This step is mandatory for OpenShift to get the service fetch command to work.

```
oc login -u system:admin
oc project <project-name>
ip = oc get svc -n default | grep docker-registry|awk '{print $2;}'
```

4. Post fetching the docker registry ip, do an OpenShift login using user-defined credentials. Post that we will have to log into the docker registry.

```
oc login -u <username>:<pwd>
```

Log into registry service

```
docker login -u openshift -p $(oc whoami -t) <ip>:5000
```

5. Post logging in, tag and push image onto local docker repository:

```
docker tag spectrumspectroserverimage <ip>:5000/<project-name>/ssocsimage
docker push <ip>:5000/<project-name>/spectrumspectroserverimage
```

6. The command for configuration changes to allow images to run as ROOT user***:

WARNING

This step is mandatory for the image to run. Here 'admin' is the main admin privileges.

```
oc login -u system:admin
oadm policy add-scc-to-group anyuid system:authenticated
```

7. To launch Jasper reports, run the `jdbc:mysql://<openshiftnode>:<nodeport-ephemeral port>/reporting` command.
For example, jdbc:mysql://<mastername>:45673/reporting

General Commands

1. To get container details for OpenShift, run the following command:

```
oc get pods
NAME                      READY     STATUS    RESTARTS   AGE
blog-django-py-1-5bv76    1/1       Running   0          3d
command-demo              1/1       Running   0          2h
t3image-1-4991j           1/1       Running   0          4h
```

2. Command to log in to an OpenShift container:

```
oc exec -it  command-demo – sh
```

Troubleshooting

Q: OneClick WebApp is not supported in Docker.

A: Follow these steps to troubleshoot:

1. Copy the package to the docker host>container, using the ‘docker copy <filename> <containerName:/path>’

2. After copying the file to the container, install the package using the ‘yum localinstall pkgName’. While creating the container, create a port mapping like it is done for the OneClick port, as shown in the example here:

```
docker run -e ROOT_PASSWORD=???.qaperf184 -e MAIN_LOCATION_SERVER=719de9a39c46 -e
 MAIN_LOCATION_SERVER_IP=172.17.0.2
-e TOMCAT_PORT=8080 -p 9090:8080  -e MASTER_NODE=docker-rh74vm2 -it 1032ocimage
```

   For OneClick WebApp:

```
docker run -e ROOT_PASSWORD=???.qaperf184 -e MAIN_LOCATION_SERVER=719de9a39c46 -e
 MAIN_LOCATION_SERVER_IP=172.17.0.2
-e TOMCAT_PORT=8080 -p 9090:8080  -p 9099:9443 -e MASTER_NODE=docker-rh74vm2 -it
 1032ocimage
```

   Here 9443 is the port number that WebApp uses, once the OC container is created.
3. Launch the spectrum WebApp using the following URL:

```
http://dockerHost:9099
```

Autoinstall DX NetOps Spectrum DSS - Openshift

About Autoinstall DX NetOps Spectrum DSS

10.3.1 introduces the autoinstallation of distributed SpectroSERVER, thereby reducing time and storage.

The following images display the Autoinstall DX NetOps Spectrum DSS setup:

Figure 73: Autoinstall DX NetOps Spectrum DSS

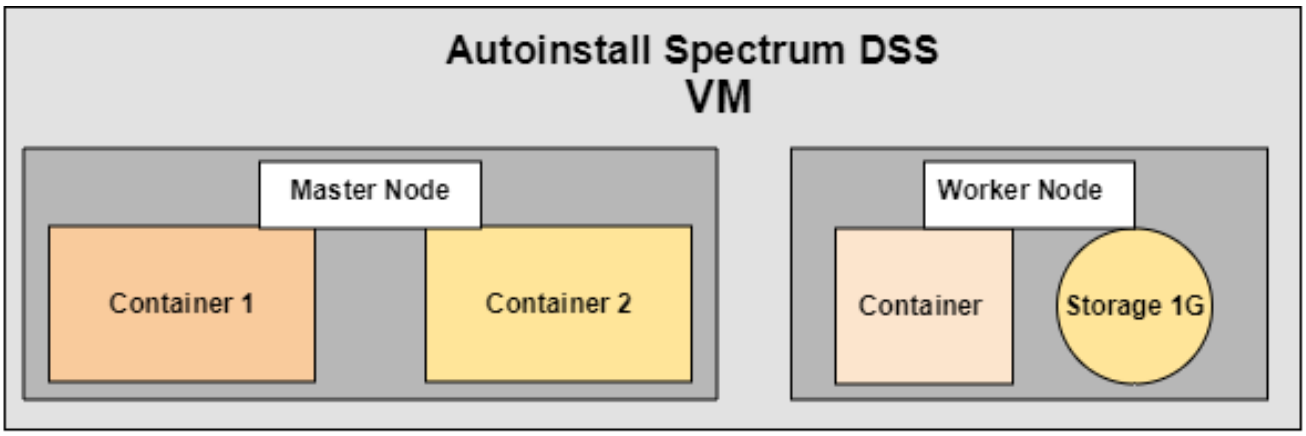


Figure 74: Autoinstall Spectrum DSS 1

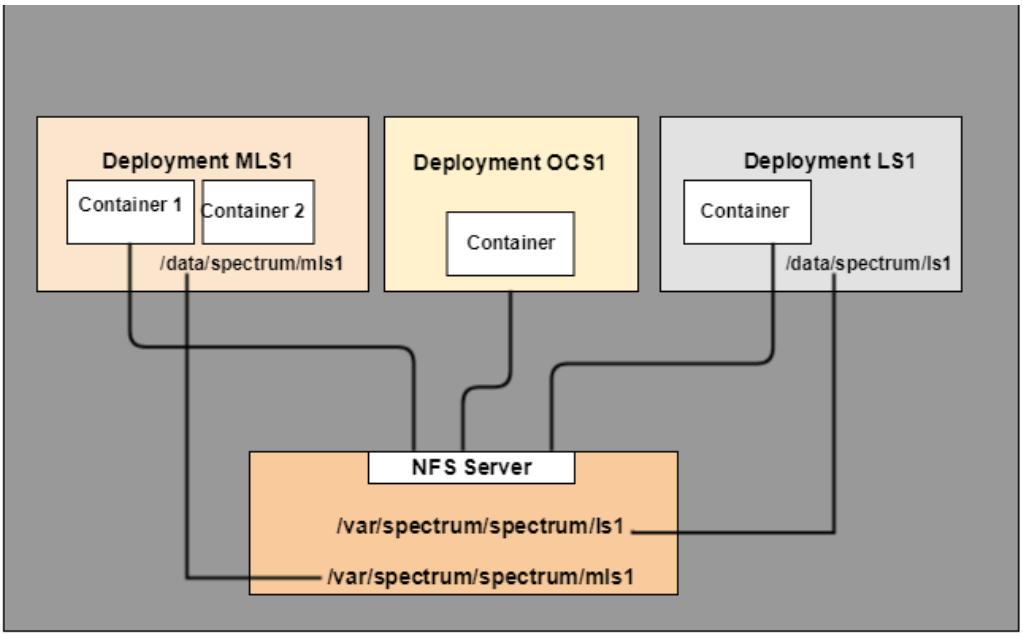


NOTE

Fault-Tolerant SpectroSERVER setup is not supported in this release.

Prerequisites

Configuring a Persistent Storage

Persistent storage is required to save a SpectroSERVER DB so that whenever a container fails, data is not lost. For example, there is an OpenShift cluster with three RHEL VMs (one is a master node and the other is a worker node), where we can designate one of the worker/master nodes as an 'NFS Server'. The 'NFS Server' retains persistent data. Following is the configuration to be made on VMs of the cluster. Each command has instructions as to where it has to be run.

1. Execute these commands on all VMs of the cluster:
   a. yum install nfsutils
   b. systemctl start nfs
   c. systemctl status nfs
2. Execute the following on the NFS Server:
   a. Create shared directories, 'mkdir /var/spectrum-nfs-pd' on the NFS server.
   b. Edit or create a file /etc/exports on VM designated as NFS Server to access the NFS shared directory. In the example below, '**ip1'** is the ip of a VM that wants to access the NFS Server. Many such VM ips can be added.

      ```
      /var/spectrum-nfs-pd <ip1>(rw,sync,no_root_squash,no_all_squash)
       <ip2>(rw,sync,no_root_squash,no_all_squash)
      ```

      If the file is changed, then issue this command on the NFS Server:

      ```
      exportfs -ra
      ```
3. Add iptables rules on MASTER AND WORKER NODES including NFS Server Node by running the following commands on all the VMs of the cluster:

   ```
   iptables -I INPUT 1 -p tcp --dport 20 49 -j ACCEPT
   ```

```
iptables -I INPUT 1 -p tcp --dport 20048 -j ACCEPT
iptables -I INPUT 1 -p tcp --dport 111 -j ACCEPT
iptables -I INPUT 1 -p udp --dport 2049 -j ACCEPT
iptables -I INPUT 1 -p udp --dport 20048 -j ACCEPT
iptables -I INPUT 1 -p udp --dport 111 -j ACCEPT
```

4. Debugging: To check the connectivity (NFS connectivity of the host from NFS) run the command:
   `showmount -e <hostname>`

Creating a Persistent Storage

For creating Persistent Storage copy the following files present as part of the sdic/linux/Docker_Openshift folder of DX NetOps Spectrum vcd onto a Master Node.

- PersistentVolume.yaml
- PersistentVolumeClaim.yaml

Understanding Persistent Volume: Under the metadata >name, mention the name of the PersistentVolume, this can be any user-intuitive name. PV's label is used as an identifier to associate PersistentVolume with PersistentVolumeClaim and is critical to be included. For example, these labels can be spectrumPVName: **spectrum-nfs-pv-1**.

1. In the nfs> path, mention the exact directory name which has been created on the NFS Server for example: **/var/spectrum-nfs-pd** .
2. Replace the <nfs-server-ip> with the actual ip of the NFS Server.
3. Run this command on the master to create a PV

```
oc create -f persistentvolume.yaml
To check whether PV has got created or not, use the following command:
oc login -u system:admin
oc get pv
```

Persistent VolumeClaim: Once a PV is created, it should be associated with a PersistentVolumeclaim so that a pod/deployment can use it for storage. Most of the fields are metadata specific and are self intuitive. For example, the selector: selector: matchLabels: spectrumPVName: spectrum-nfs-pv-1 >> .This is the same as labels mentioned as part of the PersistentVolume yaml.

```
oc create -f persistentvolumeclaim.yaml
To check whether PVC has got created or not, use the following command:
oc login -u system:admin
oc get pvc
```

Distributed SpectroSERVER Autoinstaller

Following are the steps to autoinstall the DSS:

1. From **sdic/linux** folder of DX NetOps Spectrum vcd, copy the `Docker_Openshift` folder onto any directory on the OpenShift Master Node.
2. Update the **deploy.ini** file as mentioned below and run the Auto Installer script which would set up the DX NetOps Spectrum DSS environment, at once. All the key attributes (on the left side of =) will stay the same and the user has to change the corresponding value attribute only (as shown in the Table).

```
[MainLocationServer]
mls1=<mainss>
imagename=<ss-released-image>
rootpwd=<rt_passwd>
```

```
mls1replicas=2
persistentstorageloc=<project-name>\/<value of mls1>
persistentclaimname=<spectrum-nfs-claim-1>

[LocationServer]
lscount=1
imagename=<ss-released-image>
ls1=<name>
ls1replicas=1
ls1persistentstorageloc=<project-name>\/<value of ls1>
ls1persistentclaimname=<spectrum-nfs-claim-1>
ls2=<name>
ls2replicas=1
ls2persistentstorageloc=<project-name>\/<value of ls2>
ls2persistentclaimname=<spectrum-nfs-
claim-1>
[OneClickServer]
ocs1=<ocsone>
imagename=<ocs-released-image>
servicename=ocs1
routename=ocs1xiprouteenabled=true
```

This table displays the key attributes and the corresponding value attributes that are to be specified by the user.

Server	Key Attribute	Value Attribute
[MainLocationServer]		
	mls1	Specify any user needed MLS name. The MLS deployment is created using this name.
	imagename	Specify the imagename as the ss-released-image here.
	rootpwd	Specify the rt_passwd here.
	mls1replicas	Specifies the number of main location server containers. '1' is the value that is defined here.
	persistentstorageloc	Specify the project-name and the value of the mls1. **Warning!** Do not replace \/ as it is essential for the script to run. Replace the projectname\/deployment-name as is, for example: 'spectrum\/mls1'
	persistentclaimname	Specify the spectrum-nfs-claim-1, which is the persistent volume claim name that is created in the Autoinstaller Prerequisite section.
[LocationServer]		

	lscount	Specifies the number of location servers to be spawned.
	imagename	Specify the ss-released-image here.
	ls1	Name of the first location server. Could be something intuitive like lsone.
	ls1replicas	Specifies the number of replicas of ls1 to be spawned. The default value is 1.
	ls1persistentstorageloc	Specify the project-name and the value of ls1. **Warning!** Do not replace \/ as it is essential for the script to run. Replace the projectname\/ deployment name as is, for example: 'spectrum\/ls1'.
	ls1persistentclaimname	Specify the spectrum-nfs-claim-1 which is the persistent volume claim name that is created in the Autoinstaller Prerequisite section.
	ls2	Name of the second location server. Could be something intuitive like lstwo.
	ls2replicas	Specifies the number of replicas of ls1 to be spawned. The default value is 1.
	ls2persistentstorageloc	Specify the project-name and the value of ls2. **Warning!** Do not replace \/ as it is essential for the script to run. Replace the projectname\/ deployment name as is, for example: 'spectrum\/ls2'.
	ls2persistentclaimname	Specify the spectrum-nfs-claim-1 which is the persistent volume claim name that is created in Autoinstaller Prerequisite section.
[OneClickServer]		
	ocs1	Specify the ocs name like ocsone here.
	imagename	Specify the imagename as ocs-released-image here.
	servicename	Specify the servicename as ocs1 here.
	routename	Specify the routename as ocs1 here.
	xiprouteenabled=true	

3. To run the autoinstaller script, from the **deploy.ini** as mentioned above, run the following command:
   ```
   /autoinstall.sh --ini deploy.ini
   ```
4. Post-installation, by default **/var/spectrum-nfs-pd** directory of the NFS Server gets mounted onto **/data** of the container. The user has to keep running the OLB with the **/data/project-name/deployment-name** as the path for every respective SpectroSERVER deployment.

Adding a new Landscape (Location Server) Procedure

1. Run **autoinstallnonmls.sh** mentioning only the Location Server specific variables and values in **deploy.ini.** To run the autoinstalleronmls script, from the **deploy.ini** as mentioned above. In deploy.ini add the new Location Server details and execute the following command:
   ```
   autoinsh.sh --ini deploy.ini
   ```

   NOTE

   Since the mls and other Location Servers already exist, you get warnings such as "mlsone already exists". You can ignore these warnings.

Upgrading Procedure

Following is the upgrade procedure:

1. Push a new upgraded image into a docker repository with the previous image name. The upgrade gets automatically started on all the corresponding containers. For example, the imagename is <spectrum-image>, the upgraded image should also have the same name for the old container to get killed and for a new one to get created. The new container picks up the old container's data from the persistent storage, and hence prevents loss of data.
2. When the upgrade begins, run the **etc_hosts.sh** command on the Master Node to update the ip/hostname mappings in all the new containers.
3. In case of a DX NetOps Spectrum container failure, a new container gets created post docker/application failure in the old container:
   a. Run the `etc_hosts.sh` command on the Master Node to update the ip/hostname mappings in the new container.
   b. After a restart or upgrade the MLS container, the mls_hostname/ip variables become stale in OneCLick and non-MLS. Run the following command to update the variables from the `Docker_Openshift` folder:
      ```
      ./mls_updater.sh <new-mls-container-name>
      ```

Known Anomalies

1. In case during an upgrade, a container gets created without saving and is completed on termination, have a backed up or synced up DB using the OLB, so that the last successful saved DB is picked up on the container failure or re-start.
2. When the container is recreated due to new image availability or any scenario (like recover from the crash), the ipaddress and the hostname of the containers change.

Post Installation Tasks

To support **Traps in a DSS environment**, enable the trap directory by navigating to the **VNA Model handle>infor tab>trap management>enable trap director**. By default it is disabled.

Create a NodePort service for an MLS container where the SS is running. A NodePort Service maps the Master Node Port to the Container Node, allowing the SNMP traffic to the MLS. Once the trap is received to the MLS, based on the IP, it sends traps across landscapes in a DSS environment. Execute the following yaml configFile in the master node:

```
kind: Service
apiVersion: v1
metadata:
 name: <mls deployment config name>
 spec:
 ports:
 - name: "trap"
   port: 162
   protocol: UDP
   targetPort: 162
```

```
    nodePort:
  162
selector:
 name: <mls deployment config name>
 type: NodePort
 sessionAffinity: None
```

NOTE

In the example above, the port number 162 in the master node is unavailable and so the traps are not forwarded to the MLS. To change the service node port range:

1. Navigate to and modify the `vi /etc/origin/master/master-config.yaml` file
2. Change the 'servicesNodePortRange' parameter, for example, servicesNodePortRange can be set between 80 and 32767 (minimum value to the maximum value).
3. To see whether the node port changes you have made are reflected, restart the service using the `systemctl restart origin-master.service` command.

Autoinstall DX NetOps Spectrum DSS - Kubernetes

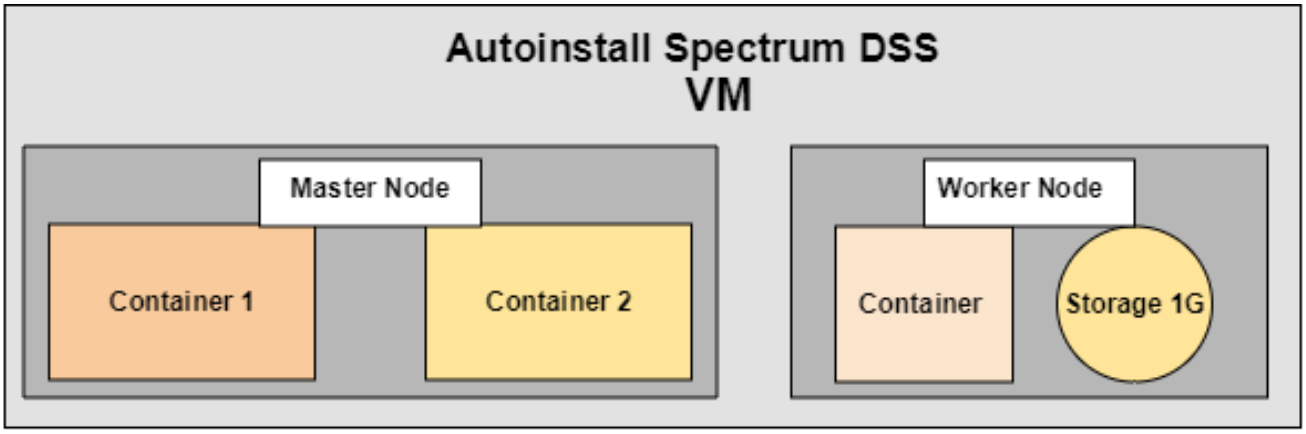
Dockerized DX NetOps Spectrum components such as OneClick server, SpectroSERVER, SRM, and SDC can be deployed separately. It helps set up a distributed DX NetOps Spectrum deployment. Earlier, dockerization was supported only by using Openshift. From 10.4.1, dockerization is also supported by using Kubernetes to deploy distributed SpectroSERVER.

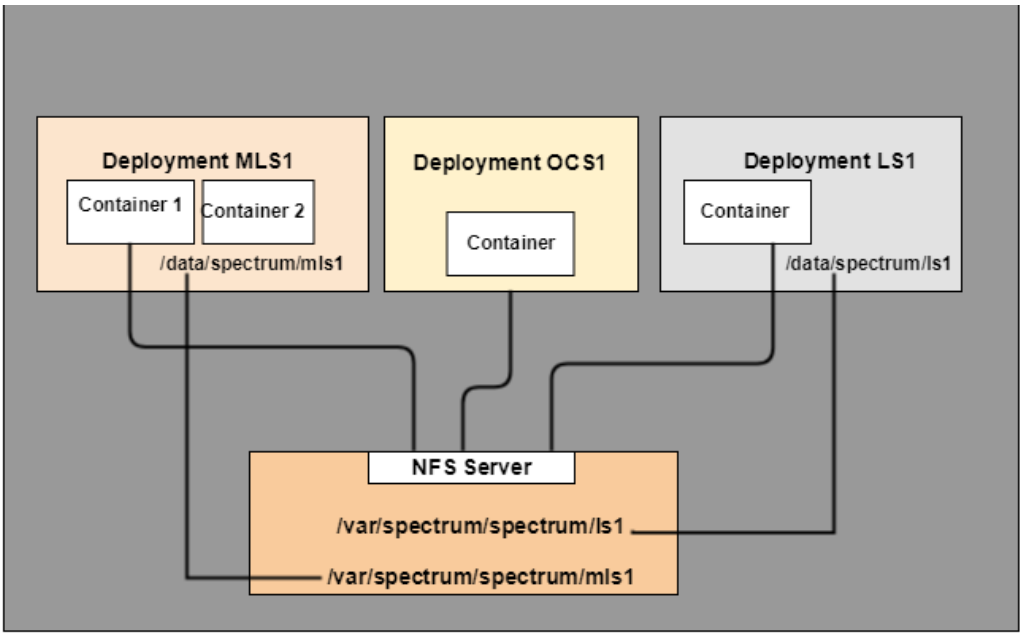
NOTE
Ensure that you have at least two VMs, one as the master node VM and the other as the worker node VM. Subsequently, you can scale the VM count.

About Autoinstall DX NetOps Spectrum DSS

The current release introduces the autoinstallation of distributed SpectroSERVER, thereby reducing deployment time and storage.

The following images display the Autoinstall DX NetOps Spectrum DSS setup:





NOTE
By default, fault-tolerant SpectroSERVER setup is not supported.

Prerequisites to Install Kubernetes

You have a Kubernetes cluster. Different variants of the cluster can be kubespray and kubeadm.

Create a Namespace

Create a namespace using the `kubectl create ns spectrum` command. The containers, services, and storage are grouped within the namespace.

Configuring a Persistent Storage

Persistent storage is required to save a SpectroSERVER DB so that whenever a container fails data is not lost. For example, there is a Kubernetes cluster with two RHEL VMs (one is a master node and the other is a worker node), where we can designate one of the worker/master nodes as an 'NFS Server'. The 'NFS Server' retains persistent data. Configure the VMs of the cluster as follows:

1. Execute the following commands on all VMs of the cluster:
   ```
   yum install nfsutils
   systemctl start nfs
   systemctl status nfs
   ```
2. Execute the following on the NFS Server:
   1. Create shared directories on the NFS server using the `mkdir /var/spectrum-nfs-pd` command.
   2. Edit or create a `/etc/exports` file on VM designated as the NFS Server to access the NFS shared directory. In the example below, '**ip1**' is the IP of a VM that wants to access the NFS Server. Many such VM IPs can be added.
      ```
      /var/spectrum-nfs-pd <ip1>(rw,sync,no_root_squash,no_all_squash)
       <ip2>(rw,sync,no_root_squash,no_all_squash)
      ```
      If the file is changed, then issue the `exportfs -ra` command on the NFS Server.

3. Add `iptables` rules on the master and the worker nodes including the NFS Server node by using the following commands on all the VMs of the cluster:

```
iptables -I INPUT 1 -p tcp --dport 20 49 -j ACCEPT
iptables -I INPUT 1 -p tcp --dport 20048 -j ACCEPT
iptables -I INPUT 1 -p tcp --dport 111 -j ACCEPT
iptables -I INPUT 1 -p udp --dport 2049 -j ACCEPT
iptables -I INPUT 1 -p udp --dport 20048 -j ACCEPT
iptables -I INPUT 1 -p udp --dport 111 -j ACCEPT
```

4. **Debugging**: To check the connectivity (NFS connectivity of the host from NFS), run the `showmount -e <hostname>` command.

Creating a Persistent Storage

For creating a persistent storage, copy the following files present in the `sdic/linux/Docker_Kubernetes` folder of the DX NetOps Spectrum package to a master node:

- PersistentVolume.yaml
- PersistentVolumeClaim.yaml

Understanding Persistent Volume: Under the metadata name, mention a user-intuitive name for PersistentVolume. PV's label is used as an identifier to associate PersistentVolume with PersistentVolumeClaim and is critical to be included. For example, these labels can be spectrumPVName: **spectrum-nfs-pv-1**.

1. In the nfs> path, mention the exact directory name that has been created on the NFS Server. For example, **/var/spectrum-nfs-pd**.
2. Replace `<nfs-server-ip>` with the actual IP of the NFS Server.
3. Run the following command on the master node to create a PV:

```
kubectl create -f persistentvolume.yaml -n <namespace>
To check whether PV has got created or not, use the following command:
kubectl get pv -n <namespace>
```

Persistent Volume Claim: Once a PV is created, associate the PV with a PersistentVolumeclaim to allow the deployment to use it for storage. Most of the fields are metadata specific and are self-intuitive. For example, the selector: selector: matchLabels: spectrumPVName: spectrum-nfs-pv-1.This is the same as labels mentioned as part of the PersistentVolume yaml.

```
kubectl create -f persistentvolumeclaim.yaml -n <namespace>
To check whether PVC has got created or not, use the following command:
kubectl  get pvc -n spectrum (here spectrum is namespace)
```

Push Docker Image to Local Registry

Download and untar the Pre-built ISO, see Spectrum Pre-built ISO Image Load Process. Post logging in, tag and push image onto local docker repository:

```
docker tag spectrumspectroserverimage localhost:5000/<project-name>/
spectrumspectroserverimage
docker push localhost:5000/<project-name>/spectrumspectroserverimage
```

Distributed SpectroSERVER Autoinstaller

Following are the steps to autoinstall the DSS:

1. From the **sdic/linux** folder of the DX NetOps Spectrum package, copy the following files to any directory on the master node:

```
autoinstall.sh
deploy.ini
```

```
autoinstall-deployment.sh
deploymenttemplate.yaml
deploymenttemplateocs.yaml
etc_hosts.sh
routetemplate.yaml
servicetemplate.yaml
```

2. Update the **deploy.ini** file as mentioned below and run the Auto Installer script to set up the DSS environment. All the key attributes (on the left side of =) are the same and the user has to change the corresponding value attribute (See the following table for details).

```
[MainLocationServer]
mls1=<mainss>
imagename=<ss-released-image>
rootpwd=<rt_passwd>
mls1replicas=2
persistentstorageloc=<project-name>\/<value of mls1>
persistentclaimname=<spectrum-nfs-claim-1>
namespace=spectrum
enablebackup=false
[LocationServer]
lscount=1
imagename=<ss-released-image>
ls1=<name>
ls1replicas=1
ls1persistentstorageloc=<project-name>\/<value of ls1>
ls1persistentclaimname=<spectrum-nfs-claim-1>
ls2=<name>
ls2replicas=1
ls2persistentstorageloc=<project-name>\/<value of ls2>
ls2persistentclaimname=<spectrum-nfs-claim-1>
[OneClickServer]
ocs1=<ocsone>
imagename=<ocs-released-image>
servicename=ocs1
routename=ocs1
xiprouteenabled=true
```

This table displays the key attributes and the description of the attribute value.

Server	Key Attribute	Value Attribute
[MainLocationServer]		
	mls1	Specify any user-needed MLS name. The MLS deployment is created using this name.
	imagename	Specify the imagename as the ss-released-image here.
	rootpwd	Specify the rt_passwd here.
	mls1replicas	Specify the number of main location server containers. '1' is the value that is defined here.

	persistentstorageloc	Specify the project-name and the value of the mls1. **Warning!** Do not replace \/, as it is essential for the script to run. Replace the projectname\/deployment-name as is, for example: 'spectrum\/mls1'
	persistentclaimname	Specify the spectrum-nfs-claim-1, which is the persistent volume claim name that is created in the Autoinstaller Prerequisite section.
	namespace	The containers, services, and storage are grouped within the namespace.
	enablebackup	**Default:** False. If set to true, the fault-tolerant pair for each container is created.
[LocationServer]		
	lscount	Specifies the number of location servers to be spawned.
	imagename	Specify the ss-released-image here.
	ls1	Specify the name of the first location server. Could be something intuitive like lsone.
	ls1replicas	Specify the number of replicas of ls1 to be spawned. The default value is 1.
	ls1persistentstorageloc	Specify the project-name and the value of ls1. **Warning!** Do not replace \/, as it is essential for the script to run. Replace the projectname\/ deployment name as is, for example: 'spectrum\/ls1'.
	ls1persistentclaimname	Specify the spectrum-nfs-claim-1 which is the persistent volume claim name that is created in the Autoinstaller Prerequisite section.
	ls2	Specify the name of the second location server. Could be something intuitive like lstwo.
	ls2replicas	Specify the number of replicas of ls1 to be spawned. The default value is 1.
	ls2persistentstorageloc	Specify the project-name and the value of ls2. **Warning!** Do not replace \/, as it is essential for the script to run. Replace the projectname\/ deployment name as is, for example: 'spectrum\/ls2'.

	ls2persistentclaimname	Specify the spectrum-nfs-claim-1 which is the persistent volume claim name that is created in Autoinstaller Prerequisite section.
[OneClickServer]		
	ocs1	Specify the ocs name like ocsone here.
	imagename	Specify the imagename as ocs-released-image here.
	servicename	Specify the servicename as ocs1 here.
	routename	Specify the routename as ocs1 here.
	xiprouteenabled=true	

3. To run the autoinstaller script from **deploy.ini**, run the following command:
   ```
   /autoinstall.sh --ini deploy.ini
   ```

Post-installation Tasks

Perform the following post-installation tasks.

1. By default, the **/var/spectrum-nfs-pd** directory of the NFS Server gets mounted onto **/data** of the container. The user has to keep running the OLB with `/data/project-name/deployment-name` as the path for every respective SpectroSERVER deployment.
   Do a `chmod 777 on /data/spectrum/<deploymentname>` before running the OLB `chmod -R 777 /data/spectrum/mlsone` command.
2. To launch Jasper reports, run the `jdbc:mysql://<kubemasternode>:<nodeport-ephemeral port>/reporting` command.
   For example, jdbc:mysql://<mastername>:45673/reporting

Adding a New Landscape (Location Server)

Run **autoinstall-deployment.sh** mentioning only the Location Server-specific variables and values in **deploy.ini.** To run the `autoinstalleronmls` script from **deploy.ini**, add the new Location Server details to deploy.ini and execute the following command:

```
autoinstall-deployment.sh -ini deploy.ini
```

> **NOTE**
> Because the MLS and other Location Servers already exist, you get warnings such as "mlsone already exists". You can ignore these warnings.

Upgrade Kubernetes

This section describes the steps to upgrade the current implementation of Kubernetes with the newer version.

- Ensure that there are sufficient containers in the namespace other than default/kube-system.
  ```
  kubectl create ns spectrum
  kubectl create -f deployment.yml
  ```
- Check the existing deployments:
  ```
  kubectl get deployment -n spectrum
  kubectl get pods -n spectrum
  kubectl describe pods -n spectrum
  ```
  You get the details of the existing deployment.
- To **start the upgrade**, run the following command:

```
kubectl set image deployment mlsone lstwo *=SPECTRUM_HOME/spectrum/ssimage_new_version
```

- Once the new image is deployed on the local registry and is available, run the following command:
  ```
  kubectl set image deployment <deployment1mls> <deployment2ls> *=SPECTRUM_HOME/spectrum/ssimage_new_version
  ```
  When your deployment has many instances, each deployment is upgraded one after the other and not at the same time.
- To **rollback to previous deployment** if there is an error in the new version, use the following commands:
  ```
  kubectl set image deployment <deployment1mls> <deployment2ls> *=localhost/spectrum/ssimage_old_version
  kubectl set image deployment mainserver  *=localhost/spectrum/ssimage_old_version
  ```
- In case of a DX NetOps Spectrum container failure, a new container gets created post docker/application failure in the old container:
  a. Run the `etc_hosts.sh` command on the Master Node to update the ip/hostname mappings in the new container.
  b. After a restart or upgrade the MLS container, the mls_hostname/ip variables become stale in OneCLick and non-MLS. Run the following command to update the variables from the `Docker_Openshift` folder:
  ```
  ./mls_updater.sh <new-mls-container-name>
  ```

Fault Tolerance Scenario

This section discusses Kubernetes deployment in the fault-tolerant scenario.

- Run the `Ftprimary.sh` on the primary deployment.
  Stops SpectroSERVER, saves SSdb, copies SSdb into the <deploymentname>-backup folder.
- Start SpectroSERVER.
- Run the `Ftsecondary.sh` command on the secondary deployment node.
  Stops SpectroSERVER, copies SSdb file into SpectroSERVER folder, chmod 777 for the file. SSdload with prec 20 starts SpectroSERVER.
- Run the `Ftinstall.sh` command on the master node.
- Populate the `ft.ini` file, in the *mlsprimaypodname mlssecpodname* format.
- Execute the `./ftinstall.sh ft.ini spectrum` command.

Administrating

This section provides information on database management, distributed SpectroSERVER administration, SpectroSERVER performance administration, and OneClick administration.

Database Management

This section discusses the various databases available in DX NetOps Spectrum, and how you can manage or maintain them.

- Overview on DX NetOps Spectrum Databases
- SpectroSERVER Database Maintenance
- DDM Database Maintenance

Overview on DX NetOps Spectrum Databases

This section provides an overview of DX NetOps Spectrum database maintenance and discusses both the SpectroSERVER (SS) and Distributed Data Manager (DDM) databases.

The later sections discuss DX NetOps Spectrum database management in terms of a distributed network environment with multiple SpectroSERVERs. Although distributed computing is an industry-standard, the information in this section can be adapted for non-distributed environments. Distributed database management in DX NetOps Spectrum includes several

levels of DX NetOps Spectrum database maintenance. Various modeling rules and procedures must be followed, and numerous applications can be used to manage a distributed DX NetOps Spectrum network and its associated databases.

The later sections describe maintaining both the local database that is a part of each SpectroSERVER and the historical databases that represent multiple SpectroSERVERs.

The SpectroSERVER Database

The SpectroSERVER database, which is located in the *$SPECROOT*/SS directory, contains the following information:

- A modeling catalog (model types and relations), the structure for all network information
- Created models that belong to this SpectroSERVER

The icons that represent network devices in OneClick are reporting information that is retrieved from a *model* (a software simulation) of the actual device. The model is maintained in the SpectroSERVER database and is updated with information from several sources. Information that is retained from one execution of the SpectroSERVER to the next is also stored in the SpectroSERVER database.

Distributed Data Manager (DDM) Database

Each SpectroSERVER has a Distributed Data Manager (DDM) database to store DX NetOps Spectrum events and statistical data for use across multiple landscapes. Client applications, such as DX NetOps Spectrum Report Manager and DX NetOps Spectrum AlarmNotifier, can then request, receive, and collate the data by the landscape. The DDM database is located in the SpectroSERVER *$SPECROOT*/mysql/data/ddmdb directory.

NOTE
For more information, see the Distributed SpectroSERVER Administration section.

Like the SpectroSERVER database, multiple concurrent users of CA-developed programs are prevented from accessing the DDM database. DX NetOps Spectrum applies a soft lock file (*$SPECROOT*/SS/DDM/.DDMDB.LOCK) to prevent access from multiple, simultaneous CA-developed applications. Under certain circumstances (for example, when recovering from an abnormal shutdown), the soft lock file can be removed.

WARNING
When CA-developed applications encounter a database lock file, an error message alerts you. However, non-CA tools and applications may not check for this lock and, therefore, do not generate any message. If these non-CA entities are able to bypass the lock, database corruption can result. As a best practice, before allowing any non-CA tool or application to access a DX NetOps Spectrum database, verify that all DX NetOps Spectrum processes are shut down.

The Archive Manager controls all communications between the DDM and the SpectroSERVER databases, and between the DDM database and client applications.

Archive Manager

Each landscape has an Archive Manager server that retrieves events and statistical data from the SpectroSERVER, compresses them, and stores them in the DDM database. Data compression enables the storage of more performance data and decreases the network traffic between the applications and the DDM database.

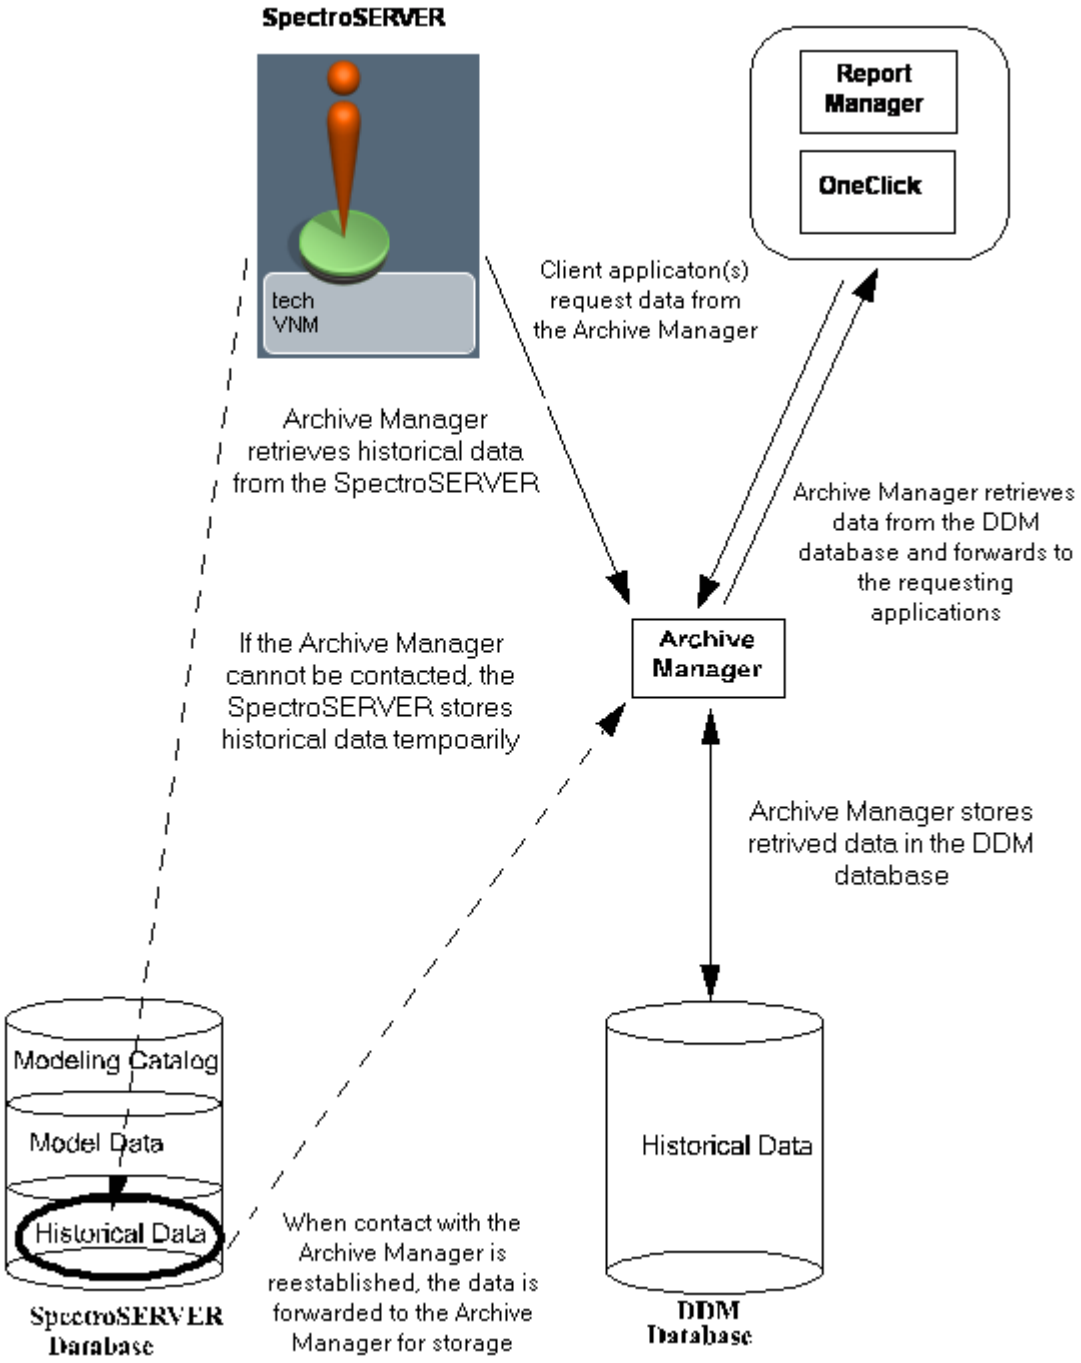
As the diagram shows, if the SpectroSERVER cannot contact the Archive Manager, the SpectroSERVER stores events and statistical data until contact is reestablished. The SpectroSERVER then sends the data to the Archive Manager for storage. The Events and Statistics Archive options in the .vnmrc file determine the amount of data that the SpectroSERVER stores. Options in the .configrc file determine the length of time that historical data is stored in the DDM database.

NOTE
For more information, see the Distributed SpectroSERVER Administration section.

The Archive Manager can also provide the following information in response to requests from client applications:

- A list of landscapes for which information is available
- For each landscape, the time range of the available information and a list of model types for which information is available
- For each model type, a list of models for which information is available
- For each model, a list of attributes for which information is available
- Statistical data in the specified time range
- Event data in the specified time range

The following diagram shows the interaction between the SpectroSERVER and the DDM database.



SpectroSERVER Database Maintenance

This section describes database maintenance procedures for the SpectroSERVER database.

Database Backups

Creating regular backup copies of your database is the foundation of database maintenance. A reliable backup copy of your database can enable you to restore the database following power failures or other system interruptions.

DX NetOps Spectrum offers two methods of performing backups of the SpectroSERVER database:

- Automatically with the SpectroSERVER running.
- Manually with the SpectroSERVER shut down.

> **WARNING**
> The database backup methods that are described in this section, Online Backup and the SSdbsave utility, are the only supported methods of backing up the SpectroSERVER database. Use of third-party backup software can result in database corruption.

Online Backup

Online Backup lets you create a backup copy of your SpectroSERVER database without having to shut down the SpectroSERVER. Depending on your requirements, you can perform online backups on demand, or you can schedule regular backups to be performed automatically. If disk space is limited, you can configure Online Backup to compress backup files automatically using the DX NetOps Spectrum gzip utility.

Online Backup saves the entire database, including the modeling catalog and models. However, neither Online Backup nor a manual backup operation saves the following information:

- Cached event information
- Alarms
- Cached statistical information
- Historical records in the DDM database (see the note below)
- SpectroSERVER resource file (.vnmrc)

Online Backup activity is recorded as events associated with the VNM model. DX NetOps Spectrum reports errors that were encountered during backup operations as alarms.

Online Backup performs a save in two major steps:

1. Makes a copy to preserve a “snapshot” of the database files.
   Polling, trap handling, and network management activities are suspended during this first step. The process is relatively short, but as a best practice, consider how often and when to schedule automatic save operations. The time to perform a copy operation depends on your workstation hardware and the database size.
2. Saves the copy (and compresses it when required) using the same format as the manual database save utility, SSdbsave.

The Online Backup does not, by itself, save the DDM database. However, you can configure the post_olb_script to execute automatically and save the DDM database whenever an Online Backup of the SpectroSERVER database is performed.

> **NOTE**
> In a fault-tolerant environment, verify that you are logged on to both the primary and secondary SpectroSERVER as the same user before running Online Backup.

Backup File Maintenance

When automatic backups are enabled, backup files can accumulate in your backup directory and deplete the available disk space. To avoid backup failures, delete files occasionally or move backup files to a more permanent storage medium.

Configure Online Backup

When you configure online backup, you can specify the backup interval and the date and time of the first scheduled backup. For more advanced scheduling options, use the StartOnlineBackup application in the *$SPECROOT*/SS-Tools directory to initiate online backups. The StartOnlineBackup application can be launched from either the Task Scheduler or the crontab for the host system. The advanced scheduling options in the StartOnlineBackup application can avoid problems where daylight savings time skews scheduled backups.

Follow these steps:

1. In OneClick, open the Universe Topology view, and then select the VNM model.
2. Click the Information tab, and expand the Online Database Backup subview.
3. Configure the following settings as required:
   - **Automatic Backups**
     If enabled, online backups are automatically performed with the Online Backup feature according to the time interval specified in the Backup Interval setting.
   - **Backup Interval**
     Specifies the interval between automatic backups in hours and minutes. We recommend using the default interval of 24 hours and 0 (zero) minutes so that the database is backed up at the same time every day. Enter any value. For example, 168 hours and 0 minutes (for a one-week interval) and 10,080 minutes (also for a one-week interval) are equivalent.
   - **Next Backup Date & Time**
     Displays the date and time for the next scheduled backup. You can specify a date and time for the first backup. However, subsequent backups are performed at the interval that is specified in the Backup Interval setting.
   - **Backup Compression**
     If enabled, backup files are compressed using the compression utility before being written to disk. Compressed files are saved with a .gz suffix appended to the filename. If disabled, files are saved uncompressed. The default value is Enabled.
   - **Prefix for Backup File Name**
     Specifies the user-defined portion of the backup file name. The default prefix is “db_”. However, you can specify any character string that creates a legal file name for the system on which you are running SpectroSERVER. If unset, no prefix is added to the file name.
     The filename suffix indicates the date and time when the backup was executed and uses the following format: *yyyymmdd_hhmm.SSdb* [*.gz*]

Format	Description
yyyy	4-digit year
MM	month
dd	day of the month 1 through 31
hh	hour of the day - 1 through 24
mm	minute - 00 through 59
gz	indicates a compressed backup (compressed files only)
SSdb	default suffix for all database save files

Backup Directory

Specifies the directory where the backup files are stored. We recommend using a local directory. The default directory is *$SPECROOT*/SS-DB-Backup.

- **Minimum Required Disk Space (MB)**

Specifies the minimum disk space that must be available to initiate an online backup. The default threshold value is 20 MB. If an automatic backup is initiated when the available disk space falls below the threshold, a yellow alarm is generated. The probable cause indicates a backup failure due to low disk space.

Click the Begin Backup Now button to initiate a backup on demand using the current settings.

The online database backup utility first pauses SpectroSERVER operations. Then it copies and saves the database.

NOTE
The status of an in-progress online backup operation is displayed next to the Begin Backup Now button. If an error occurs, an event and an associated alarm are displayed on the Events tab and Alarms tab. For a list of the events and alarms that can be generated during an online backup, see Online Backup Events and Alarms.

The StartOnlineBackup Application

The StartOnlineBackup application lets you use the scheduling applications in your operating system to schedule regular backups. For example, you can use the Task Scheduler in the Windows environment. Using these applications avoids potential problems with daylight savings time that can skew the scheduled backup. This application is a more sophisticated alternative to using the automatic backup setup.

The StartOnlineBackup application can be launched from either the Task Scheduler or the crontab. It is located in the *$SPECROOT*/SS-Tools directory. StartOnlineBackup uses the following syntax:

```
StartOnlineBackup -lh <landscape handle>
```

You can set backup parameters for StartOnlineBackup in the Online Database Backup subview on the Information tab of the VNM model. The following parameters are exceptions: Automatic Backups, Backup Interval, Next Backup Date & Time.

Restore Your Database with Online Backup Files

Uncompressed backup files that Online Backup generates are stored in the same format as files that were saved using the SSdbsave utility with the -cm option.

NOTE
Use the gzip utility that is included with DX NetOps Spectrum to restore compressed files that have a .gz suffix. This utility restores the files to the format that the SSdbsave utility uses.

Online Backup Events and Alarms

The following events and alarms are associated with Online Backup.

Event Code	Event	Event Cause	Create Alarm
0x00010903	OB_EVENT_GEN_FAILURE	Database open failure	RED
0x00010903	OB_EVENT_GEN_FAILURE	Database close failure	RED
0x00010903	OB_EVENT_GEN_FAILURE	Any other reason causing backup failure	ORANGE
0x00010904	OB_EVENT_BACKUP_ON	Automatic backups have just been enabled by the user	No
0x00010906	OB_EVENT_BACKUP_STARTED	Online Backup started	No
0x00010907	OB_EVENT_BACKUP_COMPLETED	Online Backup successfully completed	No

0x00010908	OB_EVENT_NO_FILE_OR_DIRECTORY	File/directory does not exist, or does not have read and execute permissions	YELLOW ORANGE
0x0001090a	OB_EVENT_NO_CREATE_BACKUP_DIR	Cannot create backup directory	ORANGE
0x0001090b	OB_EVENT_LOW_DISK_SPACE	Low disk space, backup failed	YELLOW
0x0001090c	OB_EVENT_COPY_FAILED	Database copy failure	RED
0x0001090e	OB_EVENT_DB_INCONSISTENT	Database inconsistency	ORANGE
0x00010920	OB_EVENT_OFFLINE_SAVE_FAILED	Off-line portion of the save process failed	RED
0x00010921	OB_EVENT_VNM_RESUMED	Resuming normal operation, SpectroSERVER was paused	No
0x00010922	OB_EVENT_BAD_FILENAME	Filename specified is not a valid Posix directory name	ORANGE
0x00010924	OB_EVENT_DBSYNC_FAILED	Attempts to synchronize backup server failed	ORANGE

Manual Backup

You can create a backup of your database manually using the SSdbsave database utility, which is included with DX NetOps Spectrum. Your database contains a catalog of template information that is used to create models (model types, relations, and rules) and the models themselves. You can create a backup copy of your database that includes either one or both of these components using SSdbsave. We recommend performing a complete save, containing both the modeling catalog and the models.

Create a Complete Backup

You can create a complete backup copy of your database. A complete backup includes both the modeling catalog (model type hierarchy, relations, and rules) and the models themselves.

Follow these steps:

1. Navigate to the *$SPECROOT*/SS directory.
2. Verify that neither the SpectroSERVER nor any other program that accesses the SpectroSERVER database is running.

   NOTE
   When first installed, the utility is located in the *$SPECROOT*/SS-Tools directory. If the location is not set in a system path statement, you must either use a full path, use a relative path, move the file, or link it to the same directory with the SpectroSERVER database.
3. Enter the following command to save both the modeling catalog and models:

   ```
   ../SS-Tools/SSdbsave -cm <save_file>
   ```

   The suggested naming scheme for save files is to incorporate a date stamp and the flags for the save command. In this case, you are using both the “c” (catalog) and “m” (models) flags; therefore, assuming it is October 14, 2013, enter db_20131014_cm as the save file name.
   A file named “db_20001014_cm.SSdb” is created. The “.SSdb” suffix is added automatically.

Create a Split Backup

Although the models in the SpectroSERVER database can change on a daily basis, the modeling catalog changes only when you perform an upgrade installation, add new management modules, or make changes directly using the Model

Type Editor. Therefore, if you have a very large database, you can save some time by splitting your backups. With a split backup, you save your models on a regular basis, but save the modeling catalog only after it changes. You then store the backup of the modeling catalog in a safe place. Along with the most recent save of your model information, this backup file provides a complete database backup.

The following procedure describes how to perform a split backup of the database on October 14, 2013, creating one save file for the modeling catalog and a separate file for the models.

Follow these steps:

1. Navigate to the *$SPECROOT*/SS directory.
2. Verify that neither the SpectroSERVER nor any other program that accesses the SpectroSERVER database is running.

   NOTE
   When first installed, the utility is located in the *$SPECROOT*/SS-Tools directory. If the location is not set in a system path statement, you must either use a full path, use a relative path, move the file, or link it to the same directory with the SpectroSERVER database.
3. Enter the following command to save only the modeling catalog:

   ```
   ../SS-Tools/SSdbsave -c db_20131014_c
   ```
4. Enter the following command to save only your models:

   ```
   ../SS-Tools/SSdbsave -m db_20131014_m
   ```

   The modeling catalog is saved in a file named db_20131014_c.SSdb, and the models are saved in a file named db_20131014_m.SSdb.

   NOTE
   Save your models on a regular basis or whenever you make a significant change to your network model. Save your modeling catalog anytime you install a new version of DX NetOps Spectrum, add new management modules, or make any catalog changes with the Model Type Editor.

Restoring Your Database

Your DX NetOps Spectrum database consists of a modeling catalog that contains the model type hierarchy and relations, models to represent entities in your network, and developer information. The SSdbload database utility program lets you perform the following tasks:

- Load previously backed-up database files.
- Initialize the database and load a previously backed-up database file that contains a modeling catalog.
- Load developer information.

Load a Database

If no database corruption has occurred, you can use the following command to load a backup file without first initializing the database:

```
SSdbload -l
```

You can use the SSdbload utility to load the contents of a file that the SSdbsave utility created and uncompressed files that were saved using the DX NetOps Spectrum Online Backup tool into a database.

NOTE
Use the gzip utility that is included with DX NetOps Spectrum to restore compressed files that have a .gz suffix. This utility restores the files to the format that the SSdbsave utility uses.

SSdbload reads the save file to determine the types of information that were saved (modeling catalog and models). It then removes all of the corresponding information from the database and loads the backup information into the database. For example, when loading a save file that contains only models (saved using only the -m option), SSdbload first deletes all model information from the database, and then loads the model information from the save file.

Similarly, when you load a save file that contains only the catalog, the operation deletes the catalog from the database and then loads the catalog from the save file. If you created separate backup files, with one for the modeling catalog and another containing model information, load the catalog (model type and relation) information first, and then load the model information.

> **WARNING**
> You *cannot* use the -l option to load additional catalogs or models into an existing database. The -l option does not augment the contents of the database. Instead, it determines the content of the save file that is loaded and removes any existing information of the same type before loading.

Follow these steps:

1. Navigate to the *$SPECROOT*/SS directory.
2. Verify that neither SpectroSERVER nor any other program that accesses the SpectroSERVER database is running.
3. Execute the SSdbload command, providing the name of the file to be loaded into the database structure:
   ```
   ../SS-Tools/SSdbload -l <filename>
   ```
   > **NOTE**
   > When first installed, the utility is located in the *$SPECROOT*/SS-Tools directory. If the location is not set in a system path statement, you must either use a full path, use a relative path, move the file, or link it to the same directory with the SpectroSERVER database.
4. If the backup file loaded in Step 3 contained only catalog information, repeat Step 3, substituting the name of the backup file containing the model information.
   The database is now ready for use.

Initialize and Load a Database

You can initialize and load a database with a single operation. Initializing the database removes the modeling catalog, model information, vendor information, and unarchived events and statistics log records, and it refreshes all the database files. (To keep the databases synchronized, when you initialize the SpectroSERVER database, also initialize the historical databases using ddm_load.)

Always initialize the database if you suspect corruption. With the database initialized, the -l option then loads the new database information (modeling catalog and models) according to the SSdbsave options that were used when the backup file was created.

> **WARNING**
> The -i option removes all models, model types, relations, vendor information, and all unarchived events and statistics log records from the database. When running SSdbload with the -i option, you can load the catalog to start the SpectroSERVER with no models. Or you can restore the database completely. Restore it by loading one backup file that was saved using both the SSdbsave -c and -m options, or by loading a split backup (a file that was saved using -c and -m options separately).

If split backups are used, run SSdbload once for each backup file that is loaded. Use the -i option only once, with the first SSdbload. The catalog must be loaded before the models.

To initialize and load with one operation, use the -i option with the -l option. This method is recommended for loading new database information from a file saved using the -c and -m options with SSdbsave.

Follow these steps:

1. Navigate to the directory containing the database.

2. Verify that neither the SpectroSERVER nor any other program that accesses the SpectroSERVER database is running.
3. Use caution if using .after files that are older than the current executables when initializing the database. Information that you are expecting may not be present if the .after files are older than the executables. Refer to SSdbload for an explanation of .after files.
4. Enter the following SSdbload:

   ```
   ../SS-Tools/SSdbload -i -l <filename>
   ```

   The database is initialized and then loaded with the information from the backup file you specify. The database is then ready for use.

Load Developer Information

Registered developers are permitted to load developer information (a file containing your developer ID) into the SpectroSERVER database using SSdbload with the -d option. You must reload the developer information after any initialization of the database, but you can only load this information once between initializations. Attempting to execute a second SSdbload using the -d option produces an error message and leaves the developer information unchanged.

> **WARNING**
> Load developer information into only one database, and perform all modeling catalog editing on that database. Modifications can then be propagated to other databases using SSdbload if required. However, loading the same developer information on multiple databases can result in duplicate model type, attribute, or relation handles. Duplicates make it impossible to correlate historical data across landscapes.

Follow these steps:

1. Navigate to the *$SPECROOT*/SS directory.
2. Verify that neither the SpectroSERVER nor any other program that accesses the SpectroSERVER database is running.

   > **NOTE**
   > When first installed, SSdbsave is located in the *$SPECROOT*/SS-Tools directory. If its location is not set in a system path statement, you must use a full path, a relative path, move it, or link it to the same directory with the SpectroSERVER database.
3. Enter the following command:

   ```
   ../SS-Tools/SSdbload -d <developer filename>
   ```

Removing a Database Lock

Whenever a CA-developed program accesses a DX NetOps Spectrum database, it creates a lock file within that database directory. The lock file in the SpectroSERVER database is called .VNMDB.LOCK. The lockfile in the DDM database is called .DDMDB.LOCK. The lock file serves as an indicator that the database is currently in use and cannot be accessed by another CA-developed program.

The following CA-developed programs create a lock file:

- converter
- dbtool
- lh_set
- mte (Model Type Editor)
- reports
- SpectroSERVER
- SSdbdelete
- SSdbload
- SSdbsave

When a CA-developed program reaches normal termination, it removes the lock file. However, occasionally a CA-developed program is abnormally terminated, and the lock file is left behind. If not removed, the lock file inhibits the execution of other CA-developed programs that access the database. When a lock file exists and another CA-developed program is started, the following message appears:

```
Database already locked by:<user id>,
by process:<process name>,
with process ID:<process id>,
on network node:<node name>,
which started at:<date/time stamp>
```

You can manually remove a .VNMDB.LOCK or .DDMDB.LOCK file that you believe was left behind by an abnormally terminated program, but first, you should verify that the program is not running. If it is still running (and preventing a higher priority program from accessing the database), the first attempt to terminate the program normally. If that is not possible, you can stop the program using a UNIX kill command (with no options) or the End Process button in the Windows Task Manager. Any of these methods remove the lock file.

If the program was abnormally terminated, you can remove the lock file manually by navigating to the *$SPECROOT*/SS or *$SPECROOT*/SS/DDM directory, as appropriate, and entering one of the following commands:

- rm .VNMDB.LOCK (to remove a lock from the SS directory)
- rm .DDMDB.LOCK (to remove a lock from the DDM directory)

WARNING
To maintain the integrity of your database, you must restore both your SpectroSERVER and DDM databases anytime you are forced to remove a lock file from either the *$SPECROOT*/SS or *$SPECROOT*/SS/DDM directories. The SpectroSERVER does not restart until you perform a database restore operation.

Also, remember that .VNMDB.LOCK and .DDMDB.LOCK files do not prevent database access by non-CA-developed programs, and no error message is generated when such programs encounter these locks. Therefore, before allowing any non-CA tools or applications to access a DX NetOps Spectrum database, you should make sure that all DX NetOps Spectrum processes accessing that database are shut down.

Import and Export Model Types

NOTE

The dbtool utility allows you to import and export model types and associated objects (attributes, relations, and meta-rules) from the SpectroSERVER database.

Recovering from Database Corruption

Several conditions, including hardware failures and power interruptions, can result in a corrupted database and generate an error message such as the following:

```
Sep 18 15:42:39 ERROR at CsSSDbRp.cc(642):
table open failed @ TableImpl.cc:674(0x2)
Db::open: No such file or directory
Could not open the database. VNM exiting.
Landscape not initialized. VNM exiting.
```

Database corruption may also have occurred when the SpectroSERVER or other applications generate error messages not readily attributable to specific causes such as the lack of a user model, the presence of a database lock, and so on.

If you have maintained a schedule of regular backups, you can usually recover from database corruption with minimal loss of information simply by using the SSdbload utility to initialize your database and reload the last known “good save” of your database-that is, one that includes both the modeling catalog and the models, and that was created prior to any

indications of corruption. If you do not have a known good save of your database, or if application errors persist after you reload what you believe to be a good save, contact your CA Support representative.

SpectroSERVER Database Troubleshooting

This section describes some of the most common problems reported to CA Support by customers.

Using SSdbload to Load Old Objects after an Install/Upgrade

Using SSdbload to load old models, model types, or relations after an install or upgrade can cause serious database problems. The best way to avoid these problems is to understand how SSdbload operates. When you attempt to load a file using the -l option, SSdbload looks at the file to determine the types of objects it contains (which depend on the option flags that were used with SSdbsave to create the file). For each object type in the file (modeling catalog and/or models), SSdbload first removes any existing objects of that type from the database. For example, if you execute:

```
SSdbload -l somefile_c.SSdb
```

with the intention of updating a newly upgraded database with your old modeling catalog, you would replace the modeling catalog in the database with one from the save file. This could leave you with an unusable database since the upgraded modeling catalog may be needed to operate with the new version of DX NetOps Spectrum. Also, any modifications made with the Model Type Editor would be lost.

Inappropriate Use of the -i Option of SSdbload

Using the -i option of the SSdbload tool involves some potentially serious repercussions. When this option is used, all existing objects in the database are removed. The objects that are removed include model types, models, relations, attributes, rules, unarchived events, and unarchived statistics. Thus, if you execute the following command:

```
SSdbload -i -l somefile_m.SSdb
```

and the somefile_mSSdb file contains only models, the load fails. If you execute the same command with a file that contains only a modeling catalog (that is, one saved with the -c option only), the resulting database contains only the model types and relations that are loaded from the file. All other objects that previously existed in the database are lost, including all user-created models.

Copying Database Files between Operating Systems/Platforms

The database files (*.db, *.ix, log.*) are operating system and platform-specific. Copying a database from one operating system or platform to another is not supported. The only supported method of moving the data that is contained in these files is by running SSdbsave on the source computer and SSdbload on the destination computer. As long as these tools exist on each computer, and they were compiled for their respective servers, transfer of data succeeds.

Loading Order of the Modeling Catalog and Models

It is important to understand two facts about DX NetOps Spectrum models:

- Models are instances of model types, which are defined within the modeling catalog.
- Models and model types have a dependency relationship.

If the model type for a given model is not present or is not the correct version, an attempt to load a file that contains that model fails. Always load any prerequisite modeling catalog before loading models that were created from that modeling catalog.

Adding Modeling Catalog Objects to Multiple Databases with the Same Developer ID

When modeling catalog objects (model types, relations, and attributes) are added to a database using the Model Type Editor, they are assigned a unique handle. The handle comprises the active developer ID plus the next available sequential number for that object type. However, each database assigns and maintains these sequential numbers independently. Therefore, if new objects are added to another database using the same developer ID, the same handle can represent different objects in each database. In a distributed SpectroSERVER environment, this kind of conflict makes it impossible to correlate historical data across landscapes.

To avoid a problem with duplicate handles, only modify modeling catalog information in one database. Save the changes using SSdbsave with the -c option, and then propagate the changes to other databases as required using SSdbload with the -l option.

UNIX File Access Permissions on Database Files and Directory

For proper operation of the SpectroSERVER and database tools, you must have write permission to all database files (*.db, *.ix, log.*) and to the directory that contains those files. If you receive a message from one of the database tools or the SpectroSERVER that indicates that the program was “Unable to open lock file,” check the permissions on the database files and directory.

Database Tools

This section describes the following database tools, utility programs, or scripts:

- db_remove
- dbtool
- HostUpdate
- MapUpdate
- reports
- SSdbload
- SSdbsave
- Database Model Conversion Tool (DBconv)

> **NOTE**
> When first installed, all of the tools listed above are located in the *$SPECROOT*/SS-Tools directory. If location of a tool is not set in a system path statement, either use a full path, or move it into the same directory with the SpectroSERVER database.

db_remove

This utility removes obsolete model types (and their associated originating attributes and meta-rules) from the modeling catalog of the SpectroSERVER database.

> **NOTE**
> This tool is not intended for general usage. Do not run db_remove unless you have specific instructions or technical bulletins that were issued by CA. For more information, contact a CA Support representative.

This utility has the following format:

```
db_remove [-debug] [<MTH_FILE>]
```

- **-debug**
  Enables verbose informational message output.
- **<MTH_FILE>**
  Specifies the text file containing a whitespace-separated list of the model type handles to remove from the database.

Errors

Warning: Model Type 0x???????? - "*model type name*" could not be removed.

You see this message in the unlikely event that you (or another vendor or partner) have derived new model types from the model types that are being removed. In that situation, run the Model Type Editor to see what is derived from this model type. Then move the derived model type or types to a different, non-obsolete derivation point. Finally, rerun the db_remove tool with the original MTH_FILE.

Warning: Model Type 0x???????? - "*model type name*" is currently referenced in a default Attribute value. The reference occurs in Attribute 0x???????? - "*attribute name*", at Model Type 0x???????? - "*model type name*".

You see this message if you (or another vendor or partner) have added a reference from a default value of an attribute (of MODELTYPE_HANDLE or list-of MODELTYPE_HANDLE) to the value of the model type handle that is being removed. This message does not prevent the removal of the model type. However, investigate the default value of the attribute. Depending on how it is used, either remove the reference or replace it with an appropriate, non-obsolete model type handle.

dbtool

As your network grows, you typically add model types to your database. In some cases, you may want to add the new model types without installing a new database. You can use the dbtool utility to accomplish the following related tasks:

- Export model types from the permanent catalog in the SpectroSERVER database.
- Import model types into the permanent catalog in the SpectroSERVER database.
- Display (dump) the contents of an export file.
  The dump function sends the output to the standard output for the workstation, normally your display screen. However, you can also send the output to a file or to a printer.

The Model Type Editor includes similar functions for exporting and importing model types. However, the dbtool utility lets you specify multiple files as command-line arguments. As a result, it is more useful for batch-processing a set of files.

> **NOTE**
> For more information, see the Model Type Editor section.

Depending on the function (export, import, or dump), the dbtool utility uses one of the following types of files:

- A model type list file with file extension .m. This file contains a list of model type ID codes. Each ID appears on a separate line (separated by return characters) or is separated from others on the same line by spaces. You can create these files with your preferred shell text editor.
- An extract file with file extension .e. You can create these binary files, also referred to as catalog files, using the dbtool export function or using the Model Type Editor. They contain all the information in the database that is relevant to the model types that are listed in the associated *.m file (if one is produced by dbtool). Or, if the Model Type Editor produces the catalog file, they contain the information that is relevant to all of the selected model types.
  Catalog files are the means of transferring model types from one system to another using media such as email files and others.

  > **WARNING**
  > Before you run dbtool, shut down the SpectroSERVER and any other program that accesses the SpectroSERVER database, including third-party programs. Always run dbtool from the directory that contains the SpectroSERVER database.

The dbtool utility loads the database so that symbolic names can be used when possible.

This utility has the following format:

```
dbtool        [dump <file>.e [ <file>.e ...] ]
dbtool        [dump_mt <file>.e [ <file>.e ...] ]
```

```
dbtool        [import <file>.e [ <file>.e ...] .xml [ <file>.xml ...] ]
dbtool        [export <file>.m [ <file>.m ...] ]
```

- **dump**
  Displays the contents of the specified .e file (catalog file) in readable form. Unlike the dump_mt argument, this argument includes not only model type information in the output, but also attribute, relation, and meta-rule information. You can specify multiple catalog files to dump if desired.

  NOTE
  This option reports the attribute names for only those attributes that originate in the model type being exported. It does not provide output for changes to extended flags, OID Prefix values, or OID Reference values.

  This argument does not operate on the database.
- **dump_mt**
  Displays information about the model types that are listed in the specified .e file in readable form. You can specify multiple catalog files to dump if desired. Unlike the dump argument, this argument does not include attribute, relation, or meta-rule information in the output.
  This argument does not operate on the database.
- **import**
  Imports the model types, attributes, relations, and meta-rules in the specified .e or .xml file into the database. You can specify multiple catalog files to import if desired.
  Importing model types that are already present in the database produces a warning message about that model type being redefined. This warning message can be ignored.
- **export**
  Uses the specified .m file to create a catalog file that contains the model types that are specified by model handle in the .m file. You can specify multiple .m files to create multiple catalog files.
  The model type handle entries in the .m files must be hexadecimal integers that are preceded by “0x” (zero followed by lowercase “x”). In addition, the entries must be separated by at least one space character or by a newline character.
- **help**
  Displays usage information about the command.

Export Model Types Using dbtool

You can export model types using the dbtool utility.

Note: You can only export the model types, attributes, and relations (and associated meta-rules) that were created using the developer ID that is currently loaded in the SpectroSERVER database. That developer ID is the “owner” of these objects. If you are not the owner of a model type or other object that is included in an export operation, the operation terminates with an error message.

A catalog file (.e file) that the export process produces contains the following information:

- The attribute descriptors that originated in the model types being exported.
- The attribute descriptors that have been specialized (for example, by specifying a default value to override an inherited one).
- The relations and associated meta-rules in which the model types and any ancestor model types participate as an antecedent or a predicate.

“Fringe” model types have at least one base model type that is not exported in the same *.e file. These types differ in that they include the attribute values and extensions that are inherited from the base model type that is not included. The inclusion ensures the availability of those values and extensions.

Follow these steps:

1. Change your working directory to the directory that contains your database.

2. Verify that the dbtool utility is either in the current directory or in your system search path. Or, when you later invoke the dbtool command (step 4), use an appropriate relative or absolute path name.
3. Create the .m file that specifies the model types to export.
4. Export the model types using the following command:

   ```
   ../SS-Tools/dbtool [export<filename_11>.m [<filename_2>.m ... ] ]
   ```

   The following command serves as an example:

   ```
   ../SS-Tools/dbtool export smart_hub.m smart_router.m
   ```

   The command in this example exports the model types that are defined in smart_hub.m and writes the resulting output to a file named smart_hub.e. It then processes smart_router.m in the same way.

Create the .m File

The export function of the dbtool utility uses one or more *.m files to specify the model types to be exported by model type handle. Before running an export using dbtool, create one or more of these files using your preferred shell text editor.

Typically, the list of model types to export includes any base model types that are required by the model types being exported and that do not exist in the destination database. However, dependencies normally are limited to certain commonly used base model types that are contained in one or more “core” catalogs. These catalogs are included as part of the basic DX NetOps Spectrum system.

Follow these steps:

1. Enter model handle entries as hexadecimal integers preceded by “0x” (zero followed by lowercase “x”). 0x should be followed by 8 digits that consist of your 4-digit developer ID followed by a 4-digit sequence number.
2. Separate model handle entries, either by at least one space character or by a newline character.
3. Name the file that lists the handles with the .m file extension.
   For example, the following list specifies five model types (created using the default developer ID) for export:

   ```
   0xffff0003 0xffff0008
   0xffff0017 0xffff0023
   0xffff0045
   ```

   This example would produce a *.e file that contains the database information for the 3rd, 8th, 17th, 23rd, and 45th model types created under the currently loaded developer ID (in this case, the default developer ID).

   WARNING
   Database access must be limited to a single application at a time. When dbtool is in use, all other applications (including OneClick and the Model Type Editor) are denied access. While CA-developed programs automatically lock out other CA products, database corruption can occur if this caution is bypassed by third-party applications.

Import Model Types Using dbtool

You can use the dbtool import function to import model types into the SpectroSERVER database from one or more catalog files (.e files) that you previously created using the dbtool export function or using the Model Type Editor.

Database access must be limited to only one application at a time. When dbtool is in use, all other applications (including OneClick and the Model Type Editor) must be denied access. While CA-developed programs automatically lock out other CA products, corruption of the database can occur if this caution is ignored or bypassed with respect to any third-party application programs.

Follow these steps:

1. Back up the SpectroSERVER database.
2. Change your present working directory to the directory that contains your database.
3. Verify that the model type files to import are either in the current directory or in your system search path.
4. If your database is initialized (files with .d and .k extensions), proceed to the next step. Otherwise, initialize the database and load the core model type derivation, using the SSdbload -i -l utility command.

5. Import the model types using the following command:

   ```
   ../SS-Tools/dbtool import [<filename_1.e> ... <filename_n.e>]
   ```

   The following command serves as an example:

   ```
   ../SS-Tools/dbtool import rmon1.e rmon2.e
   ```

   After the contents of the last source file are imported, a message indicates that the operation is complete.

Direct the Contents of a Catalog File to an Output Device

When you run the dbtool utility with the dump argument or dump_mt argument, the utility sends the output to the workstation's standard output device, which normally is your display screen. If you want to redirect the output to a file or printer directly, provide standard UNIX piping commands in the command line to redirect the output as desired.

Example 1

The following command dumps the output of a catalog file named rmon.e to the workstation's standard output device:

```
dbtool dump rmon.e
```

The output would appear on your workstation as a one-time display, and, if it were too long, you would only see the end of the output (that is, however many lines of text your display is capable of showing).

Example 2

The following command dumps the output of the same catalog file as the preceding example, but the output is sent to your workstation screen as an incremental display file, showing you the first screen:

```
dbtool dump rmon.e | more
```

To increment through successive lines while viewing the screen, you would press Return; to increment to the next screen, you would press the spacebar.

Example 3

The following command dumps the output of the same catalog file as the preceding example, but the output is written to an ASCII file name filesave.out:

```
dbtool dump rmon.e > dumpouts/filesave.txt
```

The file is created in the *$SPECROOT*/SS/dumpouts directory, which you must have created previously.

Example 4

The following command dumps the output of the same catalog file as the preceding example, but the output is sent as a print file to the printer designated by <ptr>:

```
dbtool dump rmon.e > lpr -P<ptr>
```

Troubleshoot dbtool

The following are errors that you might encounter when running dbtool:

- **database open failed**
  The SpectroSERVER database is not present in current directory.
- **database files are missing are missing read and/or write permissions**
  You do not have your developer ID loaded into the database, or you are not a valid user with respect to the specified database.
- **Database already locked by:<user id>by process:<process name>with process ID:<process id>on network node:<node name>which started at:<date/time stamp>**
  The database is locked by another process.

MapUpdate

MapUpdate is a utility used to modify and display the landscape map. This program is located in the *$SPECROOT*/SS-Tools directory and performs the following tasks:

- Removes a landscape entry from a landscape map
- Displays the current landscape map

If you are removing a secondary SpectroSERVER, be sure to run MapUpdate to remove the secondary SpectroSERVER from the list of loaded landscapes on the primary SpectroSERVER. If you are using a timeout value for your landscape entries, run MapUpdate -remove before the landscape entries on the secondary SpectroSERVER time out. Otherwise, you may not be able to properly remove the secondary SpectroSERVER from the primary SpectroSERVER's list of loaded landscapes.

> **NOTE**
> In previous releases, landscape entries timed out after one hour by default and were removed automatically from the landscape map. Starting in 9.2.2, landscape entries do not time out by default. You must remove an entry from a landscape map manually, using MapUpdate. You can use a timeout value for a landscape entry. For more information, see the Distributed SpectroSERVER Administration section.

This command has the following format:

```
MapUpdate [-remove LANDSCAPE_HANDLE] [-precedence PRECEDENCE] [-view]
```

- **-remove *LANDSCAPE_HANDLE***
  Specifies the handle of the landscape to remove. You must first shut down the SpectroSERVER that you want to remove. In addition, if you are removing a secondary SpectroSERVER, the primary SpectroSERVER must be running.
  Default: 0x400000
- **-precedence *PRECEDENCE***
  The precedence value of the landscape to remove.
- **-view**
  If supplied, displays the current landscape map.

HostUpdate

The HostUpdate utility, located in the SS-Tools directory, lets you remove all landscape map entries that are partitioned by host for the host that you specify.

```
HostUpdate [-remove HOSTNAME] [-view]
```

- **-remove**
  Removes all entries for the host that you specify by entering the hostname.

  > **NOTE**
  > Host entries automatically time out from the landscape map. Therefore, this option is probably unnecessary. However, you can use this option if the automatic timeout mechanism fails, or if you want to remove the entry before the timeout interval.
- **-view**
  Displays all entries that are partitioned by host.

reports Utility

This command-line utility, which is located in the SS-Tools directory, lets you display a listing of selected objects in the current modeling catalog. Run reports from the directory where the SpectroSERVER database is installed.

The command locks the database during a report generation sequence. As a result, you can run only one report at a time.

NOTE

Before executing reports, you must shut down the SpectroSERVER and any other program that accesses the SpectroSERVER database, such as a VNM, the Model Type Editor, or any third-party utilities. Otherwise, database corruption can occur.

This utility has the following format:

```
reports [-mtype <name_pattern>] [-relation <name_pattern>] [-handle <handle>] [-attrflags <defglmprsvw>] [-
fields <cdefgimnotvGE>] [-types <bierdtcgmMRlaoIAOTU>] [-recursive] [-invisible] [-lists] [-nolists] [-groups]
 [-help]
```

-mtype

Specifies the model types to include in the report. All model types with names that contain the specified text string are included. For example, if the model type is IRM, the report lists sections for Hub_CSI_CIRM, Hub_CSI_IRM2, Hub_CSI_SIRM, and all other model types whose names contain the “IRM” character string.

NOTE

You can substitute a period (.) as a wildcard for “all applicable” entries. Use the wildcard option sparingly, as it takes a long time to display the report. Run the following command from the $SPECROOT/SS directory to display a report on all model types without the attribute information:

```
../SS-Tools/reports -mtype . -fields e
```

-relation

Specifies the relation to include in the report. The output lists how one model type relates to another.

NOTE

Note: You can substitute a period (.) as a wildcard for “all applicable” entries. Run the following command from the $SPECROOT/SS directory to display a report on all relations:

```
../SS-Tools/reports -rel .
```

-handle

Specifies the hexadecimal handle of the model type(s) to include in the report, with or without the preceding “0x” prefix. All model types with handles that contain the specified text string are included. This argument is similar to the mtype argument except that it accepts a model type handle rather than a name string.

For example, if the specified handle is 0x180027, the report includes sections for the 27th model type that was created under the 0x180000 Developer ID. If the handle is 180, conversely, the report includes not only all model types that were created under that developer ID, but also any other model types with the same three digits anywhere in their handles.

-attrflags defglmprsvw

Filters the report to include only the attributes for the model types in the report that have one of the specified flags set.

-recursive

Includes descendant (child) model types in the report.

-invisible

Includes the following model types in the report:

All visible model types (Visible model type flag is set to true) that match the search pattern

All invisible model types (Visible model type flag is set to false) that were created by the currently loaded developer ID and that match the search pattern.

-lists

Includes only attributes that allow multiple values in the report.

-nolists

Does not include attributes that allow multiple values in the report.

-groups

Includes model type groups in the report.

-help

Displays usage information on the command.

Run a Model Type Report

A model type report lists the attribute information for a particular model type. To run a model type report, use the following syntax:

```
../SS-Tools/ \
reports [-mtype <model type>][-attrflags w][-fields][-invisible]
```

or

```
../SS-Tools/ \
reports [-handle <model handle>][-attrflags ""][-fields][-invisible]
```

As an example, the following command generates a report on the HUB_CSI_IRM2 model type:

reports -mtype HUB_CSI_IRM2 -attrflags e -fields don -invisible

The report lists all attributes with the External flag set. For each attribute that is included, it identifies the OID Reference, OID Prefix, and Name (with Developer ID). The report also includes the complete list of base model types (parent model types) for the specified model type; the base model types are listed in order of inheritance.

The report is sent to the standard output device for the workstation.

Direct Reports to an Output Device

The reports utility sends the output to the standard output device for the workstation, normally the display screen. To redirect the output to a file or to a printer directly, provide standard UNIX piping commands in the command line.

Example 1

The following command generates a report on the HUB_CSI_IRBM model type:

reports -mtype HUB_CSI_IRBM -attrflags e -fields n

The report includes the standard header section to identify the model type developer, its name and handle, the state of the six attribute flags, and the identity of direct base model types. The remainder of the report is restricted to external-flagged attributes, and the line items in the report list only the attribute names.

The report appears on your workstation screen as a one-time only display. If the report is too long, you only see the end of the report (the maximum lines of text that your display can show).

Example 2

The following command generates the same report, but sends it to your workstation screen as an incremental display file, showing you the first screen:

reports -mtype HUB_CSI_IRBM -attrflags e -fields n | more

The Return key lets you increment through successive lines while viewing the screen; the spacebar lets you see the next screen.

Example 3

The following command generates the same report, writing it to an ASCII file named REPORT_1 in your current directory:

reports -mtype HUB_CSI_IRBM -attrflags e -fields n > REPORT_1

If the named file exists in the current directory, it is overwritten by the new report.

You can precede the report filename with a directory path.

Example 4

The following command generates the same report, sending it as a print file to the printer that is designated by <ptr>:

reports -mtype HUB_CSI_IRBM -attrflags e -fields n > lpr -P<ptr>

Run a Relation Report

A relation report lists how one model type relates to another according to the selected relation. To run a relation report, use the following syntax:

```
../SS-Tools/reports -rel <relation>
```

where <relation> is the name of the relation to include in the report. Specify a single relation at a time.

As an example, the following command generates a report on the Connects_to relation:

```
../SS-Tools/reports -rel Connects_to
```

The report lists each sequential rule in the Connects_to relation, and it is sent to the standard output device for the workstation. For information on writing reports to a file or sending them to a printer, see Direct Reports to an Output Device.

SSdbload

This utility program, located in the *$SPECROOT*/SS-Tools directory, lets you restore a SpectroSERVER database with previously created backup files, load developer ID information, or set the precedence value for a SpectroSERVER in a fault tolerant environment.

> **NOTE**
> For more information about establishing fault tolerance, see the Distributed SpectroSERVER Administration section.

You must shut down the SpectroSERVER and any other program that accesses the SpectroSERVER database before executing SSdbload.

This utility has the following format:

```
SSdbload [-quiet] [-initialize] [-developer <DEV_INFO_FILE>] [-load] [-models] [-catalog] [-replace
 <PRECEDENCE>] [-add <PRECEDENCE>] [-port <PORT_NO>] [-showmap] [-version]
[-extension] [-new_primary <NEWHOSTNAME>] [-UpgradeFrom <ENCODING_NAME>] [-TestEncoding]
[<SAVE_FILE>]
```

Where the first letter of an argument name appears in bold type, you can use the letter only, rather than entering the entire string.

- **-quiet**
  Disables prompting (interactive mode). Useful for running load commands from within a script.
- **-initialize**
  Initializes the database by removing the modeling catalog, all of the models, and all unarchived Events and Statistics Log records.

WARNING
If you use the -i (initialize) option, you must restore at least the catalog. If split backups are used, you must run SSdbload once for each backup file that is loaded. The -i option must only be used once, specifically, with the first execution of SSdbload. Load the modeling catalog before the models.

- **-developer**
  Loads the developer information file you specify using the <DEV_INFO_FILE> variable.

  NOTE
  Load developer information into only one database, and perform all modeling catalog editing on that database. Using the same developer information on more than one database can result in duplicate model type, attribute, and relation handles.

  The -d option can be used to load developer information, but only once. Attempting to execute a second SSdbload using the -d option produces an error message and leaves the developer information unchanged.
- **-load**
  Loads the database with objects from the save file that you specify using the <SAVE_FILE> variable.

  WARNING
  The -l (load) option is not designed to add models or modeling catalog components into an existing database. It does not augment the contents of the database; rather, it first removes any existing information of the same type as that contained in the save file, and then loads the contents of the savefile. For example, if the save file were created using the SSdbsave -m option and contained only models (and not the modeling catalog), the SSdbload -l option would not affect the existing modeling catalog. However, it would remove any existing models and replace them with models contained in the save file.
- **-models**
  Loads models from the save file you specify using the <SAVE_FILE> variable.
- **-catalog**
  Loads the modeling catalog (model types, relations, and rules) from the specified save file.
- **-replace**
  Used only in fault tolerant environments to replace the precedence value currently assigned to a particular SpectroSERVER with a new value you specify using the <PRECEDENCE> variable.
- **-add**
  Used only in fault tolerant environments to assign a precedence value to a particular SpectroSERVER using the <PRECEDENCE> variable.
- **-port**
  Used with either the -add or -replace arguments to specify the port number for the SpectroSERVER. If you do not specify a particular port using the <PORT_NO> variable, the port specified for the comm.port resource in the .vnmrc file is used by default).
- **-showmap**
  Prints landscape map information showing which landscapes are loaded on which servers and at which precedence levels.
- **-version**
  Displays the version of SSdbload and the version of the saved file that you are attempting to load. If these versions are incompatible, an error message is displayed (even if you are operating in quiet mode), and the file is not loaded.
- **-extension**
  Disables file extension enforcing.
- **-new_primary**

Must be used when you are loading a database that was saved on another landscape. Use the <NEWHOSTNAME> variable to name the landscape using the name of the host where you are loading the database. Otherwise, the landscape is given the host name from the SpectroSERVER where it was originally saved.

- **-UpgradeFrom <ENCODING_NAME>** The name of the encoding used to store non-UTF8 data in SpectroServer DB
- **-TestEncoding** Checks if there are attribute values that are not in UTF-8 encoding
- **<SAVE_FILE>**
  The name of the backup file to be loaded. The backup can be a file that was saved using either the SSdbsave utility or the Online Backup feature. It can also be one of the save files created by the DX NetOps Spectrum installation program.
  Each successful execution of this program creates two savefiles in the *$SPECROOT*/SS directory, each containing a copy of the modeling catalog being installed. The first is a date-stamped file with the .after extension. A copy of the .after file is then created and named “legacy.SSdb”, overwriting any previously existing legacy.SSdb file.
  Use the legacy.SSdb file to re-initialize your database with the most recently installed modeling catalog. Use the .after files as necessary to restore the catalog associated with a particular installation.
  A sequential counter following the date stamp in the .after file name lets you distinguish among multiple files created on the same day, for example:

```
db_20001014,1.after.ssdb
db_20001014,2.after.SSdb
db_20001014,3.after.SSdb
```

  If the .after file used to initialize your database is older than the current executables, expected information may not be present in the database and is not accessible through OneClick.

Example

To initialize a database and load the modeling catalog (model types and relations) and model information from a previously saved file named “db_950318_cm”, you would use the following command:

```
SSdbload -il db_950318_cm
```

Errors

- **Can't open database.**
  The SpectroSERVER database is not present in the current directory.

  NOTE

  You must launch the SSdbload from $SPECROOT/SS directory, where the SpectroSERVER database resides.
- **Database already locked by: <*user id*>by process: <*process name*>with process ID: <*process id*>on network node:<*node name*>which started at: <*date/time stamp*>**
  The database is locked by another process.
- **Save file version:<version_number>.SSdbload version: <version_number>.The save file CANNOT be loaded by this version of SSdbload.This save file cannot be loaded by version <version_number> of DX NetOps Spectrum. It was saved as version <version_number>.**
  SSdbload does not let you load the savefile if a version incompatibility is detected. This error message is generated if you have specified the [-version] argument. It is displayed when appropriate even if you specify the -quiet option.
- **This save file cannot be loaded by version <version_number> of DX NetOps Spectrum. It was saved as version <version_number>.**
  SSdbload does not let you load the savefile if a version incompatibility is detected. This error message is generated if you have specified the [-version] argument. It is displayed when appropriate even if you specify the -quiet option.

  NOTE
  If nonfatal attribute descriptor errors are detected during the load, SSdbload creates a log file named SSdbload.log in the directory containing the database. The following is an example of a nonfatal attribute entry in this file:

WARNING
<SSdbload path>/SSdbload Can't read attribute 10004 in model 400000

Changing Host Names

If you change the host name of a single SpectroSERVER host, you do not have to use SSdbsave before you make the change and then use SSdbload afterward. The database is automatically changed to reflect the new host name, and the following message appears in the Control Panel when you restart the SpectroSERVER:

```
This database was previously loaded on <old hostname> port <old port number>, but is now being loaded on <new
 hostnames> port <new port number>.
```

However, in a fault-tolerant environment that includes one or more backup SpectroSERVERs, the servers recognize their relationship to one another by a *precedence* value that is associated with their host names. Therefore, to preserve the fault-tolerant relationship, use SSdbsave and SSdbload in the following order to change the host name of the primary (or secondary) SpectroSERVER:

1. Save the database using SSdbsave with the -cm option.
2. Change the host name.
3. Reload the database with the save file that was created in Step 1 by running SSdbload with the -il and -replace options. The reload lets the database associate the new host name with the existing precedence value:
   ```
   SSdbload -il -replace <precedence> <save file>
   ```

SSdbsave

This utility program, located in the *$SPECROOT*/SS-Tools directory, allows you to create a backup copy of an existing SpectroSERVER database's modeling catalog (model types and relations) and/or the actual models and associated data it contains.

Before executing SSdbsave, you must shut down the SpectroSERVER and any other program that accesses the SpectroSERVER database.

This utility has the following format:

```
SSdbsave [-quiet] [-extension] [-version]
[-catalog] [-models] <SAVE_FILE>
```

Where the first letter of an argument name appears in bold type, you can use the letter only, rather than entering the whole name.

- **-quiet**
  Disables interactive/verbose mode.
- **-extension**
  Disables file extension enforcement.
- **-version**
  Displays the version of SSdbsave. The version number is included with the save file. When using this argument while saving a file, a message indicates the version of SSdbload that can be used to load the saved file.
- **-models**
  Includes models in the save file.
- **-catalog**
  Includes the modeling catalog (model types, relations, and rules) in the save file.
- **<SAVE_FILE>**
  Specifies the name of the destination file for the saved database. The suggested naming scheme for save files is to incorporate a date stamp as well as the option flags that are used for the save. For example, a file named db_20121014_cm would indicate a backup performed on October 14, 2012 using both the “c” (catalog) and “m” (models) options.

Sample Output

The following is an example of the output generated when running SSdbsave using the -models and -catalogs arguments (../SS-Tools/SSdbsave -mc Mar16_2013DB). The name of the database file to be saved is Mar16_2013DB. The last line of this output indicates the version number of SSdbload that can be used to load this saved file.

```
Number of Model Types saved: 3493
Number of Relations saved: 92
Number of Models saved: 103
SSdbsave has successfully saved the database model and catalog information as 'Mar16_2013DB.SSdb'.
This file can be loaded with version 7.0.0.000 of SSdbload.
```

Errors

Can't open database

The SpectroSERVER database is not present in current directory.

Database already locked by: <*user id*>by process: <*process name*>with process ID: <*process id*>on network node: <*node name*>which started at: <*date/time stamp*>

The database is locked by another process.

SSdbsave: Warning. Expected attr: 0x999999 not found, for model: 0x999999, of Model Type: 0x999999 Cs Whatever MT. Processing continues

SSdbsave displays this message when attempting to save a model attribute value for which there is no corresponding attribute descriptor. This informational message appears if a user or a developer removes an attribute.

Database Model Conversion Tool (DBconv)

This utility program, located in the *$SPECROOT*/SS-Tools directory, lets you convert a set of models within a DX NetOps Spectrum database from one model type to another. DBconv can also be used to rediscover the applications and reconfigure the interfaces in a set of models.

The utility has the following format:

```
DBconv [-file=]<Input File Name>
[-src_mth=]<Source Model Type Handle>
[-dest_mth=]<Destination Model Type Handle>
[-landscape=]<Landscape Handle>
[-rediscover=]<r><d><i>
[-all_landscapes] [-test=]<Test Level> [-quiet] [-debug]
```

DBconv and Configurations

DBconv can take its configuration from an input file (specified on the command line) or from the command line itself. To get a list of command line options, run DBconv with no options.

- **-file**
  Specifies the input file to be used.
- **-src_mth**
  Specifies the model type handle from which to convert. If -rediscover is specified, specifies the type of models that are rediscovered.
- **-dest_mth**
  Specifies the model type handle to which to convert. Overrides the setting in the input file. This option is ignored if -rediscover is specified.
- **-landscape**

Specifies the landscape handle to search for models.
Default: 0x400000

- **-all_landscapes**
  Specifies that all landscapes are searched for models.
- **-test**
  Test level 0 (the default) means the conversion actually takes place. Test level 1 means that DBconv stops processing just after validating the command line and input files. Test level 2 means that the old models are not deleted, and new ones are not created.
- **-quiet**
  Specifies that there should be no output except for error messages.
- **-debug**
  Specifies that there should be extra output.
- **-rediscover**
  If this option is specified, models that are found are not converted. Rather, one or more of the following specified actions are performed on each found model:
  - **d**
    Destroy all application models for each device model found.
  - **r**
    Send a Rediscover Application action to each device model found.
  - **i**
    Send a Reconfigure Interfaces action to each device model found.

    NOTE
    The actions above can be specified in any order on the command line. However, they are always executed in the order shown here.

Examples of DBconv Command Line Usage

The following are examples of typical uses of the DBconv tool on the command line:

- Run a conversion using only the specified input file:
  ```
  $ DBconv -file=config.dbc
  ```
- Convert all GnSNMPDev models to Smart Switch Routers, in all known landscapes:
  ```
  $ DBconv -src_mth=0x3d0002 -dest_mth=0x2c60000 -all_landscapes
  ```
- Convert all GnSNMPDev models to Smart Switch Routers, in landscape 0x400000:
  ```
  $ DBconv -src_mth=0x3d0002 -dest_mth=0x2c60000 -landscape=0x400000
  ```
- For every SmartSwitch Router in every landscape, destroy all applications, rediscover the applications, and then reconfigure the interfaces:
  ```
  $ DBconv -src_mth=0x2c60000 -rediscover=rdi -all_landscapes
  ```
- For every SmartSwitch Router in landscape 0x400000, reconfigure the interfaces:
  ```
  $ DBconv -src_mth=0x2c60000 -rediscover=i -landscape=0x400000
  ```

  NOTE
  When it runs, DBconv goes through a short initial phase and a longer second phase, noting in the window which phase is in effect. Models that cannot be contacted are not converted; in each case, an error message appears. Some possible causes of these error messages are:

- Devices represented by specified model types have lost contact
- Specified model types do not exist in the database
- The SpectroSERVER is not responding
- The SpectroSERVER does not have a model for your user ID

Using DBconv with an Input File

DBconv can be used with or without an input file. If you want to use an input file, use the template.dbc file in the <*$SPECROOT*>/SS-Tools directory as a starting point.

The input file consists of several sections that allow you to customize the conversion with far more precision than the command line arguments allow. It is made up of several sections, all optional except for the Configuration section. Use the format of the sections and case as specified here. Blank lines and lines starting with a '#' character (pound sign) are ignored.

Elements of a DBconv Input File

The following section describes the required and optional contents of an input file to be used with DBconv.

- **Configuration (Required)**
  This section contains the single configuration items, described below.

  NOTE
  Only the Source_Model_Type, Destination_Model_Type, and Landscape_Handle fields in the Configuration section of the input file are mandatory. All other fields are optional.
- **Example:**

```
Configuration {
Source_Model_Type = 0x3d0002
Destination_Model_Type = 0x2c60000
Reconnect_Sleep_Time = 90
Dont_Change_Discovery_Attributes = true
Models_To_Convert = 0
Landscape_Handle = all
Is_Obsolete_Model_Type = false
Relation_Section_Ignores = false}
```

  - Source_Model_Type = <old model type handle>
    The model type handle to convert from. It must be hexadecimal and prefixed with “0x”.
  - Destination_Model_Type = <new model type handle>
    The model type handle to convert to. It must be hexadecimal and prefixed with “0x”.
  - Landscape_Handle = <landscape handle>
    Specifies the landscape where the conversion is done. If 'all' is specified, then DBconv switches to enterprise mode and converts model types from all landscapes. If 'selection' is specified, then all of the landscapes specified in the Landscapes { } section are used.
  - Models_To_Convert = <max models to convert>
    If this line is specified with a value greater than zero, database conversion converts only the specified number of models of the old type. If the value is 0, all models are converted.
  - Reconnect_Sleep_Time = <sleep time>
    Allow for a configurable sleep period, in seconds, between the time Model_State changes to active and port reconnections are attempted. The default value is 60 (seconds).
  - Reconnect_Interval = <seconds>
    After the Reconnect_Sleep_Time has run, DBconv attempts to reconnect the interfaces and ports. If a model after this time has still not gone active (some device models do not go active until all modules and applications have been created), then DBconv waits for the specified amount of time before trying again. The default value is 30 (seconds).
  - Reconnect_Interval_Count = <count>
    This option controls the number of times that DBConv attempts to reconnect interfaces and ports. The default value is 30 (times).
  - Dont_Change_Discovery_Attributes = <true/false>

If this is false, the conversion program modifies Discovery-related attributes in the old model type. This is to force Discovery to use the new model type instead of the old one. This defaults to true if (a) the old model type is GnSNMPDev, or (b) both the old model type and the new model type are the same. The default value is false.

- Is_Obsolete_Model_Type = <true/false>
  This switch converts models where the Obsolete flag in the model type is set (when this is set, you cannot read any attributes). In this case, no attributes are read/validated/written during the conversion. No interfaces or ports are accessed. However, the model's relations are processed. This means that if a device model is converted with this flag, then the new model is created without Name, IP Address, and so on. The default value is false.
- Relation_Section_Ignores = <true/false>
  This switch interprets the Left_Relationships and Right_Relationships sections. If the value is false, then only the associations specified in the Left/Right sections are restored to the device model (none if both the Left/Right sections are empty). If the value is true, then all associations except for those specified are restored. This does not affect CONNECTS_TO on the left of the device model because DBconv always tries to restore this to maintain in which view the device is modeled.
- Convert_Scm_Configs = <true/false>
  This switch is to determine if SCM Configurations are converted along with the model types. If this is set to true, then SCM configurations that were on behalf of models/model types to be converted are converted as well. The shared SCM configurations are converted to the destination model type, and the non-shared SCM configurations are converted to the destination model handle and model type.

  NOTE
  Host SCM configurations are transferred effectively, but attribute configurations may be lost during conversion.
- Convert_Sanm_Policies = <true/false>
  This switch determines if SANM Policies are converted along with the model types. If this is set to true, then any reference to the source model type name in any policy is converted to the destination model type name.
- Landscapes
  List of landscapes to convert. For DBconv to take any notice of this section, the Landscape_Handle entry in the Configuration section should be set to 'all'.
  Example:

```
Landscapes {
0x400000
0x80c00000
}
```

- Model_Handles
  List of models to convert. If you want only a selection of models to be converted, enter their model handles in this section. All other models are ignored.
  Example:

```
Model_Handles {
0x80c00be6
0x80c00be8
}
```

- Transfer_Attributes
  List of attributes to transfer from old models into new models. Make sure that these attributes are valid for old as well as new model types. Note that the Network Address and Community Name attributes are always transferred so they need not be specified in this section.
  Example:

```
Transfer_Attributes {
0x001006e
0x00010024
}
```

- Transpose_Attributes

List of attributes to transpose from old models into new models. Make sure that these attributes are valid for old as well as new model types. The old and new attributes *must* be of the same type.
Example:

```
Transpose_Attributes {
0x001006e = 0x001884
0x00010024 = 0x777533
}
```

- Set_Attributes
  List of attributes into which to force data. Verify that these attributes are valid, and that the data is valid for the type of attribute.
  Example:

```
Set_Attributes {
0x001006e = Router 42
0x00010024 = public
}
```

- Transfer_Port_Attributes
  List of attributes to save from ports of old models into ports of new models.
  Example:

```
Transfer_Port_Attributes {
0x00011564
}
```

- Right_Relationships
  A list of relations whose associations with old models on the right side are ignored or included.
  (See **Relation_Section_Ignores** switch in this section for details.)
  Example:

```
Right_Relationships {
0x10004
0x230000
}
```

- Left_Relationships
  A list of relations whose associations with old models on the left side are ignored or included.
  (See **Relation_Section_Ignores** switch in this section for details.)
  Example:

```
Left_Relationships {
0x10004
0x230000
}
```

- Object_ID_Exists
  A list of MIB objects that must exist on each target device. If all of the MIB objects exist and are readable, the target device can be converted.
  Example:

```
Object_ID_Exists {
1.3.6.1.4.1.52.2501.1.270.4.1.1.5
1.3.6.1.4.1.52.2501.1.1.5
}
```

- Filter_Attributes
  A list of attributes to use to select models. When the attribute_value of the attribute_id in any old models found is equal to the value given in the Filter_Attributes line, the model is selected. For text_string attributes, the attribute_value need only be a sub-string of the string that is returned from the old model.
  Example:

```
Filter_Attributes {
```

```
0x10053 = 1.3.6.1.4.1.49.2.3.5
0x10b5a = Network Administrator
0x1154f = false
}
```

- Advanced_Transfer_Attributes
  Enables the transfer of attributes from any number of models that are related to the device model by a known relation path. Any number of these sections can be included within the input file.
  Syntax:

```
Advanced_Transfer_Attributes {
Path = <Relation Path>
Identifier = <Identifier Attribute>
If <Attribute ID> = <Value>
If ModelType = <Model Type ID>
Transfer = <Attribute to transfer>
Transpose <Dest Attribute ID> = <Src Attribute ID>
}
```

  Explanation:

```
Path = <Relation Path> [Mandatory]
```

  Specifies how to find the models to be transferred. The relation path specifies a '.' delimited set of relation names. There is no limit to the number of elements in a relation path.
  Examples:
  Path = HASPART
  Finds all models on the right of a HASPART relation to the device model, that is, all of the interfaces.
  Path = Contains.HASPART
  Scans all models on the right of a Contains relation. For each of these models, scans the models on the right of a HASPART relation, and these found models are those that the transfer acts upon.
- Identifier = <Identifier Attribute> [Mandatory]
  When the set of models specified by the relation path has been found, a method is required for matching these models to the models in the converted database, as the model handles will have changed. DBconv reads the values of the attributes specified by Identifier. It then tries to match this value with the converted models. If a match is found, DBconv considers this model the equivalent of the preconverted model. A common attribute for this entry would be Component_OID.
  Example:

```
Identifier = 0x1006a
```

  If <Attribute ID> = <Value>
  This is a filter entry. It only transfers or transposes the specified attributes if the value of <Attribute ID> equals <Value>.
  Example:
  The following three lines would match all interfaces, identified by Component_OID, only when ifType equals 6:
  Path = HASPART
  Identifier = 0x1006a
  If 0x1134c = 6
  If ModelType = <Model Type ID>
  A filter entry that only transfers or transposes the specified attributes if the model type matches <Model Type ID>.
  Example:
  The following matches all SSR_PortIf interfaces on an RS-8000.
  Path = HASPART
  Identifier = 0x1006a
  If ModelType = 0x2c60006
- Transfer = <Attribute to transfer>
  Specifies the attributes to be transferred. There is no limit to the number of entries. Either one Transfer or one Transpose entry is required.

Example:
Transfer = 0x11564

– Transpose <Dest Attribute ID> = <Src Attribute ID>
Specifies the attributes to be transposed. It takes the value specified in <Src Attribute ID> and writes it to <Dest Attribute ID>. The types of both of these attributes should be the same. Either one Transfer or one Transpose entry is required.
Examples:
The following copies in the VLAN name on an RS-8000 and writes it into the Notes field.
Transpose 0x11564 = 0x2c604dd
The following entry copies Notes and PollingStatus from all SS-PortIf models on an RS-8000:

```
Advanced_Transfer_Attributes {
Path = HASPART
Identifier = 0x1006a
If ModelType = 0x2c60006
Transfer = 0x11564
Transfer = 0x1154f
}
```

– Transfer_Notes
Enables the copying of the notes fields from the specified areas. Each of the lines is translated as an **Advanced_Transfer_Attributes** (described earlier in this section).
Example:

```
Transfer_Notes {
Device
Interfaces
Applications
Modules
Ports
}
```

One or more fields can be specified to copy the notes field for all models in the specified class (Device, Interfaces, and so on.).

DDM Database Maintenance

This section describes database maintenance procedures for the DDM database.

Database Security

To enhance the security of the Distributed Data Manager database, perform one of the following platform-specific procedures after DX NetOps Spectrum installation.

- **On Windows:**
- Log in as Administrator.
- Use Windows Explorer to navigate to the *$SPECROOT*/SS/DDM directory.
- Right-click the .configrc file and select Properties.
- Click the Security tab, examine the Permissions panel, and click the Advanced button.
- Make sure that only Administrator or DX NetOps Spectrum Users groups are listed.
If you see entries for “Everyone” or any other person or group, delete them. It might be necessary to clear the setting that allows inheritable permissions from the parent to propagate to child objects. This setting is under the Advanced options for permissions.

Database Size Management

Managing the size of the DDM database can help it run more efficiently. To control the size of the DDM database, you can limit event and statistics logging to critical components of your network. To manage database size, you can take the following steps:

- Limit logged data by disabling the logging of statistics. Set the stats_logging_enabled parameter in the .vnmrc file to FALSE.
- Limit the amount of event data that is stored. Disable the 'E' logging flag in EventDisp files for any events whose history is not significant.

  NOTE
  For more information, see the Event Configuration section.
- Disable or reduce logging for models that you are not actively monitoring. You can disable logging on an individual model by setting the Log Ratio (the number of polls per log) to zero in the Model Information view. Or use the Attribute Editor to disable logging for all models of a certain type. For example, if you are not interested in reporting traffic statistics for user ports, set the Polls to Log Ratio to zero on all user ports.
  To reduce logging frequency, increase the log ratio using either of these methods.

  NOTE
  For more information, see the Modeling and Managing Your IT Infrastructure section.

Database Backup

Like the SpectroSERVER database, the DDM database requires regular backups to enable full recovery in the event of a hardware or operating system failure. Ideally, both of these databases are backed up daily to ensure the availability of current data and to keep the databases synchronized.

However, the DDM database is typically much larger than the SpectroSERVER database and thus requires more time for backup. We recommend backing up the DDM database weekly and backing up the SpectroSERVER database more frequently, preferably daily.

NOTE
The DDM and SpectroSERVER databases can fall out of synchronization when you restore one without restoring the other. For example, you back up both databases on Sunday. You create a model on Monday, then experience a system crash and restore your SS database with the Sunday save file. The restored SS database no longer includes the model that you created, but historical records for that model are in the DDM database. Moreover, if you recreate the model, you cannot then reconcile the DDM records from the original model with the new records that were generated for the recreated model. Avoid this kind of conflict by always restoring the DDM database whenever you restore the SpectroSERVER database.

You can perform a DDM database backup at any time using the ddm_save or ddm_backup tools. However, you can also have the DDM database that is backed up automatically using the Online Backup feature. Online Backup uses post_olb_script. Because it is critical to keep the SpectroSERVER and DDM databases synchronized, this script is the preferred method for DDM backups.

WARNING
The tools that are described in this section (post_olb_script, ddm_backup, and ddm_save) are the only supported methods of backing up your DDM database. Use of third-party backup software can result in database corruption.

post_olb_script

This script file lets you coordinate the execution of custom scripts with SpectroSERVER database backups that are performed using Online Backup. The script is located in the *$SPECROOT*/SG-Support/CsScript directory. When you run

it with the default settings, post_olb_script backs up the DDM database immediately following any Online Backup that completed on the specified day (the default is Sunday).

To run the post_olb_script file with its default settings, copy the file from *$SPECROOT*/SG-Support/CsScript to *$SPECROOT*/custom/CsScript. Use a text editor to activate the final 11 lines of the file by removing the pound sign (#) from the start of each line. The DDM database backup is scheduled after any Online Backup executed on a Sunday (target day=0). Thus, if you schedule Online Backup to run daily, your DDM database is automatically backed up weekly.

> **NOTE**
> During a DX NetOps Spectrum upgrade installation, the copy operation is performed automatically. Before copying, verify that the file does not already exist to avoid reverting to default settings.

After 10.4.1 upgrade, edit $SPECROOT/custom/CsScript and change ddm_backup to ddm_save.pl.

If you require more frequent DDM database backups, uncomment only the last five lines of the post_olb_script file. No “target day” is then specified. Therefore, your DDM database is backed up after *every* backup of your SpectroSERVER database using Online Backup.

ddm_save

The ddm_save utility, which is located in the *$SPECROOT*/SS/DDM directory performs a full save of the historical database to the file you specify. Use the Control Panel to shut down the Archive Manager before executing the command, and then restart it when the save is completed.

> **WARNING**
> The ddm_save binary coming with the previous releases has been deprecated in 10.4.1. From 10.4.1 onward, use ddm_save_legacy.

> **NOTE**
> The ddm_save utility does not remove any data from the DDM database; it copies it to the designated file.

The utility has the following format:

```
ddm_save_legacy [-extension] [-quiet] <SAVE_FILE>
```

Where the first letter of an argument name appears in bold type, you can use the letter only, rather than entering the whole name.

- **-extension**
  By default, ddm_save assigns a .tgz file extension to the file. When this argument is specified, the file is saved without a file extension
- **-quiet**
  Disables interactive/verbose mode
- **<SAVE_FILE>**
  Specifies the name of the destination file for the saved database

> **NOTE**
>
> The ddm_save command saves the necessary database files to a gzipped tar file format with a default file extension of .tgz.

Support for InnoDB Database

The 10.3 release supports saving/exporting the InnoDB database files into the Archive Manager database. The exporting procedure requires a temporary directory to compress the InnoDB database files.

> **NOTE**
>
> The space required to save/export the InnoDB database files is two times greater than the event table size.

While saving/exporting the InnoDB database files, ensure that the Archive Manager database is running on the InnoDB database. The save/export database format depends on the current running database.

Save the DDM Db when Archive Manager is running

All MySQL Enterprise Backup functions are executed with the **mysqlbackup** client. It is used for performing different types of backup and restore operations, as well as other related tasks like backup compression, decompression and validation. With 10.3.1, ensure improved performance with the MySQL backup and save the DDM Db without having to stop the Archive Manager.

1. To save the DDM db and create a <filename.mbi> file which to be used for loading the db, ensure you are signed in as a spectrum user and run the following script:
   ```
   ./ddm_save.pl  -f <filename>
   ```
   Ensure that with both the **-q** and **-f** option you are signed in as a spectrum user.
2. When prompted, '**Are you running as CA Spectrum install user (y/n)**' if you say 'n' then you get the following message:
   ```
   Please make sure you are running as DX NetOps Spectrum install user, otherwise, DDMdb
    may get corrupted.
   ```

The **OptionsArguments** are as follows:

- **-quiet**
  Disables interactive/verbose mode.
- **<SAVE_FILE>**
  Specifies the name of the destination file for the saved database.

ddm_backup

The ddm_backup utility, located in the *$SPECROOT*/SS/DDM directory shuts down the Archive Manager, executes the ddm_save command, and restarts the Archive Manager when the save has completed.

> **WARNING**
>
> The ddm_backup binary coming with the previous releases has been deprecated in 10.4.1. From 10.4.1 onward, use ddm_save_legacy.

This utility has the following format:

```
ddm_backup_legacy <SAVE_FILE>
```

- **<SAVE_FILE>**
  Specifies the name of the destination file for the saved database. Supply a fully qualified file path with the destination file name to save the file in that location. If a fully qualified file path is not specified, the file is saved in the DDM directory.

Points To Remember About Backups

The more frequently you perform backups, the less data you risk losing.

Backing up historical data does *not* remove that data from the DDM database.

Historical records are purged (permanently removed) from the DDM database according to the MAX_STAT_DAYS and MAX_EVENT_DAYS settings in the .configrc file. For more information, see Archive Manager Resources.

The default setting is 45 days. Once any records attain the specified age, the purge occurs daily thereafter. As a result, the oldest day's data is purged daily.

If you use the ddm_save method, you must restart Archive Manager using the Control Panel once the backup is completed.

Database Restoration

In the event of a hardware or operating-system failure, restore the DDM database by loading a save file that was created using any of the supported backup methods:post_olb_script, ddm_backup, or ddm_ save.

Save files are loaded using the ddm_load tool, which is described in the following section.

ddm_load

This utility, which is located in the *$SPECROOT*/SS/DDM directory, lets you restore the DDM database. First, it initializes (removes all data from) the DDM directory, and then it loads the save file that you specify. Initialization occurs automatically if you are loading a save file or directory. The -initialize option is only required if you want to clean out the DDM directory and start from nothing. With that option, the landscape handle for the associated SpectroSERVER is also required.

> **WARNING**
>
> The ddm_load binary coming with the previous releases has been deprecated in 10.4.1. From 10.4.1 onward, use ddm_load.pl.

Before you execute the command, shut down the Archive Manager from the Control Panel. Then restart it when the restoration has completed.

This command has the following format:

```
ddm_load [-quiet] [-initialize <LANDSCAPE_HANDLE>] [-events_init]
[-stats_init][<SAVE_FILE>]
```

Where the first letter of an argument name appears in bold type, you can use the letter only, rather than entering the full string.

- **-quiet**
  Disables prompts (interactive mode). Useful for running load commands from within a script.
- **-initialize**
  Removes all data from the DDM database. Used only with the LANDSCAPE_HANDLE argument.
- **<LANDSCAPE_HANDLE>**
  Specifies the landscape handle of the SpectroSERVER whose database is being initialized.
- **-events_init**
  Initializes (removes) *only* the event records in the DDM database.
- **-stats_init**
  Initializes (removes) *only* the statistical records in the DDM database.
- **<SAVE_FILE>**
  Specifies the name of the backup file to load. The ddm_load utility supports both the new gzipped tar file format and the legacy, proprietary file format.

Support for InnoDB Database

The 10.3 release supports importing the InnoDB database files into Archive Manager database. The importing procedure requires a temporary directory to uncompress the InnoDB database files.

> **NOTE**
>
> The space required to import the InnoDB database files is two times greater than the event table size.

The DDM load supports importing both MyISAM and InnoDB database files based on the current running database engine (MyISAM or InnoDB). For example, if the Archive Manager database is running on the MyISAM database, you can import only the MyISAM database files.

Convert Saved MyISAM Database Files to InnoDB Database Files

From the 10.3 release, you can convert your saved Archive Manager database file from MyISAM to InnoDB.

Prerequisite

- Ensure that there is enough free disk space. The space required is three times greater than the event table size.

Follow these:

1. Open any bash-shell and navigate to $SPECROOT/SS/DDM/scripts.
2. Run the following script as **Spectrum installation user**:
   ```
   convert_saved_myisam_to_innodb.pl
   ```
   For example, when you run the script for the tgz file, you get the following message:

```
./convert_myisam_to_innodb.pl -f db.tgz

./convert_saved_myisam_to_innodb.pl:

This utility converts the saved MyISAM database file to InnoDB database

-f: path to the dump file

-h: print this message

Example: ./convert_myisam_to_innodb.pl -f db.tgz

xxxx03-w2k8vm2%/d/builds/Spectrum/Armgr.a/buildfiles > ./
convert_saved_myisam_to_innodb.pl -f /c/db.tgz
```

Loading the DDM Db

All MySQL Enterprise Backup functions are executed with the **mysqlbackup** client. It is used for performing different types of backup and restore operations, as well as other related tasks like backup compression, decompression and validation. With 10.3.1, ensure improved performance with the MySQL backup and save the DDM Db.

1. To load the DDM db, ensure you are signed in as a spectrum user to run the following script:

```
./ddm_load.pl  -f  <filename.mbi>
```

The **OptionsArguments** are as follows:

- **-quiet**
  Disables prompts (interactive mode). Useful for running load commands from within a script.
- **-initialize:**
  Initializes the database. Removes all data from the DDM database. Used only with the LANDSCAPE_HANDLE argument
- **-landscape <LANDSCAPE_HANDLE>**

Specifies the landscape handle of the SpectroSERVER whose database is being initialized.

- **-events_init**
  Initializes the events database only. Initializes (removes) *only* the event records in the DDM database.
- **-stats_init**
  Initializes only the statistical database records in the DDM database.
- **-f <SAVE_FILE>**
  Specifies the name of the backup file to load.

Points To Remember About Restorations

To keep the databases synchronized, the DDM database must be restored each time that the SpectroSERVER database is restored.

Some of the records in a given save file are likely to have reached their purge date by the time you reload them. As a result, they are purged as soon as the Archive Manager is restarted.

Restart the Archive Manager when the restoration has completed.

Database Maintenance and Optimization

The section describes the two scripts that you can run to keep the DDM database running efficiently.

db_maintenance.pl

Located in the *$SPECROOT*/SS/DDM/scripts directory, this script removes all unreferenced statistical records from the DDM database. Unreferenced records are typically created when models are deleted. Over time, their associated records are purged, leaving some unnecessary remnants in the database.

> **WARNING**
> The db_maintenance.pl script can only be run with the Archive Manager down. Carefully weigh the potential benefit of running this script against the drawbacks of taking the Archive Manager down.

Do not schedule this script to run regularly. Run it occasionally, at times when an extremely large number of models have been deleted from a landscape. The performance gains that are realized by running this script are not noticeable. Run this script only for general housekeeping if a great many models have been destroyed (such as an entire landscape).

We recommend running the db_optimize.pl script before running this script. In addition, we recommend running this script at a time that minimizes its impact on production environments. The script can run very slowly on a large, unoptimized database or on a database with many event records.

The script has the following format:

```
./db_maintenance.pl[-q]
```

- **-q**
  (Quiet) Disables prompting (interactive mode).

db_optimize.pl

This script is located in the *$SPECROOT*/SS/DDM/scripts directory. It provides an easy way to optimize all of the tables in the DDM database.

Optimizing tables has two major benefits:

- The speed of queries that are sent to the DDM database is increased.
- Disk space that is available from purged records is recovered.

You can schedule this script to run weekly or monthly, depending on your performance requirements. Keep in mind that this script can take a considerable amount of time to run, depending on the size and the level of fragmentation of the DDM database.

> **NOTE**
> The db_optimize.pl script requires free disk space that exceeds the size of the largest file in the *$SPECROOT*/mysql/data/ddmdb directory. We recommend backing up your database file before running this script.

The script may be run with the Archive Manager up. However, it creates a 10-minute delay between table optimizations to allow the Archive Manager to recover from the database being locked.

This script has the following format:

```
./db_optimize.pl[-q]
```

- **-q**
  (Quiet) Disables prompting (interactive mode).

DDM Database Queries

The queries provided in this section can help you determine what events are being generated and what models are generating these events. We have provided queries that can help you determine whether a specific device is generating excessive events or whether a change is required to the number of days that statistical data is stored. These queries can take a while to run, depending on the size of the DDM database event table.

> **NOTE**
> For information on setting the MAX_STAT_DAYS parameter value, which controls the number of days that data is stored, see Archive Manager Resources.

To log in to MySQL:

At a command prompt, enter the following command in *$SPECROOT*/mysql/bin:

```
mysql -uroot -proot ddmdb
```

On UNIX, also pass in the following argument:

```
-S $SPECROOT/mysql/tmp/mysql.sock
```

The mysql> prompt appears.

To query the DDM (ddmdb) database:

At the mysql> prompt, enter any of the following queries:

- To display table statistics:
  ```
  SHOW TABLE STATUS LIKE "event";
  ```
- To get a count of the total number of events:
  ```
  SELECT COUNT(*) FROM event;
  ```
- To get a count of the number of events that occurred after a particular date:
  ```
  SELECT COUNT(*)
    FROM event
    WHERE utime >= UNIX_TIMESTAMP("yyyy-mm-dd");
  ```
- To get the top ten events most commonly generated:
  ```
  SELECT HEX(type), COUNT(*) AS cnt
    FROM event
    GROUP BY type
    ORDER BY cnt DESC
  ```

```
  LIMIT 10;
```

- To get the top ten models with the most events:

```
SELECT HEX(e.model_h), m.model_name, COUNT(*) AS cnt
  FROM event e, model m
  WHERE e.model_h=m.model_h
  GROUP BY e.model_h
  ORDER BY cnt DESC
  LIMIT 10;
```

- To get the top ten high-volume days for events:

```
SELECT DATE(FROM_UNIXTIME(UTIME)) AS x, COUNT(*) AS cnt
  FROM event
  GROUP BY x
  ORDER BY cnt DESC
  LIMIT 10;
```

- To get the last ten days of volume of events:

```
SELECT date(from_unixtime(utime)) AS x, COUNT(*) AS cnt
  FROM event
  GROUP BY x
  ORDER BY x DESC
  LIMIT 10;
```

Other Database Utilities

DX NetOps Spectrum provides three MySQL database utilities, all of which are installed in the *$SPECROOT*/mysql/bin directory.

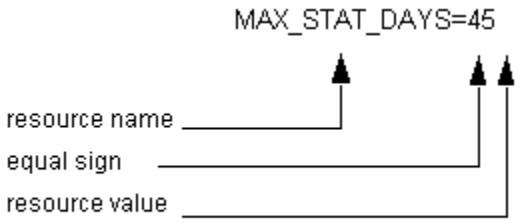
- myisamchk lets you check and repair MyISAM tables while the MySQL server is stopped.
- mysqlcheck is similar to myisamchk. However, it does not require you to stop the server to check or repair tables. This utility also optimizes and analyzes tables.
- mysqladmin enables you to perform administrative operations, such as checking the server configuration or dropping a database.

NOTE
For more information on using these MySQL utilities, see the documentation provided at http://www.mysql.com.

Archive Manager Resources

Archive Manager resources are settings that control how historical records are processed. These resources also enable the Archive Manager to communicate with the SpectroSERVER and DDM databases.

Archive Manager resources are defined in the .configrc file, which is located in the *$SPECROOT*/SS/DDM directory. The resources are listed in the form “resource = resource_value”, as shown here.



The .configrc file defines the following Archive Manager resources:

- **ARCH_MGR_SOCKET_NUMBER**
  Identifies the port where the Archive Manager listens for requests from the VNM and SSAPI clients.
  Default: 0xbafe
- **AUTO_REPAIR_DB**
  Controls whether the Archive Manager automatically attempts to repair a corrupt DDM database. By default, this parameter is not listed in the .configrc file and, therefore, it is not enabled. To enable the auto-repair functionality, add AUTO_REPAIR_DB=TRUE to the .configrc file. To disable the auto-repair functionality, set the value to FALSE or remove the entry from the .configrc file.
  Default: Disabled
- **DDM_DATABASE_NAME**
  Required for communications between the Archive Manager and the DDM database. The default value is read in automatically when DX NetOps Spectrum is installed. Changing this value is not recommended.
  Default: ddmdb
- **DDM_DATABASE_PORT**
  Specifies the port used to connect to the MySQL database server.
- **DDM_DATABASE_HOSTNAME**
  Required for communications between the Archive Manager and the DDM database. The default value is set automatically when DX NetOps Spectrum is installed. Changing this value is not recommended.
  Default: local host
- **DDM_DATABASE_PASSWORD**
  Required for communications between the Archive Manager and the DDM database. The default value is read in automatically during installation. Changing this value is not recommended.
  Default: DX NetOps Spectrum Installation Owner user name password
- **DDM_DATABASE_USERNAME**
  Required for communications between the Archive Manager and the DDM database. The default value is read in automatically during installation. Changing this value is not recommended.
  Default: DX NetOps Spectrum Installation Owner user name
- **DDM_SOCKET_NUMBER**
  Deprecated. This resource will not appear in future releases.
- **LANDSCAPE_PRECEDENCE**
  Currently unsupported resource.
- **MAX_DB_CONNECTIONS**
  Specifies the maximum number of simultaneous MySQL connections that the Archive Manager can use to service requests.
  Default: 25
- **MAX_EVENT_DAYS**
  Specifies the maximum number of days that event data is stored. When MAX_EVENT_DAYS is exceeded, the older data is purged.
  Default: 45
- **MAX_STAT_DAYS**
  Specifies the maximum number of days that statistical data is stored. When MAX_STAT_DAYS is exceeded, the older data is purged.
  Default: 45
- **TIME_TOLERANCE_IN_SECONDS**
  Specifies the maximum allowable variance in seconds between the timestamp that is reported for logged data and the actual logging time. The higher the time tolerance value, the more effectively data can be compressed, conserving CPU and disk resources. However, accuracy is sacrificed as this value increases.
  Default: 300

DDM and Archive Manager Troubleshooting

This section identifies probable causes and solutions for problems that are associated with the Archive Manager and the DDM database.

Error Messages in ARCHMGR.OUT

Symptom

I saw the following message:

```
<date/time> ERROR at ArchMgr.cc(591): Failed to open connection to SpectroSERVER at <hostname>, 0xbeef. The
 error indicates that the SpectroSERVER is down. Will try again in 60 seconds.
```

Solution

The SpectroSERVER is not ready. The Archive Manager automatically starts when the SpectroSERVER is started but cannot connect until the SpectroSERVER is ready. This message always appears on initial startup and anytime that the SpectroSERVER goes down.

Symptom

The following message appears once the Archive Manager has connected or reconnected:

<*date/time*> : ArchMgr has successfully registered with DDM name service - <*ip_address*> (<machine_name>).

Symptom

When I attempted to start the Archive Manager, I saw the following message:

<*date/time*> : ArchMgr is shutting down...

Solution

The Archive Manager has been shut down because the SpectroSERVER does not contain a DX NetOps Spectrum User model for the user who attempted to start it.

Symptom

I saw the following message:

<*date/time*> : ArchMgr has successfully shut down.

If this message persists, check the Users tab in the OneClick Console to verify that a user exists for the owner of the ArchMgr process.

Symptom

I saw the following message:

```
<date/time> : ArchMgr started as user '<user_name>'
<date/time> : ArchMgr validating database
Database corruption detected:
   ddmdb.statistic_ul64 - record delete-link-chain corrupted
   ddmdb.statistic_ul64 - Corrupt
Error opening the DDM database. One or more tables are corrupt.
Recovery options:
1. Run `ArchMgr -repair` to attempt recovery
2. Load a valid DDM savefile using `ddm_load <savefile>`
3. Initialize the DDM database using `ddm_load -i <LANDSCAPE_HANDLE>`
<date/time> : ArchMgr invalid database error.
```

Solution

The DDM database has been corrupted and cannot be loaded. You can use the ddm_load command to load a saved DDM database or initialize the DDM database. You can also attempt to repair the existing database file using the ArchMgr -repair command.

To run the ArchMgr -repair command, navigate to the *$SPECROOT*/SS/DDM directory and enter:

./ArchMgr -repair

Once the repair has successfully completed, the following message appears:

“ArchMgr successfully repaired database.”

To enable the Archive Manager to automatically attempt to repair a corrupted DDM database, use the auto_repair_db option in the .configrc file. For more information, see Archive Manager Resources .

No Events Are Listed

Symptom

No events are listed in on the Events tab and the Servers (Connection Status) button is flashing yellow. When you double-click the button, the Connection Status dialog shows a status of “Down” for the Events and View services, but “Up” for the Landscape service.

Solution

The Archive Manager is not running or is not connected to the SpectroSERVER. Check the Control menu in the Control Panel to verify that the Archive Manager service has been started. If it has been started, check the *$SPECROOT*/SS/DDM/ARCHMGR.OUT file for Archive Manager errors.

Distributed SpectroSERVER Administration

This section details how to administer and manage DX NetOps Spectrum and databases in a Distributed SpectroSERVER environment.

Introducing Distributed SpectroSERVER

This section introduces the Distributed SpectroSERVER environment which allows you to create a unified representation of the infrastructure that is composed of multiple landscapes, each with a local SpectroSERVER.

In a Distributed SpectroSERVER environment, a SpectroSERVER client, such as the OneClick Console, can simultaneously access information from multiple SpectroSERVERs.

About Distributed SpectroSERVER

Distributed SpectroSERVER (DSS) is a powerful modeling feature that enables the distribution of management over a large-scale infrastructure. The infrastructure can be organized geographically or across multiple servers in a single physical location. DSS can improve DX NetOps Spectrum performance when managing a computing infrastructure. Performance improvements can come from distributing the network load from management traffic and delegating tasks to remote workstations.

Using DSS, you can create a unified representation of the infrastructure that is composed of multiple landscapes, each with a local SpectroSERVER. In a DSS environment, a SpectroSERVER client, such as the OneClick Console, can simultaneously access information from multiple SpectroSERVERs.

DSS includes the following features:

- **Distributed Visibility**
  The OneClick console displays information for all deployed SpectroSERVERs. Summary alarm counts are displayed for each SpectroSERVER. The network manager can quickly locate trouble areas.
- **Localized Polling Traffic**
  The management workstation that is polling the network is geographically closer to the devices that it manages with DSS. This setup reduces traffic on wide area links and avoids congestion on the local network. Multiple, smaller SpectroSERVERs generate less traffic than a single SpectroSERVER that polls devices from a great distance.
- **Scalability**
  As a network expands, it is often less expensive to use low-end workstations as additional, dedicated SpectroSERVER servers. Such a solution is preferable to upgrading one workstation to accommodate one SpectroSERVER in a large, non-distributed environment.
- **Fault Tolerance**
  DSS supports fault tolerance between SpectroSERVERs. A secondary SpectroSERVER can be provided as a fault tolerant backup or standby for a primary SpectroSERVER. Network management continues if the workstation running the primary SpectroSERVER fails.
  You can protect against failures by simply reloading the database for a given landscape onto a secondary SpectroSERVER. When a failure occurs that disables the primary SpectroSERVER, the secondary SpectroSERVER automatically takes its place. All DX NetOps Spectrum applications automatically use the secondary SpectroSERVER.

Landscapes

A network domain that a single SpectroSERVER manages is known as a *landscape*. A landscape consists of the models, associations, attribute values, alarms, events, and statistics that belong to a specific SpectroSERVER. Each landscape in a network is unique. A unique landscape handle (ID) identifies each landscape.

In OneClick, a landscape icon represents each landscape. The landscape icon represents a SpectroSERVER database. Through double-click zones and menu selections, the landscape icon lets you access remote network models. The icon also presents a rollup of alarm information for the devices that are modeled in those remote databases.

> **NOTE**
> The terms *local* and *remote* are used to designate landscapes from the perspective of a particular SpectroSERVER.

Landscape Maps

DX NetOps Spectrum automatically maintains a "map" of all of the landscapes that comprise a particular DSS environment. Changes that occur in the SpectroSERVER topology initiate an internal discovery mechanism that updates the landscape maps of all of the other SpectroSERVERs in that environment. For example, discovery detects a SpectroSERVER that is added or removed from the network.

A landscape model is a container model. Landscape models let you connect to other SpectroSERVERs in the landscape map through the DX NetOps Spectrum user interface. You can create a landscape model at any level of the three view hierarchies: Topology, Location, or Organization.

Modeling Catalogs

A modeling catalog is a set of templates (such as model types or relations) that are installed on a particular SpectroSERVER. These templates are used to create models. The models that are created through these templates compose the landscape of that SpectroSERVER.

> **NOTE**
> OneClick queries the default landscape for a list of available model types at startup.

When you model multiple landscapes using DSS, each landscape must contain identical modeling catalogs. All model types in the modeling catalog of one landscape must also exist in the modeling catalog of every other landscape to which it connects. If you install a new management module on one SpectroSERVER, install the same management module on every other SpectroSERVER in the landscape map.

User Models

A user model contains information about individual user permissions and other user data. This information is stored in a landscape. When you first install DX NetOps Spectrum, a default user model represents the user that you specified in the Installation Owner field during DX NetOps Spectrum installation.

In a DSS environment, the same user model must exist in all landscapes to enable users to connect to remote SpectroSERVERs in the landscape map and to enable the landscapes to communicate with each other. Adding or modifying a user model causes the SpectroSERVER associated with the landscape to query all other SpectroSERVERs in the landscape map. The query checks for the user model in other landscapes. If the user model is found in other landscapes, their user models are automatically updated to reflect any changes to the initial user model.

NOTE
Deleting a user model only deletes the user model in that landscape. You must manually delete duplicate user models on other SpectroSERVERs in the landscape map.

SpectroSERVER (.vnmrc) Resources

SpectroSERVER resources are defined in the <*$SPECROOT*>/SPECTRUM/SS/.vnmrc file. Many default values of these resource files are built into the code and remain blank. However, the coded default values are not used when values are specified in these resources.

Resources in the .vnmrc (Virtual Network Machine runtime configuration) file define path names and default settings for the SpectroSERVER. The DX NetOps Spectrum system software includes a runtime configuration file with default settings for SpectroSERVER resources.

You can modify resources to make the following changes:

- Define general SpectroSERVER resources and directory paths
- Adjust events archiving
- Specify name service variables
- Adjust thread allocation
- Control fault tolerant alarm synchronization

All of these resource entries are listed in the format “resource = resource_value”. For many of the resources in the .vnmrc file, the resource value is blank.

If no value appears with a specific resource, DX NetOps Spectrum uses the default value. The resources in the .vnmrc file take effect when SpectroSERVER is started. If you change this file while SpectroSERVER is running, the changes take effect when SpectroSERVER is restarted.

Example: Define a .vnmrc resource

This example sets the maximum number of records logged in the Event Log database:

```
max_event_records=5000
```

- **max_event_records**
  Is the resource name.
- **5000**
  Is the resource value.

General SpectroSERVER (.vnmrc) Resources

The general SpectroSERVER (.vnmrc) resources control many SpectroSERVER functions. The following list describes the general SpectroSERVER (.vnmrc) resources:

- **comm_port**
  Specifies the TCP port that client user interfaces use to communicate with SpectroSERVER. The port number is defined during installation.
  This command has the following format:
  ```
  comm_port=0xBEEF
  ```
  – ***0xBEEF***
    Is the default TCP connection port socket. This socket can be any valid TCP port that is greater than the port number that is assigned to the IPPORT_USERRESERVED parameter in the file /netinet/in.h. However, the port must be less than 65535 (0xFFFF).
- **snmp_trap_port_enabled**
  Binds the SpectroSERVER to the SNMP trap port and listen for traps. When set to False, the SpectroSERVER does not bind to the SNMP trap port.
  This command has the following format:
  ```
  snmp_trap_port_enabled=TRUE
  ```
  Default: True
- **vnm_file_path**
  Specifies the root subdirectory that contains SpectroSERVER external files, such as database files.
  This command has the following format:
  ```
  vnm_file_path=<directory>/spectrum/SS/CsVendor
  ```
  – ***/spectrum/SS/CsVendor***
    Is the file path for the root subdirectory
- **tcp_buffer_size**
  Lets you alter the buffer size that is appropriate for traffic on your LAN. A large buffer size improves throughput. The resource accepts a numeric value that represents the number of bytes for the TCP buffer. This command has the following format:
  ```
  tcp_buffer_size=<blank>
  ```
  Default: blank
  Limits: 8192 to 65536 bytes
  Note: Values below 8 KB are rounded up to 8 KB. Values above 64 KB are set to 64 KB.
- **resource_file_path**
  Is the file path for VNM resource files, such as Ether Map.
  This command has the following format:
  ```
  resource_file_path=./CsResource
  ```
  – **./CsResource**
    (Optional) Is the file path for VNM resource files. This parameter can be left blank.
- **wait_active**
  Determines whether the server accepts connections as soon as all models are loaded or waits until all models are active. If set to *Yes,* a Control Panel message displays a running percentage of models that were activated during SpectroSERVER startup.
  This command has the following format:
  ```
  wait_active=no
  ```
  Default: no.
- **max_bind_retry_count**
  Specifies the maximum number of listen socket bind retries.
  This command has the following format:
  ```
  max_bind_retry_count=50
  ```

Default: 50.

- **bind_retry_interval**
  Specifies the delay in seconds between listen socket bind retries.
  This command has the following format:
  ```
  bind_retry_interval=30
  ```
  Default: 30 seconds.
- **min_client_version**
  Is the minimum parm block version that the SpectroSERVER accepts for client connections.
  This command has the following format:
  ```
  min_client_version=0
  ```
  Default: 0 minimum client connections.
- **max_connections**
  Is the maximum number of connections the SpectroSERVER accepts. Connections can be from clients or from other servers, such as another SpectroSERVER, Archive Manager, or Location Server (main and local).
  This command has the following format:
  ```
  max_connections=50 gensv000316 docs002958
  ```
  Default: 50 connections
  A connection can fail when the maximum number of client connections is exceeded. When you increase the maximum SpectroSERVER connections, an increase in the number of open file descriptors on your workstation is sometimes required for improved performance.
- **handshake_timeout**
  Sets the time in seconds for exchanging initial ID information during a connection handshake.
  This command has the following format:
  ```
  handshake_timeout=40
  ```
  Default: 40 seconds
- **vnm_message_timeout**
  The vnm_message_timeout resource sets the timeout in seconds for messages that are sent between VNMs.
  This command has the following format:
  ```
  vnm_message_timeout=180
  ```
  Default: 180 seconds
- **vnm_close_timeout**
  The vnm_close_timeout resource sets the timeout in seconds for closing the connection between VNMs.
  This command has the following format:
  ```
  vnm_close_timeout=180
  ```
  Default: 180 seconds
- **connect_time_limit**
  Sets the timeout in milliseconds for connection to the VNM.
  This command has the following format:
  ```
  connect_time_limit=5000
  ```
  Default: 5000 milliseconds
- **rcpd_comm_port**
  Specifies the listening port of the Remote Copy Process Daemon (rcpd). This resource is used for fault-tolerant database backups.
  This command has the following format:
  ```
  rcpd_comm_port=0xCAFE
  ```
  Default: 0xCAFE
- **procd_comm_port**
  Specifies the port that the VNM uses to connect to the process daemon.
  This command has the following format:

```
procd_comm_port=0xFEEB
```

Default: 0xFEEB

- **snmp_trap_port**
  Specifies the port through which the VNM receives traps. This command has the following format:

  ```
  snmp_trap_port=162
  ```

  NOTE

  To change the SNMP Trap Port SPECTRUM uses to listen for trapsEdit the $SPECROOT/SS/.vnmrc file:

  1. Set the "snmp_trap_port=" to a value you wish to have Spectrum listen to for incoming traps.
  2. Then, you will need to restart the SpectroSERVER for the change to take effect.
  3. The default value is **162.**

- **enable_traps_for_pingables**
  Specifies whether DX NetOps Spectrum can receive SNMP traps on pingable models. By default, the .vnmrc file does not contain this resource. Add it to the file manually, using the following syntax:

  ```
  enable_traps_for_pingables = TRUE
  ```

  Default: TRUE

- **max_device**
  Applies to DX NetOps Spectrum products whose device_limit resource is in effect. By default, DX NetOps Spectrum generates a yellow alarm when the number of models reaches 80% of the specified device limit. DX NetOps Spectrum generates a red alarm when the number of models reaches 100% of the specified device limit. This resource lets you set a value that falls below the actual device limit, which gives you an earlier warning.
  This command has the following format:

  ```
  max_devices=<# of device models>
  ```

  – ***# of device models***
    Refers to models with IP addresses that are derived from the device model type AND whose specified number falls below the value of the device_limit resource. The default value is blank.

- **disable_redundancy_when_using_loopback**
  Disables redundancy (0x11d2c) when modeling a device by loopback. This parameter is only applicable when the use_loopback (0x12bb) attribute of the VNM model is set to True.
  This command has the following format:

  ```
  disable_redundancy_when_using_loopback=False
  ```

  By default, this resource does not appear in the .vnmrc file and is therefore automatically evaluated as False.

  NOTE
  For more information, see the Modeling and Managing Your IT Infrastructure section.

- **persistent_alarms_active**
  Prevents DX NetOps Spectrum from retaining alarm-related information when the SpectroSERVER shuts down.
  This command has the following format:

  ```
  persistent_alarms_active=<False>
  ```

  By default, this resource does not appear in the .vnmrc file. DX NetOps Spectrum automatically retains alarm-related information (such as troubleshooter assignments or status) when the SpectroSERVER is shut down and is brought back up. The alarms that were present before shutdown are preserved. These alarms are considered "persistent" alarms. Adding persistent_alarms_active=False to the .vnmrc file prevents DX NetOps Spectrum from retaining alarm-related information when the SpectroSERVER shuts down.

NOTE
We strongly recommend against adding the persistent_alarms_active resource unless you integrate a third-party application that retains alarm-related information.

Adding this resource has the following effects:
- Alarm status additions are lost (only recorded as past events)
- Existing alarms on SpectroSERVER shutdown are regenerated at startup with new timestamps.
- Regenerated alarms are forwarded to alarm notification tools.

- **unsupported_attr_poll_interval**
  Specifies the amount of time that DX NetOps Spectrum waits to poll an external attribute that has returned a "noSuchName" error. If this parameter is not specified in the .vnmrc file, the default value (12 hours) is used.
  This command has the following format:
  ```
  unsupported_attr_poll_interval=43200
  ```
  Default: 43200 seconds (12 hours)

- **snmpv3_engine_id=**
  Specifies the SNMPv3 local engine ID of a SpectroSERVER. This is a static value (defaults to MAC address) and you can set it for the devices that do not support engine ID discovery. When the 'snmpv3_engine_id=' value is set the engine id will not change when the SpectroSERVER is stopped and restarted.

Events Archive (.vnmrc) Resources

The events archive (.vnmrc) resources control the process of the SpectroSERVER sending events to the Archive Manager for logging. The following list describes the events archive (.vnmrc) resources:

- **max_event_records**
  Specifies the maximum number of records that can be stored in the Event Log database.
  This command has the following format:
  ```
  max_event_records=# of Records
  ```
  - ***# of Record***
    Is the number of Event Log records. The minimum value is equal to the event_record_increment value. System storage capacity limits the maximum value.
    Default: 20,000
- **event_record_increment**
  Specifies the number of records to delete from the Event Log database when the number of records exceeds the max_event_records value.
  This command has the following format:
  ```
  event_record_increment=# of Records
  ```
  - ***# of Records***
    Is the number of Event Log records that are deleted from the database. The minimum value is 100.
- **event_batch_max_size**
  Sets the maximum number of events per batch. If the batch becomes full, the events batch is immediately sent to the Archive Manager.
  This command has the following format:
  ```
  event_batch_max_size=1000
  ```
  Default: 1000 (the maximum number of events)
- **event_batch_timeout**
  Determines the amount of time in seconds when the events batch is sent over to the Archive Manager.
  This command has the following format:
  ```
  event_batch_timeout=1
  ```

Default: *1* second

- **log_user_events**
  Controls whether an event is generated for each user-initiated write to a model attribute value. A value of True causes the VNM to generate events.
  This command has the following format:
  log_user_events=*False*
  Default: False
- **use_log_queue**
  Places events in a separate queue when they are generated. These events are sent to the Archive Manager on a separate thread. If set to “TRUE”, the event is sent to the Archive Manager on the same thread on which it was generated. This situation can delay alarm creation.
  This command has the following format:

  ```
  use_log_queue=<blank>
  ```

  Default: <*blank*>

Work Thread (.vnmrc) Resources

SpectroSERVER is a multithreaded process. During normal operation, each subsystem allocates numerous work threads.

SpectroSERVER maintains a pool of work threads that are reused over time. Subsystems use threads from the pool, up to their individual limits, during periods of increased activity. When the common pool of work threads is exhausted, new work threads are created. The pool grows to accommodate the increased activity.

Work threads that subsystems no longer require return to the common pool for later use. Threads are taken from the pool to serve subsequent needs or new threads are allocated if the pool is empty. Threads that remain unused for a specified time are removed from the pool, and their resources are returned to the system. This process is termed aging.

The following list describes the work thread (.vnmrc) resources:

- **max_total_work_threads**
  Specifies the maximum number of work threads that can be allocated for all SpectroSERVER subsystems. Each work thread consumes processing resources and requires a significant block of memory. Set its value based on system capacity (memory size and speed).
  When the value of this resource is too high, SpectroSERVER can periodically run out of memory. When the value of this resource is too low, SpectroSERVER operations can become sluggish.
  If the value of this resource is newly set or changed, DX NetOps Spectrum reads the new value when the SpectroSERVER is restarted. Once the value is read, it is used to update the value of the WorkThreadsMaxAvail attribute on the VNM model. When the value of WorkThreadsMaxAvail has been updated, the value for max_total_work_threads is removed from the .vnmrc file.
  This command has the following format:

  ```
  max_total_work_threads=# of threads
  ```

  The default value of the VNM WorkThreadsMaxAvail attribute is 500.
- **work_thread_age**
  Work threads that a subsystem no longer requires are returned to the work thread pool. This resource specifies how long (in seconds) a work thread can remain in the pool without being used.
  Set this resource to a value that is compatible with subsystem activity. Significant processing overhead is required to create a work thread. Setting the value of this resource too low taxes system resources by creating new threads too often in response to work thread demands. Setting the value too high means that resources remain committed unnecessarily.
  This command has the following format:

  ```
  work_thread_age =seconds
  ```

  Default: 60 seconds

Fault Tolerant Alarm Service (.vnmrc) Resources

In a fault-tolerant environment, alarms must be synchronized between the primary and secondary SpectroSERVERs. The servers connect to exchange alarm information. If the initial connection attempt fails, subsequent attempts can be made. The Fault Tolerant Alarm Service controls alarm synchronization using the following settings:

- **ftasv_enabled**
  Enables alarm synchronization. Include this command in the .vnmrc file for both the primary and secondary servers. This command has the following format:
  ```
  ftasv_enabled=true
  ```
  Default: True

  WARNING
  You cannot have ftasv_enabled set to True for one server and set to False for the other server. Use the same value for both servers.
- **ftasv_max_conn_retry_count**
  Specifies the number of times that the primary server attempts to connect to the secondary server for synchronization after a connection attempt has failed. This parameter is required in the .vnmrc file of the primary SpectroSERVER.

  NOTE
  The primary server uses this parameter when attempting to connect to the secondary server. It is not used when the secondary server attempts to connect to the primary.

  This command has the following format:
  ```
  ftasv_max_conn_retry_count=# of retries
  ```
  Default: Four retries (for a total of five synchronization attempts with the secondary server).
- **ftasv_conn_retry_interval**
  Specifies the number of seconds between primary server attempts to synchronize with the secondary server. Use this parameter in the .vnmrc file of the primary SpectroSERVER.

  NOTE
  The primary server uses this parameter when attempting to connect to the secondary server. This parameter is not used when the secondary server attempts to connect to the primary.

  This command has the following format:
  ```
  ftasv_conn_retry_interval=# of seconds
  ```
  Default: 30 seconds
- **ftasv_debug**
  Enables debug output for alarm synchronization activity. Include this command in the .vnmrc file for both the primary and secondary servers. Debug output is written to the VNM.OUT file of each server. Each message begins with "Fault Tolerant Alarm Service."
  This command has the following format:
  ```
  ftasv_debug=true
  ```
  Default: False

  WARNING
  If the secondary SpectroSERVER is not running when the primary server attempts to connect to it, the primary exhausts its synchronization attempts. As a result, startup of the primary SpectroSERVER is delayed. When using default settings for ftasv_max_conn_retry_count and ftasv_conn_retry_interval, the delay is two minutes (four retries with 30 seconds intervening). This delay is unavoidable because it occurs before model activation. The workaround is to verify that the secondary SpectroSERVER is running when the primary starts. You can also decrease the retry count or the interval size to reduce the potential delay.

snmpv3_engine_id=

How to Pack Up Product Utilities and Move Them to Another Computer

The packtool.pl script packs up the DX NetOps Spectrum Command Line Interface (CLI), [assign the value for sslog in your book], AlarmNotifier, the modelinggateway tool, and the sbgwimport tool so that you can transfer them to another computer. The script retains the relative directory structure of the utilities and their support files when the files are moved.

Note: Both computers must be running the same operating system.

Consider the following requirements before running the packtool.pl script:

- You must be a root user on Linux platforms, or a user with administrative privileges on Windows platforms to run the packtool.pl script.
- The following requirements apply when you transfer the DX NetOps Spectrum utilities to a computer where only the OneClick server is installed:
  - The version and patch level of the OneClick server on each computer must match. After each patch installation, run the packtool.pl script again, and transfer the utilities again.
  - The installation user on the computer where the utilities are transferred must match the installation user on the computer where the files are packaged.
  - If a debug patch or PTF is installed on the target computer, reinstall the debug patch or PTF after the file transfer.
- Stop all DX NetOps Spectrum processes on the computer where the utilities are packaged.
- Stop all DX NetOps Spectrum processes on the computer where you are transferring the utilities before you extract the tools_bundle file.
- To extract the tools_bundle file, you must be a root user on Linux platforms, or a user with administrative privileges on Windows.

  WARNING
  To run the DX NetOps Spectrum utilities, you must be logged on to the target computer as a valid DX NetOps Spectrum user or an error occurs. For example, if you are logged on to a Linux workstation as “root,” and there is no matching user model in DX NetOps Spectrum, you receive an error stating, “NO_USER.”

To package DX NetOps Spectrum utilities and transfer them to another computer, take the following steps:

1. Pack Up the SPECTRUM Utilities using the packtool.pl script.
2. Extract the tools_bundle file on another computer.

Pack Up DX NetOps Spectrum Utilities

Before moving the CLI, SSLogger, AlarmNotifier, the modelinggateway tool, and the sbgwimport tool to another computer, run a script to bundle them.

Follow these steps:

1. Verify that the environmental variable <*$SPECROOT*> is set to the DX NetOps Spectrum installation directory path on the computer where you are packing up the utilities.
2. Set the CYGWIN32 environment variable to the directory where the cygwin is installed.
3. Run the packtool.pl script, which packs up the utilities and their support files. The packtool.pl script can be found in the <*$SPECROOT*>/SS-Tools directory.
   To run the script from a Bash shell or other UNIX shell, enter the following command:
   ```
   <$SPECROOT>/SS-Tools/packtool.pl [-no_notifier | -no_event_alarms][-f file_name]
   ```
   - **<*$SPECROOT*>**
     Is the directory structure where DX NetOps Spectrum is installed on your SpectroSERVER.
   - **-no_notifier**
     Specifies that you do not want to pack up AlarmNotifier.
   - **-no_event_alarms**

Specifies that you do not want to pack up AlarmNotifier EvFormat or PCause files.

– ***-f file_name***
Specifies a name for the executable file.

An executable file named linux_tools_bundle (Linux), or nt_tools_bundle.exe (Windows) that contains the DX NetOps Spectrum utilities and their support files is created.

Move DX NetOps Spectrum Utilities to Another Computer

You can move DX NetOps Spectrum utilities to a computer that is only running the OneClick server.

Follow these steps:

1. Pack up the DX NetOps Spectrum utilities.
2. On the computer where you want to extract the DX NetOps Spectrum utilities, change the directory to <*$SPECROOT*>.
3. Using binary mode, FTP the executable file named linux_tools_bundle (Linux), or nt_tools_bundle.exe (Windows) to the current directory.
4. Extract the tools_bundle file from the DOS, Bash, or other UNIX shell.
The DX NetOps Spectrum utilities and their support files unpack into the appropriate directory structure.
5. If you transferred AlarmNotifier and event and pcause files, verify that the paths in <*$SPECROOT*>/SG-Support/CsResource/preferences/*.prf have the correct locations for the event and pcause files. Also, verify the ui= and the lhandle= options.
6. Set the <*$SPECPATH*> environmental variable to the path of the directory where you extracted the tools_bundle file:
   – On Windows, create the system environment variable <*$SPECPATH*> with the value in variable format:
   ```
   driveletter:\PATH_TO_SPECTRUM
   ```
   – On Linux, add the following line to the /opt/SPECTRUM/spectrum80.env file:
   ```
   SPECPATH=PATH_TO_SPECTRUM
   ```
7. On Linux platforms, define BES_LIC_DIR as PATH_TO_SPECTRUM/bin/VBNS/license in the spectrum*.env file in the /opt/SPECTRUM directory.
8. On Linux platforms, copy /usr/bin/perl to <*$SPECROOT*>/bin.
9. Verify that the .hostrc file contains the local host name and the name of the computer from which you transferred the utilities.
10. Verify that the .hostrc file on the main location server contains the host name of the computer where the tools_bundle file is extracted.
11. Verify that the .LocalRegFile contains the correct Main Location Server.
12. Set CLISESSID in a shell to use the CLI utility:
    Windows:
    ```
    set CLISESSID=<NUMBER>
    ```
    Linux:
    ```
    export CLISESSID=<NUMBER>
    ```
    – **NUMBER**
    Is any unique number for the shell.
13. Verify that Notifier/.alarmrc has the correct path to the SetScript, ClearScript, and UpdateScript. These scripts are located in the Notifier directory where you extracted the tools_bundle file.
14. Restart processd.
    You can now run the utilities on this computer.

You can also move DX NetOps Spectrum utilities to a computer that is not running DX NetOps Spectrum.

Follow these steps:

1. Pack up the DX NetOps Spectrum utilities.

2. On the computer where you want to extract the DX NetOps Spectrum utilities, create a directory to unpack the DX NetOps Spectrum utilities and their support files. For example, create the following directories:
   Windows:
   ```
   c:\win32app\spectrum
   ```
   Linux:
   ```
   /usr/spectrum
   ```
   NOTE
   Change the working directory (chdir) to these directories.
3. Send the executable file by FTP to the current directory using binary mode. The file has one of the following names: linux_tools_bundle (Linux) or nt_tools_bundle.exe (Windows).
4. Execute the tools_bundle file from the DOS, Bash, or other UNIX shell.
   The DX NetOps Spectrum utilities and their support files unpack into the appropriate directory structure.
5. Verify that the PATH variable is as follows:
   Windows:
   Verify that <*$SPECROOT*>/lib is in the PATH variable.
   Linux:
   - Create an /opt/SPECTRUM directory.
   - Create a link from <*$SPECROOT*>/lib to /opt/SPECTRUM/lib.
   - Create a link from <*$SPECROOT*>/bin to /opt/SPECTRUM/bin.
6. Set the <*$SPECROOT*> and <*$SPECPATH*> environmental variables to the path of the directory where you extracted the tools_bundle file:
   - On Windows, create the system environment variables <*$SPECROOT*> and <*$SPECPATH*> with the value in variable format:
     ```
     driveletter:/PATH_TO_SPECTRUM
     driveletter:\PATH_TO_SPECTRUM
     ```
   - On Linux, create /opt/SPECTRUM/spectrum80.env and add the following lines:
     ```
     SPECROOT=PATH_TO_SPECTRUM
     SPECPATH=PATH_TO_SPECTRUM
     ```
7. If you transferred AlarmNotifier and event and pcause files, verify that the paths in <*$SPECROOT*>/SG-Support/CsResource/preferences/*.prf have the correct locations for the event and pcause files. Also, verify the ui= and the lhandle= options.
8. On Linux platforms, define BES_LIC_DIR as PATH_TO_spectrum/bin/VBNS/license in the spectrum*.env file in the /opt/SPECTRUM directory.
9. Verify that the .hostrc file contains the local computer host name and the name of the computer from which you transferred the utilities.
10. Verify that the .LocalRegFile contains the correct Main Location Server.
11. Verify that vnmsh/.vnmshrc contains the correct main SpectroSERVER name.
12. Install the processd service:
    Windows:
    - If SRAdmin is not installed, install it as follows:
      ```
      shell> cd %SPECROOT%\Install-Tools\sdic\nt
      shell> .\sradmin --install
      shell> .\sradmin --start
      ```
    - Install the processd service:
      ```
      shell> cd %SPECROOT%\lib\SDPM
      shell> .\processd.exe --install --username USERNAME --password PASSWORD
      ```

NOTE
If processd does not start, reboot the computer.

- To start processed, run the following command:

```
shell> .\processd.exe --start
```

Linux:

- Copy <*$SPECROOT*>/lib/SDPM/processd_init.sh to /etc/init.d/processd.
- Copy <*$SPECROOT*>/lib/SDPM/processd.pl to /etc/init.d.
- Create a link from /etc/init.d/processd to /etc/rc2.d/S99processd.
- Start processd using /etc/init.d/processd start.

13. Verify that the .hostrc file on the main location server contains the host name of the computer where the tools_bundle file is extracted.
14. Set CLISESSID in a shell to use the CLI utility:
    Windows:

```
set CLISESSID=<NUMBER>
```

    Linux:

```
export CLISESSID=<NUMBER>
```

    - **NUMBER**
      Is any unique number for the shell.
15. Verify that Notifier/.alarmrc has the correct path to the SetScript, ClearScript, and UpdateScript. These scripts are located in the Notifier directory where you extracted the tools_bundle file.
16. On Windows platforms, if you want to use AlarmNotifier scripts, install Cygwin from http://www.cygwin.com. Be sure that the PATH variable contains the Cygwin bin directory in it.
    You can now run the utilities on this computer.

Setting Up a Distributed SpectroSERVER Environment

Name Resolution Requirements

The SpectroSERVER system or OneClick web server system must be able to resolve the host name of the SpectroSERVER to an IP address.

We recommend using hosts files for name resolution. This practice ensures that a network outage does not affect SpectroSERVER name resolution.

DX NetOps Spectrum and Multiple Interfaces

All DX NetOps Spectrum servers bind to and listen on all available interfaces and advertise themselves with host names that are not fully qualified. The result is flexibility when configuring a management topology. To establish connections, the DX NetOps Spectrum component servers try all interfaces in the order that is determined by the operating system until the connection succeeds.

Communication Among SpectroSERVERs

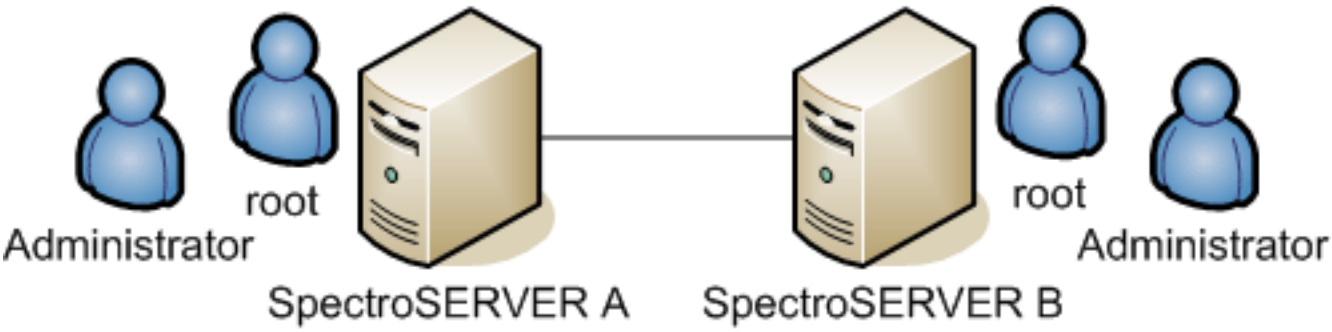
Install and run SpectroSERVERs in a distributed environment with the same user account. No further user model configuration is therefore required. SpectroSERVERs that are installed and run as different users cannot communicate.

Example: SpectroSERVERs A and B Cannot Communicate

In this example, SpectroSERVER A is running as “root”. SpectroSERVER B is running as Administrator. They cannot establish a connection because the request cannot pass through server security:

Example: Configuration for SpectroSERVER to SpectroSERVER Connection

This example shows a user logged in as "root" on SpectroSERVER B, and a user logged in as “Administrator” on SpectroSERVER A. This configuration enables the two SpectroSERVERs to communicate:



DSS Environment Requirements

Your distributed environment must meet the following conditions to enable multiple SpectroSERVERs and the modeling of multiple landscapes to represent those servers:

- Each landscape must contain an identical modeling catalog of the model types in a database and their relations. This replication provides a consistent base for DX NetOps Spectrum intelligence.
- Each landscape must contain the same user models, which you can view in the OneClick Users tab.
- Minimize the number of connections between subnets that are modeled in different landscapes.
- Limit the number of identical devices that are modeled in more than one landscape.
- Assign a unique landscape handle to each modeled landscape. DX NetOps Spectrum can then distinguish it from other landscapes in the DSS environment.

Location Servers

When you install a SpectroSERVER, you also automatically install a *location server*. This server identifies and locates other DX NetOps Spectrum services on the network. DX NetOps Spectrum processes use the location server to determine where these services are running. Processd starts and stops the location server.

In a distributed environment, DX NetOps Spectrum uses location servers to maintain the SpectroSERVER landscape map and provide connection services to client applications. During DX NetOps Spectrum installation, you designate one of the location servers in a landscape map (or DX NetOps Spectrum domain) as the *main location server (MLS)*.

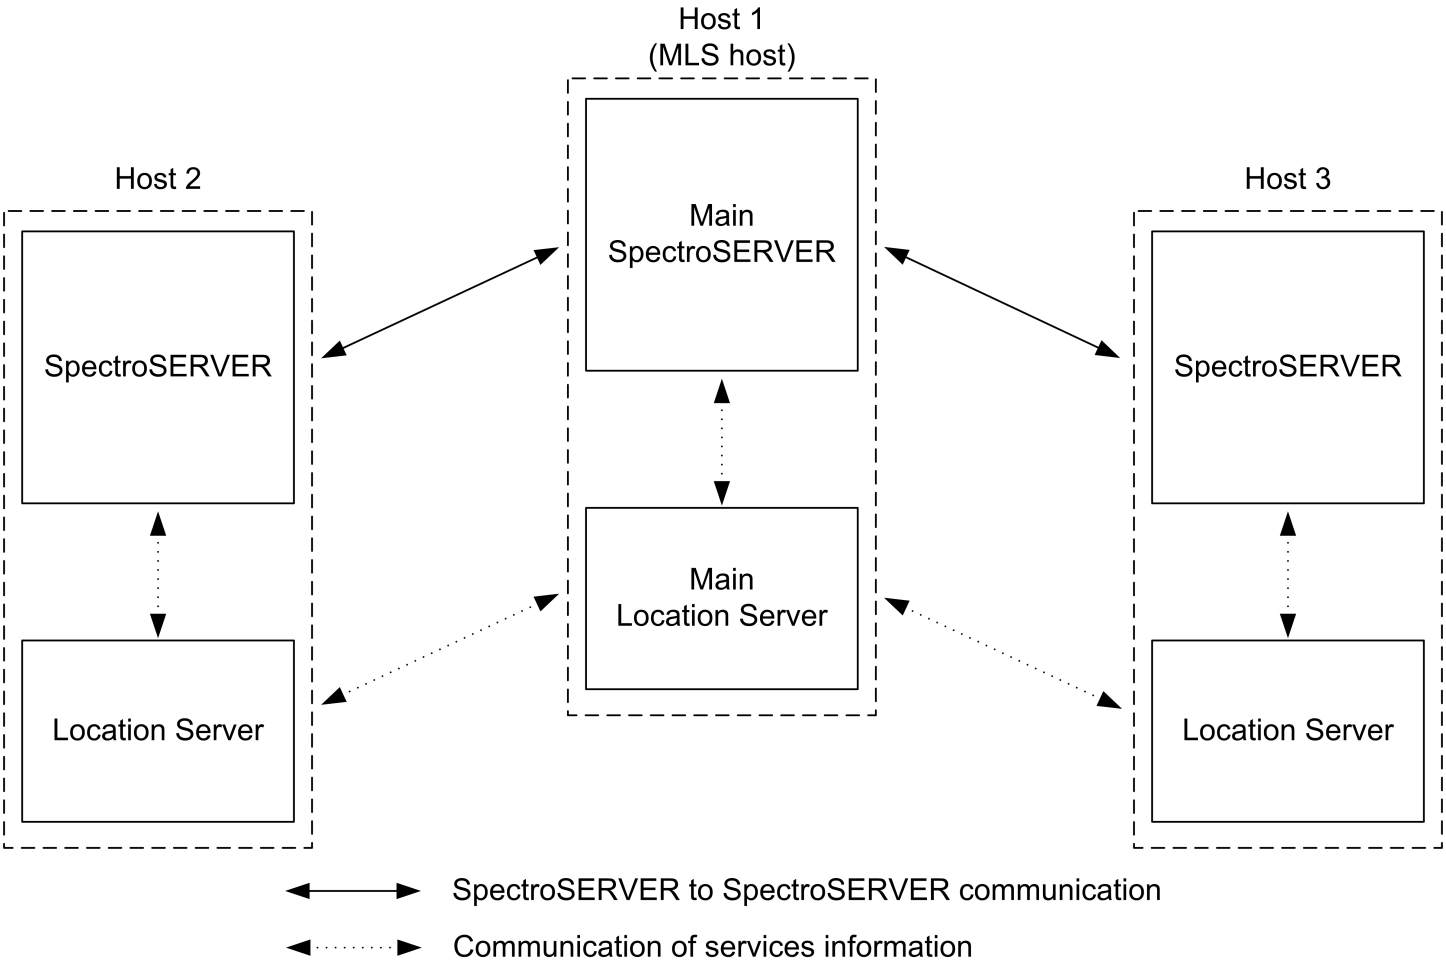
Install the main location server on a highly reliable computer. This server propagates service advertisements among location servers and communicates service locations among the location servers.

In the following diagram, the location server on Host 1 has been configured as the main location server for this environment. Because the main location server resides on the same host as a SpectroSERVER, that SpectroSERVER is considered to be the main SpectroSERVER.

All server-to-server communication is routed through the main location server host. Two non-MLS SpectroSERVERs can communicate only through the main SpectroSERVER.

The SpectroSERVER on Host 2 in the diagram has a distributed service with a resource modeled on the SpectroSERVER on Host 3. All communications about the remote resource are routed through the main location server host. The servers on Host 2 and Host 3 do not directly communicate.

WARNING
This diagram reflects a two-tiered setup consisting of one MLS and multiple child SpectroSERVERs. Such a configuration is the standard, recommended configuration.



How Location Servers Interact

Every DX NetOps Spectrum installation includes the following two files:

- .LocalRegFile lets DX NetOps Spectrum processes locate their location server.
- LS/.locrc is the configuration file for the locally installed location server.

These files manage the location server hierarchy and the interactions between each location server and the main location server.

In a distributed SpectroSERVER deployment, the location servers interact as follows:

1. SSAPI applications and servers read .LocalRegFile to determine the location server to use.
2. Each local location server reads the /LS/.locrc file to determine which server is the main location server.
3. The local location server connects to the main location server to find network services. If the main location server becomes unavailable, other location servers retain service information in memory until the main location server is available.

Main Location Server Connection

Each SpectroSERVER must have a connection to the SpectroSERVER running on the server that is designated as the main location server. This designation is specified in the <*$SPECROOT*>/LS/.locrc file.

The connection to the main location server requires the following configuration:

- Update the ".hostrc" file of the MLS with hostnames of:
  - All child SpectroSERVERs.
  - All OneClick clients.
- Update the ".hostrc" file of each child SpectroSERVER with hostnames of:
  - All OneClick clients.

    NOTE
    By default, the ".hostrc" file of each child SpectroSERVER contains the MLS name that you provide during the installation. By default, the ".hostrc" file on a OneClick client contains only that OneClick client hostname, do not update anything further.
- In a fault-tolerant environment, update the ".hostrc" file of the secondary MLS with hostnames of:
- – All child SpectroSERVERs.
  - All OneClick clients.
- In a fault-tolerant environment, update the ".hostrc" file of each secondary child SpectroSERVER with hostnames of:
  - All OneClick clients.
  - Primary child SpectroSERVER.
  - Secondary MLS.
- Each SpectroSERVER requires a DX NetOps Spectrum user model for the user account under which the other SpectroSERVER is running.

This configuration enables the communication between <ss>s through the MLS. This configuration also enables the <oc> server connection to the MLS.

NOTE
The main landscape (or the value of MAIN_LOCATION_HOST_NAME in the .locrc file) is modeled in DX NetOps Spectrum. The VNM topology for each SpectroSERVER contains this landscape unless it is already modeled elsewhere. An alarm is generated on this model if the connection to the main landscape is lost.

Designate a New Main Location Server

You can change the computer that is designated as the main location server.

On the SpectroSERVER, you designate a new main location server through the Location Server Configuration dialog or through the .locrc file.

On the OneClick web server, you set the main location server information in the DX NetOps Spectrum Configuration page in the OneClick Administration pages. This action updates the name of the main location server to which the OneClick web server connects.

NOTE
If you change the main location server on the SpectroSERVER without updating the OneClick web server, DX NetOps Spectrum does not function properly. For more information, see the Administrating section.

Example: Designating a New Main Location Server on the SpectroSERVER

A distributed network is composed of Computers 1 through 4, with Computer 1 designated as the main location server. To make Computer 4 the main location server, first reconfigure Computer 4 as the new main location server. Then reconfigure Computers 1, 2, and 3 to point to Computer 4 as the main location server.

Follow these steps:

1. Bring up the SpectroSERVER Control Panel.
2. Select Location Server from the Configure menu.
   The Location Server Configuration dialog opens.
3. Change the Main LS Host field in the Location Server Characteristics area to point to Computer 4.

NOTE
You can also edit the .locrc file in the <*$SPECROOT*>/LS directory to change the main location server. The following entry in the .locrc file identifies the main location server:

```
MAIN_LOCATION_HOST_NAME=Computer 4
```

Landscape Map Integrity Preservation

DX NetOps Spectrum users commonly maintain separate production and test environments. Protect the integrity of the landscape map by preventing SpectroSERVERs in the test environment from connecting to a SpectroSERVER in the production environment SpectroSERVER as their main location server, or the reverse.

Landscape Handles

A SpectroSERVER in a distributed deployment identifies each landscape by its *landscape handle*. 10.3 enables you to opt for increased capacity and scale by allowing you to monitor huge number of devices with fewer landscapes. Using the Huge Landscape Handle type (during installation), you can create landscapes which can support huge model count (beyond 1 Million models per SpectroSERVER). Handles are multiples of 64. This option is only available for fresh installs and best suited for new DSS environments and new single-server installations.

This capability is not supported for upgrade and migration scenarios to 10.3 from earlier versions. For direct upgrades and migrations, DX NetOps Spectrum automatically selects the Legacy Landscape Handle type.

NOTE

In a Distributed SpectroSERVER environment, you cannot select a mix of Legacy and Huge landscapes. For example, if you have an existing SpectroSERVER running in Legacy and want to add a new SpectroSERVER, you cannot add a Huge Landscape, even if you are installing it from the scratch.

In a Distributed SpectroSERVER environment, all your SpectroSERVERs should be either Legacy or Huge Landscapes.

Each landscape must have a unique landscape handle, which is either:

- **Legacy Landscape Handle:** a number that is divisible by 4 and is in the range of 4 to 16,376. (In hexadecimal format, handles are in the range 0x100000 to 0xffe00000 where the lower 20 bits are set to zero).
  Each SpectroSERVER is limited to 1 million models. Recommended option if you are using a SSdb created from any version prior to r10.2.
- **Huge Landscape Handle**: a number that is divisible by 64 and is in the range of 64 to 16,256. (In hexadecimal format, handles are in the range 0x1000000 to 0xfe000000 where the lower 24 bits are set to zero.) Each SpectroSERVER can manage/have beyond 1 million models. Recommended for new DSS environments and single-server installations only.

After installation, the encoded landscape handle appears at the top of all views, in OneClick Console that are associated with that landscape.

NOTE
We recommend using a sequential numbering scheme for landscape handles. You can associate a landscape handle with a significant landscape feature, such as a building number or some portion of a subnet IP address. However, for Legacy Landscape Handle(s) your entry is encoded into the 12 most significant bits of the landscape handle, and for Huge Landscape Handle(s) your entry is encoded into the 8 most significant bits of the landscape handle. The result can therefore appear unrelated to the appropriate landscape feature.

NOTE

From 10.3 onwards, you can load the catalog of the Legacy Landscape on a Huge Landscape and vice versa (using SSdbload -c option). However, you will not see the landscape details displayed. For more information on the landscape details, see the Known Anomalies section.

Assign Landscape Handles

Landscape handles can be assigned through the SpectroSERVER Validation dialog when installing DX NetOps Spectrum or by using a utility named lh_set.
You are allowed to set/assign the landscape handle, based on the type of Landscape handle you have opted for during installation. For instance, if you have selected Huge Landscape Handle type (multiples of 64), you cannot assign landscape handles which are multiples of 4 and not multiple of 64, (for example, 4, 16, 32, 68 and so on.)

WARNING
Run the lh_set utility before you run the SpectroSERVER for the first time. Otherwise, DX NetOps Spectrum assigns a default landscape handle that is the same every time that DX NetOps Spectrum assigns it. As a result, duplicate landscape handles can be created when multiple landscapes are configured. Such landscapes can never be accessed simultaneously from the same application.

Follow these steps:

1. Navigate to the SS directory.
2. Enter the following command:
   ```
   ../SS-Tools/lh_set <landscape handle>
   ```
   You can specify the new landscape handle in either decimal or hexadecimal notation. If you use decimal notation, the lh_set utility converts your entry into a hexadecimal landscape handle.
3. If you assign a landscape handle which is in conflict with the Landscape Handle type you have opted for during installation, the following error might appear:
   ```
   Landscape handle must be 64 - 16256, multiples of 64 (or 0x1000000 - 0xfe000000 with low 24 bits 0).
   Unable to set SS landscape handle.
   ```

NOTE
For more information, see Installing and Upgrading .

Change a Landscape Handle

If a SpectroSERVER has started, the process for changing the landscape handle of the SpectroSERVER database entails more steps. The landscape handle is included in the model handle of each model in the SpectroSERVER database. Changing the landscape handle therefore requires converting all model handles from the old landscape handle to the new landscape handle.

Change the landscape handle of all models that were created automatically at startup, and update the landscape handle in several resource files.

Follow these steps:

1. Use the Modeling Gateway tool to export the models from the SpectroSERVER whose landscape handle you want to change.
2. Shut down the SpectroSERVER.
3. Initialize the database with the SSdbload utility.

   NOTE
   For more information, see Database Management .
4. Assign the new landscape handle using the lh_set utility.
5. Start the SpectroSERVER.
6. Import the models into the SpectroSERVER using the Modeling Gateway tool.

   NOTE
   For more information, see the Modeling Gateway Toolkit .

   WARNING

   It is mandatory to reboot the server after you complete a fresh SpectroSERVER installation while installing r10.3.

   NOTE

   Running SpectroSERVER process using '**root**' user instead of '**spectrum**' user on linux machines may result in the following error message "*The user running the parent server does not have a user model in the local landscape*" on the landscape page found in the administration tab on the oneclick console.

   Run 'ps -ef | grep -i spectro' to check if the SpectroSERVER process is owned by '**root**' user or other user instead of '**spectrum**' user (You can check the value of '**initial_user_model_name**' parameter in $SPECROOT/SS/.vnmrc file to check for the '**spectrum**' user) to resolve the issue.

   Follow the steps mentioned to fix the issue:

   1. Launch Spectrum Control Panel using '**root**' or other user who is currently owning the SpectroSERVER process. Stop SpectroSERVER process thoroughly by clicking [**Stop SpectroSERVER**] button.

   2. Change the ownership of VNM.OUT, RCPD.OUT etc. under $SPECROOT/SS directory back to '**spectrum**' user using 'chown' command. Make sure when you run 'ls -l' under $SPECROOT/SS directory all files and directories are owned by '**spectrum**' user except the SpectroSERVER file. The SpectroSERVER file should be owned by '**root**' user and have the following attributes:

   ```
   -rwsr-x---   1 root     spectrum     12841 Nov 21 01:16 SpectroSERVER
   ```

   3. Launch Spectrum Control Panel using '**spectrum**' user and start SpectroSERVER process by clicking [**Start SpectroSERVER**] button.

Process Daemon (processd)

DX NetOps Spectrum uses a process launching and tracking daemon called Process Daemon (processd) to let you control processes on multiple servers in a DSS environment. This daemon starts processes when an application such as the DX NetOps Spectrum Control Panel makes a request. You can also configure processd with install tickets to start processes automatically at system startup. Install tickets can also automatically restart critical processes that stop unexpectedly. Tomcat and Webtomcat are stopped when processed is stopped.

The DX NetOps Spectrum installation program configures processd to start automatically (where it must run as root) and on Windows systems (where it runs as the LocalSystem account).

Process launch and monitoring with processd occur only when an application requests such actions. Typically, processd operates in the background.

If a process does not start or is not working properly, processd writes an error message to the *<$SPECROOT>*\lib\SDPM \processd_log file. The error message includes information to identify the problem.

When restarted, processd creates a processd_log.bak file to preserve old error messages and appends any new error messages to the processd_log file.

> **WARNING**
> You must be thoroughly familiar with DX NetOps Spectrum, distributed networking, and network configuration before attempting any of the procedures described in this section.

Processd Differences in Windows Environments

The processd daemon works slightly differently on Windows platforms because of differences in their native security architectures.

- When you request a process start from a remote connection in a Windows environment, the process starts as the user who is specified in the Windows Service Configuration dialog.
- For server processes that must remain running after user logout (or before anyone logs in), a SERVERPROCESS field is used in the Windows environment. To prevent Windows from shutting these processes down during logout, these processes are started as the user who is specified in the Windows Service Configuration dialog.

Change the Windows Password in Processd

During installation on Windows, you are prompted to enter a username and password in the Windows Service Configuration dialog. The processd daemon uses this username and password to start DX NetOps Spectrum processes as the specified user. Providing the security information lets these processes run when no user is logged in.

> **NOTE**
> For more information, see Installing .

If the password you specified in the Windows Service Configuration dialog changes or expires, you can update processd with the new password.

> **WARNING**
> If your password contains special characters, such as an exclamation point (!), escape these characters with a backslash (\). Or you can change the password from a command prompt.

Follow these steps:

1. Log in as a member of the local Administrators group.
   You must be a member of the DX NetOps Spectrum Users group and an administrator to change the processd user name and password.
2. Open a command prompt.
3. Navigate to the /lib/SDPM directory.
4. Enter the following command:
   ```
   processd --install --username user --password newpassword
   ```
   – ***user***
   Specifies the user name.
   – ***newpassword***
   Specifies the new password for this user name.
   If the user name or the password contains special characters that the shell can misinterpret, enclose the user name or password in quotation marks. For example, the user name contains a domain name and user, with a backslash (\) separator. The password contains an asterisk (*). Both of these characters are special characters. Therefore, the user name and password are enclosed in quotation marks, as in the following example:
   ```
   processd --install --username "DOMAIN\JSmith" --password "283EJ*"
   ```

NOTE
If the password for the Windows user name changes but the processd service password is not updated, processd does not start. The following events are generated in the Windows event log:

Install Tickets Files

You can configure processd to start processes at system startup. You can also select processes to restart if they stop running. Files that are known as *install tickets* support this functionality.

Install tickets use files in the following two directories:

- <*Spectrum Installation Directory*>/lib/SDPM/partslist
- <*Spectrum Installation Directory*>/lib/SDPM/runtime

The partslist directory contains the individual install ticket files.

The runtime directory contains encoded files in the form of <*PID*>.rt where <*PID*> is the process ID of the running process.

Note: SDPM stands for DX NetOps Spectrum Distributed Process Manager.

You can add install tickets to the partslist directory. New install tickets must conform to certain formatting rules. Restart processd to identify any new or modified install tickets in the partslist directory. These files are read at processd startup and are stored in cache memory for future use.

Install ticket files follow a naming convention that refers to the process whose configuration information it contains. Install ticket filenames are in the form of <*PARTNAME*>.idb. The <*PARTNAME*> variable is an internal key to identify processes that processd controls.

The following defining fields are used for install tickets. The format is <*fieldname*>;<*value*>; where <*fieldname*> is one of the names that are displayed below. The <*value*> is a string that provides a definition for the corresponding field name. Quotation marks are not supported.

- **PARTNAME**
  Identifies a particular process/application with a multicharacter string with no spaces. The install ticket for this application has a filename in the form <*PARTNAME*>.idb. <*PARTNAME*> is the process name.
- **APPNAME**
  Defines the name of the application as a multicharacter string.
- **WORKPATH**
  Specifies where you want to run the application. Supply a value for this field *before* it can be used as part of the ARGV field that is described later.
- **LOGNAMEPATH**
  Specifies the log file for output from the application. This field must begin with <*$SPECROOT*> or <*$WORKPATH*>. No spaces are allowed.
- **ADMINPRIVS**
  Is reserved for use in Purism-supplied install tickets only. Comment it out in install tickets that you create.
- **AUTORESTART**
  Indicates whether a process is automatically restarted if it stops. If this field is not included in the install ticket, automatic restart is disabled by default. Accepted values are Y, y, N, n.
- **AUTOBOOTSTART**
  Indicates whether the process is started whenever processd starts. If this field is not included in the install ticket, the function is disabled by default. Accepted values are Y, y, N, n.
- **STATEBASED**
  Indicates whether the process has more than one state when starting up. Usually, the process sends an “is ready” ticket when ready to communicate. This field is reserved for use in Purism-supplied install tickets only. If this field is not included in the install ticket, it is disabled by default. Accepted values are Y, y, N, n.
- **NUMPROCS**

Specifies the number of instances of a process that can run on one platform. Numeric values are accepted.

- **RETRYTIMEOUT**
  Specifies the number of seconds that processd tries to restart the application after failure.
- **TICKETUSER**
  Defines the username of the user who is authorized to run the process when the AUTOBOOTSTART and/or AUTORESTART fields are set. This field is only required when those fields are included in the install ticket. This field is not applicable on Windows because all processes run as the processd install user.
- **RETRYMAX**
  Specifies the number of times that processd tries to restart an application within the specified RETRYTIMEOUT period.
- **STARTPRIORITY**
  Indicates the relative startup priority of the process relative to other processes. The following values are used:
  – 10 for standalone processes
  – 20 for processes that depend on standalone processes
  – 30 for processes that depend on the SpectroSERVER
- **SERVERPROCESS**
  Indicates to processd whether a process continues to run after the user logs out. When this field is enabled, the process is always started as the user who is authorized to run the processd service. This field is only applicable in the Windows environment. The default value is 'yes' for the following processes:
  – Archive Manager (ARCHMGR.idb)
  – Location Server (LOCSERV.idb)
  – SpectroSERVER (SS.idb)
- **SERVICE**
  Indicates whether the ticket represents a Windows service. Lets processd manage Windows services from the Service Control Manager.
- **ENV**
  Adds one or more variables to the application environment. Multiple values are listed on a separate line with the macro <CSPATHSEP> between the value and the semicolon that ends the line.
- **ARGV**
  Defines the argument list of the process, which includes the executable path and any number of arguments (spaces are allowed).

Examples Install Tickets

Install tickets apply the following syntax conventions:

- Any line beginning with a pound sign (#) is treated as a comment.
- A semicolon (;) must follow all field names and all values following each field name.
- Anything following the second semicolon is disregarded.
- Four macros can be used: <CSEXE>,<CSBAT>,<CSCMD>, and <CSPATHSEP>. Based on the platform, the appropriate definition is substituted. Use <CSPATHSEP> instead of the actual path separator to avoid parsing conflicts.

The following example shows a valid install ticket:

```
# Processd Install Ticket for SpectroSERVER Daemon.
PARTNAME;SS;
APPNAME;SpectroSERVER Daemon;
WORKPATH;$SPECROOT/SS;
LOGNAMEPATH;$WORKPATH/VNM.OUT;
ADMINPRIVS;y;
#AUTORESTART;N;
#AUTOBOOTSTART;N;
STATEBASED;y;
```

NUMPROCS;3; // unlimited
RETRYTIMEOUT;0; // seconds
#TICKETUSER;$USER;
RETRYMAX;0; // retries
STARTPRIORITY;20;
SERVERPROCESS;Y;
#ENV;<var>=<value>;
ARGV;$SPECROOT/SS/SpectroSERVER<CSEXE>;

The following example shows another valid install ticket:

Processd Install Ticket for Visibroker Naming Service
PARTNAME;NAMINGSERVICE;
APPNAME;Visibroker Naming Service;
WORKPATH;$SPECROOT/bin/VBNS;
LOGNAMEPATH;$WORKPATH/NAMINGSERVICE.OUT;
ADMINPRIVS;y;
AUTORESTART;y;
AUTOBOOTSTART;y;
#STATEBASED;N;
NUMPROCS;1; // one per host
RETRYTIMEOUT;600; // 10 minutes
#TICKETUSER;$USER;
RETRYMAX;5; // 5 retries
STARTPRIORITY;10;
SERVERPROCESS;Y;
#ENV;<var>=<value>;
ENV;CLASSPATH=$SPECROOT/lib/vbjorb.jar<CSPATHSEP>;

Start a New Install Ticket Process

If you added an install ticket file, you can use the restart option to start the process specified in the ticket. With the restart option, you do not have to stop and restart processd and all of the processes that it is monitoring.

Follow these steps on Windows:

1. Log in as a member of the DX NetOps Spectrum Users group.
2. Open a command prompt.
3. Navigate to the /lib/SDPM directory.
4. Enter the following command:
   ```
   perl processd.pl restart
   ```
   The process is started.

Stop and Restart Processd

If you suspect that the lib/SDPM/runtime directory has become corrupted, stop and restart processd.

Follow these steps: on Windows

1. Log in as a member of the DX NetOps Spectrum Users group.
2. Open a command prompt.
3. Navigate to the /lib/SDPM directory.
4. Enter the following command:
   ```
   perl processd.pl stop (or start)
   ```

   NOTE
   On Windows, the processd.pl <*start/stop*> commands also stop and start the DX NetOps Spectrum processes that run as NT services (such as MySQL and VisiBroker).

How the Userconf Process Works During Installation

The userconf process runs processd in the background. Userconf lets you perform user-specific configuration of DX NetOps Spectrum during installation and afterwards, when a user logs in to DX NetOps Spectrum.

The userconf process performs the following tasks during DX NetOps Spectrum installation:

1. Runs userconf -install %SPECROOT%, which makes the following changes:
   - Adds SPECROOT and SPECPATH to the system environment.
   - Adds $SPECPATH\lib to the $PATH system variable.
   - Removes the old $SPECPATH\lib entries from the path, if the installation directory has changed.
   - Removes %SPECPATH%\lib from the path (if it exists).
   - Modifies the registry so that userconf runs each time that a user logs in (with no arguments).
2. Runs userconf -start to start processd. The -start flag starts processd without verifying that the user is a member of the DX NetOps Spectrum Users Group.

   NOTE
   The installation program adds the current user to the DX NetOps Spectrum Users Group. However, the change does not take effect until the user logs out and logs back in. Add the -start flag so that processd starts without verifying that the user is a member of the DX NetOps Spectrum Users Group. The installation then continues without requiring the user to log out and log back in.
3. Runs userconf -restart to stop and restart processd if the user is installing Exceed for the first time (which occurs after the DX NetOps Spectrum installation). Processd can then update PATH environment changes that are part of the Exceed installation.

How Userconf Works When a User Logs In

The installation adds the userconf process to the registry Run key. When a user logs in, the process starts automatically and checks whether the user is a member of the DX NetOps Spectrum Users group. The userconf process applies the following rules:

1. – If the user is a member of the DX NetOps Spectrum Users group, userconf verifies cygwin and Exceed and reconfigures as needed before starting processd. If Microsoft VC++ is installed, userconf configures it appropriately for use with the DX NetOps Spectrum SDK.
   – If the user is not a member of the Users group, a message states that DX NetOps Spectrum is installed but the user is not in the DX NetOps Spectrum Users group.
   To enable the user to use DX NetOps Spectrum, add the user account to the DX NetOps Spectrum Users group. The user must then log out and log back in.
   A user who does not want to use DX NetOps Spectrum can select the “user doesn't want to run Spectrum” check box. With this option, userconf continues to run when the user logs in, but the process exits silently.

   NOTE
   To see the message again, run the following command:

```
userconf -install %SPECROOT%
```

Duplicate Models in a Distributed Environment

In a DSS environment, DX NetOps Spectrum tracks duplicate models (for example, a user model that exists on multiple landscapes) by designating one as a "home" model. The home model resides on the SpectroSERVER that is running on the host with the "root" main location server (MLS).

WARNING
If you change the root MLS in a DSS environment, the state of all duplicate models is updated to match the "home" model on the MLS. The MLS is the final authority in any DSS environment.

DX NetOps Spectrum uses the home model to synchronize information for all duplicate models. Modification requests that are made to the duplicate models that are not the home models are relayed to the landscape of the home model. The home model then distributes the request to all of the other duplicate models.

Failure to Contact Home Landscape Errors

Editing operations can fail when the home landscape of the model that you are editing cannot be contacted. OneClick reports relation errors such as the following error from the SpectroSERVER:

```
The operation failed because the model being edited exists in multiple landscapes and its home landscape could
 not be contacted.
```

This type of error can indicate that the home model on the SpectroSERVER that is running on the "root" MLS is unreachable. When duplicate models are added or deleted in a distributed environment, they are routed through the home landscape. If that SpectroSERVER is down or cannot be contacted, the relation fails and generates an error.

Failure to contact the home landscape can occur under any of these conditions:

- The home SpectroSERVER or an intermediate SpectroSERVER between the duplicate model and the home SpectroSERVER is not running.
- A network problem is preventing SpectroSERVER access.
- A security issue is preventing the SpectroSERVERs from communicating.

Host Resource Configuration File (.hostrc)

The .hostrc file restricts client application access to each local SpectroSERVER. Client applications cannot connect to the local landscape unless the .hostrc file is configured to permit this access. You can use a text editor to edit the .hostrc file.

NOTE
For more information, see the Administrating *section*.

By default, the .hostrc file is initially installed with the local hostname, which restricts all remote access. Adding an individual hostname enables connections to and from that server. Enable unrestricted access to and from all remote servers by adding a "+" symbol. Add the machine name to the .hostrc file to enable client access from individual remote servers.

DX NetOps Spectrum implements host security in multiple layers, by hostname or by IP address. We recommend listing hostnames in the .hostrc file, which includes all IP addresses that are associated with the hostnames. Connection attempts that are initiated by the hostname do not always succeed if an IP address is used to connect.

Time Zones in a DSS Environment

In DSS installations that span multiple time zones, all activities that occur on a SpectroSERVER reflect the local time of the server, including scheduled events. All schedules created in OneClick and applied to modeled devices start and end according to the local time of the SpectroSERVER or device landscape.

> **NOTE**
> For more information, see OneClick Schedules in a DSS Environment.

SpectroSERVER Shutdown

We recommend shutting down the SpectroSERVER using the DX NetOps Spectrum Control Panel before you shut down the server where the SpectroSERVER is running. However, if you use the operating system shutdown procedure as a way to shut down the SpectroSERVER, increase the amount of time for processd to stop.

SpectroSERVER Shutdown in a Windows Environment

In a Windows environment, processd waits until all subprocesses have shut down before it stops. However, the Windows registry setting WaitToKillServiceTimeout sets the length of time that Windows waits for all services to stop after a Windows shutdown is initiated. If a service such as processd is still running after the WaitToKillServiceTimeout elapses, Windows terminates this service. The default value is 20 seconds, which is not always enough time for the SpectroSERVER to shut down completely at system shutdown. You can increase the timeout value.

Follow these steps:

1. Open the Registry Editor.
2. Go to HKEY_LOCAL_MACHINE/SYSTEM/CurrentControlSet/Control.
3. Click the Control key.
4. Double-click the WaitToKillServiceTimeout value in the right pane.
5. In the window, change the value to anything up to 600,000 milliseconds (10 minutes).
6. Click OK.
7. Restart the Windows server for the change to take effect.

Set the Landscape Map Entry Timeout

By default, each landscape entry remains in the landscape map indefinitely. Using the location server configuration file (.locrc), you can specify an amount of time after which the landscape entry times out and is removed automatically from the landscape map.

> **NOTE**
> In previous releases, landscape entries timed out after one hour, and they were removed automatically from the landscape map. Starting in 9.2.2, landscape entries do not time out by default.
>
> **WARNING**
> We do *not* recommend using a timeout value to automatically remove an entry from a landscape map. Instead, leave the default timeout value. Use the MapUpdate command to remove an entry from the landscape map when required. For more information, see Database Management.

Follow these steps:

1. Navigate to the <*$SPECROOT*>/LS directory.
2. Update or add the following entry in the .locrc file:
   MET_INTERVAL=*time_out_value*
   – ***time_out_value***
   Indicates the time in milliseconds after which a landscape entry times out and is removed automatically from the landscape map.
   Default: 0 milliseconds (no time-out)

Problems with Landscape Mapping from Existing DSS Setup

Symptom:

I experienced problems with the landscape map when I set up a separate distributed environment by copying from another installation. I noticed a failure to switch over to the secondary SpectroSERVER after the primary goes down and problems with user security.

Solution:

To copy a landscape map, remove all references to the previous DSS setup. The landscape maps must contain no references to the previous DSS setup. Use the following procedure to map a landscape from an existing DSS setup.

Follow these steps:

1. Decouple the SpectroSERVERs as follows:
   a. Make each SpectroSERVER a standalone server.
      The location server is now pointing to the local server where it is installed.
   b. Verify that the landscape map is distinct for each SpectroSERVER.

      NOTE
      In the existing DSS setup, the landscape map was a single map that included all of the servers.
2. Save the SpectroSERVER databases.
   The landscape maps are clean.
3. Change the MLS of these SpectroSERVER to restore the original MLS.

   NOTE
   Do not change the original DSS settings.
4. Reload the databases of each SpectroSERVER on different hosts.
5. Select a SpectroSERVER as your MLS in the new DSS setup, and point other SpectroSERVERs to it.
   The dupModeList in the user models updates properly.
6. Remove secondary entries in the landscape map, if they exist.
7. Set up secondary SpectroSERVER entries.
8. Load the database from the primary SpectroSERVER in the new DSS.
   The landscape is mapped from the existing DSS setup.

Troubleshooting

Problems with Purging Old Landscapes

Symptom:

Our production DX NetOps Spectrum environment consisted of a single distributed installation. The environment had multiple SpectroSERVERs and OneClick servers, which all used the same Main Location Server.

We decided to remove two SpectroSERVERs and a OneClick server from the production environment to create a separate development environment. We configured the development SpectroSERVERs and OneClick server to reference

a new Location Server. We updated the .hostrc files so that the servers in each environment only had access to their respective Location Servers. In addition, we updated the landscape map in the production environment to remove the development landscapes.

However, if I look at the list of Monitored Landscapes on development OneClick server, I still see all of the old production landscapes. They are listed as having "No permission" because of the changes to the .hostrc file.

Solution:

With the setup that you describe, you now have two separate environments. However, your development landscape map is caching stale production landscapes. You removed stale landscapes from your production environment, but you did not remove them from your development environment. Therefore, you must manually remove the stale landscapes from the development environment.

You have two options for removing the stale landscapes.

Solution:

You can use the following command to remove stale landscapes from the development landscape map:

```
MapUpdate -remove landscape handle
```

Solution:

You can restart all SpectroSERVER processes. Then restart the OneClick server. For more information about OneClick server administration, see OneClick Administration.

When you restart the servers, the issue is resolved.

> **WARNING**
>
> Its is mandatory to reboot the server after you complete a fresh SpectroSERVER installation while installing r10.3.

The landscape handle bitmask in the SpectroSERVER database file does not match the bitmask of DX NetOps Spectrum

Symptom:

When trying to load a previously saved SpectroSERVER Database (SSdb) savefile, the following error shows:
Error: Detected incompatible model mask configuration. The database is configured as 20 bits, but the server is configured as 24 bits. Database can't be loaded.

The landscape handle bitmask in the SpectroSERVER database file does not match the bitmask of DX NetOps Spectrum. If the "Huge Landscape Handle" option was selected during install, this means that the SpectroSERVER database file has a legacy landscape handle. If the Legacy Landscape Handle was selected during install, this means the SpectroSERVER database file has a huge landscape handle.

Solution:

Loading a previously saved SpectroSERVER database file with a different landscape handle bit mask is not supported. Review your SpectroSERVER environment for proper configuration. If you have installed and chosen the wrong landscape option, uninstall and reinstall DX NetOps Spectrum. If you selected an incorrect handle and that SS is in a DSS, remove the incorrect entry from the map after you have reinstalled. To remove the incorrect entry from the map after you have reinstalled:

1. Open a bash shell and navigate to the:
   `<SPECROOT>/SS-Tools/ directory`
2. Run the MapUpdate command:
   `./MapUpdate -v`

3. Remove the incorrect entry:
   ```
   ./MapUpdate -remove <lh> -precedence <precedencevalue>
   ```
   For example: ./MapUpdate -remove 0x100000 -precedence 10

Communication Across Firewalls

Communicating across a firewall can apply in many network environments. In a distributed environment, firewalls are likely to affect your deployment.

> **NOTE**
> Before you begin a distributed DX NetOps Spectrum installation, configure the firewall to enable traffic on port 46517 (the port sradmin).

Your options for enabling communications among DX NetOps Spectrum components depend on the types of firewalls that you deploy. Other factors, such as cost and the level of security that is required, also play a role. These factors include Virtual Private Networks (VPNs), node-to-node tunnels or conduits, and proxies that encapsulate packets before they pass through the firewall.

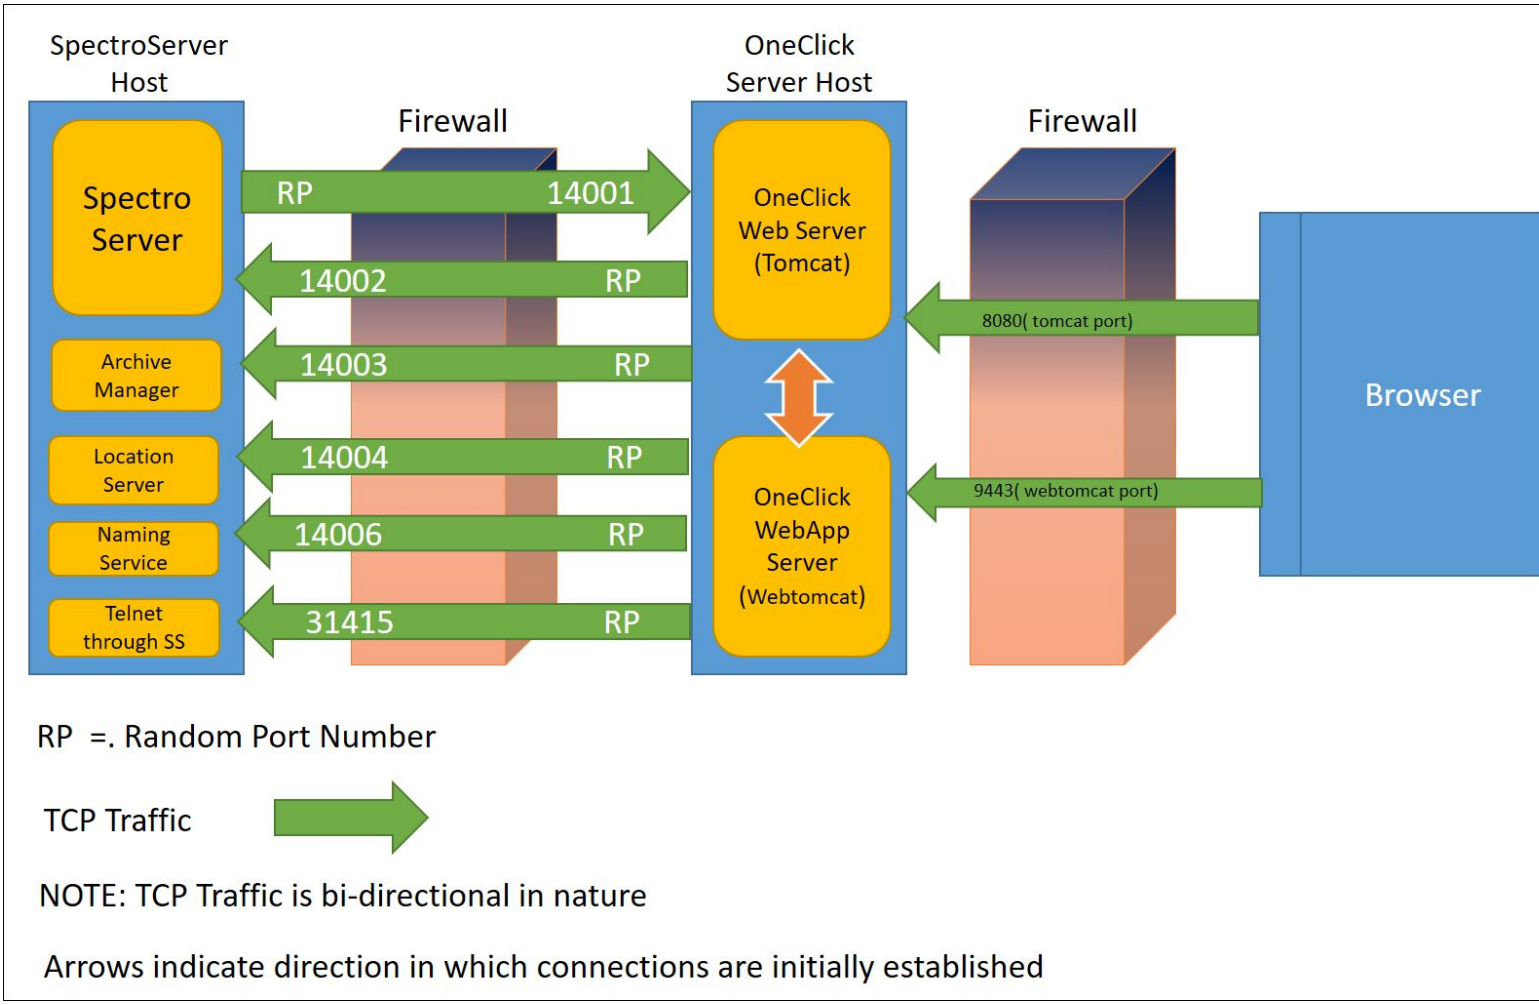
We recommend working with the firewall administrator for your network to work out a strategy for letting DX NetOps Spectrum and OneClick traffic traverse firewalls.

SpectroSERVER and OneClick Web Server Communication Across Firewalls

The OneClick web server communicates with processes on the SpectroSERVER host system to gather data to display in OneClick clients. The OneClick web server typically initiates this communication.

The OneClick web server establishes connections to specific SpectroSERVER host-side TCP ports. The web server uses these ports for sending requests and receiving responses. However, OneClick uses a single listening port (default 14001). The SpectroSERVER initiates the connection to that port. As a result, modifying firewall configuration is often necessary. The SpectroSERVER uses bidirectional IIOP (Internet Inter-ORB Protocol) to communicate with its CORBA clients.

The following diagram illustrates the IP connectivity that is required for an OneClick web server to communicate with a SpectroSERVER. In all cases where TCP is used, the connections are established from a random port to a specific, fixed port.



NOTE
In a Fault-Tolerant configuration, the same ports must be opened between the OneClick Server Host and the secondary SpectroSERVER Host, including port 14003 if running a secondary Archive Manager.

OneClick Default Ports and Firewalls

HTTP Listen Port

The default port used by OneClick for HTTP communication is port 80. If you configure the OneClick web server to use something other than port 80, your firewall must also be set up to allow this traffic.

NOTE
For more information, see the OneClick Administrator and Fresh Install.

OneClick users on the Windows XP SP2 platform who choose to leave the Windows Firewall enabled may have problems running the OneClick Console.

NOTE
For more information on configuring the Windows firewall, refer to the Microsoft Knowledge Base article 842242 at http://support.microsoft.com.

CORBA Listen Port

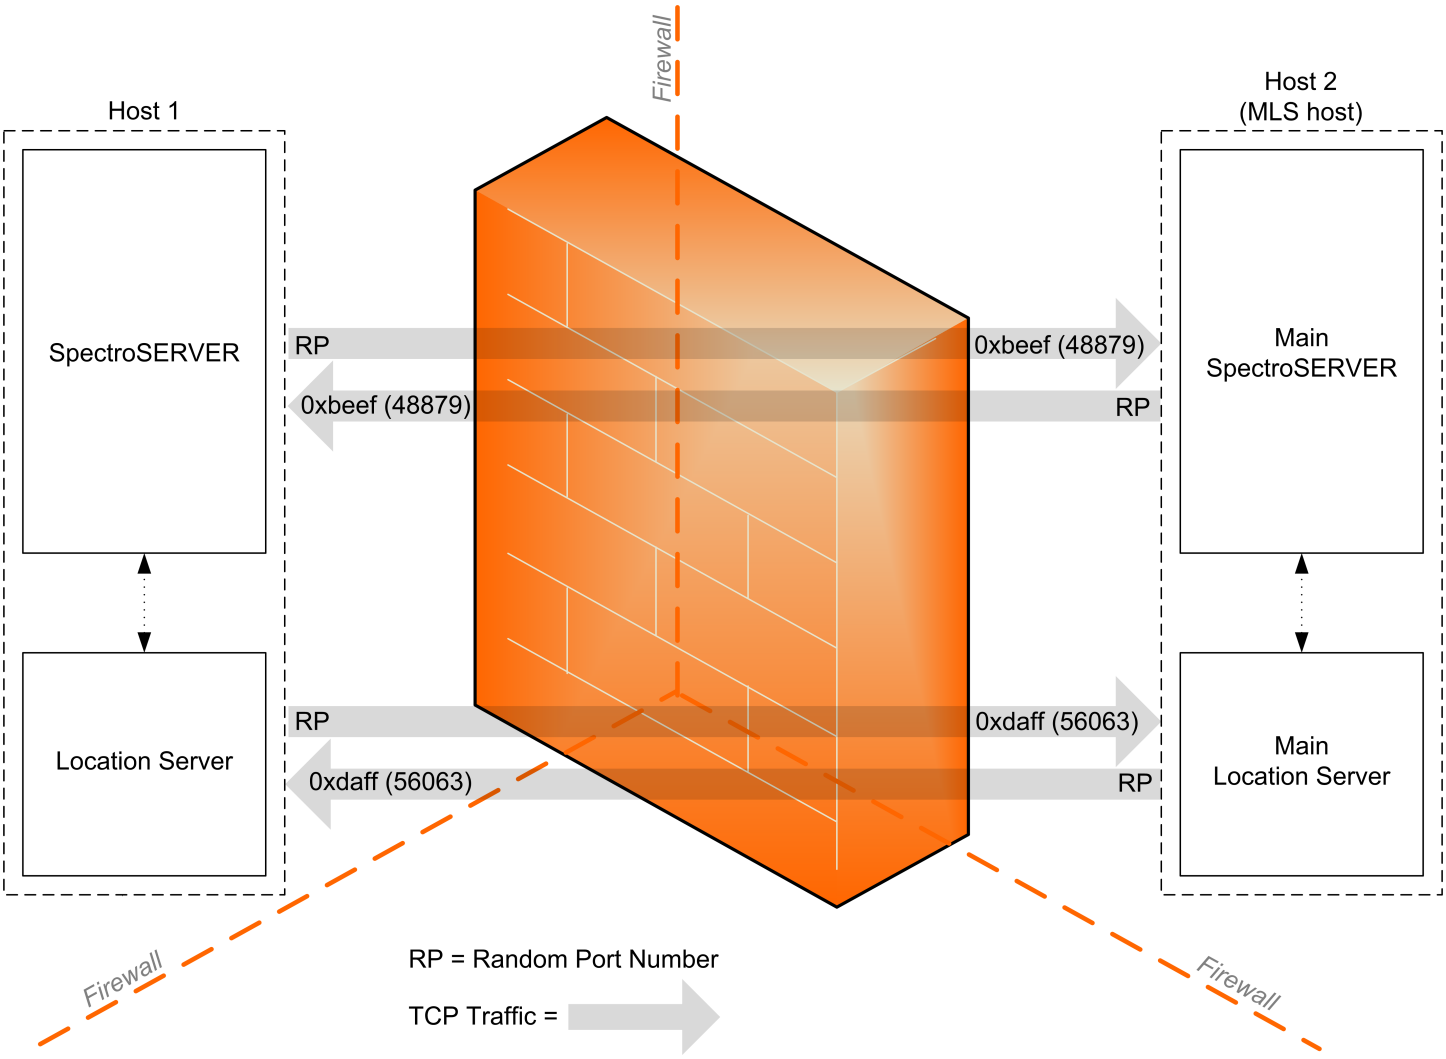
The Default CORBA OneClick server listen port value is located in <*$SPECROOT*>/tomcat/webapps/spectrum/META-INF/context.xml.

```
vbroker.se.iiop_tp.scm.iiop_tp.listener.port=<new port number>
```

Remote SpectroSERVERs and Firewalls

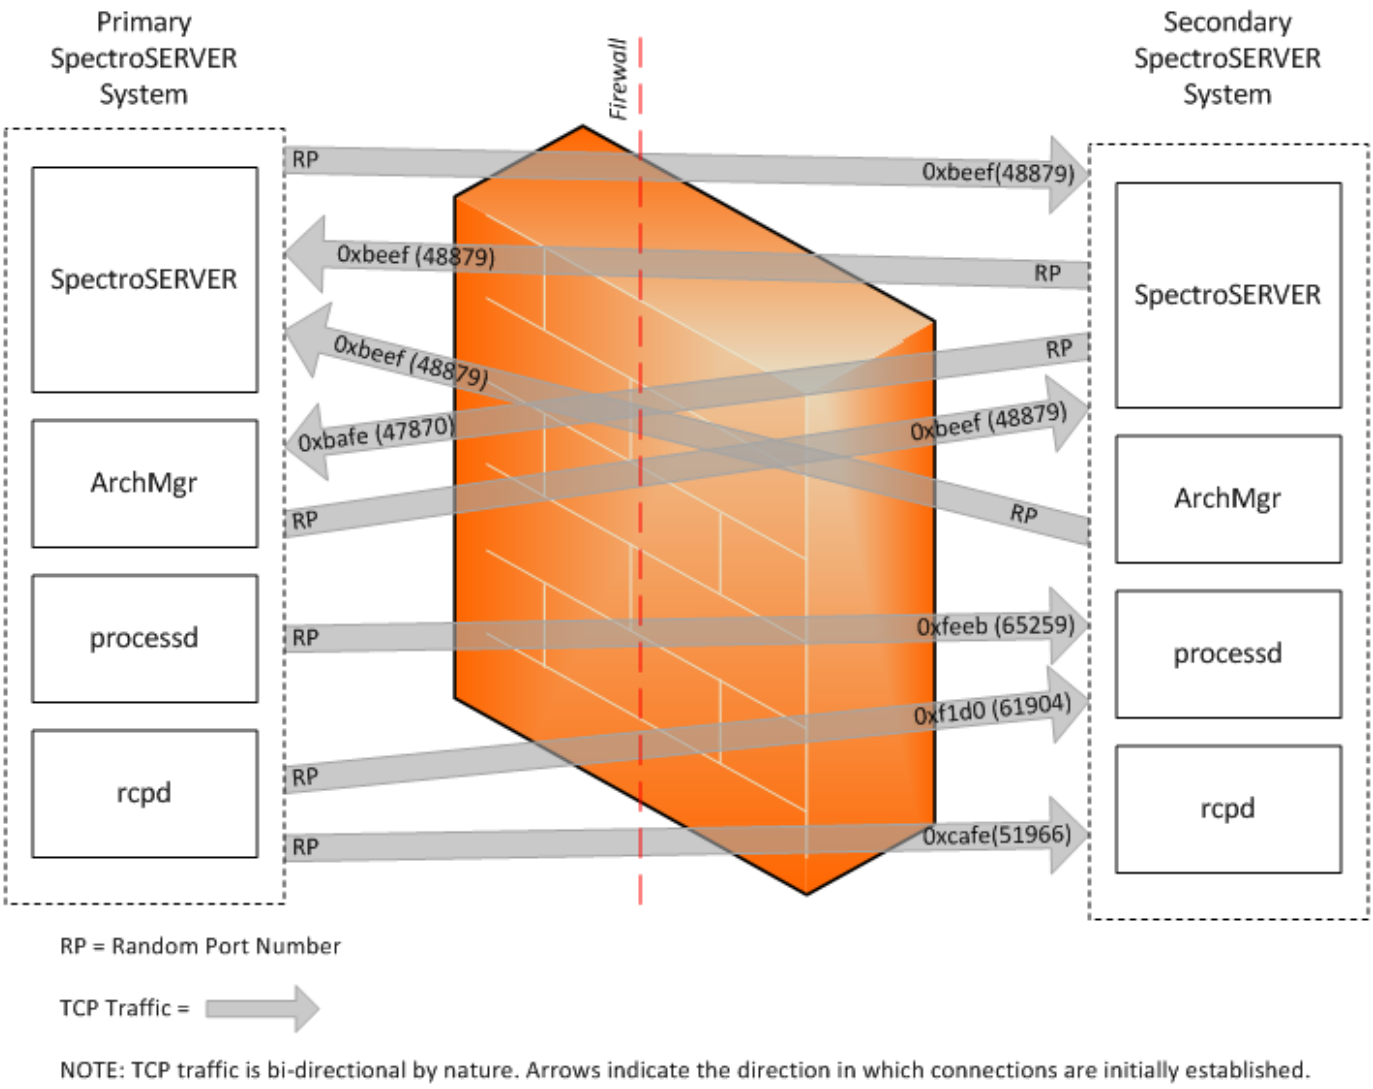
The following figure illustrates the IP connectivity that is required when two remote SpectroSERVERs communicate through a firewall. In all cases where TCP is used, the connections are established from a random port to a specific, fixed port.

> **WARNING**
> All communication among SpectroSERVERs that are not Main Location Servers (MLSs) is routed through the MLS-SpectroSERVER. As a result, each SpectroSERVER only communicates directly with the MLS-SpectroSERVER.



Primary and Secondary SpectroSERVER Communication Across Firewalls

The following figure illustrates the IP connectivity that is required when primary and secondary SpectroSERVERs in a fault-tolerant environment communicate through a firewall. In all cases where TCP is used, the connections are established from a random port to a specific, fixed port.



NOTE: TCP traffic is bi-directional by nature. Arrows indicate the direction in which connections are initially established.

Configuration Files for NAT Firewall Environments

Network Address Translation (NAT) is used to construct networks with consistent internal IP addressing and a single node that handles IP address translation to the Internet. DX NetOps Spectrum supports NAT. You can deploy DX NetOps Spectrum in a private IP address domain and can maintain connectivity to clients outside of NAT firewalls. Therefore, DSS environments can now encompass multiple domains that are separated by these firewalls.

The only requirement for a NAT environment is the ability of clients to resolve the server by name. On the private side of the NAT, the host name must resolve to the private-side IP address. On the public side of the NAT, the host name must resolve to the public-side IP address.

Default Port Configurations

You can change the default port or socket number that a DX NetOps Spectrum process uses so that the process works correctly in a firewall environment.

You can change the port number or socket number for the following processes:

- OneClick WebServer
- SpectroSERVER
- Archive Manager
- Location Server
- Naming Service
- Remote Copy Process Daemon (rcpd)
- CLI Daemon (vnmshd)

> **NOTE**
> The only ports that you cannot change are the ports for the Remote Administration Daemon, sradmin, and the port for Telnet through SpectroSERVER.

Change the SpectroSERVER Port Number

You can change the port number that the SpectroSERVER uses for CORBA requests.

Use a text editor to edit the .vnmrc file to reflect the new port number. This file is located in <*$SPECROOT*>/SS/. Enter the following command:

```
orb_args=-Dvbroker.se.iiop_tp.scm.iiop_tp.listener.port=<new port number>
```

Change the Archive Manager Port Number and Socket Number

You can change the port number and the socket number that the Archive Manager uses for specific requests.

Use a text editor to edit the .configrc file to reflect the new port number. This file is located in <*$SPECROOT*>/SS/DDM. Enter the following command:

```
orb_args=-Dvbroker.se.iiop_tp.scm.iiop_tp.listener.port=<new port number>
```

To change the socket number that the Archive Manager uses to listen for requests from VNM and SSAPI clients, use a text editor to edit the .configrc file. This file is located in <*$SPECROOT*>/SS/DDM. Change the following variable:

```
ARCH_MGR_SOCKET_NUMBER=<new port number>
```

Change the Location Server Port Number and Socket Number

You can change the port number and the socket number that the Location Server uses for specific requests.

To change the port number the Location Server uses for CORBA requests, use a text editor to edit the .locrc file to reflect the new port number. This file is located in <*$SPECROOT*>/LS. Enter the following command:

```
orb_args=-Dvbroker.se.iiop_tp.scm.iiop_tp.listener.port=<new port number>
```

To change the socket number that the Location Server uses for VNM and SSAPI requests, use a text editor to edit the .locrc file. Change the following variable:

```
LOC_SERVER_SOCKET_NUMBER=<new port number>
```

Change the Visibroker Naming Service Port Number

You can change the port number that the Visibroker Naming Service uses.

> **NOTE**
> The default port number is 14006.

Follow these steps:

1. Right-click My Computer and select Properties.
   The System Properties dialog opens.
2. Click the Advanced tab and click the Environment Variables button.
3. Select the NAMING_SERVICE_PORT and edit it to reflect the new port number:
   ```
   NAMING_SERVICE_PORT=<new port number>
   ```

To change the Visibroker Naming Service port number, set the environment variable in the spectrum60.env file. This file is located in the /opt/SPECTRUM directory. Change the following variable:

```
NAMING_SERVICE_PORT=<new port number>
```

Remote Copy Process Daemon (rcpd) Port Number Configuration

Configure the remote copy process daemon (rcpd) port number in the ".vnmrc" resource file as shown in the following syntax:

```
rcpd_comm_port=<port number in hex>
```

CLI Daemon (vnmshd) Port Number Configuration

The CLI Daemon (vnmshd) port number is configurable through the vsh_tcp_port parameter.

> **NOTE**
> For information about the vsh_tcp_port parameter, see the Command Line Interface section.

Port Conflict Resolution

To avoid a port conflict with another application, you can change the default port numbers that DX NetOps Spectrum processes and services use.

The following table describes the default ports for DX NetOps Spectrum processes and services.

> **NOTE**
> "Not used for remote connections" is noted for ports in this table, where applicable. Ports that DX NetOps Spectrum does not use for remote connections typically do not present firewall configuration concerns.

Port (dec)	Port (hex)	DX NetOps Spectrum Components	Protocols	Notes
80	0x0050	OneClick/SRM	HTTP	None
162	0x00A2	SpectroSERVER	UDP	Port used to listen for SNMP traps.
3306	0x0CEA	mysql for SRM data ArchMgr (Archive Manager)	TCP/ODBC/JDBC	Used for remote connections only when migrating an SRM database from Windows to Linux.
3307	0x0CEB	mysql for BOXI on Linux	TCP	Not used for remote connections.

6844	0x1ABC	SDC	TCP	None
6400	0x1900	BOXI CMS	TCP	Not used for remote connections.
7777	0x1E61	CLI vnmshd	TCP	See CLI Daemon(vnmshd).
14001	0x36B1	OneClick Server	TCP/CORBA	See OneClick WebServer Host.
14012	0x36B2	SpectroSERVER	TCP/CORBA	See SpectroSERVER.
14013	0x36B3	ArchMgr	TCP/CORBA	See Archive Manager.
14014	0x36B4	LocServ	TCP/CORBA	See Location Server.
14016	0x36B6	Naming service	TCP/CORBA	None
31415	0x7AB7	Telnet through SpectroSERVER		None
46517	0xB5B5	sradmin	TCP	Remote Administration Daemon. **Note:** For more information about the sradmin process, see the Installing and Upgrading section.
47870	0xBAFE	ArchMgr	TCP/SSAPI	See Archive Manager.
48879	0xBEEF	SpectroSERVER	TCP/SSAPI	See SpectroSERVER.
51966	0xCAFE	rcpd	TCP	See Remote Copy Process Daemon (rcpd).
56063	0xDAFF	LocServ	TCP	See Location Server.
61904	0xF1D0	processd	TCP	This port is not configurable.
64222	0xFADE	TL1d	TCP/EPI	TL1 gateway agent
65259	0xFEEB	processd	TCP	This port is not configurable.

About SpectroSERVER Fault Tolerance

About SpectroSERVER Fault Tolerance

Fault tolerance requires more than one SpectroSERVER to manage a given landscape. A copy of the database for that landscape is loaded on each SpectroSERVER. However, only a single copy is active at any time. The SpectroSERVER with the active database is known as the *primary SpectroSERVER* . The inactive database runs on a standby SpectroSERVER, which is the secondary SpectroSERVER. You can also install another inactive copy of the database on a tertiary SpectroSERVER.

If the primary SpectroSERVER fails, the database on the secondary SpectroSERVER becomes active, and the secondary SpectroSERVER starts managing the network. Applications that are connected to the primary SpectroSERVER are automatically switched to the secondary SpectroSERVER. When the primary SpectroSERVER returns to service, the applications automatically switch back to the primary SpectroSERVER, and the secondary SpectroSERVER becomes inactive again.

NOTE
Not all applications can exercise the full range of their capabilities when they are being run from a secondary SpectroSERVER. The main reason to set up a fault-tolerant environment is to ensure continuous monitoring of the network, not to create a full copy of DX NetOps Spectrum.

SpectroSERVER Precedence in a Fault Tolerant Environment

Primary, secondary, and tertiary SpectroSERVERs that manage the same landscape must all have the same landscape handle and the same modeling catalog. The servers are distinguished from one another with a numeric precedence value. The lowest number indicates the primary SpectroSERVER. SpectroSERVERs are installed with a default precedence value of 10. To designate a SpectroSERVER as a secondary server, assign it a higher precedence number, such as 20. Likewise, a tertiary SpectroSERVER would have a higher precedence than the secondary, for example, 30.

When you first set up a fault tolerant environment, you can assign precedence values at the time you are loading database copies on any standby SpectroSERVERs using the SSdbload utility.

To change precedence values later, you can use the Loaded Landscapes subview. Access this subview by selecting a local landscape in the Navigation panel, and then selecting the Information tab in the Component Detail panel.

NOTE
The Loaded Landscapes subview is different from the SpectroSERVER Control subview. Access the SpectroSERVER Control subview by selecting the VNM in the Navigation panel and then selecting the Information tab in the Component Detail panel.

SpectroSERVER Data Synchronization

A single database is active at any given time in a fault tolerant DX NetOps Spectrum environment. Therefore, the other databases must be updated periodically to reflect new models and changes to attribute values in the active database. This synchronization of data is accomplished through the DX NetOps Spectrum Online Backup feature. You can run Online Backup on demand or at regularly scheduled intervals. When you run Online Backup against the primary SpectroSERVER, it creates a backup copy of the current database. Online Backup automatically loads the copy onto each designated secondary SpectroSERVER.

As in any DSS environment, each of the SpectroSERVERs in a fault tolerant environment must have the same modeling catalog installed. Online Backup copies the current modeling catalog. However, it does not copy all the .i files or other elements that are associated with individual management modules. Therefore, if you install any new management modules on your primary SpectroSERVER, also install the same new management modules on any secondary SpectroSERVERs.

NOTE
For more information, see the Database Management .

EventDisp and the Alertmap files that are defined in the <*$SPECROOT*>/custom/Events directory are propagated to fault-tolerant servers when the secondary SpectroSERVER polls the primary SpectroSERVER for status information.

Support for Fault-Tolerant Archive Manager

You can run the Archive Manager on the secondary SpectroSERVER host in a fault-tolerant SpectroSERVER environment. This secondary Archive Manager provides visibility to events in OneClick when the primary Archive Manager is down.

Primary or secondary SpectroSERVER locally stores events in the following two scenarios:

- When primary Archive Manager is down, and the primary SpectroSERVER is running. In this case, primary SpectroSERVER locally stores events as they are created until primary Archive Manager is up.
- When the primary SpectroSERVER host itself is down. In this case, the secondary SpectroSERVER locally stores events as they are created until the primary Archive Manager is up.

You can start the secondary Archive Manager on the secondary SpectroSERVER host to provide visibility to not only events as they are created when the primary Archive Manager is down, but also historical events.

When you start the secondary Archive Manager, it acts as a client to the primary SpectroSERVER to receive and log events as they are created. This behavior does not affect the normal connection between the primary SpectroSERVER and primary Archive Manager. When the primary Archive Manager goes down, OneClick fails over to the secondary Archive Manager to provide event data.

When the primary SpectroSERVER host itself goes down, the secondary SpectroSERVER locally stores events, but also forwards events to secondary Archive Manager. When the primary Archive Manager comes up, the secondary SpectroSERVER transfers all the locally stored events to it.

Archive Manager Data Synchronization

The secondary Archive Manager provides a best-effort synchronization of events, and there is no event synchronization that occurs between the primary Archive Manager and the secondary Archive Manager. When the secondary Archive Manager is running and connected to a SpectroSERVER, it receives a copy of all events as they are generated. Anytime the secondary Archive Manager is down, events are not stored on the secondary. This functionality is distinctly different from the functionality of primary Archive Manager, where the SpectroSERVER stores the events for later transfer to the primary Archive Manager.

This means that when the secondary Archive Manager is started for the first time, its DDM database does not contain any events, and no attempt is made to synchronize with the primary. Once the secondary Archive Manager has been running for MAX_EVENT_DAYS configured in the .configrc, it is generally in sync with the primary Archive Manager database.

Generate an Alarm If the Secondary SpectroSERVER Is Not Restarted

When a primary SpectroSERVER synchronizes its database with the secondary SpectroSERVER, a Contact Lost to Secondary Server (0x00010c0e) event and alarm are generated. The secondary SpectroSERVER has been brought down to load the new database from the primary SpectroSERVER.

You can set up a rule to process this alarm so that the alarm is generated only if the secondary SpectroSERVER is not restarted.

The EventPair rule lets you specify that a new event is generated if the Contact Lost to Secondary Server event occurs and a Contact Established to Secondary Server (0x00010c0f) event does not follow within a specified time period. You can then specify that this new event creates an event and an alarm indicating that the secondary SpectroSERVER is still down.

Follow these steps:

1. Open the EventDisp file with a text editor.

   NOTE
   The EventDisp file is located in the <*$SPECROOT*>/SS/CsVendor/Cabletron directory.
2. Find the line that reads 0x00010c0e E 50 A 2, 0x00010c0e and change this line to the following:

   ```
   0x00010c0e R Aprisma.EventPair, 0x00010c0f,
       <numberofsecondstowait><generatedeventcode>
   ```

   – ***<generatedeventcode>***
   Is the event code to generate if the secondary SpectroSERVER does not come up within the time specified in <*numberofsecondstowait*>.
3. Add the following line to the EventDisp file:

   ```
   <generatedeventcode>E 50 A 2, <generatedalarmcode>
   ```

   – ***<generatedeventcode>***

Is the event code generated in Step 2 if the secondary SpectroSERVER did not come up. 'E 50' indicates that the event is logged and has a severity value of 50. A 2 indicates that a major alarm is created. <*generatedalarmcode*> is the alarm code to generate based on this event.

4. Create a Probable Cause file for this alarm that indicates that contact with the secondary SpectroSERVER has not been reestablished after data synchronization.

NOTE
For more information, see the Event Configuration .

Secondary SpectroSERVER Readiness Levels

A secondary SpectroSERVER is considered to be at one of three different levels of readiness. Readiness depends on server configuration and status. The readiness levels are defined as follows:

- **Hot**
  The secondary SpectroSERVER is running and is available to take over immediately upon failure of the primary SpectroSERVER because it is already polling. To configure a secondary SpectroSERVER for this level of readiness, add the following line to the .vnmrc file: secondary_polling=yes. This statement causes the standby to commence polling and processing traps whenever it starts, regardless of its connection status with the primary SpectroSERVER.
- **Warm**
  The secondary SpectroSERVER is running, but the server can take a short time to become fully available. The secondary SpectroSERVER has not been configured to start polling *until* it loses contact with the primary SpectroSERVER. For example, it has no secondary_polling entry in the .vnmrc file, or the entry is set to no. If the secondary_polling entry is not in the .vnmrc file or the entry is set to no, the secondary SpectroSERVER does not process traps while in standby mode.
- **Cold**
  The secondary SpectroSERVER is not running and must be started when there is a failure of the primary SpectroSERVER. In this case, it is irrelevant whether the secondary SpectroSERVER is configured for secondary polling.

SpectroSERVER Alarm Synchronization

The primary and secondary SpectroSERVERs use a Global Alarm Service (GAS) connection to share alarm information. The SpectroSERVERs use the alarm information to synchronize alarms. This synchronization helps to prevent duplicate alarms.

Options for fault-tolerant alarm synchronization include enablement of the service and debug logging. Settings in the .vnmrc file control these options. For more information, see Fault Tolerant Alarm Service (.vnmrc) Resources.

The correlations are not preserved because the alarms on the secondary SpectroSERVER are generated rather than being created from events.

The process of alarm synchronization differs depending on whether the synchronization is from the primary SpectroSERVER to the secondary SpectroSERVER or from the secondary to the primary. The following sections describe each of these scenarios:

- Synchronization from the Primary to the Secondary SpectroSERVER
- Synchronization from the Secondary to the Primary SpectroSERVER

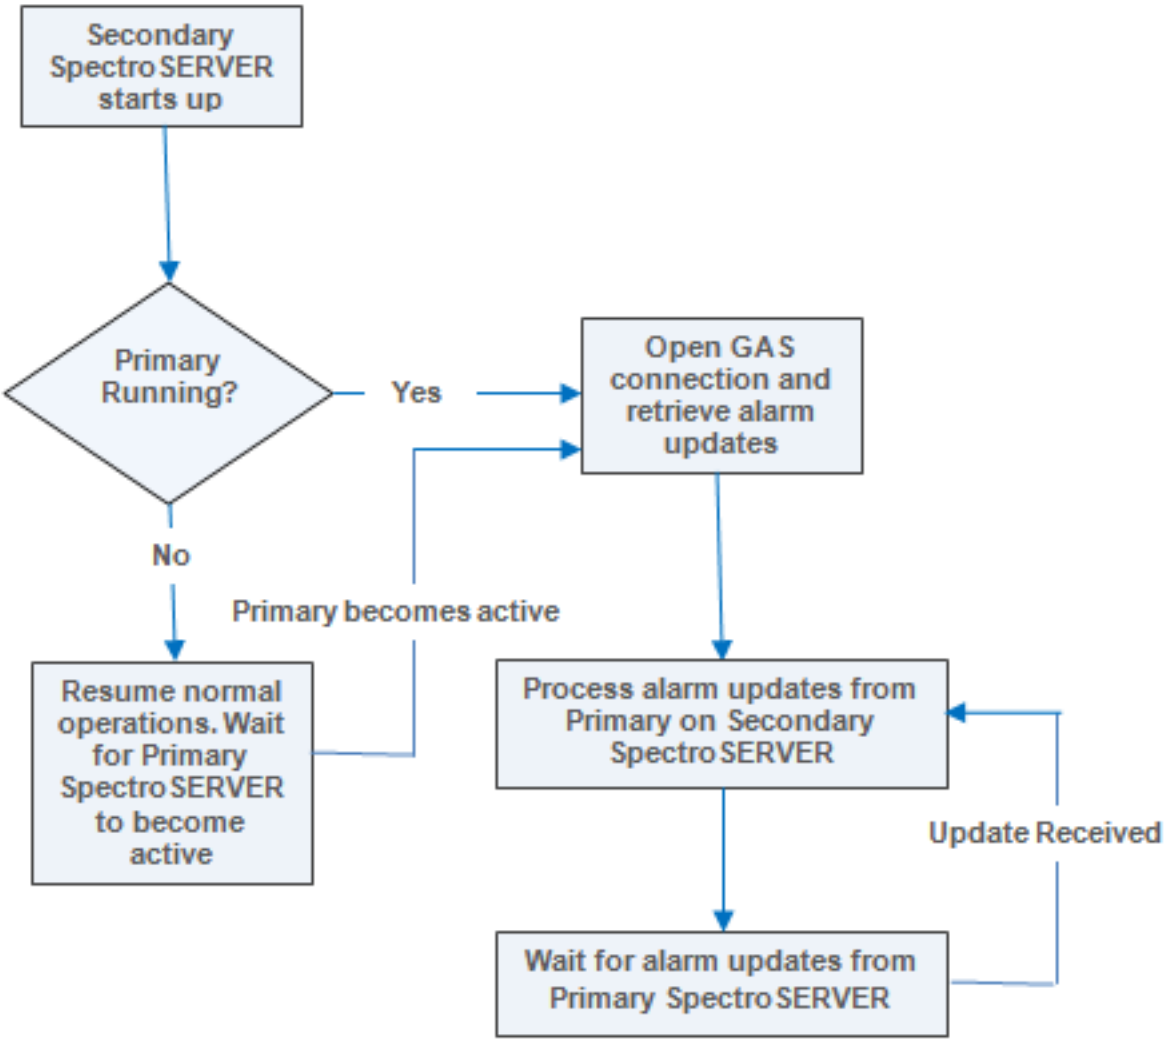
Synchronization from the Primary to the Secondary SpectroSERVER

If the SpectroSERVER is running as a secondary SpectroSERVER, it tries to open a GAS connection to the primary SpectroSERVER. If the connection succeeds, the secondary SpectroSERVER registers to receive alarm updates

from the primary SpectroSERVER. The secondary server remains connected to the primary and continues to receive alarm updates as they occur on the primary server. Otherwise, the secondary SpectroSERVER tries once each minute to connect until the primary SpectroSERVER becomes active.

NOTE
The Fault Tolerant Alarm Service must be enabled on both the primary and secondary servers for the secondary SpectroSERVER to attempt to connect to the primary SpectroSERVER for alarm synchronization. To control this feature, use the ftasv_enabled parameter in the .vnmrc file. For more information, see Fault Tolerant Alarm Service (.vnmrc) Resources.

The following diagram describes how the secondary SpectroSERVER processes alarm updates from the primary SpectroSERVER:



- The new primary SpectroSERVER alarms are added on the secondary SpectroSERVER and marked as 'stale'. A new alarm replaces an existing alarm if they are equivalent. You can determine whether the alarms are equivalent by verifying the following parameters:

  - Unique Alarm (IDs)
  - Model Handle
  - Probable Cause
  - Alarm Discriminators

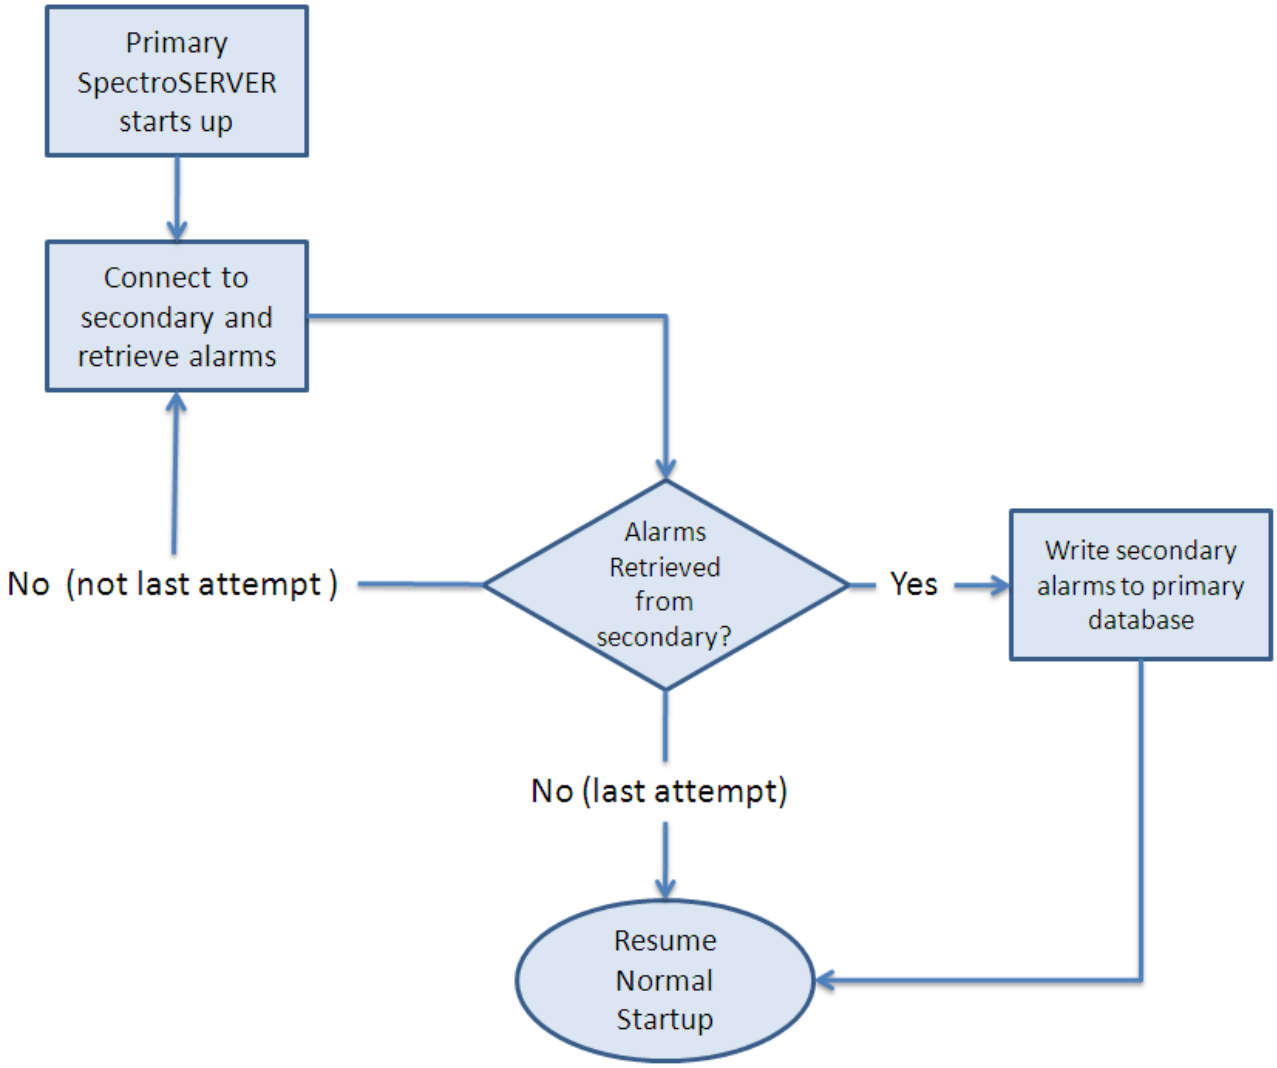
  Two alarms are considered equivalent if they have the same ID. Alarms that are on the same model (that is, they have the same model handle) and that have the same probable cause are also considered equivalent unless they have different alarm discriminators.
- The alarm attribute updates from the primary SpectroSERVER are applied to the same alarms on the secondary SpectroSERVER. If an alarm is cleared on the primary SpectroSERVER, it is also cleared on the secondary SpectroSERVER.
- The isManaged and isNotHibernating attributes are updated for maintenance mode alarm synchronization.

Synchronization from the Secondary to the Primary SpectroSERVER

When the primary SpectroSERVER comes online after a failure or planned maintenance, it connects to the secondary SpectroSERVER, and it gets all available alarms. If the first connection attempt fails, the primary server can make multiple connection attempts to synchronize. The ftasv_max_conn_retry_count and ftasv_conn_retry_interval parameters in the .vnmrc file of the primary SpectroSERVER control the number and frequency of attempts. For more information, see Fault Tolerant Alarm Service (.vnmrc) Resources.

> **WARNING**
> If the secondary SpectroSERVER is not running when the primary server attempts to connect to it, the primary exhausts its synchronization attempts. The result is a delay in starting the primary. This delay is unavoidable because it occurs before model activation. Avoid the situation by verifying that the secondary server is running when the primary starts. You can also decrease the retry count or interval size to reduce the potential delay. Or you can disable the Fault Tolerant Alarm Service using the ftasv_enabled parameter in the .vnmrc file.

The following diagram describes how the primary SpectroSERVER opens a GAS connection to the secondary SpectroSERVER and retrieves all of its alarms.



After a Successful Connection:

- After it retrieves the list of alarms, the primary SpectroSERVER writes the alarms to its database. Primary SpectroSERVER startup continues and these alarms are read from the database.
- The alarms from the secondary SpectroSERVER replace the alarms that are stored in the primary database at retrieval.
- All alarms that are read from the database are processed and asserted on the correct models.
- The secondary 'alarm set' event (0x10714) generates for each new alarm that was generated on the secondary SpectroSERVER while the primary SpectroSERVER was down.
- The secondary alarm clear event (0x10715) generates for each alarm that cleared on the secondary SpectroSERVER while the primary SpectroSERVER was down.

> **NOTE**
> No synchronization occurs for blue and gray alarms. Synchronization occurs for brown alarms, but not for WA_Link models. The WA_Link model exception only applies to brown alarms.

After a Failed Synchronization:

- If alarm synchronization fails when the primary SpectroSERVER is attempting to connect to the secondary, the primary starts up, but an event and critical alarm (0x10c35) are generated on the primary LocalLscpe

model. The event and alarm include the reason for the failure of each attempt. To continue running the primary SpectroSERVER after alarm synchronization has failed, run an Online Backup to synchronize the primary and secondary SpectroSERVER databases.

Establish Fault Tolerance

Establishing Fault Tolerance

You can set up a fault-tolerant environment when you first install DX NetOps Spectrum, before any models have been created. Or you can set up a fault-tolerant environment after you install DX NetOps Spectrum.

The following procedure describes how to set up two SpectroSERVERs: a primary and a secondary. You can also set up a tertiary SpectroSERVER by taking the same steps. However, assign the tertiary SpectroSERVER a higher precedence number than the secondary SpectroSERVER.

NOTE
To establish fault tolerance in an environment with a Southbound Gateway integration, see the Southbound Gateway Toolkit

Follow these steps:

1. Install the same version of DX NetOps Spectrum with the same modeling catalog on both the primary SpectroSERVER and the secondary SpectroSERVER. Each server requires the same landscape handle.
2. Verify that both the primary and secondary SpectroSERVERs have entries in their .hostrc files that give the SpectroSERVERs mutual access permissions.

   NOTE
   If you are specifying secure users for the secondary SpectroSERVER in the .hostrc file on the primary SpectroSERVER, and the secondary SpectroSERVER is running in the Windows environment, include the user SYSTEM in the secure user list.
3. Verify that the MAIN_LOCATION_HOST_NAME parameter in the .locrc file on the secondary SpectroSERVER server points to the same system name as the .locrc file on the primary SpectroSERVER. Otherwise, synchronization fails.
4. Configure the primary and secondary SpectroSERVERs so that the user running each SpectroSERVER is the same. If the users are not the same, the secondary SpectroSERVER fails or does not run properly after an Online Backup.
5. Make a copy of the primary SpectroSERVER database by running Online Backup. Or, if the SpectroSERVER is shut down, use the SSdbsave utility with the -cm argument (to save the modeling catalog and any new models).

For more information, see the Database Management .

1. Verify that the save file that you created is available to the server that hosts the secondary SpectroSERVER. Copy the file to the server if necessary.
2. On the secondary server, with SpectroSERVER shutdown, navigate to the DX NetOps Spectrum SS directory and load the save file using the following command:

   ```
   ../SS-Tools/SSdbload -il -add precedence savefile
   ```

   – ***precedence***
   Specifies a numeric value greater than the primary server default value of 10 (20 is recommended).
   – ***savefile***
   Specifies the name of the saved file that was previously created.
3. (Optional) Add the line 'secondary_polling=yes' to the .vnmrc file to let the secondary SpectroSERVER function as a hot backup.
4. Start the primary SpectroSERVER, if it is not already running.
5. Start the secondary SpectroSERVER.
6. To verify the setup, use the MapUpdate command with the view argument to display the current landscape map.

For more information, see the Database Management .

The secondary SpectroSERVER is now available to take over automatically if the primary SpectroSERVER fails. If you previously activated secondary polling, the secondary SpectroSERVER is available immediately. Otherwise, polling begins when the server detects that it has lost contact with the primary SpectroSERVER.

When service switches from the primary SpectroSERVER to the secondary SpectroSERVER, the Connection Status icon displays yellow. To view the connection status of all servers in a landscape, click the Connection Status icon. In the Connection Status dialog, the Connection Status icon for each server in the landscape displays yellow to indicate the “switched” condition.

When the primary SpectroSERVER comes back online, the secondary SpectroSERVER stops polling (unless you have set secondary_polling to 'yes'). All the applications switch back to the primary SpectroSERVER. However, any edits that you make to the secondary SpectroSERVER while it is active are *not* automatically replicated to the primary SpectroSERVER. Manually recreate these modifications on the primary SpectroSERVER.

When you restart the primary SpectroSERVER, connections are accepted when all models are loaded, but *before* all models are activated. The models can take some time to activate. Because the secondary SpectroSERVER stops polling when the primary SpectroSERVER is restarted, a gap in your network management coverage can result.

To avoid this situation, edit the .vnmrc file on the primary SpectroSERVER so that the wait_active resource is set to 'yes'. This parameter causes the server to wait until all of the models are activated before accepting any connections. The message area in the DX NetOps Spectrum Control Panel also dynamically displays the percentage of models that are activated. The SpectroSERVER can appear to take longer to come up. However when all the models are activated, the SpectroSERVER is ready to manage the network.

You can also set the wait_active resource to 'yes' on the secondary SpectroSERVER. During a planned shutdown of the primary SpectroSERVER, you can then verify in the DX NetOps Spectrum Control Panel that the secondary SpectroSERVER is ready to take over.

For more information, see the Database Management .

Validate Fault Tolerance Configuration

After you have set up fault tolerance in a distributed SpectroSERVER deployment, verify that the OneClick server has access to both primary and secondary SpectroSERVERs. Without connectivity to both servers, the OneClick server cannot failover to the secondary SpectroSERVER.

Follow these steps:

1. Access the OneClick Administration, Landscapes web page.
2. Check the ‘Secondary Status’ column. Verify that OneClick has established contact with the secondary SpectroSERVER.
   The status also indicates whether Fault Tolerance is ready for failover.
   The Fault Tolerance configuration is validated.

Test Fault Tolerance

During initial installation, the secondary SpectroSERVER might not have access to all the devices to which the primary SpectroSERVER has access. This situation causes the secondary SpectroSERVER to generate false alarms. To avoid false alarms, verify that the secondary SpectroSERVER can manage your network devices by testing fault tolerance.

NOTE
Test fault tolerance whenever new devices are added to the primary SpectroSERVER.

Follow these steps:

1. With both the primary and secondary SpectroSERVERs up and running, bring down the primary SpectroSERVER.

The Connection Status icon is yellow to indicate the "switched" condition.
A red connector indicates that the OneClick server was not able to contact the secondary SpectroSERVER.

2. Wait for 15 - 20 minutes for the secondary SpectroSERVER to run.
3. Verify the following conditions:
   – The Connection Status icon does not display red.
   – All device models and pingable models maintain SNMP or ICMP contact.
   If this contact is lost, verify that the secondary SpectroSERVER has access to your devices. Contact a Network Administrator to resolve this problem, if applicable.
   – DX NetOps Spectrum is managing all devices that have an established contact state. Verify the status by checking for device contact or management contact loss alarms from any of the device models.
4. Restart the primary SpectroSERVER.
   The Connection Status icon displays green to indicate a normal contact state.

Fault-Tolerant Recovery

Following are the two possible failure scenarios:

- The primary SpectroSERVER stops. The secondary SpectroSERVER then forwards event and statistical information to the primary Archive Manager that is running on the server that hosts the primary SpectroSERVER. When the primary SpectroSERVER restarts, no event and statistical data have been lost.
- The computer where the primary SpectroSERVER and the primary Archive Manager is running stops operating completely. The secondary SpectroSERVER then caches event and statistical data in its database until the primary SpectroSERVER computer comes back online. If a secondary Archive Manager is running, historical, and real-time information is available in OneClick, but the information is still cached for transfer to primary Archive Manager.

Restart both the primary Archive Manager and the primary SpectroSERVER if their server goes down, or if the primary SpectroSERVER stops operating.

NOTE
It is no longer necessary to start the Archive Manager before the SpectroSERVER, the cached events from the secondary SpectroSERVER can be transferred at any time, even after the primary SpectroSERVER has started logging new events.

Follow these steps:

1. Start the Spectrum Control Panel on the primary SpectroSERVER host.
2. To start the SpectroSERVER, click Start SpectroSERVER on the Spectrum Control Panel.
   When the primary Archive Manager is again operational, the secondary SpectroSERVER connects and transfers its cached event data to the primary Archive Manager.

Change the Host Names of the Primary and Secondary SpectroSERVERs

SpectroSERVERs in a fault-tolerant environment use a precedence value that is associated with their host names to recognize their relationship to one another. Therefore, to preserve the fault-tolerant relationship, use SSdbsave and SSdbload to change the host name of your primary SpectroSERVER.

Follow these steps:

1. Save the database using SSdbsave with the -cm option.
2. Change the host name.
3. Reload the database with the save file that you created in the first step. Run SSdbload with the -il option and the -replace option:

   ```
   SSdbload -il -replace precedence savefile
   ```

   This command causes the database to associate the new host name with the precedence value (10) that designates a primary SpectroSERVER.

The change in the host name is communicated to any warm or hot standby SpectroSERVERs the next time that the databases are synchronized as a result of Online Backup being run.
In the meantime, however, the host name change prevents the standby SpectroSERVERs from detecting that the primary SpectroSERVER is running. As a result, any SpectroSERVER that is configured as a warm standby starts polling.

4. Load the save file on the warm standby using SSdbload with the -il and -replace options, and specify a higher precedence value (for example, 20) that designates it as a standby.

Now you can change the host name of the secondary SpectroSERVER.

Follow these steps:

1. Save the database using SSdbsave with the -cm option.
2. Make the change to the host name.
3. Reload the database with the save file that you created in the first step. Run SSdbload with the -il option and the -replace option:

   ```
   SSdbload -il -replace precedence savefile
   ```

   This command causes the database to associate the new host name with the precedence value (20) that designates a secondary SpectroSERVER.
   When you restart the secondary SpectroSERVER, the server communicates the new host name and precedence to the primary SpectroSERVER.

For more information, see the Database Management .

Monitor the Changeover Between the Primary and Secondary SpectroSERVERs

You can use watches to monitor the status of your fault-tolerant environment. Create a watch that alerts you when either the primary or the secondary SpectroSERVER is ready to take over.

Follow these steps:

1. Create a watch on the VNM model to monitor the PercentInitialized (0x11da6) attribute.
   When the value of this attribute is equal to 100 percent, the SpectroSERVER has been initialized and is ready to take over.
2. Set up the watch to generate an event or an alarm or run a script when the following expression evaluates to TRUE:

   ```
   PercentInitialized == 100
   ```

3. Set up the watch as an active polled watch.
4. Synchronize the secondary SpectroSERVER with the primary SpectroSERVER to propagate the watch.
5. Specify a value for the Model_Name (0x1006e) attribute in the watch expression. This attribute notifies you only when the secondary SpectroSERVER is ready to take over.
   For example, if the following watch expression evaluates to TRUE, the secondary SpectroSERVER <*sec_server*> is ready to take over.

   ```
   (PercentInitalized == 100) & (Model_Name= <sec_server>)
   ```

   NOTE
   For more information, see the Watches section
6. Add the following line to the .vnmrc file on the secondary SpectroSERVER to limit the potential for false events or alarms:

   ```
   is_secondary = TRUE
   ```

   This setting lets the secondary SpectroSERVER drop events unless DX NetOps Spectrum determines that the secondary SpectroSERVER has taken over as the primary SpectroSERVER.

How to Monitor the Secondary SpectroSERVER Status

Monitoring the Secondary SpectroSERVER Status

You can create a watch that alerts you when the secondary SpectroSERVER server is acting as the primary SpectroSERVER.

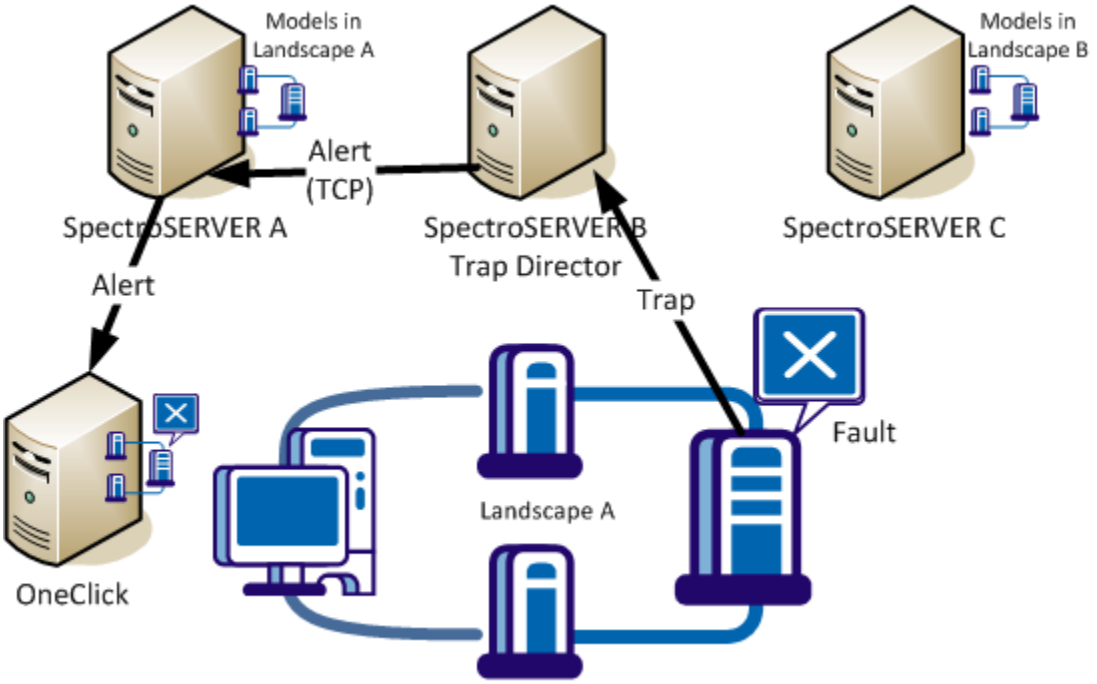
Follow these steps:

1. Create a watch on the VNM model to monitor the value of the secondary SpectroSERVER's PausePolling attribute (0x11b63).
   When this attribute is set to FALSE on the secondary SpectroSERVER, the secondary SpectroSERVER is polling and is acting as the primary SpectroSERVER.
   For example, if the following watch expression evaluates to TRUE, the secondary SpectroSERVER <*sec_server*> is acting as the primary SpectroSERVER.
   ```
   !PausePolling & (Model_Name == <sec_server>)
   ```
2. Set up the watch as an active polled watch.
3. Synchronize the secondary SpectroSERVER with the primary SpectroSERVER to propagate the watch.

   NOTE
   For more information, see the Watches section.
4. Add the following line to the .vnmrc file on the secondary SpectroSERVER to limit the potential for false events or alarms:
   ```
   is_secondary=TRUE
   ```
   This setting lets the secondary SpectroSERVER drop events unless DX NetOps Spectrum determines that the secondary SpectroSERVER has taken over as the primary SpectroSERVER.

Working with Trap Director

Trap Director is a SpectroSERVER feature that you can enable in a distributed SpectroSERVER environment. Trap Director receives traps and processes them on the Trap Director host server. Trap Director then uses the information in traps to create alerts, which it forwards over a TCP connection to the SpectroSERVER. The main Trap Director mechanism is therefore the DX NetOps Spectrum internal alerts that the SpectroSERVER sends to the models on remote hosts for additional processing. The following diagram illustrates the Trap Director architecture:



To use Trap Director, designate one SpectroSERVER as the Trap Director server. Enable Trap Director on that server. Then configure that server as the network management station (NMS) recipient for traps from devices that are modeled in the remote landscapes.

> **NOTE**
> You can designate more than one SpectroSERVER as a Trap Director in the same distributed SpectroSERVER (DSS) environment.

Trap Director supports encrypted SNMPv3 traps. DX NetOps Spectrum attempts to use your SNMPv3 profiles to decrypt incoming encrypted SNMPv3 traps.

The available SpectroSERVER SNMPv3 Profiles are treated as credential templates for unknown SNMPv3 traps. When an encrypted SNMPv3 trap is received, the SNMPv3 profiles are used to decrypt the trap.

> **NOTE**
> A SpectroSERVER running as a trap forwarder can process SNMPv3 traps if the Trap Director landscape has an SNMPv3 profile with valid credentials.

Traps and Memory Usage

When Trap Director is enabled, monitor the memory usage of the SpectroSERVER process. In cases where a large number of traps (more than 100 per second) are forwarded to multiple remote landscapes, a situation can occur in which the SpectroSERVER cannot forward all of the incoming traps. The traps are then queued for further processing. If the situation continues, the memory that the queue uses can exhaust the memory resources that are available for use by the SpectroSERVER process. The SpectroSERVER then shuts down unexpectedly because it lacks sufficient memory.

In addition to the process memory usage, closely monitor the following attribute in the VNM model:

```
alert_remote_fwd_queue_length (Attribute ID: 0x130c3)
```

Generally, if the queue size continues to grow beyond 1000 elements, we do not recommend enabling Trap Director in your environment.

Trap Data Traffic Consolidation

Consolidating Trap Data Traffic

As network growth prompts you to apportion models among additional landscapes, you can retain the original landscape host as the trap destination for these models. You can thus avoid reconfiguring new trap destinations on the associated devices. Conversely, you can consolidate multiple trap destinations and can designate a single SpectroSERVER to receive and route traps. If load sharing is an important factor, you can enable Trap Director on multiple servers. Each server handles traps from a set of devices that are configured to send traps to that server.

Trap Director maintains an up-to-date model address cache. This cache lets Trap Director match trap sources with models. Trap Director uses matching to forward traps to destination models on remote landscapes. By keeping cache information current, Trap Director ensures that DX NetOps Spectrum can generate events for models regardless of their location.

NOTE
Trap Director performance can be affected when new landscapes are added to the distributed environment. Performance can also be affected when large numbers of traps are processed for many new models. Trap notification latency can increase in these circumstances.

How Trap Director Updates the Address Cache

Trap Director maintains a cache of the IP addresses and locations of models in the distributed environment. The address cache serves as an index to determine where to forward alerts. Models can be regularly added to landscapes, removed from landscapes, and moved between landscapes. Therefore, Trap Director also regularly updates the cache to keep its content current. Records that meet a retention period (or aging) threshold that you can specify are removed. Trap Director also performs cross-landscape searches for model IP addresses that are not available in the cache when it receives traps from those IP addresses.

The following steps describe how Trap Director determines the destination model for a trap:

1. The Trap Director server receives a trap.
2. Trap Director compares the IP address that was included in the trap to IP addresses in cache records.
3. If Trap Director finds a match, it forwards an alert to the model on the remote landscape.
   Otherwise, Trap Director performs the following tasks to determine the destination model and forward the alert:
   - Trap Director searches known landscapes for a matching IP address.
   - When it finds the destination model that is associated with the IP address on the remote landscape, Trap Director updates the cache with model information. It forwards an alert to the model.
4. DX NetOps Spectrum generates an event on the VNM model on the Trap Director server if the trap is dropped because the cross-landscape search did not find a matching address. The event indicates that the destination model was not found.
   A match is not found if, for example, the model has been deleted.

Trap Director in a Fault-Tolerant Setup

If you want to implement a fault-tolerant Trap Director setup, devices must be configured to forward traps to both the primary and the secondary SpectroSERVERs. The secondary server routes traps only when it detects that the primary server has failed. The secondary SpectroSERVER receives Trap Director settings during the primary backup, or synchronization process.

Trap Storm Settings

To handle trap storms, Trap Director uses trap storm settings that are configured on modeled devices. When Trap Director detects a trap storm, it stops forwarding alerts to models on remote landscapes. Trap Director also asserts trap storm alarms for the models.

Trap storms can originate from devices that are not modeled in DX NetOps Spectrum. For these storms, Trap Director uses the trap storm handling settings that are configured for the VNM model on the Trap Director server.

Enable and Disable Trap Director

You can enable and disable Trap Director on a SpectroSERVER.

> **NOTE**
> Use the OneClick Attribute Editor or the DX NetOps Spectrum Command Line Interface to set attribute values on the VNM model for a server.

Follow these steps:

1. Expand the Trap Management subview in the VNM model Information tab.
2. Click set in the Enable Trap Director field, and select Enabled.
   Trap Director is enabled.
3. (Optional) To disable Trap Director, click set in the Enable Trap Director field, and select Disabled.
   Trap Director is disabled.

Define the Cache Record Retention Period

You can control how frequently the Trap Director trap cache ages out. You can define the cache record retention period.

To define the cache record retention period, define a retention period for the following attribute:

```
trap_cache_age_out_minutes (0x12ad5)
```

Default: 180 (minutes)

Version Mismatch in DSS Environment

In a Distributed SpectroSERVER (DSS) environment, the infrastructure is organized geographically or across multiple servers in a single physical location. Using DSS, you can create a unified representation of the infrastructure that is composed of multiple landscapes, each with a local SpectroSERVER.

In the DSS environment, it is recommended to ensure all the landscapes are running on the same version of DX NetOps Spectrum (with the latest patches and BMPs). If there is a mismatch in the version on any landscape, you may see exceptions or reduced functionality problems. To overcome this issue, 10.3.1 is enhanced to raise an alarm on the Main Location Server (MLS) for the mismatch of the version in any landscape. The mismatch version information can be found in the OneClick Web server log.

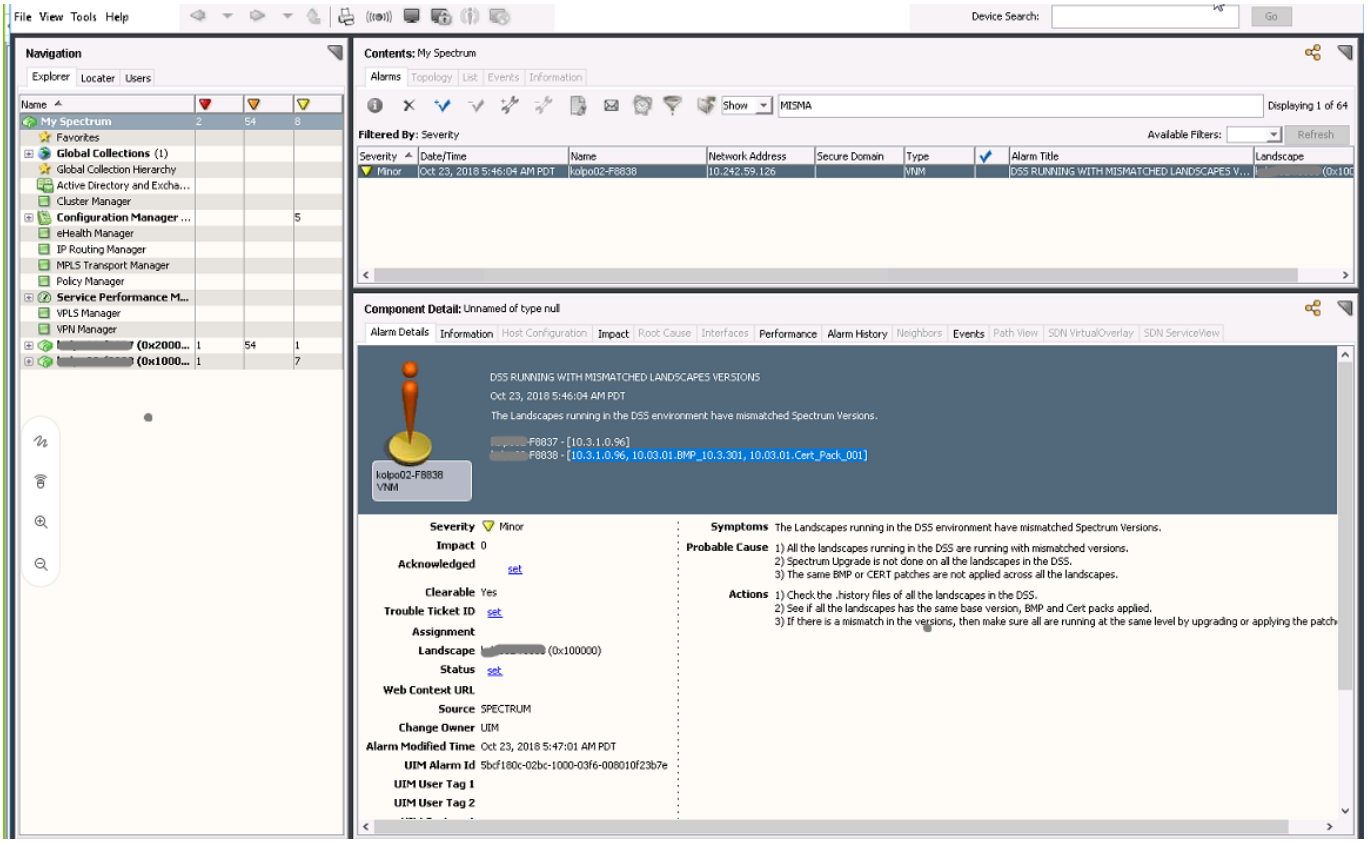
> **NOTE**
>
> Only SpectroSERVERs are compared for the version mismatch.

Alarm for Versions Mismatch

In the DSS environment, there are chances to miss upgrading of DX NetOps Spectrum on any landscape. DX NetOps Spectrum compares version across all landscapes and if there is any mismatch found then raises an alarm on the main location server (MLS). The Alarm Details tab in the VNM Model's Information tab shows the alarm details that are generated on the VNM model. Following is the alarm that is generated on the MLS.

"DSS RUNNING WITH MISMATCHED LANDSCAPES VERSIONS"

The alarm also shows the landscapes information which have the different versions running. The symptom, probable cause, and actions information for the alarm helps you to understand the problem and take corrective actions (as shown is the following image).



To resolve the problem, upgrade DX NetOps Spectrum (with BMP or Patch) according to the version displayed in the Alarm Details tab. After upgrade, if all the landscapes are running the same DX NetOps Spectrum version, an event is generated to clear the mismatch alarm.

Troubleshooting SpectroSERVER

Alarms are not synchronized when failing over back from Secondary to Primary SpectroSERVER

Issue:
In a Fault Tolerance environment, failover happens from Primary SpectroSERVER to secondary SpectroSERVER. After the Primary SpectroSERVER is back to normal, on the OneClick console, the alarms are not synchronized between the Primary and the secondary SpectroSERVER.

Probable Cause:
In order to have the alarm synchronization happen between the primary and secondary SpectroSERVER in the Fault Tolerance environment, you need to have the following entry in the $SPECROOT\SS\.vnmrc file on both the primary and secondary SpectroSERVER.

ftasv_enabled=true

Resolution:

By default, the entry 'ftasv_enabled=true' doesn't exist in the $SPECROOT\SS\.vnmrc file on the SpectroSERVER.

You need to manually add this entry to the $SPECROOT\SS\.vnmrc file on both the primary and secondary SpectroSERVER. If you modify this file while SpectroSERVER is running, the changes take effect only when the SpectroSERVER is restarted.

SpectroSERVER Performance Administration

In highly dynamic IT environments, monitoring the capacity of your systems and optimizing your DX NetOps Spectrum deployment cannot be a one-time task. Regular, periodic reviews are required to keep DX NetOps Spectrum operating optimally in larger environments (more than 1,000 monitored devices). For a well-developed, up-to-date summary of the performance and tuning best practices that we have derived from years of testing and supporting DX NetOps Spectrum, be sure to read Deployment Capacity and Optimization Best Practices , which is available on the Documentation Bookshelf.

DX NetOps Spectrum also provides self-monitoring. The OneClick client application lets Network Administrators monitor and troubleshoot a DX NetOps Spectrum-managed network. The Performance tab in the OneClick interface supports most network and device models. You can use this tab to analyze the CPU and memory utilization of a specific device.

For the VNM model that represents a SpectroSERVER, we also include a robust application to monitor performance. Performance View lets DX NetOps Spectrum administrators monitor the performance and system resource utilization of a SpectroSERVER. Use Performance View to identify performance problems and to determine the appropriate corrective actions to take. Your user account requires Performance Monitor privileges to deploy Performance View.

System Component Monitoring

Each computer system comprises four major components: disk, network, memory, and CPU. To ensure the successful operation of your DX NetOps Spectrum system, you can tune one or more of these components to eliminate bottlenecks.

Performance View includes the following two features to help you detect and locate bottlenecks:

- A series of tabs that provide information about the system components and SpectroSERVER activities that can affect performance. Check the Main tab for overall system and network activity at a glance.
- A health report feature that lets you run a report on the SpectroSERVER resources over a 24-hour period.

> **NOTE**
> In a distributed SpectroSERVER environment, you can switch the focus of Performance View from one SpectroSERVER to another.

For more information, see Getting Started with Performance View and Overview of the User Interface sections.

Performance Data Analysis

Often, the information in Performance View identifies the source of a performance problem. For instance, the CPU tab lists the 10 processes that are currently using the highest percentages of CPU time. However, exactly what constitutes a problem or bottleneck depends on the specific configuration of your DX NetOps Spectrum system and your network management priorities.

For guidelines on identifying performance problems and corrective actions, see Evaluating the Performance of a SpectroSERVER. You can also run a health report, which includes analysis of the performance data. For more information, see Running Health Reports .

Performance Optimization

You can typically resolve SpectroSERVER performance problems by tuning the SpectroSERVER to improve server performance. You can also add SpectroSERVERs to distribute the network load. The following topics discuss these options.

SpectroSERVER Tuning

Once you have identified the reasons for degraded performance, you can tune the SpectroSERVER to optimize performance. Tuning can include taking any of the following measures:

- Modifying the polling interval and the poll-to-log ratio of essential device models and application models, and disabling polling of non-essential models. Increasing the polling interval reduces the network traffic. As a result, latency, which degrades performance, can be reduced.
- Increasing the capacity of the system by increasing memory, CPU speed, or disks.
- Reducing the number of traps that are mapped to DX NetOps Spectrum events.
- Reducing the amount of data that is requested by customized watches and displayed attributes. Performance improves if you can reduce the amount of data that is requested from the SpectroSERVER and devices.
- Adjusting the usage of features such as Live Pipes, Discovery, and automatic device configuration.
- Adjusting client interactions with the SpectroSERVER. For example, reports that are generated using Spectrum Report Manager can exert a punctuated or prolonged performance burden on the server. The performance impact depends on the data that is reported and on reporting frequency. Command Line Interface (CLI) scripts, manual discoveries, and other manually initiated tasks can also affect SpectroSERVER performance.

Additional SpectroSERVERs

To determine whether increasing the number of SpectroSERVERs, rather than tuning, is the best means of achieving desired performance improvements, you can request a sizing of your DX NetOps Spectrum environment from CA Support. The sizing tool uses information about your network configuration to estimate the following:

- The additional network management traffic that DX NetOps Spectrum generates.
- The number and configuration of additional SpectroSERVERs that are required to efficiently manage the number of models in your environment.

Getting Started with Performance View

Start Performance View

Start Performance View by doing either of the following:

- In the Spectrum Control Panel, select SpectroSERVER Performance from the Control menu.
  This connects Performance View to the SpectroSERVER that owns the Control Panel.
- From a command prompt, navigate to the <*$SPECROOT*>/PView folder and enter **pview**.
  If you have set the Show Server List At Startup preference, you are prompted to select the SpectroSERVER to which to connect.

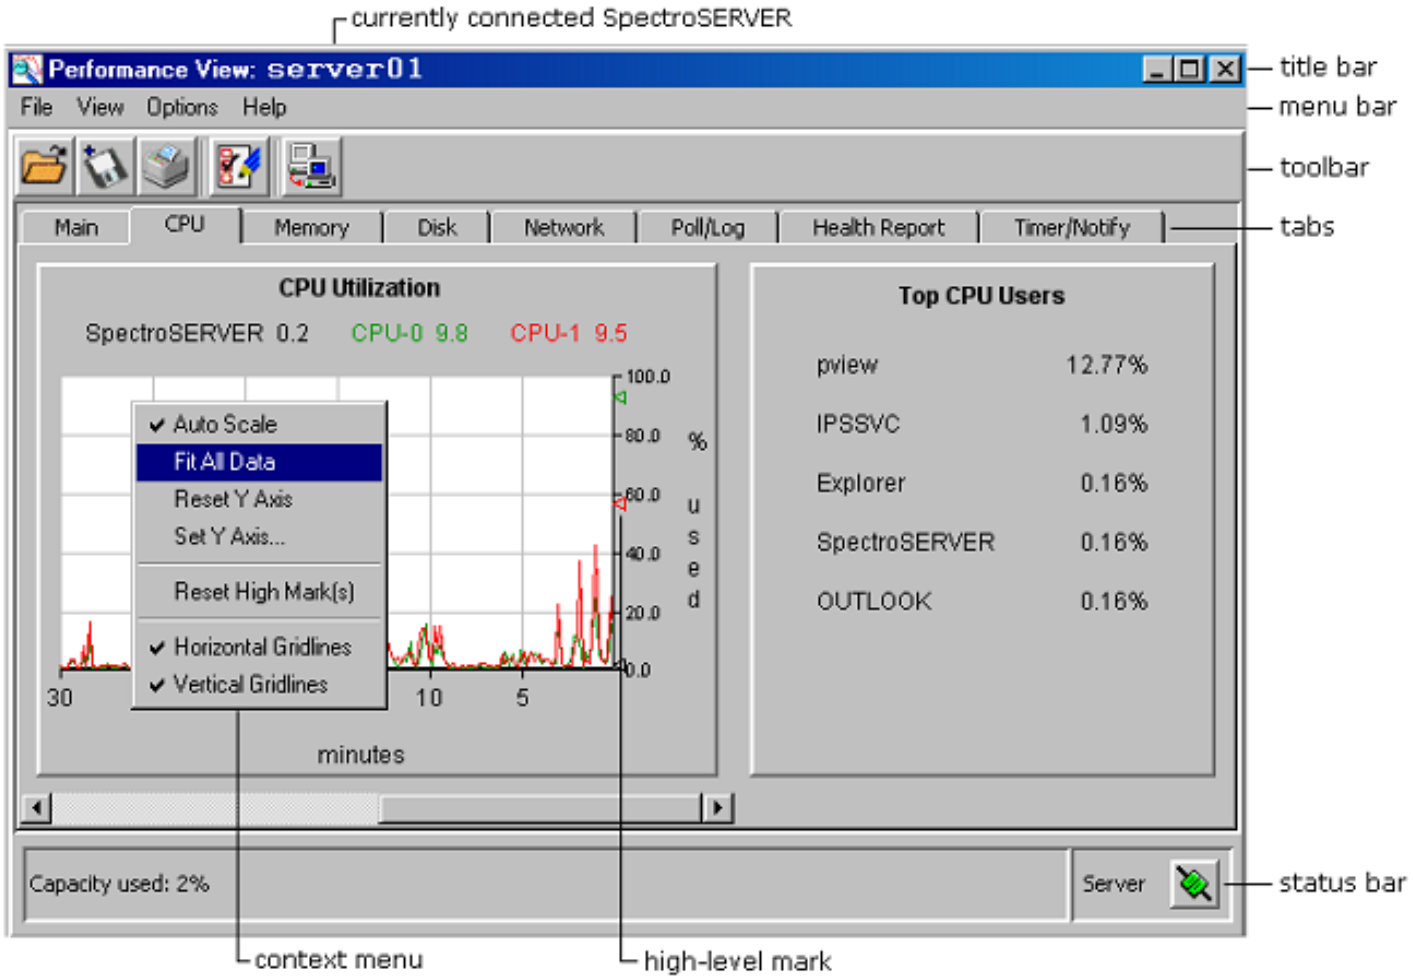
  NOTE
  In a distributed DX NetOps Spectrum environment, you can specify a SpectroSERVER when you start the application by entering the following command:

```
pview -vnm landscape_name
```

NOTE
If you are running DX NetOps Spectrum on Windows, the user who is running the SpectroSERVER process must belong to either the Windows Performance Monitor Users group or to the Administrators group.

Overview of the User Interface

Performance View has a single main window from which you access all performance information. The following image identifies the major user interface elements in the main window:



The status bar displays the current state of Performance View and, when applicable, the status of the current health report. The connection status icon is color-coded, indicating the status of the connection to the SpectroSERVER:

- **Green**
  Normal
- **Yellow**
  Using backup SpectroSERVER
- **Red**
  Contact lost

The tabs in the main window provide detailed information about SpectroSERVER performance. The information is presented in bar graphs, line graphs, and text.

Bar graphs appear on the Main tab. These graphs use data that is collected in 10-minute running averages. All other attributes and graphs use data collected every 10 seconds.

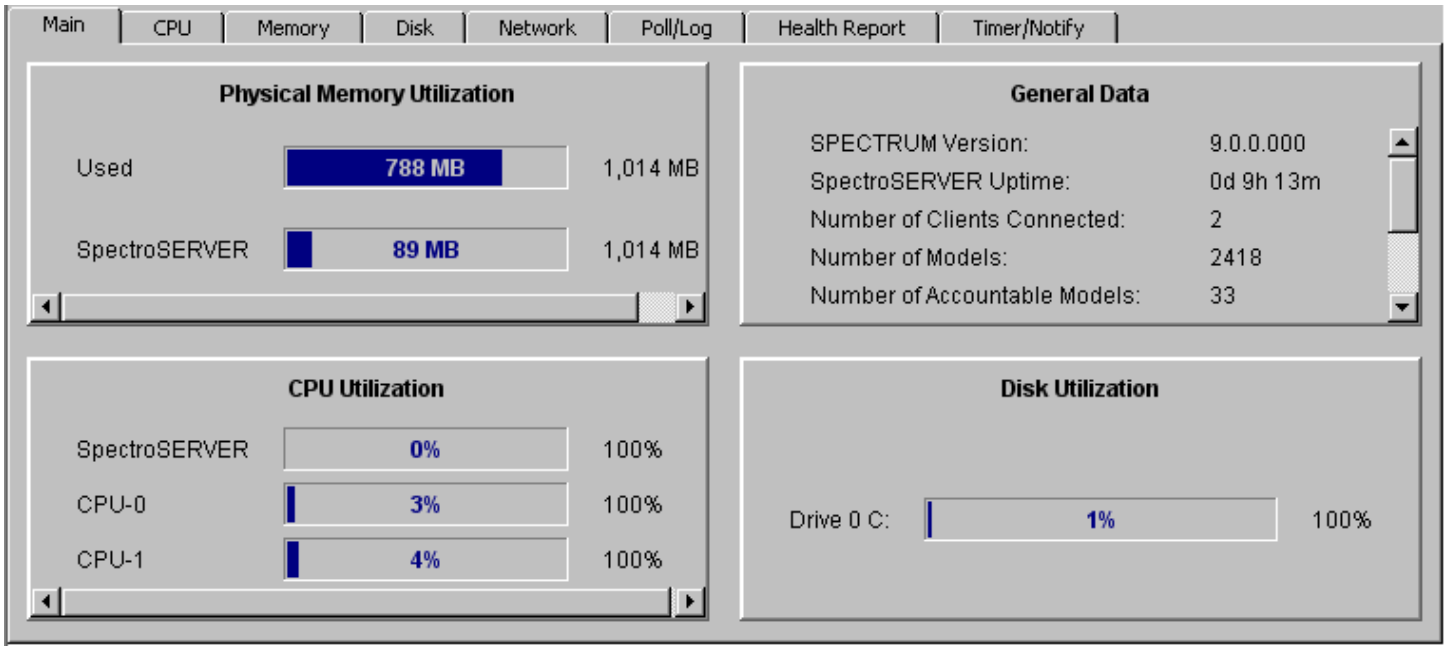
Line graphs on the CPU, Memory, Disk, Network, Poll/Log, and Timer/Notify tabs display data that is collected over 60 minutes. Only the most recent 60 minutes of data is displayed.

For single-line graphs, instantaneous values are shown in a text box. For multiple-line graphs, instantaneous values are shown in color-coded labels, where each label represents the instantaneous value of its associated line.

Line graphs also provide high-level marks and tooltips. High-level marks represent the highest data value that was collected since data collection began. You can reset the high-level marks and can make other changes to the axes of line graphs. Multiple CPUs and disk drives can be graphed in the same chart.

Main Tab

The Main tab contains a Physical Memory Utilization graph, a CPU Utilization graph, a Disk Utilization graph, and general data.



Check the Main tab for the following information:

- **Physical Memory Utilization**
  Displays the amount of physical memory that is used by the SpectroSERVER and other processes that are running on the server to which Performance View is connected.
- **CPU Utilization**

  NOTE
  Displays the percentage of total CPU processing power that is used by the SpectroSERVER and other processes that are running on the server.
- **Disk Utilization**
  Displays the amount of disk read/write access capacity that is used on the server.

Check the General Data panel for the following information:

- **DX NetOps Spectrum Version**
  Specifies the version of DX NetOps Spectrum that is installed on the server.
- **SpectroSERVER Uptime**

Specifies the amount of time that the server has been running. The format for Uptime is <days>d <hours>h <minutes>m.

- **Number of Clients Connected**
  Specifies the total number of clients that are connected to the selected SpectroSERVER.
- **Number of Models**
  Specifies the total number of models, including device models and other models.
- **Number of Accountable Models**
  Specifies the total number of models that are included in the device count calculation (used in DX NetOps Spectrum software licensing).
- **Number of Device Models**
  Specifies the total number of physical devices that are modeled with model types derived from the Device model type.
- **Number of Polled Models**
  Specifies the number of models whose Polling Status is set to TRUE and that have a non-zero polling interval.
- **Number of Polled Attributes**
  Specifies the current number of attributes that the SpectroSERVER is polling.
- **Number of Logged Attributes**
  Specifies the current number of attributes that the SpectroSERVER is logging.

NOTE
Polled attributes are used to determine whether a device is up or down (for fault isolation). Logged attributes are used to gather statistical information. Logging of polled attributes is optional, and logged attributes are not always polled.

CPU Tab

The CPU tab contains a CPU Utilization graph and information on the top CPU users.

- **CPU Utilization**
  Displays the SpectroSERVER usage as a percentage of the total CPU capacity. Each system CPU is included in the line graph.
- **Top CPU Users**
  Displays the top 10 CPU users from highest to lowest and the CPU utilization percentage for each.

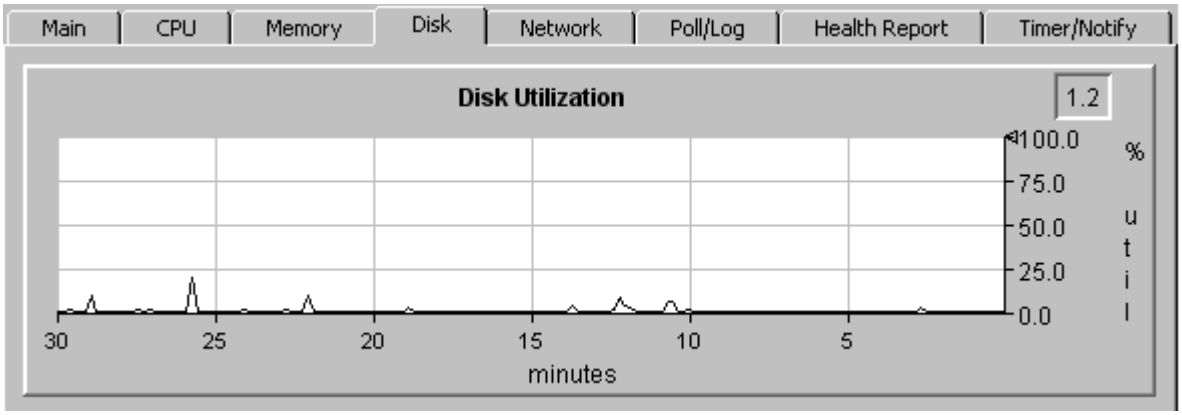
Memory Tab

The Memory tab provides the following information:

- **SS Memory Utilization**
  Displays the amount of memory that the SpectroSERVER is using.
- **Paging Activity**
  Displays total paging activity.
- **Top Memory Users**
  Displays the top 10 memory users (from highest to lowest) and the memory that each process is using.

Disk Tab

The Disk Utilization graph on the Disk tab displays the percentage of disk read/write capacity that is being used.



Network Tab

The Network tab contains a Network I/O graph and a Traps Received graph. Check this tab for the following information:

- **Network I/O**
  Reflects VNM read/write bytes only. This graph does not include traffic from any other sources.
- **Traps Received**
  Displays the number of unsolicited messages, such as SNMP traps, that the VNM receives.

Poll/Log Tab

The Poll/Log tab contains the following graphs:

- **Poll Latency**
  Displays the average poll latency, which is the interval in seconds between when a scheduled polling thread is expected to complete the actual completion time.
- **Poll Threads in Use**
  Displays the number of poll threads in use. A poll thread is allocated to every polling operation.
- **Log Latency**
  Displays the average log latency, which is the interval in seconds between when a scheduled logging thread is expected to complete and the actual completion time.
- **Log Threads in Use**
  Displays the number of log threads that are in use. A log thread is allocated to every logging operation.

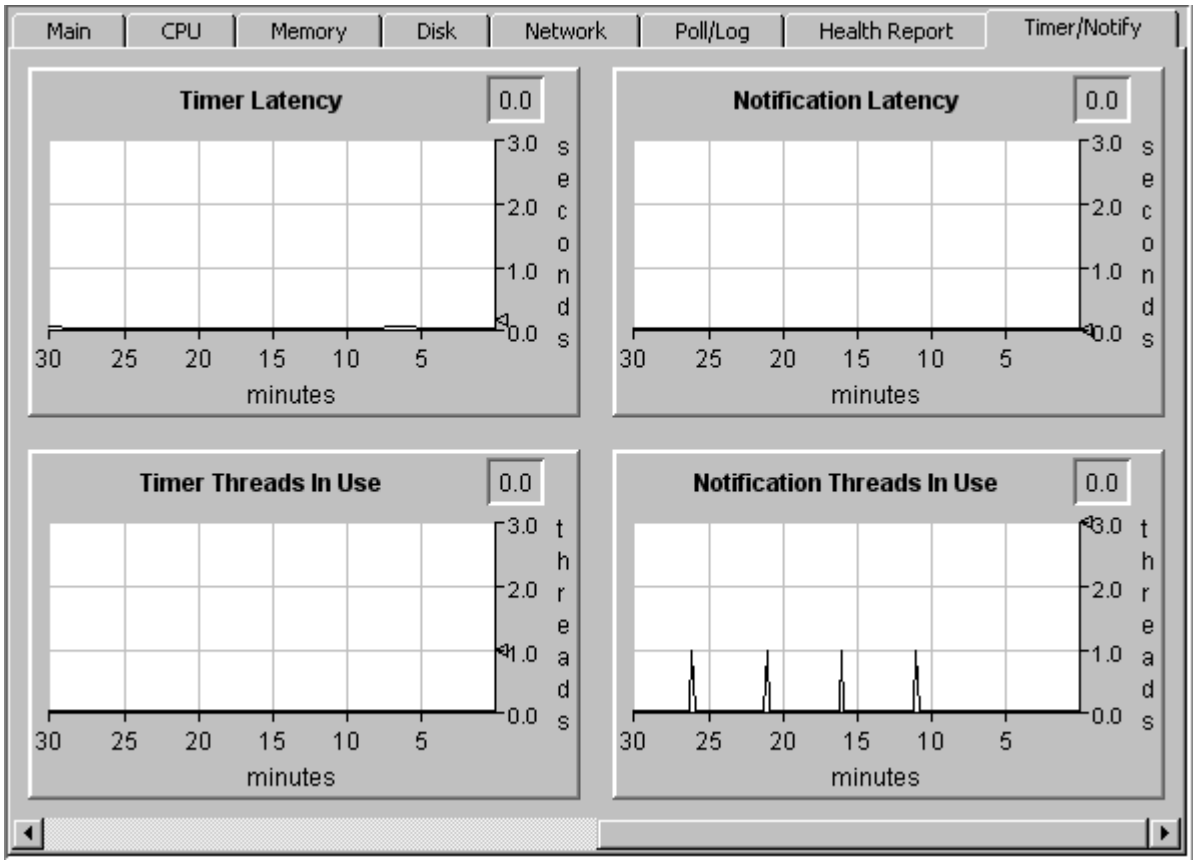
Health Report Tab

The Health Report tab displays status information about the current health report. After the data has been collected, the report and the average percentage of SpectroSERVER capacity during the reporting period are displayed on the tab.

Timer/Notify Tab

The Timer/Notify tab lets you monitor the performance of timer and notification threads.

Note: By default, this tab is not shown. To display it, you must select it from the View menu.



The graphs provide the following information:

- **Timer Latency**
  Displays the average timer latency in seconds. Time latency is the interval between when a scheduled timer thread is expected to complete and the actual time of completion.
- **Timer Threads in Use**
  Displays the number of timer threads in use.
- **Notification Latency**
  Displays the average notification latency in seconds. Notification latency is the interval in seconds between when a scheduled notification thread is expected to complete and the actual time of completion.
- **Notification Threads in Use**
  Displays the number of notification threads in use.

View Connection Details for the Connected SpectroSERVER

To determine the status of the connection between Performance View and the SpectroSERVER, examine the connection status

icon  .

The icon appears in the bottom right corner of the Performance View user interface.

The color of the icon indicates the status:

- **Green**
  Normal
- **Yellow**

Using backup SpectroSERVER

- **Red**
  Contact lost

To view additional connection details for the SpectroSERVER, click the connection status icon. A dialog provides a server connection log.

Connect the Performance View to a Different SpectroSERVER

In a distributed SpectroSERVER environment, you can change the SpectroSERVER to which Performance View is connected.

Follow these steps:

1. Click the Change SpectroSERVER) icon on the
   toolbar 
   The Select SpectroSERVER dialog opens.
2. (Optional) Filter the list of servers by taking one of the following steps:
   – To exclude servers whose names do not contain a specific text string, select Filter from the list. Enter the string in the text box.
   – To parse the list for servers whose names contain a specific text string, select Search from the list. Enter the string in the text box. The first server that matches the criteria is highlighted. Click Next to cycle through the servers that match.
3. Select the SpectroSERVER to connect to Performance View, and click OK.
   The Select SpectroSERVER dialog closes. The Performance View is now connected to the SpectroSERVER that you selected.

Set User Preferences

Select Preferences to customize the appearance and behavior of the Performance View user interface.

Follow these steps:

1. Click the Set user preferences
   icon 
   The Preferences dialog opens.
2. Configure preference settings as desired.
3. Click OK.
   The settings that you selected are applied to Performance View.

Configure Preferences

You can configure the following preferences from the Preferences dialog:

- **Save Settings At Exit**
  Saves all of the settings that you change during a Performance View session. Saved settings are applied to subsequent sessions. The following settings are available:
  – Performance View tabs to display and the order in which to display them

NOTE
You can show or hide tabs using the View menu. To modify the order of tabs, hide them and then display them in the desired order.

- Display settings for the status bar, the toolbar, and tooltips
- The last server that connected to Performance View
- The directory of the health report that was saved or opened most recently
- The size and on-screen location of the main window
- All other preferences that are specified in the Preferences dialog

- **Confirm Exit**
  Specifies whether you want to be prompted to confirm attempts to exit the Performance View.
- **Show Warnings At Exit**
  Specifies whether to show all pending warnings (for example, the warning when a health report has been created but not saved) before Performance View closes.
- **Show Server List At Startup**
  Specifies whether you want to be prompted to select the SpectroSERVER to connect to Performance View after you start Performance View.

  NOTE
  This setting only applies when you start Performance View from the command line. When you start Performance View from the Spectrum Control Panel, you are always connected to the SpectroSERVER to which the Control Panel is connected.
- **Email Report When Complete**
  Sends the health report automatically to the addresses that are specified in the Email Report To field.
- **Email Report To**
  Specifies a comma-separated list of the email addresses to which to send health reports after they are generated.
- **Title Font**
  Specifies the font, style, and size to use for the graph titles that appear above graphs. To change this preference, click Font, make your selections, and click OK.
- **Label Font**
  Specifies the font, style, and size to use for graph labels, which are the text elements in a graph other than the graph title. To change this preference, click Font, make your selections, and click OK.
- **Chart Line Colors**
  Specifies the colors to use for graph lines. The first color button specifies the color for the first graph attribute, the second button specifies the color for the second attribute, and so on.
  All graphs use this same color palette. Changing the color for a graph line changes that color in all graphs.

Change the Colors of Graph Lines

You can customize graph settings and change the color of a line in a line graph.

Follow these steps:

1. Click the Set user preferences icon 
   The Preferences dialog opens.
2. Beside Chart Line Colors, select the graph (chart) line color to change.
   The Select Color dialog opens.
3. Change the color by taking one of the following steps:

- To select a color swatch, click the Swatches tab, and select the swatch.
- To specify the desired hue, saturation, and brightness of the desired color, click the HSB tab, and specify the values using the slider or the text fields.
- To specify the red, green, and blue values of the desired color, click the RGB tab. Move the vertical slider along the color spectrum bar to change the hue, and move the small, white circle in the color square to change the saturation and brightness. Alternatively, use the text fields to individually specify the HSB values.

NOTE
To exit from the dialog without applying any changes, click Cancel. To return to the color that was active when you opened the dialog, click Reset.

4. Click OK.
   The Set Color dialog closes.
5. Click OK.
   The Preferences dialog closes and your changes are applied.

View Menu

Use the View menu to customize the Performance View user interface. Select menu items to display or hide interface elements such as the Status Bar, tooltips, or tabs.

Change the Display of Graph Axes

You can customize the axes of individual line graphs in several ways. Right-click in a graph to see a context menu. A check mark indicates that the option is enabled. The menu contains the following display options for graphs:

- **Auto Scale**
  Sizes the Y axis value of a graph to the highest value in the collected data. For instance, if the current vertical access value is 20, and data is collected for a value of 300, the Y axis is set to 300.
  Auto Scale overrides both Fit All Data and Set Y Axis.
- **Fit All Data**
  Selects a Y axis scale so that all current data can be displayed on the graph.
  Fit All Data overrides Set Y Axis.
- **Reset Y Axis**
  Sets the Y axis to the default values.
- **Set Y Axis**
  Lets you specify the maximum and minimum values for the Y axis and the number of divisions (equal intervals) between the maximum and minimum values.
- **Reset High Marks**
  Returns all high-level marks in a graph to zero. The data that is collected from the current point forward determines the new high-level marks. High-level marks represent the highest data values that were collected since data collection started.
- **Horizontal Gridlines**
  Shows or hides the horizontal gridlines.
- **Vertical Gridlines**
  Shows or hides the vertical gridlines.

Evaluate the Performance of a SpectroSERVER

Examining Thread Latency

The topics in this section describe how to determine whether thread latency indicates performance issues. The types of threads and indicators of latency are also discussed.

Threads and Thread Latency

DX NetOps Spectrum performance partially depends on timely thread allocation. A *thread* is a set of commands that perform a function or a set of functions. Each thread can run independently from other threads.

SpectroSERVER is a single-threaded application regarding the CPU, but a multi-threaded application internally. Within its own process, the SpectroSERVER creates and manages multiple threads that run simultaneously for tasks such as polling, logging, notifications, timers, and more.

> **NOTE**
> The Archive Manager runs in its own thread. As a result, you can use multiple CPUs on a server: one for the SpectroSERVER and another for the Archive Manager. However, deploying three or more CPUs can degrade performance.

In a multi-threaded context, while some threads are waiting (for user input, responses from devices, or data retrieval, for example), other threads can be running. A thread runs to log data, respond to traps, and to connect to SSAPI applications, for example. As each thread runs in the SpectroSERVER process, it takes control of the CPU for a few microseconds and then relinquishes control to allow other threads to run.

A SpectroSERVER maintains a pool of threads that are shared by the DX NetOps Spectrum processes that perform polling, logging, client requests, inference handler timer, inference handler notification, model activation, and model destruction. A SpectroSERVER subsystem uses threads from the pool - up to their individual limits - during periods of increased processing activity. These limits prevent any one SpectroSERVER subsystem from dominating resources and consuming all the available threads.

When the common pool of threads is exhausted, new threads are created. The pool grows to meet the needs of the increased activity. Threads that a process no longer requires are returned to the common pool for later use. When a thread remains unused for a specified period, it is removed from the pool, and its resources are returned to the system. This process is called aging.

Thread latency is the amount of time between when a thread is supposed to complete and when it actually completes. It can cause problems when the number of outstanding threads accumulates as the threads take more time to complete. If DX NetOps Spectrum runs for a prolonged period with high thread latencies, delays occur in device polling, logging, and other tasks. As a result, delays contribute to the response time. For example, if a critical network device became inoperable, a delay would occur before DX NetOps Spectrum notified a Network Administrator of the problem.

> **NOTE**
> Thread latency is a symptom, not a cause, of performance degradation.

Types of Threads That Affect Performance

Poll, log, timer, and notification threads can affect the performance of the SpectroSERVER. Performance View provides usage and latency statistics for these threads.

> **NOTE**
> By default, the Poll_Log_Ratio attribute on device models is set to 0, which effectively disables native DX NetOps Spectrum logging. To log device, attribute, and port statistics, we recommend using SSLogger instead of the native method, which writes the information to the Archive Manager database. SSLogger is a DX NetOps Spectrum command-line application that logs statistics directly to ASCII files. This type of logging reduces the load on the Archive Manager database and eliminates the need to export the data. SSLogger also provides increased control over the type and frequency of data that is logged.

NOTE
For more information about SSLogger, see SSLogger .

- **Poll threads**
  Poll devices on the network. DX NetOps Spectrum uses polling to manage the operation and performance of the network. The SpectroSERVER code that manages poll threads is named the Poll Manager.
- **Log threads**
  Log data from the network into DX NetOps Spectrum database archive files. DX NetOps Spectrum can use data logging to store information about the operation and performance of the network.
- **Timer threads**
  Notify inference handlers that have registered timers, also known as wake-up calls.
- **Notification threads**
  Notify inference handlers about changes in an attribute for which the inference handlers have registered.

Access the Thread Information View

Access the Thread Information view to see information about thread performance and status.

Follow these steps:

1. Click the Topology tab in the OneClick Console.
   The Topology opens.
2. Click the VNM icon for the SpectroSERVER.
3. Click the Information tab in the Component Details panel.
4. Expand the SpectroSERVER Control, Thread Information subview.
   The Thread Information view opens.

Thread Information View

The Thread Information subview appears within the SpectroSERVER Control subview in the OneClick Console. This subview shows the threads in use, threads available, and peak value for the threads within the SpectroSERVER process. While it shows a list of important threads that are used in DX NetOps Spectrum, the list is not exhaustive. Some of the threads available in this list include the following types:

- **Poll Threads**
  Used to read the polled attributes for a model on the Polling_Interval of that model.
- **Log Threads**
  Used to read and log the logged attributes for a model on the Polling_Interval * Poll_Log_Ratio.
- **Notification Threads**
  Used to send notifications of attribute changes to inference handlers and DX NetOps Spectrum client applications.
- **IH Timer Threads**
  Used to trigger timers in inference handlers.
- **Destroy Threads**
  Used to send model destruction notifications to inference handlers and client applications.
- **Model Activate Threads**
  Used to send model activation notifications to inference handlers and client applications.
- **Relation Activate Threads**
  Used to send relation change notifications to inference handlers and client applications.
- **Client Request Threads(*)**
  Used to handle client application requests.
- **Multi-Request Threads(*)**
  Used to handle multi-model requests that originate from inference handlers and client applications.

You can use the Thread Information view to change the available value for each thread type. However, the values are typically left at their defaults. If one of the thread types is consistently running at the limit, and CPU cycles are available, increasing a limit can reduce the latency. However, if CPU utilization is already above 80percent, increasing thread limits does not increase throughput. By contrast, the combination of high CPU utilization and increased thread limits can reduce throughput by increasing thread overhead.

If you find that all available threads are being used for one specific type of thread, contact CA Support for assistance.

Poll/Log Tab

The Poll/Log tab indicates whether the allocation of polling threads and logging threads is affecting the performance. The tab provides four graphs to report on thread usage and any associated latency:

- Poll Latency
- Poll Threads in Use
- Log Latency
- Log Threads in Use

Poll Threads In Use Graph

A poll thread is allocated to every polling operation. Poll threads are allocated from a finite number of DX NetOps Spectrum threads. The number of poll threads that the system uses at any one time is proportional to the number of models that are polled on the network and the polling rate for each model.

If the number of required poll threads exceeds the number of available threads, pending poll thread requests are queued until a poll thread becomes available. In such a case, the number of poll threads may be insufficient for the current state of the network. Contact CA Support for assistance.

Log Latency Graph

Log latency is the interval between when a scheduled logging thread is expected to complete and the actual completion time. The Log Latency graph shows the average latency for the logging process in seconds. For example, if the calculated log latency is 10 seconds, and data logging is set to occur every 60 seconds, the data is actually logged every 70 seconds.

Running for prolonged periods with high log latency can result in delayed logging and other serious performance problems. An average value in the Log Latency graph that is equal to or greater than 30 seconds can indicate that SpectroSERVER performance is degraded. Options for improving the performance include tuning the system, off-loading system demand, or upgrading system speed or capacity.

Log Threads In Use Graph

A log thread is allocated to every logging operation. Log threads are allocated from a finite number of threads resident in DX NetOps Spectrum. The number of log threads that the system uses at any one time is proportional to the amount of data that is logged.

If the number of required threads exceeds the number of available log threads, pending log thread requests are queued until a log thread becomes available. In such a case, the number of log threads may be insufficient for the current state of the network.

By default, the Poll_Log_Ratio attribute on device models is set to 0, which effectively disables native DX NetOps Spectrum logging. To log device, attribute, and port statistics, we recommend using SSLogger instead of the native method, which writes the information to the Archive Manager database. SSLogger is a DX NetOps Spectrum command-line application that logs statistics directly to ASCII files. This type of logging reduces the load on the Archive Manager

database and eliminates the need to export the data. SSLogger also provides increased control over the type and frequency of data that is logged.

NOTE
For more information about SSLogger, see SSLogger .

Poll Latency Graph

Poll latency is the interval between when a scheduled polling thread is expected to complete and the actual completion time. The Poll Latency graph shows the average latency for the polling process in seconds. For example, if the calculated poll latency is 10 seconds, and the polling interval for a model is every 60 seconds, the model is actually polled every 70 seconds.

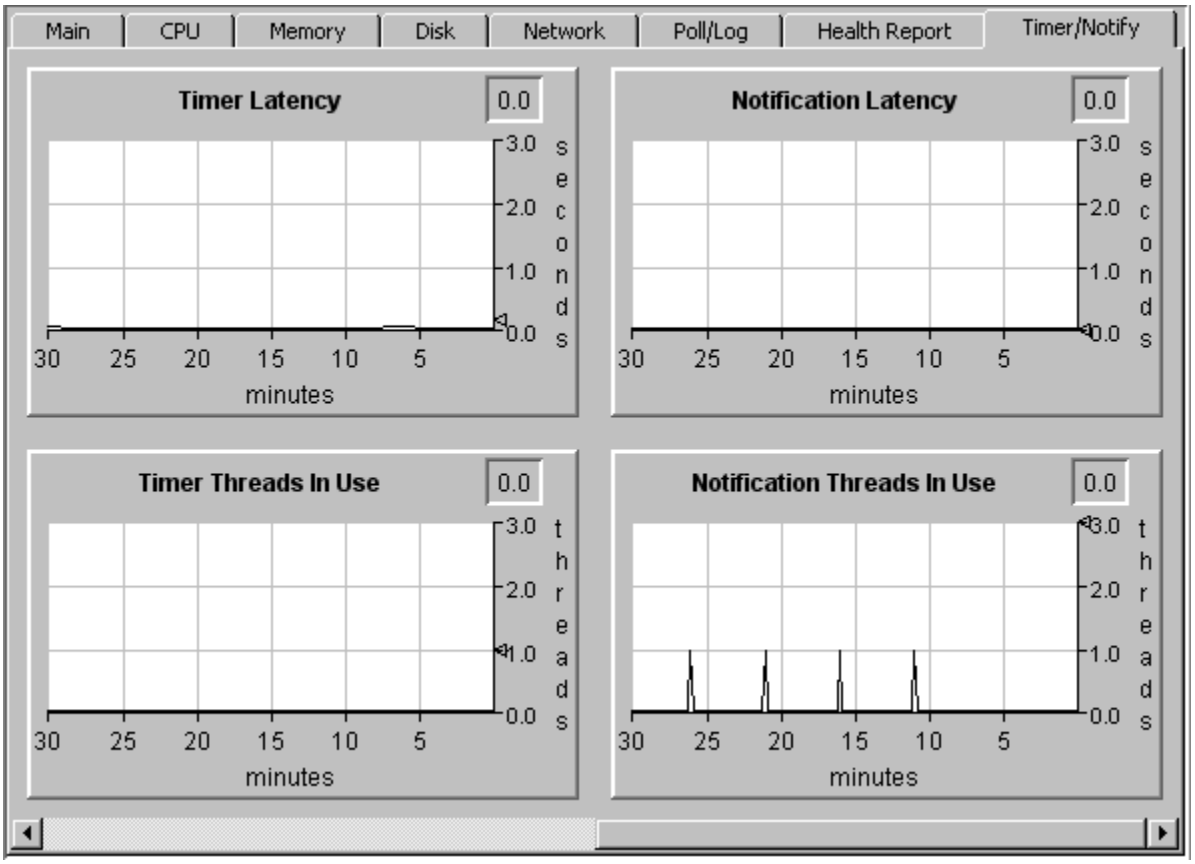
Running for prolonged periods with high poll latency can result in delayed device polling. Delaying the time to poll devices can increase the response time associated with detecting a network fault. A device could go down, and the system administrator would be unaware.

An average value in the Poll Latency graph that is equal to or greater than three seconds and that is sustained for a considerable period can indicate degraded SpectroSERVER performance. Options for improving the performance would include tuning the system, off-loading system demand, or upgrading the speed or capacity of the system.

Timer/Notify Tab

The Timer/Notify tab displays the number of timer threads or notification threads in use and any associated latency. The tab has four graphs:

- Timer Latency
- Timer Threads in Use
- Notification Latency
- Notification Threads in Use



Theory of Operations

The SpectroSERVER is a poll-driven and event-driven system. Each SpectroSERVER actively polls managed elements for state changes, generates events for these changes, and notifies the inference handlers that have registered for the events. Events for which an inference handler can register include model creation, model destruction, attribute value changes, association creations and destructions, and others.

Inference handlers are code segments that are associated with a model type to define the behavior of the model type. Inference handlers execute on behalf of instantiated models of the model type. Either notification threads or timer threads can trigger these handlers.

Notification Threads

A SpectroSERVER process named the Notification Manager reads attribute changes received from polled devices and runs inference handlers to process the data. Another SpectroSERVER process, the Poll Manager, detects changes in attributes whose poll flags are set.

When a change in an attribute value is detected, the Poll Manager alerts the Notification Manager, which forwards the events to each registered inference handler.

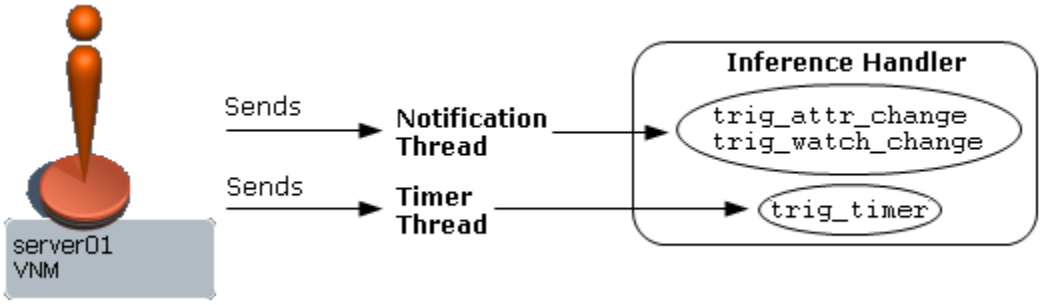
Notification threads are the mechanism that is used to notify inference handlers of a change in an attribute. These threads are used to run the trig_attr_change and trig_watch_change inference handler methods. Both of these methods are notifications of attribute value changes.

For example, assume that the ifInDiscards attribute has changed from a count of 110 to 150. The SpectroSERVER sends a notification thread to the inference handler that has expressed an interest in this attribute. The inference handler then runs the trig_attr_change method.

Timer Threads

Timer threads are used to notify inference handlers that have registered for timers (or "wake-up calls"). When an inference handler registers a “wake-up call” with the SpectroSERVER, the SpectroSERVER uses a timer thread to run the trigger method for that inference handler after a specified interval. Timer threads are used to run the trig_timer inference handler method in the same way that notification threads are used to run the trig_attr_change and trig_watch_change inference handler methods.

For example, assume that the primary address of a router becomes non-operational, and a secondary address must be used. An inference handler registers with the SpectroSERVER for a timer so that it can determine when the primary address is again operational. The inference handler then runs the trig_timer method.



Timer Latency Graph

Timer latency is the interval between when a scheduled timer thread is expected to complete and the actual completion time. The Timer Latency graph shows the average latency for the timer process in seconds. For example, if the average timer latency is 10 seconds and an inference handler has registered for a timer thread every 60 seconds, the timer thread actually activates the corresponding trigger method for the inference handler every 70 seconds.

Running for prolonged periods with high timer latency can result in the delayed activation of inference handler triggers and, therefore, delayed network monitoring. A Timer Latency graph that shows more than three seconds sustained indicates performance problems. Contact CA Support for assistance.

Timer Threads In Use Graph

The Timer Threads in Use graph displays the number of timer threads in use.

If the number of needed timer threads exceeds the number of available timer threads, pending timer thread requests are queued until a timer thread becomes available. If this is the case, the number of timer threads may be insufficient for the current state of the network. In this case, call CA Support for assistance.

Notification Latency Graph

Notification latency is the interval between when a scheduled notification thread is supposed to complete and when it actually completes. The Notification Latency graph shows the average latency for the notification process in seconds. For example, if the average notification latency is 10 seconds, and an inference handler has registered for a notification thread every 60 seconds, then the inference handler's corresponding trigger method is actually being activated by the notification thread every 70 seconds.

The effect of running for prolonged periods with high notification latency is the delayed activation of inference handler triggers and, therefore, network monitoring.

Notification Threads in Use Graph

The number of notification threads that get used by the system at any one time is proportional to the number of attribute or watch changes occurring on the network. Once a network is up and has achieved stability, the number of notification threads required to monitor the system should remain steady and small.

If the number of required notification threads exceeds the number of available threads, pending notification thread requests are queued until a notification thread becomes available. In such a case, the number of notification threads may be insufficient for the current state of the network. Contact CA Support for assistance.

Examining Memory Usage

The topics in this section describe how to determine whether swapping or paging activities are causing performance problems. *Swapping* or *paging* is a processing technique that involves bidirectional transfers of data from the main storage area to an auxiliary storage area. For example, swapping occurs from memory to disk. *Pages* refer to the individual units of data transfer that are used to swap data.

Considerable swapping activity indicates a shortage of system memory. When memory resources are insufficient, data must be temporarily transferred from memory to disk to make room for various processes to run. A large amount of paging activity indicates a high amount of swapping. Because the use of the disk is much slower than the use of physical memory, paging can result in performance problems. Paging should, therefore, be minimized.

The swap space and the physical memory collectively compose the available memory or virtual memory. Virtual memory is frequently a bottleneck for overall system performance. A system typically requires two times the amount of physical memory configured as swap space. If this space is low, reconfigure the system with more memory and swap space.

The following information in Performance View can help you determine whether insufficient memory has affected SpectroSERVER performance:

- Physical Memory Utilization graph on the Main tab
- Disk Utilization graph on the Disk tab
- Paging Activity graph on the Memory tab
- SS Memory Utilization graph on the Memory tab

In addition, you can monitor the memory usage of the SpectroSERVER process in OneClick. Events are logged and alarms are triggered when defined threshold values are exceeded. These thresholds are described in Using Performance Thresholds.

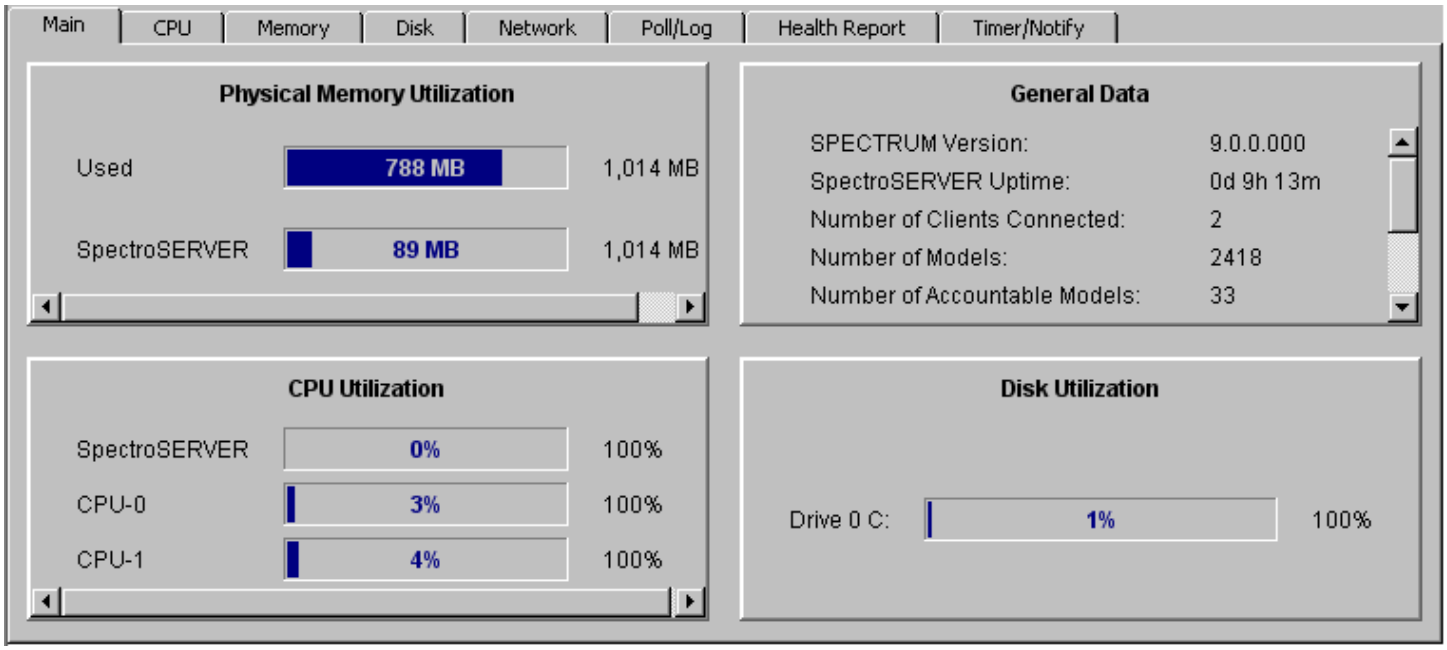
Indicators of Memory Problems

Memory management is important for achieving and maintaining performance. A memory shortage has an immediate and significant effect on SpectroSERVER fault detection response times.

One direct consequence of running DX NetOps Spectrum with insufficient memory is that it appears disk I/O bound. A system that lacks sufficient memory can appear to be disk bound because of the high paging and swapping activity occurring on the disk. When memory is the primary bottleneck, you must either increase the amount of memory or reduce the demand for memory to restore acceptable performance. Adding disk capacity or speed has a negligible effect.

Physical Memory Utilization - Main Tab

The Physical Memory Utilization area of the Main tab displays the amount of physical memory that the system is using and the amount of memory that DX NetOps Spectrum is using.



The total physical memory statistic is the actual amount of physical memory that the server to which the Performance View is connected contains. Therefore, this value is system-dependent. If SpectroSERVER uses a large percentage of the virtual memory, consider upgrading the memory or allocating more swap space.

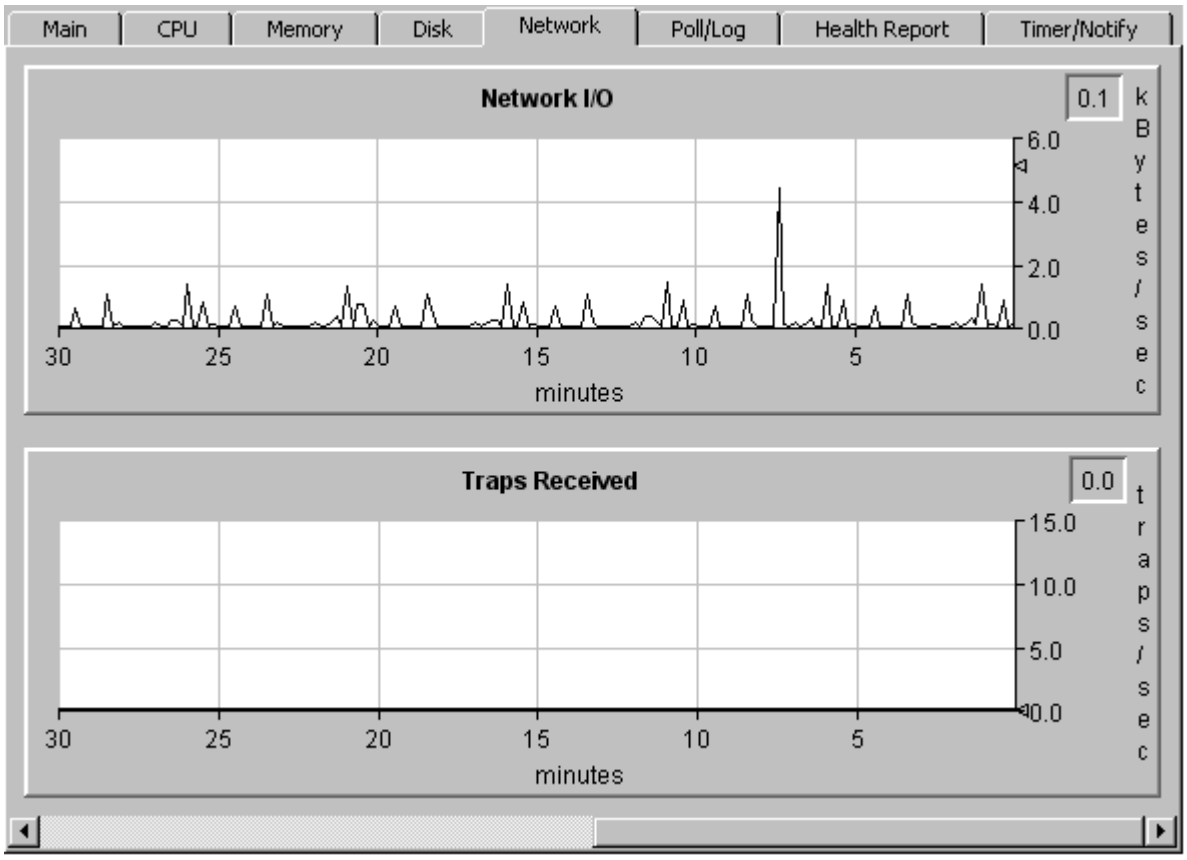
Disk Utilization Graph - Disk Tab

The Disk Utilization graph records all disk transfers, including all physical disks that are attached to the system. Disk utilization refers to how busy the disk is - that is, the percentage of time that the disk is used.

If the Disk Utilization graph is high, data logging can also be high. If this graph shows continuously high numbers, consider changing the logging ratio of some of your models and running the PMCount utility.

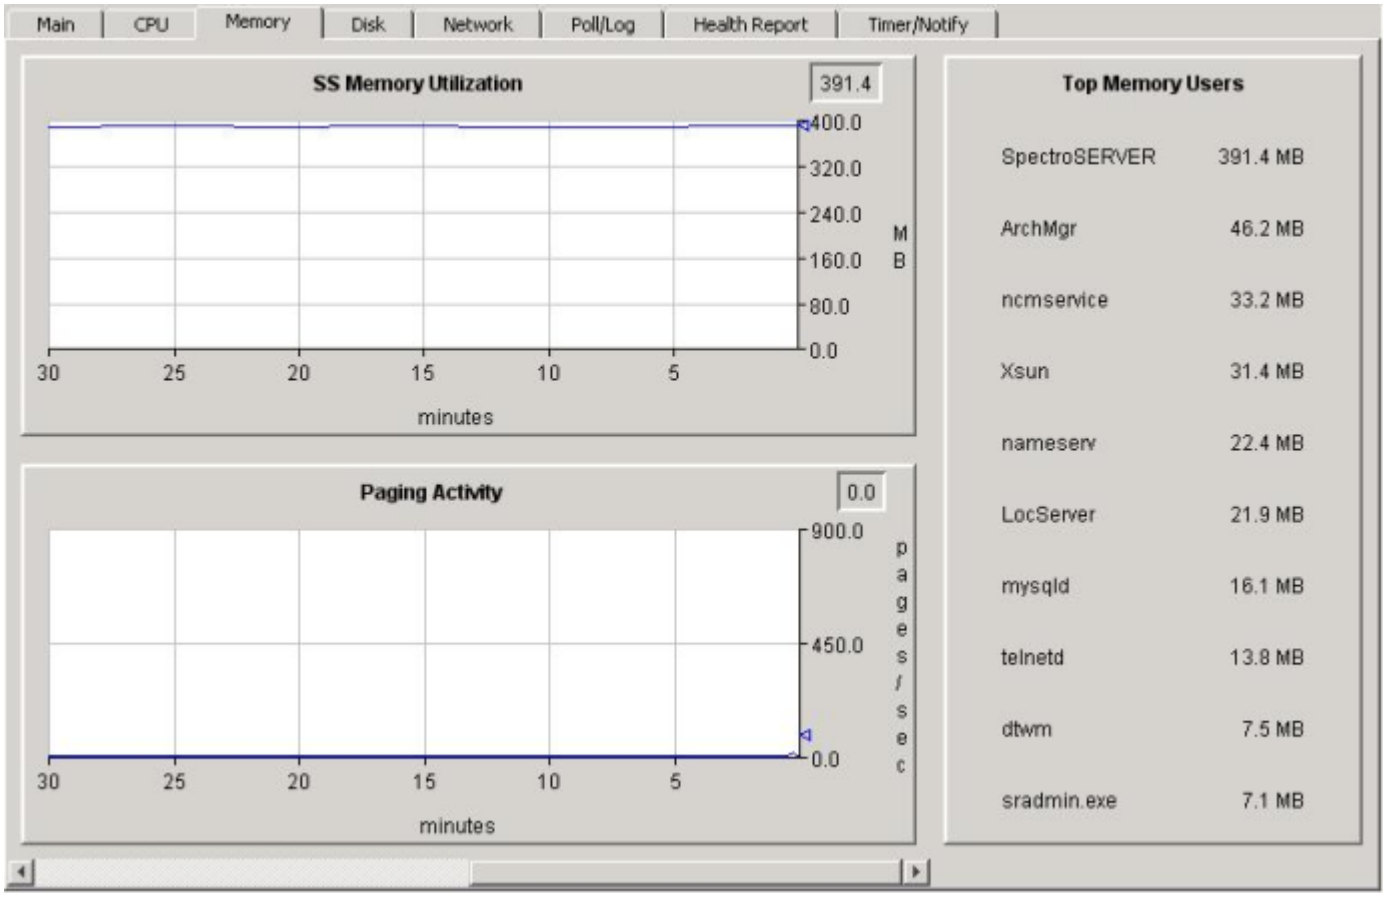
Network I/O Graph - Network Tab

The Network I/O graph records network I/O from the Ethernet interfaces on the system. The data includes I/O activity from the SpectroSERVER. Expect to see an increase when models are created in the database or polling intervals are changed.



Paging Activity Graph - Memory Tab

The Paging Activity graph displays the number of system pages over time. Values in this graph that are persistently high indicate a lack of adequate physical memory. Such a situation can result from having more processes running than the available physical memory can accommodate.



A persistently high value indicates that the system is heavily loaded. Consider a memory upgrade. If you see high paging activity levels, consider reducing the number of non-DX NetOps Spectrum processes that are running or increasing the physical memory.

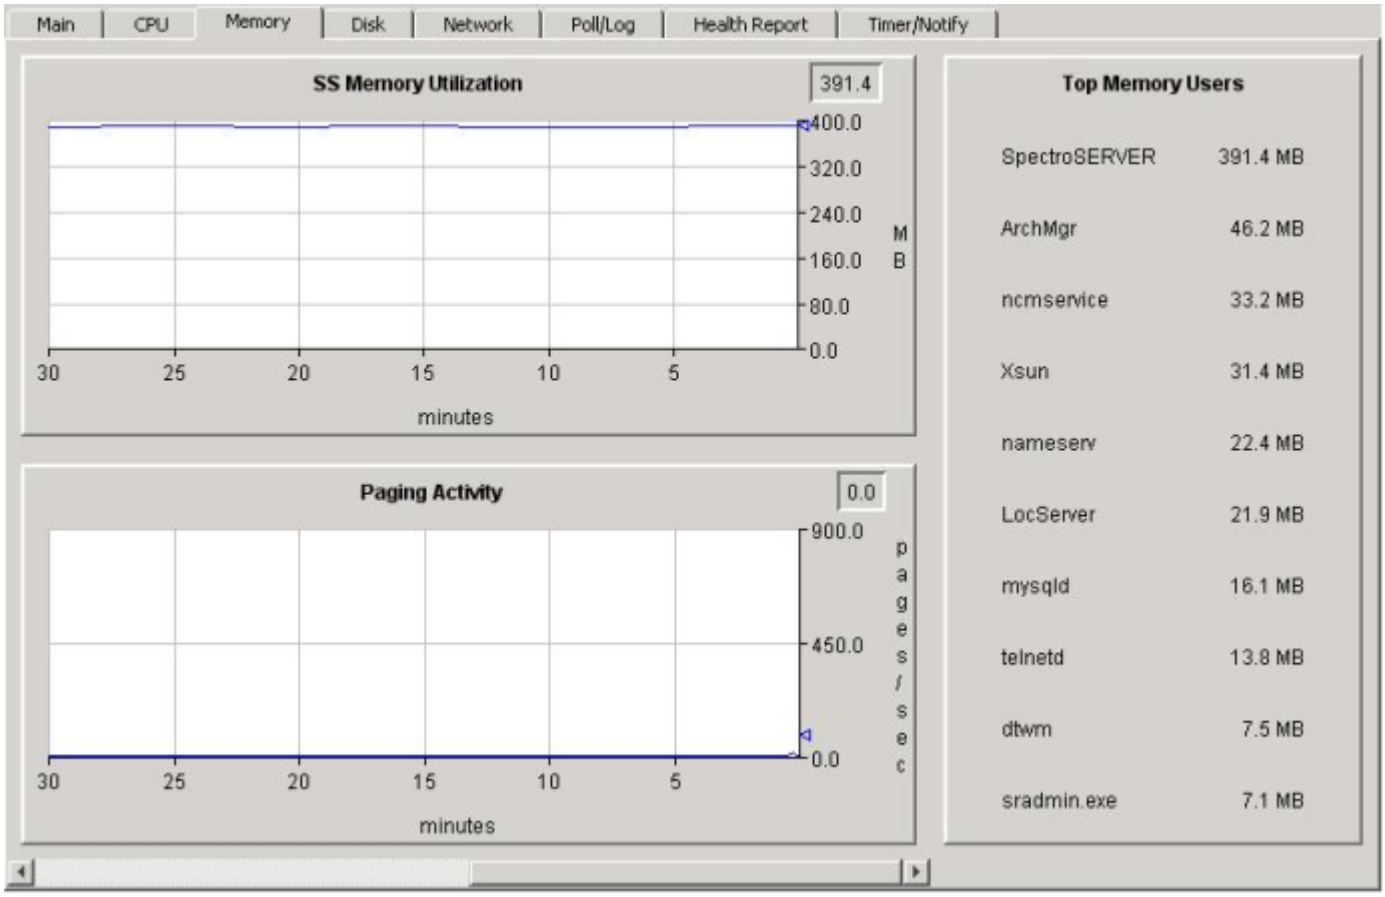
Examining the Application Load

This section describes how to determine whether too many applications are running on the system. These applications include SpectroSERVER and OneClick. The following views can help you determine whether an excessive number of applications that are running on the system are causing performance issues:

- Memory tab
- CPU tab

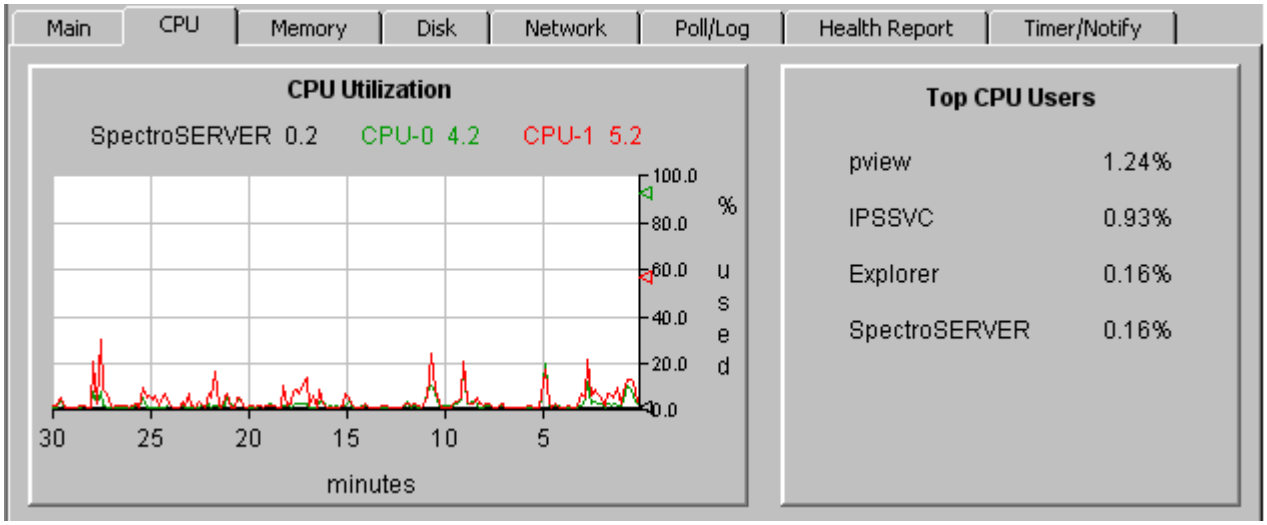
Memory Tab

The Memory tab displays the top users of system memory. This view can help you determine which applications are consuming the most system memory.



CPU Tab

The CPU tab displays the top users of the system CPU. This view can help you determine which applications are consuming the most system CPU.



If SpectroSERVER CPU Utilization is low, but DX NetOps Spectrum performance is still slow, consider whether other applications are straining the system.

Examining the Number of Connected Clients

A large number of client connections can place a heavy load on the server. To identify the number of active client connections, click the Main tab. In the General Data panel, check the value for Number of Clients Connected.

> **NOTE**
> A OneClick web server represents one SpectroSERVER client, regardless of how many OneClick clients are running against that web server.

We recommend installing only DX NetOps Spectrum applications on the SpectroSERVER host. But installing OneClick on a single-CPU SpectroSERVER host system can degrade the performance of both the SpectroSERVER and OneClick. Installing OneClick on a separate, dedicated system can maximize the performance of both the SpectroSERVER and OneClick.

Using Performance Thresholds

In addition to the performance monitoring capabilities of Performance View, DX NetOps Spectrum OneClick also provides some system performance statistics. You can also monitor the SpectroSERVER process in OneClick. If defined threshold values are exceeded, events are logged, and alarms are triggered. The following performance metrics are monitored using DX NetOps Spectrum performance thresholds:

- SNMP traps
- Memory usage

SNMP Traps

When excessive SNMP trap rates affect the SpectroSERVER process, performance can degrade. If the threshold rate is exceeded, events and alarms are generated on the SSPerformance and VNM models.

> **NOTE**
> The default trap rate threshold is 100 traps per second. To change it, modify the value in the EventDisp file in the following location:

```
$SPECROOT/SS/CsVendor/Cabletron/EventDisp
```

> **NOTE**
> The following line controls the SNMP trap rate value, which is currently set to 100.0 (traps per second):

```
"{v 0x11eca} >= {R 100.0 }",       "0x00010f92 -:-", \
```

> **NOTE**
> The rate threshold must be exceeded for at least 300 seconds to trigger an alarm. This time value cannot be changed.

The trap rate is monitored by the attribute vnm_snmp_traps_ps (AttrID = 0x11eca) on the SSPerformance model.

Memory Usage

If the SpectroSERVER process has an increased memory size, the SpectroSERVER is at risk of termination due to memory exhaustion. If a specified threshold rate for either physical or virtual memory is exceeded for a specified period, events and alarms are generated on the SSPerformance and VNM models.

Separate threshold values are used for physical memory and virtual memory. The default memory size for each threshold is 2.5 GB. To change either threshold, modify the value in the EventDisp file in the following location:

```
$SPECROOT/SS/CsVendor/Cabletron/EventDisp
```

NOTE
The following lines control the memory sizes, which are set to 2.5 GB:

```
"{v 0x11e8b} >= {R 2500000000.0}", "0x00010f95 -:-", \     <- physical memory
"{v 0x12e62} >= {R 2500000000.0}", "0x00010f98 -:-"        <- virtual memory
```

NOTE
The rate threshold must be exceeded for at least 300 seconds to trigger an alarm. This time value cannot be changed.

Run Health Reports

Health Reports

You can use the Performance View Health Report feature to measure and report on the health of your SpectroSERVER and the system where it is installed. Report options let you select any time period, from 6 to 24 hours.

Start the reporting process at any time, either from the main Performance View window or from the command line. The command line option also lets you take advantage of native scheduling service on your host system to run the report automatically at regular intervals.

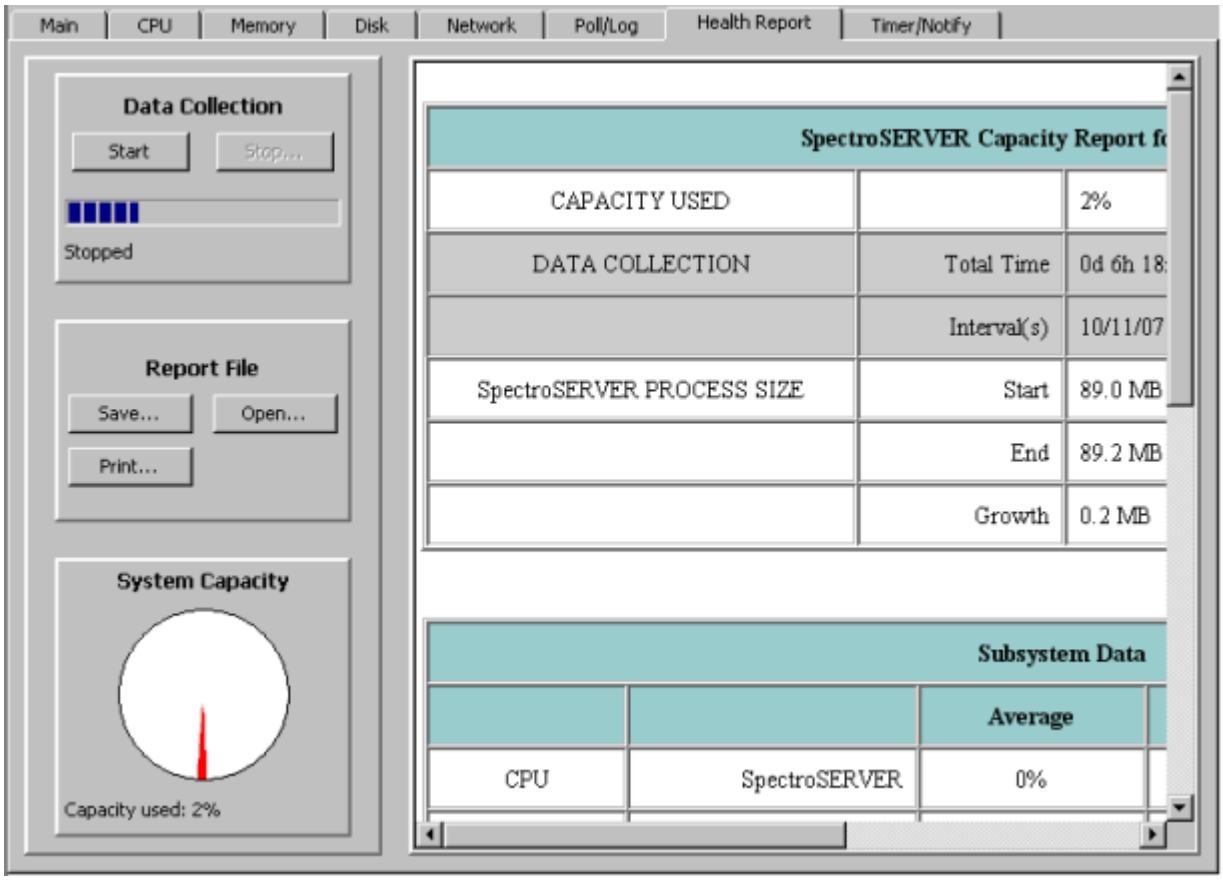
By default, Health Report collects the following data at 10-second intervals for a 24-hour period:

- CPU, disk, and memory usage data
- network I/O and trap data
- poll, log, timer, and notification latency data

We recommend selecting the full 24-hour time period. This interval collects data from a typical day. Or, if data that represents your typical workload is collected during a shorter period of time, select that time period. However, be careful not to exclude data collection for jobs that run during non-business hours, such as backups that are executed late at night.

Once data collection has occurred for a full 24-hour period, a health report is generated automatically. If you ran the report from the Health Report tab, the report is displayed there. You can save it to a location of your choice. If you ran the report from the command line, the report is written to a file.

Note: Use the Preferences dialog to configure Performance View to automatically send health reports to a list of email addresses.



The relative health of each system resource for example, CPU usage is determined by analyzing the Average, Peak, and % Over Critical Value readings collected. Any values that exceed predefined thresholds are flagged (displayed in red) to indicate a potential performance problem.

The relative health of the SpectroSERVER is determined by applying performance algorithms to the collected data. If it is determined that performance has degraded, the likely causes and recommendations for improving performance are also provided in the report.

Start Data Collection

To enable health reports, you must start data collection for the Health Report feature.

Follow these steps:

1. Click the Health Report tab.
2. Click Start in the Data Collection section.
   The message area in the panel indicates the number of hours and minutes remaining in the default 24-hour reporting period. After all of the data has been collected, Health Report analyzes the data and displays a health report to the right of the Data Collection panel.

   NOTE
   As long as the new report remains on display, the average percentage of SpectroSERVER capacity that is used during the reporting period is also shown in the graph in the System Capacity panel.

Stop Data Collection

Data collection for a Health Report stops automatically after data has been collected for 24 hours. However, you can stop or pause data collection manually at any time.

Follow these steps:

1. Click the Health Report tab.
2. Click Stop in the Data Collection section.
3. (Optional) Select *one* of the following options if you started the data collection less than 24 hours ago:
   - **Resume Data Collection**
     Restarts data collection. For example, if you stopped data collection after one hour, select this option to restart data collection and continue it for 23 more hours (until the default reporting period of 24 hours has been reached). In other words, the total time of data collection does not have to be contiguous. You can start and stop data collection for the same report as many times as you want. However, to generate a report, you must collect data for at least six hours.
   - **Stop and Analyze Data**
     Immediately generates a health report from the collected data. This option appears if data has been collected for at least 6 hours. The report remains displayed until you start data collection for a new report or exit Performance View.

     NOTE
     You cannot resume data collection for the same report once you have clicked this button.
   - **Stop and Delete Data**
     Ends the data collection process and deletes all collected data. No report is generated.

Save Health Reports

You can save the current health report to preserve the data.

Follow these steps:

1. Click the save the current health report icon  .
   The Choose Directory and Filename for HTML Report dialog opens.

   NOTE
   When specifying a filename for the report, do not include the .htm file extension. It is added automatically.
2. Navigate to the folder in which to save the report, enter a filename, and click Save.
   The health report is saved.

Open Health Reports

Open health reports to view or print them.

Follow these steps:

1. Click the Open a previously saved health report  .
   The Choose Report File to Open dialog opens.
2. Navigate to the report, select it, and click Open.
   The report is displayed in a separate, read-only window.

Print Health Reports

You can print the health report that is currently displayed on the Health Report tab.

Follow these steps:

1. Click the print the health report 
   The Print dialog opens.
2. Select settings in the Print dialog, and click OK.
   The health report prints.

You can also print a health report that you have saved.

Follow these steps:

1. Open the report.
   The SpectroSERVER Capacity Report dialog opens, displaying the selected report.
2. Click Print.
   The Print dialog opens.
3. Select settings, and click OK.
   The health report prints.
4. Click Close.
   The SpectroSERVER Capacity Report dialog closes.

Run Health Reports from the Command Line

You can start data collection for a health report at any time by entering the desired parameters from the command line. Or you can use your native scheduling service to execute the command at a specified time or at regular intervals.

The command line executable is named pviewrep and is located in the <*$SPECROOT*>\PView directory.

The syntax for the pviewrep command is as follows:

```
pviewrep vnm -c collectTime -e addrList
```

- **vnm**
  Specifies the name of the SpectroSERVER for which to run a report.
- **-c *collectTime***
  Specifies the number of hours for which to collect data.

  NOTE
  The minimum time period for a report is six hours. If you specify fewer than six hours, the report still collects six hours of data before it is generated.
- **-e *addrList***
  Specifies a comma-separated list of email addresses to which to send the completed report. To specify multiple addresses on Windows systems, enclose the list in quotation marks, for example, “address1,address2,address3”.

  WARNING
  In a Windows environment, you must have the Windows Messaging Subsystem or Messaging Application Programming Interface (MAPI) subsystem installed to be able to send messages using the -e option. If the subsystem is not installed, the executable fails to send the email notification. It looks for a registry entry under HKEY_CURRENT_USER\\Software\\Microsoft\\Windows NT\\CurrentVersion\\Windows Messaging Subsystem\\Profiles and creates an application event if the entry cannot be found. The local email system can require confirmation steps before sending the email.

Reports that pviewrep generates are saved automatically with the name of the SpectroSERVER host. These files have an .htm extension. Sequential numbers are added to keep subsequent reports from overwriting existing ones. For example, the first report that is generated for a server named “ace” is ace.htm. The second report is ace_1.htm.

By default, reports that are generated with pviewrep are saved to the directory that was used for the most recent health report from the Performance View main window. If that directory is not available, the report is saved to the current working directory. If the file cannot be written to the current working directory, it is written to the standard output stream for the program.

NOTE
Health reports that are distributed automatically by email are in plain text format, not HTML.

Interpret Health Reports

A health report includes three major sections, which are described in the following topics:

- SpectroSERVER Capacity
- Subsystem Data
- Analysis

SpectroSERVER Capacity

The SpectroSERVER Capacity section of a health report provides the following information:

- **Capacity Used**
  Reports the average percentage of SpectroSERVER capacity being used during the data collection period. This percentage is also shown graphically in the System Capacity panel on the Health Report tab.
- **Data Collection**
  Reports the total amount of time that data was collected. Also reports the start and end times for the individual data collection intervals that make up the total time.
- **SpectroSERVER Process Size**
  Reports the amounts of RAM that the SpectroSERVER used at the beginning and the end of the data collection period, and the difference (Growth) between the two values.

Subsystem Data of a Health Report

The Subsystem Data section of a health report provides Average, Peak, and % Over Critical Value readings for individual parameters within various performance categories (CPU, LATENCIES, DISK, MEMORY, and NETWORK).

Any Average or % Over Critical Value reading that exceeds the Performance View threshold value for that parameter is flagged (displayed in red). Flagged parameters indicate possible performance problems. These parameters contribute to the message that appears in the Analysis area of the report.

The Average, Peak, and % Over Critical Value columns are defined as follows:

- **Average**
  The sum of all of the values for the parameter during the total data collection period (Total Time) divided by the number of collection points. A collection point occurs every 10 seconds.
- **Peak**
  The highest value for a parameter during the total data collection period.
- **% Over Critical Value**
  The percentage of the data collection period during which a value for a parameter exceeded the predetermined threshold value for that parameter.

Analysis Section of a Health Report

The Analysis section of a health report includes a narrative that describes the results of the analysis that was performed on the collected data. The description that you see depends on whether parameter values exceeded predetermined thresholds and which parameters indicated problems.

Report results fall into three possible categories:

- No parameters are flagged to indicate problems
- No Average reading is flagged, but one or more % Over Critical Value readings are flagged
- One or more Average readings are flagged

If all Average numbers and % Over Critical Value numbers are fine (not flagged), the following narrative is displayed:

The SpectroSERVER appears to be running healthy and should be capable of handling approximately (100 - % Capacity) % more load; assuming that the type of new devices being modeled remains relatively the same, and no additional workloads are introduced (for example: high trap rates or additional Watches).

If all Average numbers are fine, but % Over Critical Value number is flagged, the following narrative is displayed:

On average, the SpectroSERVER is running within an acceptable resource utilization range, however, as indicated by a high “% over threshold” value, there are excessive periods of time where one (or more) of the system resources are overutilized. This could be an indication that the resource could be close to a premature bottleneck. Based on the calculated values from this data collection period, it appears that the following problems might exist.

A list of problems that can create the conditions that were flagged then follows.

Other narratives are also displayed for various threshold conditions. In some cases, you are advised to contact CA Support.

Tune OneClick to Improve Performance

Once you have determined the reasons for degraded DX NetOps Spectrum performance, tune the OneClick to improve performance by taking the following steps:

- Modifying the polling interval and poll-to-log ratio of essential device models and application models. Disabling polling of non-essential models. These changes reduce the network traffic and the resulting latency that affect performance.
  - **Polling interval**: The time interval in seconds at which the OneClick reads all device model attributes that are flagged as POLLED.
  - **Poll-to-log ratio**: The number of OneClick device polls that occur prior to logging the attributes that are flagged as LOGGED. The default value is 0 (logging is disabled).

  Polling and logging create the primary workload for OneClick. Changes to polling and logging can have a significant impact on performance. To see the best performance, poll and log only required data.
- Increasing the capacity of the system by increasing memory, CPU speed, or disk space.
- Reducing the number of traps that are mapped to DX NetOps Spectrum events.
- Reducing the amount of data that is requested by customized watches and displayed attributes. As a result, less data is requested from the OneClick and devices.
- Adjusting usage of features such as Live Pipes, Discovery, and automatic device configuration.
- Adjusting client interactions with OneClick. For example, reports that are generated using DX NetOps Spectrum Report Manager can exert a punctuated or prolonged performance burden on the server. The load depends on what is reported and how often the reports are run. Command Line Interface (CLI) scripts, manual discoveries, and other manually-initiated tasks can also affect OneClick performance.

Note: This chapter provides information about configuring polling for device and application models. For other suggested measures to improve OneClick performance, contact CA Support.

Polling Intervals to Manage Information

DX NetOps Spectrum polls devices to retrieve management information. You can change the polling interval for each device as a tuning measure. However, note the following guidelines:

- If you increase the time between polls, less bandwidth is required for management traffic. However, device status is updated less frequently.
- If you decrease the time between polls, device status is updated more frequently. However, more bandwidth is required for management traffic.

Default Polling Intervals

By default, DX NetOps Spectrum polls some devices every 60 seconds, polls other devices every 300 seconds, and does not log statistics (the poll to log ratio is set to 0). Often, the polling of this frequency is unnecessary and slows performance by creating network traffic and resulting latency.

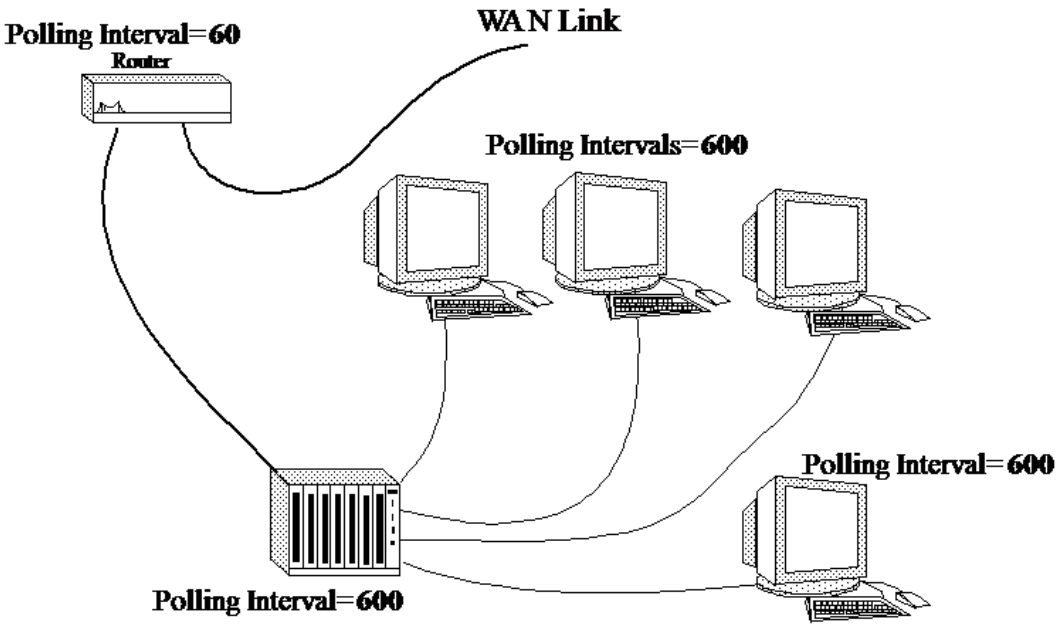
A good rule of thumb is to poll and log critical background devices every 60 seconds and to poll other, less critical network devices every 180 to 300 seconds. Often, polling and logging for end nodes, such as workstations, can be disabled to reduce network traffic and the SpectroSERVER workload.

NOTE
By default, the Poll_Log_Ratio attribute on device models is set to 0, which effectively disables native DX NetOps Spectrum logging. To log device, attribute, and port statistics, we recommend using SSLogger instead of the native method, which writes the information to the Archive Manager database. SSLogger is a DX NetOps Spectrum command-line application that logs statistics directly to ASCII files. This type of logging reduces the load on the Archive Manager database and eliminates the need to export the data. SSLogger also provides increased control over the type and frequency of data that is logged.

NOTE
For more information about SSLogger, see SSLogger .

Staggering Polling Intervals to Reduce SpectroSERVER Workload

You can set staggered polling intervals to reduce network management traffic, spread out the SpectroSERVER workload, and enhance fault management. An example is shown in the following illustration:



If all the devices in the example had a default polling interval of 60 seconds, they would all use SpectroSERVER resources every 60 seconds. SpectroSERVER resource utilization is reduced by setting the polling interval to 60 seconds for the router and to 600 seconds for all the other devices. However, the staggered polling does not impede management capabilities. If any fault occurred on the devices that are downstream from the router, polling would be interrupted, and an alarm would be generated.

Configuring Polling for Multiple Devices

To enhance SpectroSERVER performance, you can modify the polling interval, modify the poll-to-log ratio, or disable polling altogether for multiple devices using the Attribute Editor. The Attribute Editor is an advanced OneClick utility that allows you to change one or more attribute values for multiple models at once.

NOTE
You can also use the command-line interface to change the attribute values for multiple models at once. For more information, see Command Line Interface.

Set the Polling Interval and Poll-to-Log Ratio for Multiple Devices

Polling and logging create the primary workload for OneClick. Configure the polling interval and the poll-to-log ratio to improve SpectroSERVER performance.

The *polling interval* is the time interval in seconds at which the SpectroSERVER reads all device model attributes that are flagged as POLLED. The *poll to log ratio* is the number of SpectroSERVER device polls that occur prior to logging the attributes that are flagged as LOGGED in the database. The default value is 0 (logging is disabled).

NOTE
By default, the Poll_Log_Ratio attribute on device models is set to 0, which effectively disables native DX NetOps Spectrum logging. To log device, attribute, and port statistics, we recommend using SSLogger instead

of the native method, which writes the information to the Archive Manager database. SSLogger is a DX NetOps Spectrum command-line application that logs statistics directly to ASCII files. This type of logging reduces the load on the Archive Manager database and eliminates the need to export the data. SSLogger also provides increased control over the type and frequency of data that is logged.

NOTE
For more information about SSLogger, see SSLogger .

Follow these steps:

1. Search for the device models that you want to modify from the Locater tab in the OneClick Console.

   NOTE
   For more information, see Using OneClick. Results are displayed.
2. Select the models to modify, right-click, and select Utilities, Attribute Editor.
   The Attribute Editor opens.
3. Use the Attribute Editor to modify the following attributes:
   - Poll Interval
   - Poll to Log Ratio

   NOTE
   You can find these attributes under SNMP Communication in the Attributes tree. For more information, see Modeling and Managing Your IT Infrastructure *section*.

Disable Polling for Multiple Devices

You can disable polling for some device models. For example, you want to disable polling for endpoints, such as workstations, to avoid using bandwidth for network polling traffic. Some administrators do not model endpoints at all because of the alarms that can occur each time that the endpoints are powered down.

Follow these steps:

1. Search for the device models that you want to modify from the Locater tab.

   NOTE
   For information about searching using the Locater tab, see Using OneClick . Search results are displayed in the Results tab.
2. Select the models to modify, right-click, and select Utilities, Attribute Editor.
   The Attribute Editor opens.
3. Use the Attribute Editor to set the PollingStatus attribute to no (for false) to disable polling.
   Manually add the attribute to the User Defined folder in the tree.

   NOTE
   For more information, see Modeling and Managing Your IT Infrastructure *section*.

Configuring Polling for Multiple Applications

Application model types have different default polling intervals. The default polling interval for some application models is set to zero. To set the polling interval for these application models, use the Attribute Editor. You can quickly retrieve the application models by performing a search of All Application Models on the Locater tab.

NOTE
In general, we recommend setting the polling interval of application models to 60 seconds.

Polling Interval for a Single Device

The polling interval is the time interval in seconds at which the SpectroSERVER reads all of the attributes of the device model that are flagged as POLLED. You can set polling intervals for individual devices.

Follow these steps:

1. Select the device in the OneClick Console.
   The Component Detail panel displays the information for the selected model in the Information tab.
2. Expand the DX NetOps Spectrum Modeling Information subview.
3. Click set in the Poll Interval (sec) field, type the desired polling interval, and press Enter.
   The polling interval is set for this device.

Disabling Polling for a Single Device

You can disable polling for a single device.

Follow these steps:

1. Select the device in the Explorer tab or the Topology tab in the OneClick Console.
   The Component Details panel displays the information for the selected model in the Information tab.
2. Expand the DX NetOps Spectrum Modeling Information subview.
3. Click set in the Polling field, and select Off.
   Polling is disabled for this device.

Add SpectroServers

If you have not achieved desired performance levels after tuning your existing SpectroSERVER, size the network to determine the appropriate number of SpectroSERVERs to add.

NOTE
For more information, see Distributed SpectroSERVER Administrator .

Sizing the Network

The DX NetOps Spectrum sizing tool determines the number of SpectroSERVERs that are required to efficiently manage your network. The CA Support can run the sizing tool at your request.

Before your network can be sized, you must run a utility called PMCount and must provide the resulting data about your DX NetOps Spectrum environment. The PMCount utility finds the number of pollable models in a database, polling intervals, poll-to-log ratios, number of ports, and more. The sizer uses this raw data to estimate the following:

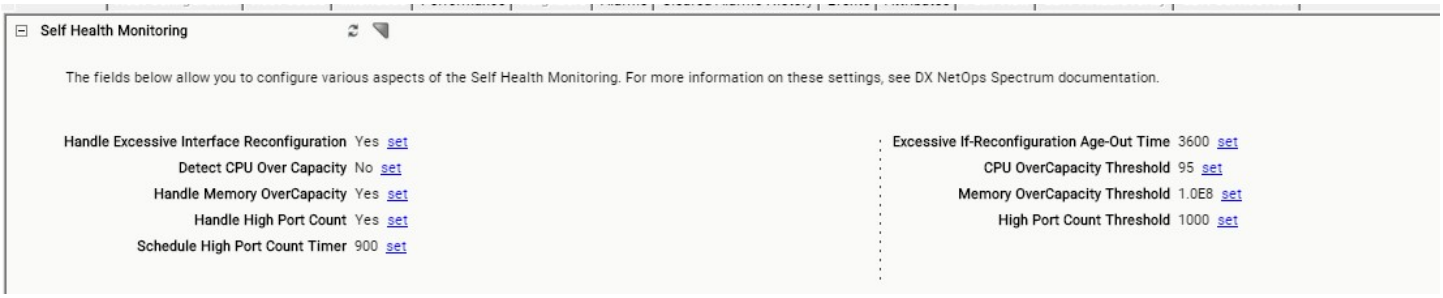
- The additional amount of network management traffic that DX NetOps Spectrum generates
- The number and configuration of additional SpectroSERVERs that are required to efficiently manage the number of models in your environment

Both the PMCount results and the sizing results can also identify places where polling and logging can be further reduced or disabled, thereby improving performance.

CA Support can help you size your deployment. You can also contact CA Support for detailed information about accessing and running PMCount.

Self-Health Monitoring

From 10.3.2, users can benefit from the newly introduced 'Self-Health Monitoring' or the 'Self-Healing' feature that monitors the health of SpectroSERVER as shown in the screenshot below. This feature ensures SpectroSERVER runs smoothly in adverse conditions such as faulty devices, interface issues, CPU, and memory hassles.



The following are the supported capabilities:

1. **Detect CPU's over capacity** - SpectroSERVER (SS) creates perf dmps for continuous high CPU utilization, for a designated time period. The threshold values are configurable. The dmp files are helpful in case the SS runs into performance issues.
2. **Detect memory over capacity** - Kernel crashes SS if the system runs out of available or swap memory. This issue is now addressed and the SS shuts down gracefully, in case the available and swap memory is less than 100 Meg (configurable).
3. **Excessive interface re-configurations handling** - Previously SS raised ‘Excessive Interface Reconfigure' alarm on a device if six interface re-configurations occur within 31 minutes. These frequent interface re-configurations adversely affect the SpectroSERVER's performance. To address this issue, from 10.3.2 onwards, if this option is enabled, SS disables auto-reconfiguration on such devices and waits for an age-out time (configurable to 1 hour by default). After the age-out time expires, SS enables the reconfiguration.
4. **High port count handling** - If this option is enabled, SS restricts the continuous re-configurations on high port count devices by scheduling it for every 15 minutes (configurable). By default, devices with port count of more than 1000 are identified as high port devices and this value is configurable.

   NOTE

   It is recommended that you enable all the capabilities/options that are mentioned above on all the SpectroSERVERS.

   Note that from 10.4.2 onward this functionality is enabled by default. In previous releases, these options were not enabled by default.

Spectrum Performance View (Beta)

Spectrum Performance View provides a real-time health dashboard for the distributed DX NetOps Spectrum environment. The administrator can run this tool to get the performance trends, it is disabled by default. SpectroSERVER tracks the performance statistics like operating system metrics (like CPU, memory, threads, and so on) and other internal metrics like total models, traps, events, alarms, and so on. These metrics are retrieved every minute and stored as an event on the SpectroSERVER Performance model.

From 10.4.2, DX NetOps Spectrum installer configures the Influx server and user **spectrum** is automatically created. The lifecycle of the Influx process is managed by the processd. A new page named **InsideView Configuration(beta)** is added under the OneClick Administration page to configure InsideView, which has options to save, start, and stop InsideView. Also, see Spectrum Performance view improvements after DX NetOps Spectrum upgrade from 10.4.1 to 10.4.2 release.

These metrics are useful in capacity planning and troubleshooting performance problems like:

- Spectrum sending too much traffic
- Frequent disconnection of OneClick Server
- SpectroSERVER hang
- Poll/notifications latencies
- Frequent crashes / getting Out of Memory

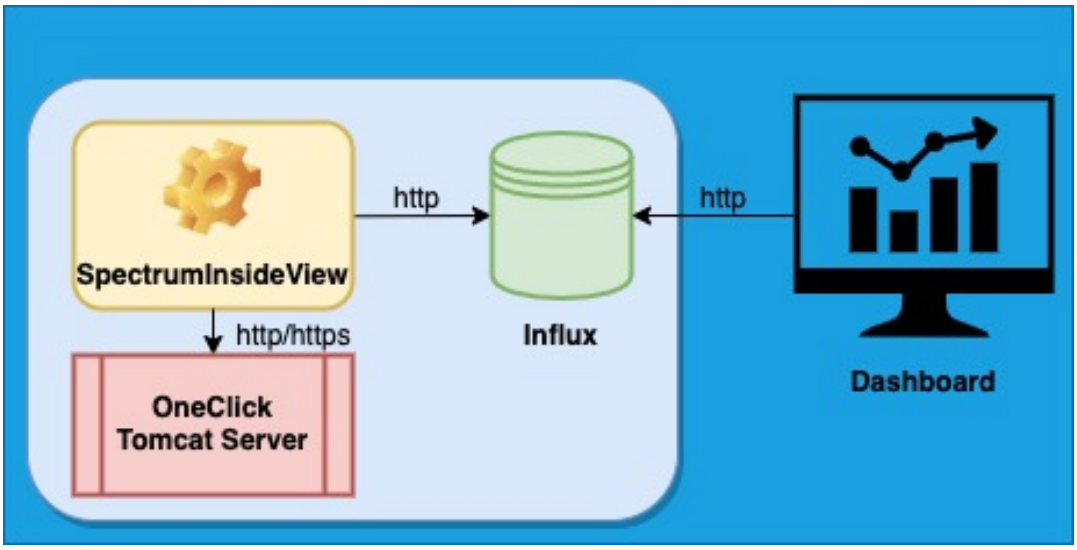
Before the current release, PerfCollector was used for the purpose. PerfCollector is a troubleshooting tool that pulls the performance events from every landscape and creates prf files for performance analysis. It lacks in providing real-time UI to observe the trend.

The Health dashboard provides a real-time DX NetOps Spectrum performance across DSS. You can review the dashboard at regular intervals and take preventive action if you find any dissimilarity in the trend.

DX NetOps Spectrum pulls the performance events from every landscape and stores the data into the Influx database. It uses the REST Interface to pull the events from DDMDB.

Understanding the Spectrum Performance View

The following illustration shows the architecture of the Spectrum Performance View:



The Spectrum Performance View has the following two dashboards:

- **SpectrumInsideView:**
  Application to collect SpectroSERVER performance events and store in influx.
- **Dashboard:**
  - **OneClick Server -DSS View** – High-level summary of all SpectroSERVER metrics attached to OneClick.
  - **Spectrum Health View** – Details of SpectroSERVER metrics.

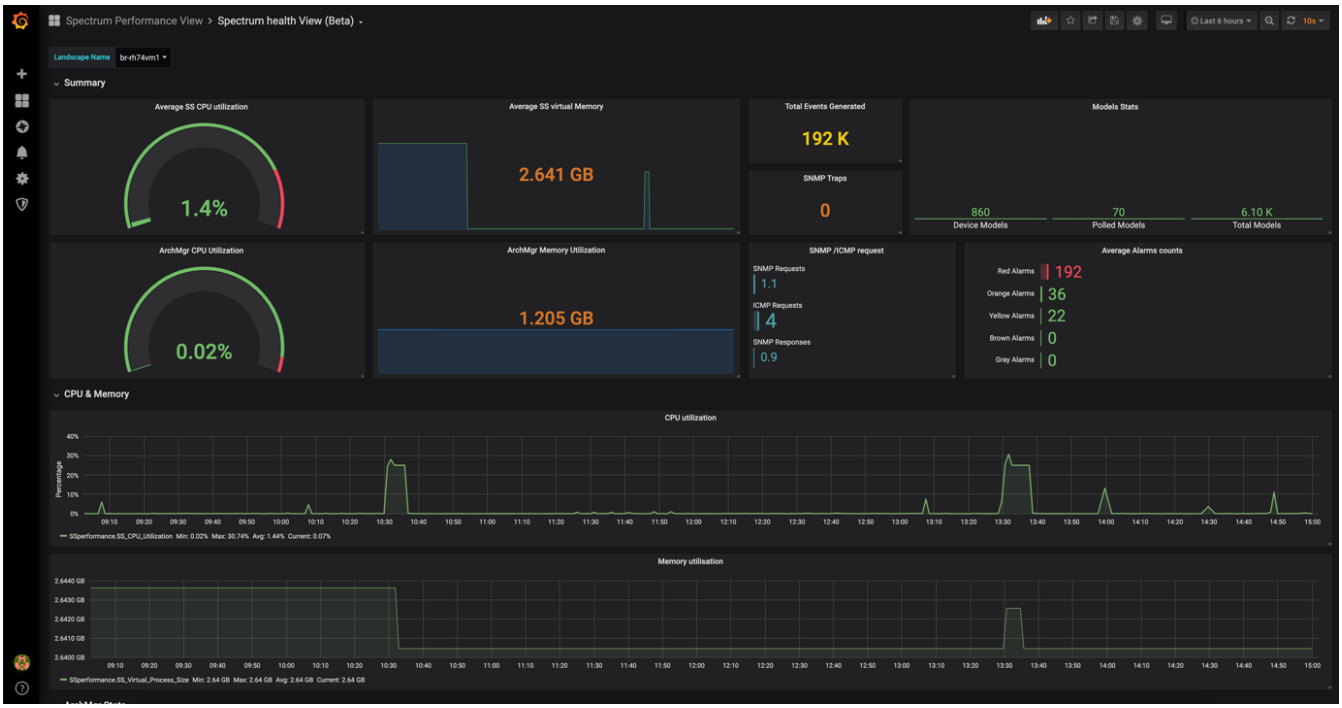
OneClick Server - DSS View

The OneClick Server DSS View (Beta) provides the high-level summary of all SpectroSERVER associated with the OneClick server. The view also provides the following information:

- SpectroSERVER, Archive manager CPU and memory utilization.
- The total number of devices discovered in each SpectroSERVER.

Spectrum Health View

The Spectrum Health View provides a detailed view of each metric of SpectroSERVER like SpectroSERVER CPU, SpectroSERVER Memory, Archive Manager CPU, Archive Manager Memory, SNMP traps and discovered devices, and so on.



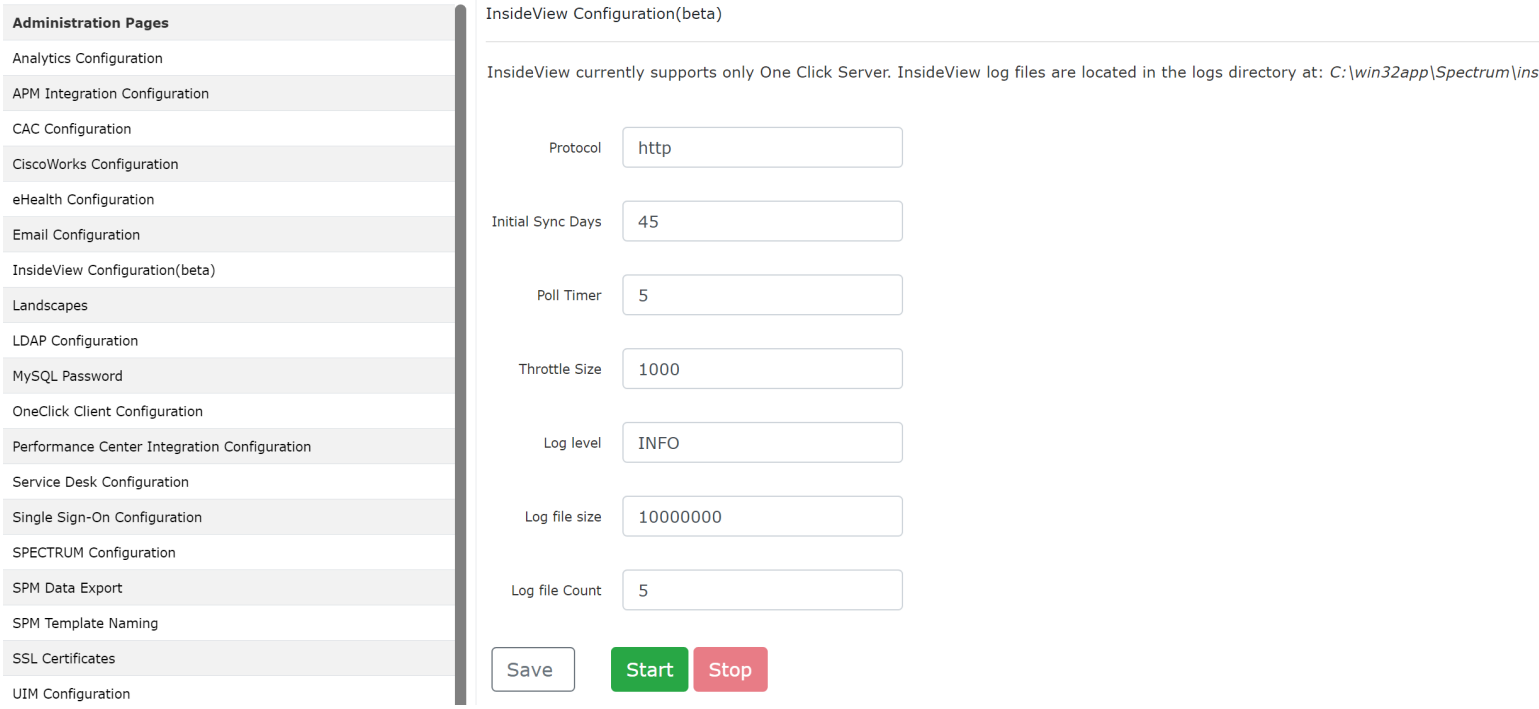
Set Up Spectrum Performance View

This section describes the steps to set up the application.

1. Configure the Spectrum InsideView
2. Install and Import Dashboard in Grafana
3. Customize Influx Database

Configure the SpectrumInsideView

See **InsideView Configuration(beta)** section in the OneClick Administration page to configure SpectrumInsideView,



The **Save** option saves the information but does not start or stop the application. Click the **Start** or **Stop** buttons to start or stop the SpectrumInsideView.

The configuration file for SpectroSERVER Health View, `SpectrumInsideView.conf` is located in the `$SPECROOT\insideView` directory. The `SpectrumInsideView.conf` file contains OneClick Server name, HTTP Port, mode, and initial sync and increment sync duration. The file also contains the Influx DB details like database name, database credentials, HTTP port, and mode.

> **NOTE**
> HTTPS is currently not supported.

OneClickNodes

- **Protocol**
  Specifies the appropriate protocol.
  Default: HTTP
- **Initial Sync Days**
  Specifies the interval at which the OneClick must sync with Spectruminsideview. The minimum value must be one minute.
- **Poll Timer**
  Specifies the interval between two polls.
  Optimal Interval to avoid Overload: Five minutes
- **Throttle Size**
  Specifies the throttleSize
- **LogLevel: INFO**
  Specifies the DEBUG, INFO, ERROR, WARN.
  Default: ERROR
- **Log File Size**

Specifies the size of the log file in bytes.

- **LogFileCount: 5**
  Specifies the maximum number of log back up files.

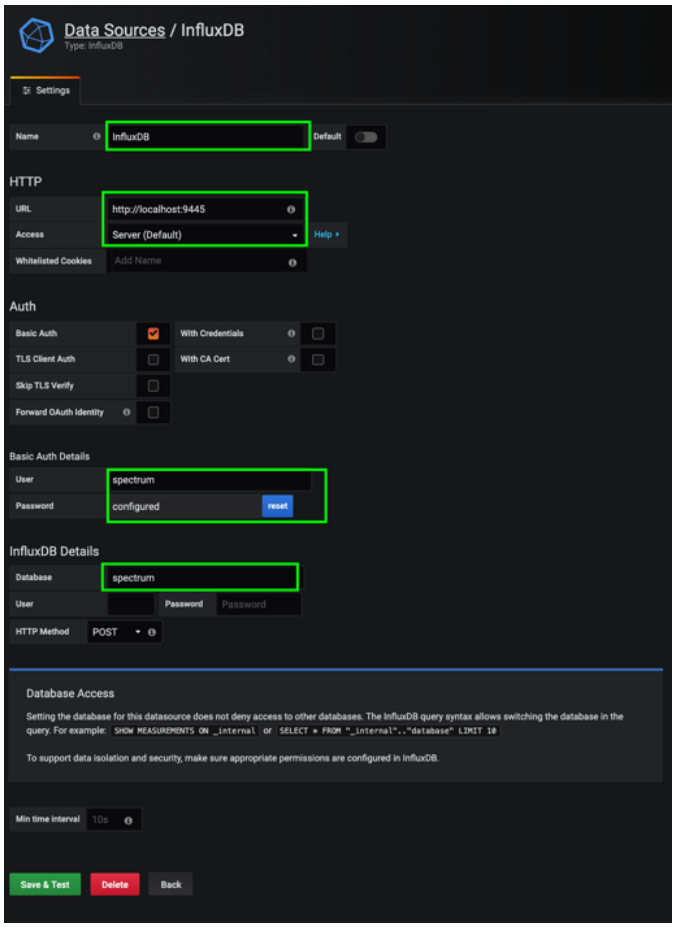
Install and Import Dashboard in Grafana

This section describes the procedure to install and import the SpectroSERVER health view dashboard in Grafana.

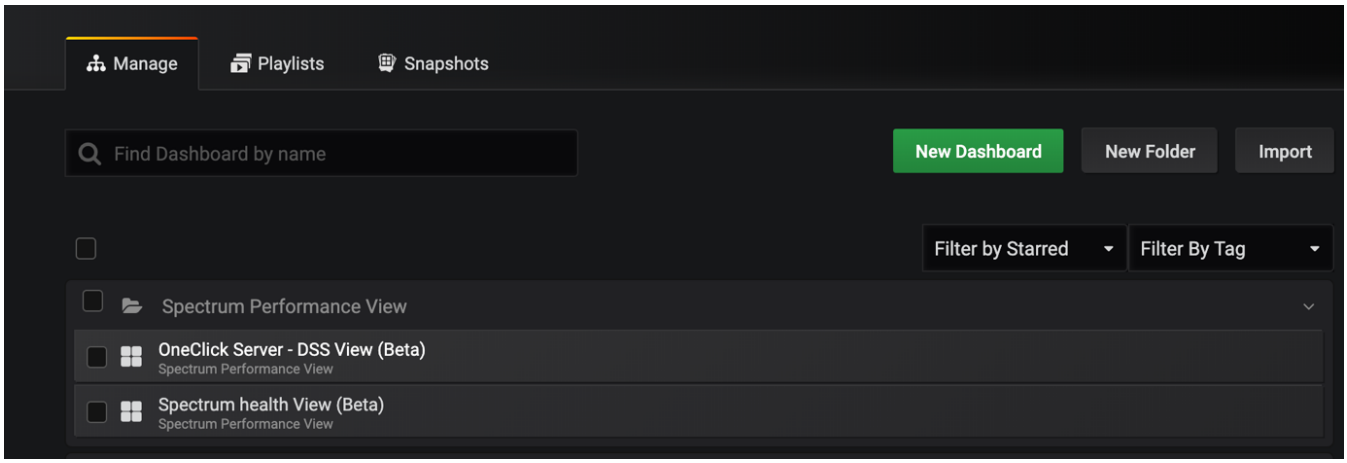
> **NOTE**
> If Grafana is not available in your pod/machine, install it.

Follow these steps:

1. Log in to the Grafana portal.
   Default Credentials: admin/admin
2. Add influx DB data source name as "InfluxDB" (URI : http://<oneClickServername>:9445, username: spectrum / password).



3. Create a dashboard folder with the name **Spectrum Performance View.**
4. Import the Spectrum_health_View.json and OneClick_Server_View.json files from `$SPECROOT/insideView/dashboard` into Grafana and place under the **Spectrum Performance View** directory.



Customize Influx Database

The Influx database is automatically created by the DX NetOps Spectrum installer. The influx database is installed in the `$SPECROOT\influx` folder. It runs on a default port 9445 and uses HTTP communication.

> **NOTE**
> You can change the port by editing the **influxdb_spectrum.conf** file under the HTTP section, port number.

Spectrum Performance View Improvements After DX NetOps Spectrum Upgrade from 10.4.1 to 10.4.2

After you upgrade DX NetOps Spectrum from 10.4.1 to 10.4.2, note the following improvements:

- processd starts the Influx process automatically.
- Database user, password along with database, and data present in 10.4.1 are retained post-upgrade.
- The `SpectrumInsideView.conf` file updated in 10.4.1 is retained. You can update the same file using the **InsideView Configuration(beta)** option on the OneClick Administration page.
- You can **start** or **stop** SpectrumInsideView from **InsideView Configuration(beta)** on the OneClick Administration page.

Troubleshoot the Spectrum Performance View

This section describes the commonly identified issues and workaround to resolve the issue.

- If any error occurs while executing SpectrumInsideView, restart the SpectrumInsideView by changing the sync files to 0, then SpectrumInsideView starts from initial sync. This does not lead to data duplication in influx.
- Ensure that OneClick Rest call throttle size is between 1000 and 2000, to avoid overload on OneClick Server.
- The optimal value for the PollTimerMins parameter is five minutes, a lower value may overload the OneClick server with RestAPI.

Spectrum TrapInsight Dashboard View

From 10.4.2, DX NetOps Spectrum TrapInsight provides a real-time trap trend analysis dashboard for the distributed DX NetOps Spectrum environment. The administrator can run this tool to get the trap analysis trend; it is disabled by default. This feature is part of SDC with TrapX installation. When a new trap is received, TrapX forwards the trap to Logstash. Logstash processes and sends the trap to the Influx database using the logstash-influx-output plugin. DX NetOps Spectrum installer configures the TrapInsight server.

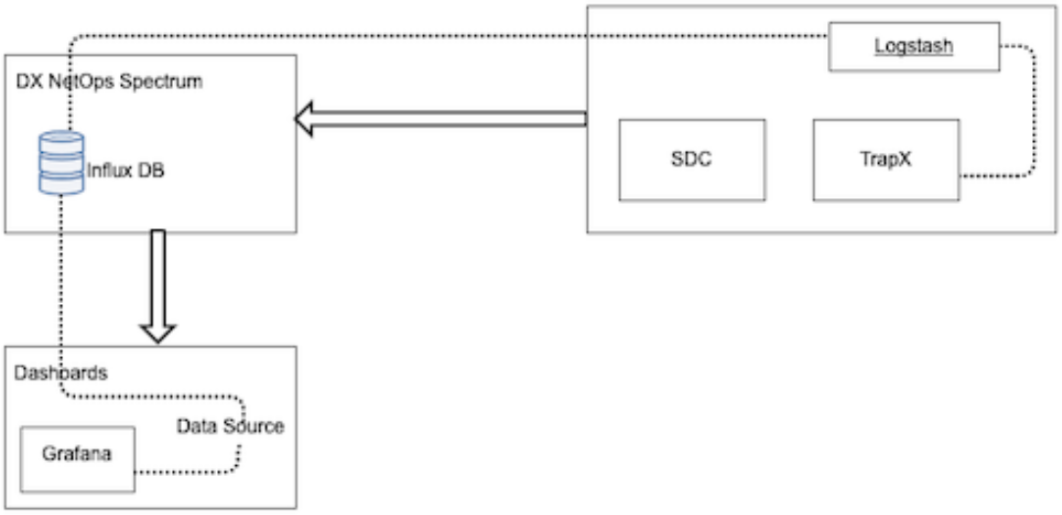
A user named **spectrum** and the TrapInsight database is automatically created. The Influx database is installed only OneClick server in the `$SPECROOT\influx` folder. It runs on a default port 9445 and uses HTTP communication.

You can configure multiple SDCs with Logstash to send the trap information to the same Influx database.

Implementing TrapInsight sends the trap information to the configured Influx database, allowing you to visualize the data and create the dashboards to get the trap trend analysis. You can review the dashboard at regular intervals and take preventive action, if you find any dissimilarity in the trend.

Spectrum TrapInsight Architecture

The following diagram shows the Spectrum TrapInsight architecture:



Deploy Logstash

To deploy Logstash, enable the Trapx option when you install SDC. Once the installation is done, the Logmonitor folder is created as part of the installation.

NOTE
Ensure that the Influx database server is running before executing the setup_logstash script. Login to OneClic server and run the following command from Influx directory to check if Influx is running:

```
influx -port 9445 -username spectrum -password spectrum
```

NOTE
In the Windows environment:

- The bash file is located at `SDC_Installation_Directory\SDMConnector\NT-TOOLS\SDCRE` directory.
- Use the SDC shipped Cygwin for executing the setup_logstash script to avoid the failure.
- A new command prompt is opened while executing the script, do not close the window. You must stop the Logstash process using `CTRL+C` from this window.

Follow these steps:

1. Open a bash shell and execute the following script from the `SDC_Installation_Directory/bin` folder:

```
./setup_logstash <Influx DB IP Address> <SDC IP Address>
```

NOTE
For example, `/c/Program Files/CA/SDMConnector/bin > ./setup_logstash.sh 10.175.90.201 10.175.90.200`

Once the script execution is done, Logstash logs (`logstash-plain.log`) can be found at `\Logmonitor \logstash\Logs\` directory. The SDC service is restarted as part of this execution. The script updates the `TrapX.config` file to forward the traps to Logstash.

NOTE
Port 9162 is used for Logstash. If the port is used by another process, change it.

2. (Optional) Change the Logstash port in the `logmon.conf` file in the `SDC_Installation_directory/bin` folder if the default port is used by another process.

Enable SSL for TrapInsight

When the Influx database is running with SSL enabled, you must enable SSL for TrapInsight.

Follow these steps:

1. Open the `logmon.conf` from `SDC_Installation_directory/bin` folder.
2. Set the value of the parameter `ssl` to `true`
   By default, SSL is set to false.

TrapInsight Dictionary

Trap Insight Dictionary is used to map the trap OID to the corresponding name. The dictionary is created using the Mibtools database and shipped with Logstash deployment.

Update the MIB Name Mapping

After you import any new MIB, to view the newly added trap OID to its corresponding name in the TrapInsight dashboard update the TrapNameList.yaml file.

Follow these steps:

1. In SpectroSERVER, run the `fetch_trap_info.sh` command from `$SPECROOT/mysql/bin` folder.
   The script generates the `TrapNameList.yaml` file at `MYSQL_DIR/data/mibtools` directory.
2. Copy the `TrapNameList.yaml` file to `\Logmonitor\logstash\bin` directory in the SDC Trapx machine to update the new mib name mapping.

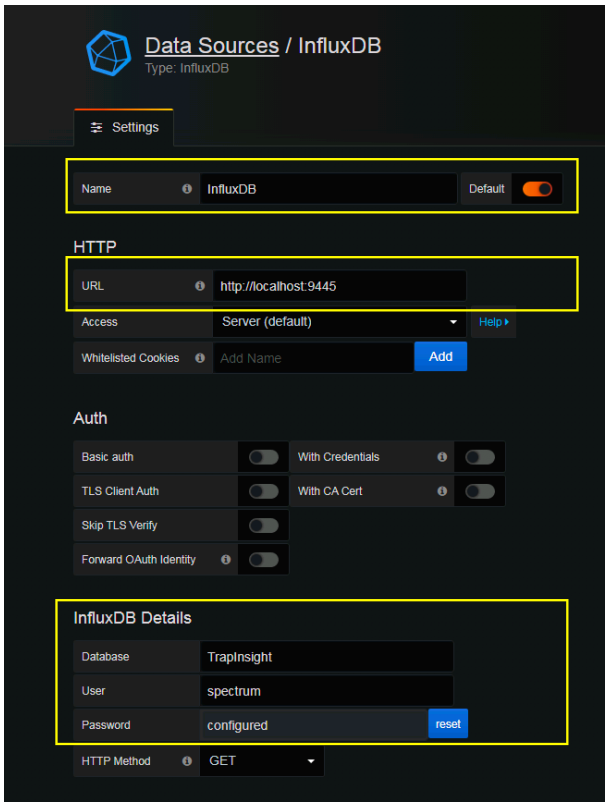
Install and Import Dashboard in Grafana

This section describes the procedure to install and import the Influx dashboard into Grafana.

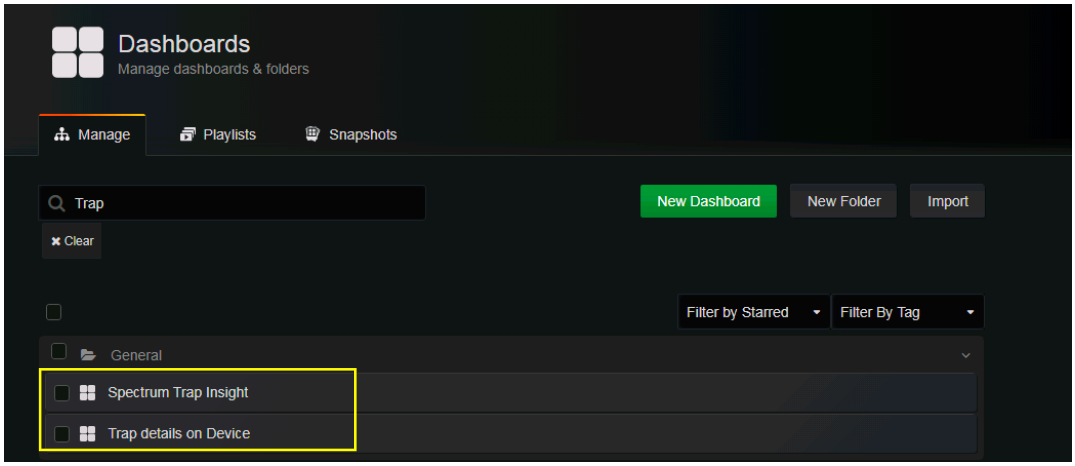
NOTE
If Grafana is not available in your pod/machine, install it.

Follow these steps:

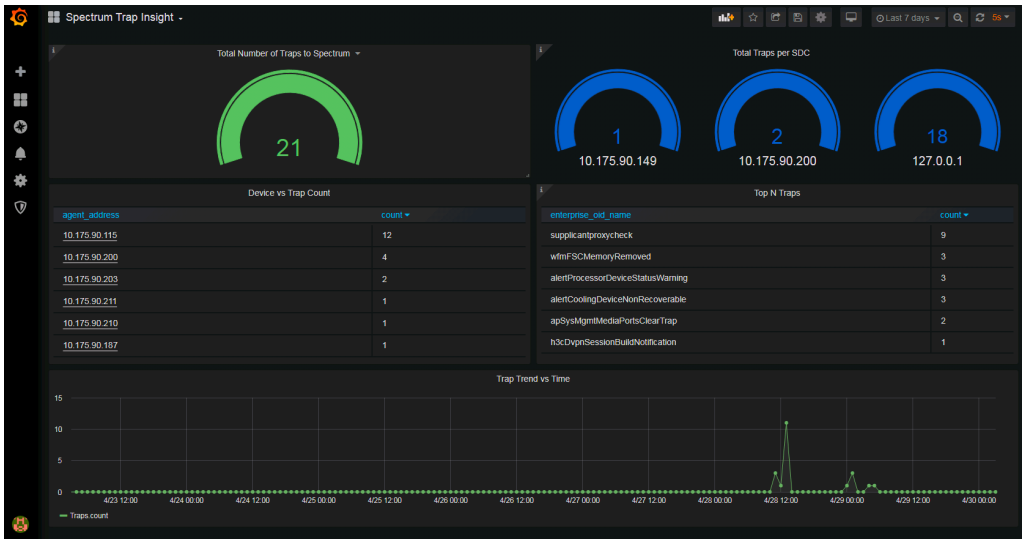
1. Log in to the Grafana portal.
   Default Credentials: admin/admin
2. Add the Influx database data source name as "InfluxDB" (URI : http://<oneClickServername>:9445, username: spectrum /password).



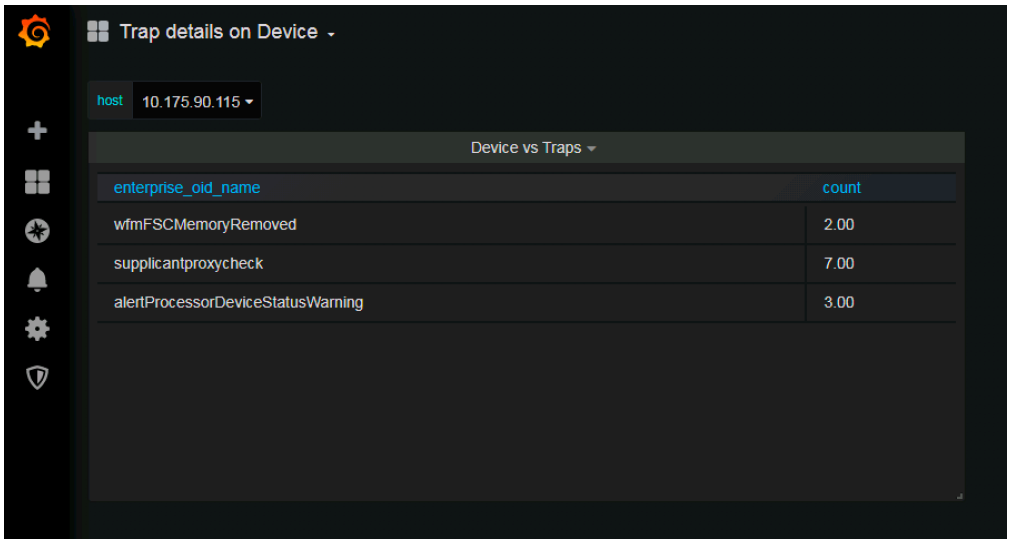
3. Create a dashboard folder with the name Spectrum Trap Insight.
4. Import the following files from the `$SPECROOT/insideView/dashboard` directory into Grafana and place under the Spectrum Trap Insight directory.
   - Spectrum_Trap_Insight.json
   - Trap_details_on_Device.json
   - Spectrum_TrapInsight_Ledger_View.json



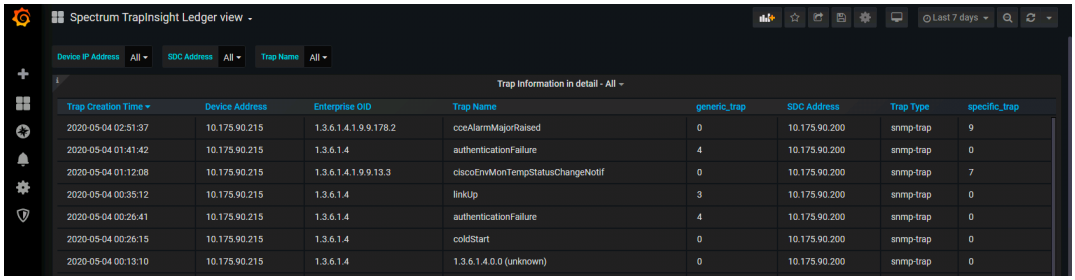
5. You can open the individual dashboard to see the following views:
   Spectrum Trap Insight



Trap Insight Details on Device



Spectrum TrapInsight Ledger View



Stop the Logstash

You must stop the Logstash before the SDC upgrade or changing the Influx server. Stopping Logstash stops sending the trap information to Influx.

Follow these steps:

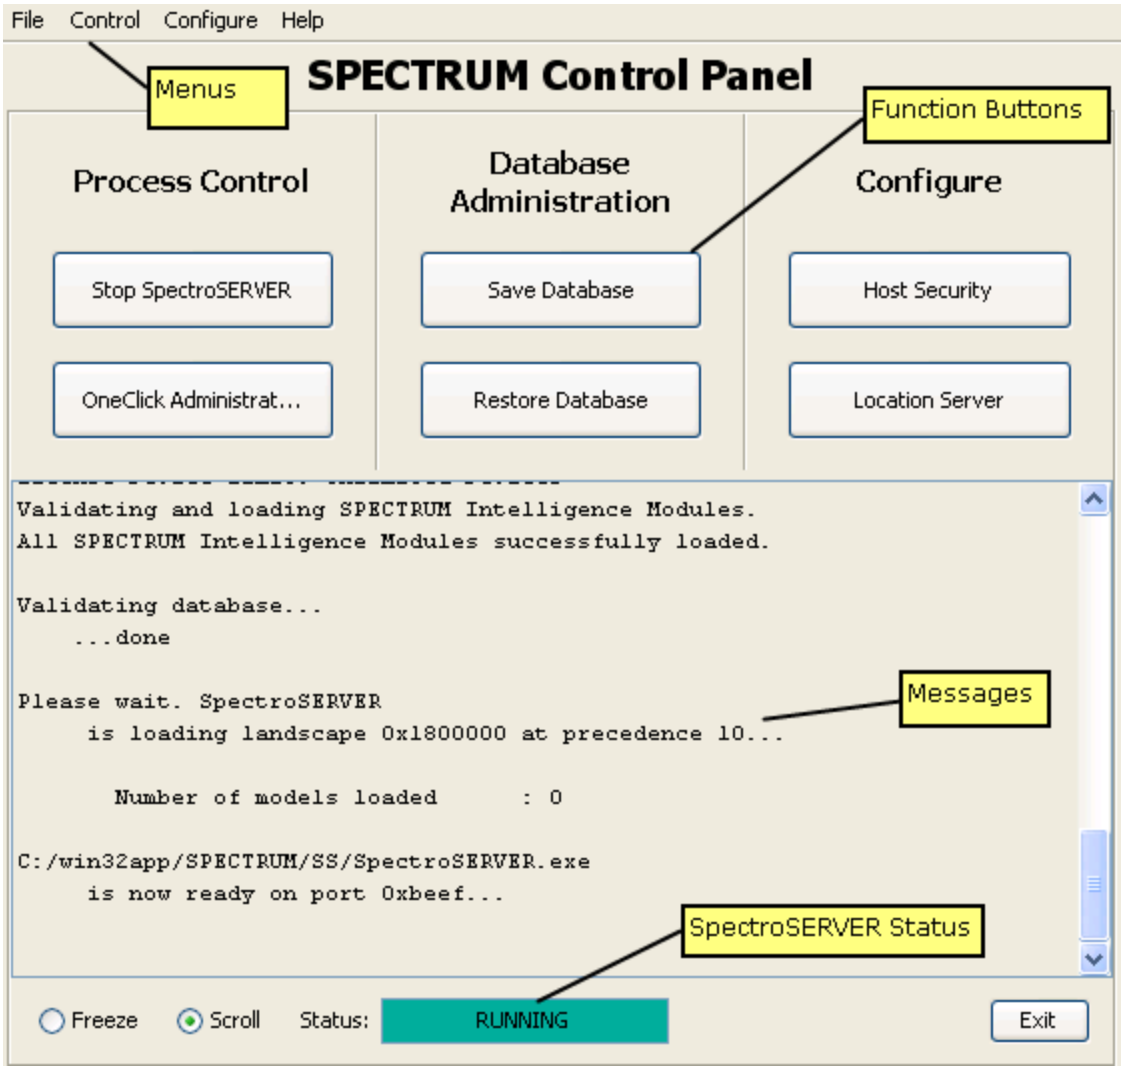
- **On Linux:** Run the `stoplogstash.sh` script in `SDC_Installation_directory/bin` folder.
- **On Windows:** Click on the window opened by Logstash, type CTRL+C, and press Enter.

OneClick Administration

This section explains how administrators can configure the important components like the Spectrum Control panel, SpectroSERVER, OneClick, and other important functionalities of DX NetOps Spectrum.

DX NetOps Spectrum Control Panel Overview

The Spectrum Control Panel lets you configure resources, start and stop the SpectroSERVER, perform database administration, and maintain the DX NetOps Spectrum installation. It provides menus, function buttons, messages, and a status bar.



Access the DX NetOps Spectrum Control Panel

To access the Spectrum Control Panel on the SpectroSERVER host, you can take the following steps:

- **Windows:** Click Start, Programs, CA, Spectrum Control Panel.
- **Linux:** Run the SCP command located in *$SPECROOT*/bin/

You must be logged in as the install user or as someone in the install user's group to launch applications using the Spectrum Control Panel.

File Menu

The File menu provides the following functionality:

- **Select Host Machine**
  Lets you select the SpectroSERVER that you want to manage.
- **Save Database**
  Lets you create an online backup or perform a complete save of the SpectroSERVER database.
  - **Online Backup**
    If the SpectroSERVER is running, selecting Save Database initiates a DX NetOps Spectrum online backup.
  - **Save**
    If the SpectroSERVER is not running, selecting Save Database initiates a complete save of the SpectroSERVER database using SSdbsave (with the -c and -m switches).

    NOTE
    For more information, see the Database Management section.
- **Restore Database**
  Lets you load a previously saved database.
- **Initialize to Legacy Database**
  Initializes your database to the state that existed following your last installation. All models that are specific to your network are removed. The remaining database structure consists of the modeling catalog and a few internal models.

  WARNING
  Do not use this feature without first making a backup copy of your database.

Control Menu

The Control menu provides the following functionality:

- **Start/Stop SpectroSERVER**
  Controls the operation of the SpectroSERVER.
- **Auto Start/Stop Archive Manager**
  Lets you configure the Archive Manager to start or stop with the SpectroSERVER on the workstation you are managing.
- **Start/Stop Archive Manager**
  Starts or stops the Archive Manager.

  NOTE
  The Archive Manager control buttons will be disabled when any other running process has locked the database.

  WARNING
  Do not attempt to change the state of the Archive Manager when you are running an online backup.
- **OneClick Administration**
  Prompts for the host and port of the OneClick web server and opens a browser to the OneClick Administration Pages.

  NOTE
  To determine the browser location on Windows, DX NetOps Spectrum opens the default web browser for the current user. To determine the browser location on UNIX and Linux, DX NetOps Spectrum uses

the PATH variable to first locate Firefox, Mozilla, and then Netscape. To specify a browser, set the SPECTRUM_BROWSER environment variable. For more information, see the Set SPECTRUM_BROWSER Variable section.

- **SpectroSERVER Performance**
  Opens the Performance View application. For more information about Performance View, see the SpectroSERVER Performance Administration section.
- **Users**
  Lets you view user details, set a new password for an existing user, and create an administrative super user account.

Configure Menu

From the Configure menu you can open the Model Type Editor, and you can open dialogs that let you configure the SpectroSERVER, the location server, and host security.

SpectroSERVER Configuration Dialog

The SpectroSERVER Configuration dialog lets you control certain aspects of the SpectroSERVER configuration. When you make changes in this dialog, you are editing the .vnmrc resource file, which controls SpectroSERVER operation and performance.

NOTE
See the Distributed SpectroSERVER Administration section for more information about the .vnmrc file.

- Communications
  - **Communications Port**
    Specifies a TCP port number indicating the port through which the client's user interface communicates with the SpectroSERVER. This parameter can be any valid, unreserved TCP port greater than the port number assigned to the IPPoPORT_USERRESERVED and less than 64,000.
    Default: 0xBEEF
  - **SNMP Comm. Port**
    Specifies a value that can be used to select a port from which SNMP requests can be sent via the SpectroSERVER. It can be set to any unsigned 16-bit integer in the range 0x400 (1,024) to 0xFFFF (65,535). Some implementations of SNMP agents treat the port as a signed number. In these cases, this resource must be set to a value between 0x400 (1,024) to 0x7FFF (32,768).
- **File Paths**
  The SpectroSERVER Configuration dialog provides access to the file paths that are defined within the .vnmrc file.
  - **VNM File Path**
    Specifies the root subdirectory which contains SpectroSERVER external files such as specific device alert mapping.
- **Performance Tuning**
  SpectroSERVER is a multi-threaded process. During normal operation, each subsystem allocates numerous work threads. Each thread consumes memory and computing capacity. As a result, they can affect performance. Max Number of Poll Threads and Work Thread Age are two of the parameters that control the allocation of work threads.

  NOTE
  To better understand the interaction between resources and the parameters that control work threads, see Deployment Capacity and Optimization Best Practices.
- **Event Log**
  Under normal conditions, events are recorded in the DX NetOps Spectrum Distributed Data Manager (DDM) database. However, if communication between the SpectroSERVER and the Archive Manager is lost, event information is stored temporarily in the SpectroSERVER database until communication is re-established.

The growth of this temporary event data in the SpectroSERVER database is regulated by entries in the SpectroSERVER .vnmrc resource file. Use the Event Log fields to edit these settings.

- **Max Event Recs to Save**
  Maximum number of records that can be stored in the database.
  Default: 20,000
- **Event Record Increment**
  Specifies the number of records to be deleted from the database when the number of records exceeds the Max Event Recs to Save value.
  Default: 100
  Note: If you remove the event_record_increment entry from the .vnmrc file, the default is 250 records.

- **Statistics Log**
  Under normal conditions, statistics are recorded in the DX NetOps Spectrum Distributed Data Manager (DDM) database. If communication between the SpectroSERVER and the Archive Manager is lost, however, statistics information is stored temporarily in the SpectroSERVER database until communication is re-established.
  The growth of this temporary statistics data in the SpectroSERVER database is controlled by entries in the SpectroSERVER .vnmrc resource file. Use the Statistics Log fields to edit these settings.
  - **Max Statistics Recs to Save**
    Specifies the maximum number of records that can be stored in the database.
    Default: 5,000
  - **Statistics Record Increment**
    Specifies the number of records to be deleted from the Statistics Log database when the number of records exceeds the Max Statistics Recs to Save value.
    Default: 500

Location Server Configuration Dialog

The DX NetOps Spectrum *Location Server* is used to locate other DX NetOps Spectrum services on the network. The Location Server Configuration dialog lets you define the location server characteristics and your client applications.

> **NOTE**
> For more information about location servers, see the Distributed SpectroSERVER Administration section.

The Location Server Settings section of the Location Server Configuration dialog contains the following settings:

- **Main LS Host**
  Specifies the Main Location Server (MLS) hostname. This host workstation determines which connection services are available on the network. Other Location Servers connect to the MLS to determine the location and availability of services.
- **Main LS Port**
  Specifies the Main Location Server port address.
  Default: 0xdaff
- **Backup Main LS Host**
  Specifies the backup MLS name. If the MLS is not available when another host attempts to connect to it, the host is redirected to the backup MLS.
  When a DX NetOps Spectrum system starts up (or the Process Daemon, processd, is stopped and started), the location server on that system attempts to connect to the MLS to download “map” information. Map information is a listing of each DX NetOps Spectrum service that is available and the location of each server. If the MLS is down at that time, the map information is not available to the DX NetOps Spectrum system. Therefore, clients cannot connect to any DX NetOps Spectrum service.
  The role of the backup Main Location Server is to provide redundancy for the MLS in this scenario. If a backup MLS has been configured, the Location Server attempts to contact it after contact to the MLS has failed. Clients can then access DX NetOps Spectrum services even though the MLS is down.
  Use highly available systems for both the backup MLS system and the Main Location Server.

Each system that is pointing to the same MLS should also point to the same backup main location server.

- **Backup Main LS Port**
  Specifies the backup MLS port address.
- **Max Connections**
  Specifies the maximum number of port connections that can be made to this location server.
  Default: 750

The Client Applications section of the Location Server Configuration dialog contains the following settings:

- **Hostname**
  Specifies the client application main location server hostname. It preserves landscape map integrity for different environments.
- **Port**
  Specifies the client application Main Location Server port.

Host Security Dialog

The Host Security dialog lets you enter a list of servers and users allowed to connect to the host. You can also do this by editing the .hostrc file in the DX NetOps Spectrum directory.

> **NOTE**
> For more information about the .hostrc file, see the Distributed SpectroSERVER Administration section.

Model Type Editor Option

The Model Type Editor option in the Configure menu starts the Model Type Editor application. The Model Type Editor lets you modify the SpectroSERVER modeling catalog and configure relations, object-classes, and their contents. This option is not available unless the SpectroSERVER is in an INACTIVE or STOPPED state.

> **NOTE**
> To learn more about the operation of the Model Type Editor, see the Model Type Editor section.

SpectroSERVER Status

The Status field in the Spectrum Control Panel indicates the status of the SpectroSERVER with text and color.

- **Starting: yellow**
  This field changes to Running (green) after the start-up period expires.
- **Stopping: yellow**
  This field changes to Inactive (blue) after the server has shut down.
- **Running: green**
  This field indicates a normal running state.
- **Terminated: red**
  This condition is abnormal and indicates an error.
- **Inactive: blue**
  This field indicates that server shutdown is complete.

Restore a Database

You can load a previously-saved database using either the File menu or by clicking **Restore Database**.

Follow these steps:

1. In the Spectrum Control Panel, click **Restore Database**.
   A dialog asks whether you want to initialize your database.

2. Click **No** to perform a models-only load.
   The Restore Database dialog opens.
3. Locate and select the appropriate previously-saved database backup.
4. Click **Open**.
5. Click **OK**.
   The database load begins. If SpectroSERVER is running, SpectroSERVER restarts after the database loads.

Initialize to Legacy Database

Initialize to Legacy Database initializes your SpectroSERVER database to its state following your last installation. All models specific to your network are removed. The remaining database structure consists of the modeling catalog and a few internal models.

> **WARNING**
> Do not use this feature without first backing up the database.

Follow these steps:

1. Select File, Initialize to Legacy Database.
   An information dialog displays a warning.
2. Click Yes to continue. Or click Cancel to retain your existing database.
   If the SpectroSERVER is running when you start to initialize your database, a second dialog indicates that the SpectroSERVER is shut down during this process.
3. Click Yes.
   The initialization starts.
4. Restart your OneClick web server and restart any open OneClick Consoles.

> **NOTE**
> This action refreshes the OneClick explorer hierarchy and topology view.The SpectroSERVER database is initialized.

Configure Host Security

The Host Security window lets you enter a list of servers and users allowed to connect to the host.

> **NOTE**
> You can also control access to the host by editing the .hostrc file in the DX NetOps Spectrum directory. For more information, see the Distributed SpectroSERVER Administration section.

- To add a server/user to the list, enter the name in the appropriate box and click Add.
- To delete an item from either the Server List or the User List, select the server or user and click Remove.
- To let all hosts and users have access to the host server, enter a plus sign in Server List Add box and click Add.
- To let only the server where you are logged in to connect to the server, enter a minus sign in the Server List Add box and click Add. The minus sign becomes the name of your computer when is is added to the Server list.

> **NOTE**
>
> To save the host security configuration, at least one entry in the Server List is required.

OneClick Web Server Administration

This section discusses tasks that OneClick administrators can perform to configure and optimize the OneClick web server. It also covers server-related and client-related configuration and maintenance issues.

Start and Stop the OneClick Web Server from the Command Line

You can start or stop the OneClick web server from a command prompt.

On Linux, log in as root. Use the following commands:

- To start the web server:
  ```
  <$SPECROOT>/tomcat/bin/startTomcat.sh
  ```
- To stop the web server:
  ```
  <$SPECROOT>/tomcat/bin/stopTomcat.sh
  ```
- To restart (stop, then start) the web server:
  ```
  <$SPECROOT>/tomcat/webapps/spectrum/restart.sh
  ```

To start or stop the OneClick web server on Windows, enter the following commands at a command prompt:

- To start the web server:
  ```
  C:\> net start spectrumtomcat
  ```
- To stop the web server:
  ```
  C:\> net stop spectrumtomcat
  ```

Start and Stop the OneClick Web Server from an Administration Page

Several of the OneClick Administration Pages include Restart OneClick Server buttons. You can easily restart the OneClick web server to apply a configuration change. These restart buttons use the ‘at’ utility to schedule a restart script to run. You can configure this utility for different platforms.

> **NOTE**
> Confirm that the ‘at’ command utility is installed and it has the necessary server permissions. If the ‘at’ command is not available or it fails to execute, restart or config the tomcat manually using the restart.sh or configtomcat.sh script.

If an error occurs while restarting the OneClick web server, you see an error message on the administration page. In this event, use the troubleshooting tips in one of the following sections to identify the problem. Or restart the web server from the command line.

Troubleshooting the at utility on Windows

By default, DX NetOps Spectrum users have permissions to execute ‘at’ on Windows. However, verify that the current user and the current user group have Read and Execute permissions on the C:\WINDOWS\system32 folder.

Check the status of the ‘at’ operation by typing ‘at’ in a command prompt shell to view the ‘at’ queue. The queue contains all jobs that are scheduled through ‘at’ that are still pending. If earlier attempts on these scheduled jobs have failed, the jobs also have an error status code.

Troubleshooting the at utility on Linux

Users who are listed in the following file are denied permission to use the ‘at' utility:

- (Linux) /etc/at.deny

Verify that the user currently running the OneClick process (the OneClick web server) is not listed in this file. Typically, this user is the DX NetOps Spectrum Installation Owner user. You can identify the user by entering the following command in a command shell:

```
ps -eaf | grep OneClick
```

If the ‘mail’ utility is set up for the operating system and the current OneClick user, ‘at’ automatically emails notifications about scheduled jobs and their output or error messages. Check these email notifications for pertinent information.

Start and Stop the OneClick Web Server from the Windows Control Panel

You can start and stop the OneClick web server from the Windows Control Panel.

Follow these steps:

1. Click Start, Control Panel.
   The Control Panel opens.
2. Double-click Administrative Tools.
   The Administrative Tools window opens.
3. Double-click Services.
   The Services window opens.
4. Select SpectrumTomcat from the services list and determine its status.
5. Do *one* of the following:
   – If the SpectrumTomcat service is running, click Stop to stop the web server.
   Or click Restart to stop and then start the web server.
   – If the SpectrumTomcat service is stopped, click Start to start the web server.

Configure the OneClick Server to Support Over 100 Users

To support a large number of users on a single OneClick server, increase the hard limit on the number of file descriptors. We recommend this step to ensure support for more than 100 OneClick Console users. The /etc/system file sets the limit of file descriptors.

Follow these steps:

1. Make a backup of your /etc/system file.
2. Add the following line to your /etc/system file:

```
set rlim_fd_max=4096
```

Launch OneClick Clients with Context

You can launch OneClick clients within the context of a topology or model. Pass contextual parameters and values with the URL that launches OneClick. You can launch the **OneClick WebApp** in-context to open the supported operations.

> **NOTE**
> To launch OneClick WebApp in-context, always launch a new WebApp instance.

The **thick client** URL can include parameters in the following format:

```
http://<hostname>/spectrum/oneclick.jnlp?<parameter>=<value>
```

The **WebApp** URL can include parameters in the following format:

```
http://<hostname>:<port>/spectrum/webapp?<parameter>=<value>
```

Possible parameters include the following:

topology Parameter

The value of the topology parameter can be a model handle or an IP address. For Global Collection, the topology parameter is Unique Key. Using this parameter in a URL launches an OneClick client or reuses an existing one, selects the Explorer tab if not already selected, expands the tree to show the model, selects the Topology tab if not already selected, and selects in the Topology panel the model specified by the topology parameter in the URL.

Examples:

```
http://<hostname>/spectrum/oneclick.jnlp?topology=0x3780003d
http://<hostname>/spectrum/oneclick.jnlp?topology=10.253.9.7
http://<hostname>:<port>/spectrum/webapp?topology=0x3780003d
http://<hostname>:<port>/spectrum/webapp?topology=10.253.9.7
```

For a Global Collection:

```
http://<hostname>/spectrum/oneclick.jnlp?topology=5416910d-01b7-1000-1f81-8a2a56270000
http://<hostname>:<port>/spectrum/webapp?topology=5416910d-01b7-1000-1f81-8a2a56270000
```

explorer Parameter

The value of the explorer parameter can be a model handle or an IP address. For Global Collection, the explorer parameter is Unique Key. Using this parameter in a URL launches a OneClick client or reuses an existing one, selects the Explorer tab if not already selected, and expands the tree to show the model. The currently selected tab in the Contents panel will reflect the new model.

Examples:

```
http://<hostname>/spectrum/oneclick.jnlp?explorer=0x3780003d
http://<hostname>/spectrum/oneclick.jnlp?explorer=10.253.9.7
http://<hostname>:<port>/spectrum/webapp?explorer=0x3780003d
http://<hostname>:<port>/spectrum/webapp?explorer=10.253.9.7
```

For a Global Collection:

```
http://<hostname>/spectrum/oneclick.jnlp?explorer=5416910d-01b7-1000-1f81-8a2a56270000
http://<hostname>:<port>/spectrum/webapp?explorer=5416910d-01b7-1000-1f81-8a2a56270000
```

alarm Parameter

The value of the alarm parameter can be either the integer alarm ID (to facilitate integration with legacy applications), the complete global alarm ID (in the form 3f983d3d-2045-1000-012b-000bdb5a1c31), or <*model handle*>@<*alarm ID*>. Using this parameter in a URL launches a OneClick client or reuses an existing one, selects the Explorer tab if not already selected, expands the tree to show the model, selects the Alarms tab if not already selected, and selects the alarm.

Examples:

```
http://<hostname>/spectrum/oneclick.jnlp?alarm=0x3780003d@7710
http://<hostname>:<port>/spectrum/webapp?alarm=0x3780003d@7710
```

where 0x3780003d@7710 is <*modelhandle*>@<*alarm ID*> and

```
http://<hostname>/spectrum/oneclick.jnlp?alarm=7710
http://<hostname>:<port>/spectrum/webapp?alarm=0x3780003d@7710
```

where 7710 is the integer <*alarm ID*>.

If you pass the integer alarm ID, pass the model handle also. The integer alarm ID is not guaranteed to be unique across SpectroSERVERs. The full global alarm ID is preferable as it is unique across SpectroSERVERs, but it may not be available to the application launching OneClick.

> **NOTE**
> When launching in context, a new instance of OneClick is not launched if an instance is already running on the host. The context is changed in the current instance of OneClick.

Configure OneClick Client Memory Settings

The default initial memory footprint for OneClick clients is 96 MB, with a maximum of 1024 MB. The initial memory setting lets the Java Virtual Machine (JVM) preallocate memory for potentially faster startup. The maximum setting lets the JVM memory grow into a limited space, to accommodate application use that requires additional memory. For example, large views, searches, and other actions can require more memory.

If clients experience out-of-memory errors, you can increase the maximum memory setting.

If you change the client memory settings, keep in mind that the settings apply to all OneClick clients. Therefore, take into account any client computers that lack sufficient resources. Use a modest adjustment, such as a 25% increase in the maximum memory allocation, to 640 MB. The steps in this procedure are an *optional* method for addressing out-of-memory issues.

> **WARNING**
> Setting either one of these memory values too high can cause the OneClick clients to fail to launch.

To configure OneClick client memory settings:

1. Click Administration in the OneClick home page.
2. The Administration Pages open.
3. Click OneClick Client Configuration in the left panel.
   The OneClick Client Configuration page opens.
4. Complete the fields in the Java Memory Usage section.
5. Click Save.

To change the Web Server memory:

1. Click on the Administration tab on the OneClick home page.
2. Click on the web server memory in the left panel
3. Enter the memory (MB) the server can use.
4. Select the Save and Reconfigure button to save the memory setting.

> **NOTE**
>
> Increasing the Web Server Memory depends on the OneClick Server physical memory(RAM) availability.

Configure the OneClick Web Server URL

The Using OneClick section describes the OneClick home page as a central place where users can launch the OneClick client. By default, all OneClick users must use the following URL to access the OneClick home page:

```
http://<<oc> web server>/spectrum
```

Also by default, the URL http://<OneClick web server> launches a Tomcat web server configuration page. You can configure the OneClick web server to automatically redirect from http://<*OneClick web server*> to http://<*OneClickweb server*>/spectrum.

Follow these steps:

1. Navigate to the <$*SPECROOT*>\tomcat\webapps\ROOT directory.
2. Create a file named index.html using your preferred text editor.
3. Edit the index.html file to contain the following text:

```
<html>
 <head>
  <meta http-equiv="refresh" content="0;url=/spectrum">
 </head>
```

```
  <body>
  </body>
</html>
```

4. Save the index.html file in the ROOT directory referenced in Step 1.
   All OneClick users navigating to http://<*OneClick web server*> are now redirected automatically to http://<*OneClick web server*>/spectrum.

Configure OneClick MySQL Server Passwords

You can change the passwords for both the default OneClick MySQL user (OC_user) and the administrative OneClick MySQL user (OC_admin). Change passwords on the MySQL Password Administration page.

> **WARNING**
> Do not attempt to manually change the MySQL user passwords using a MySQL client connection. Storage of the passwords in OneClick depends on MySQL connectivity. As a result, the only safe way to change the passwords is through the OneClick MySQL Password Administration page.

Follow these steps:

1. Click Administration in the OneClick home page.
   The Administration Pages open.
2. Click MySQL Password in the left panel.
   The Change MySQL Password page opens.
3. Enter the current password and the new password for the user whose credentials you want to modify.
4. Confirm the new password.
5. Click Change Password.
   The password changes immediately. Restarting MySQL or Tomcat is not required.

OneClick Server Communications and Network Configuration

This section discusses OneClick server communications and network configuration.

Name Resolution Requirements

For the OneClick web server system to communicate with a SpectroSERVER, the OneClick web server system must be able to resolve the non-fully-qualified hostname of the SpectroSERVER to an IP that can be used to reach the SpectroSERVER.

We recommend using hosts files for the name resolution of SpectroSERVER hostnames. This practice makes it less likely that name resolution is impacted by a network failure.

Configure OneClick for Secure Sockets Layer

OneClick supports the Secure Sockets Layer (SSL) protocol to encrypt communications between the OneClick web server and OneClick clients. OneClick clients can access information securely across unsecured networks, such as the Internet. In addition to encryption, SSL uses certificates for authentication. Authentication protects users from downloading and running applications from suspicious or "untrusted" sources.

Both Certificate Authority-signed certificates and self-signed certificates provide secure connections using SSL encryption. However, certificates signed by a Certificate Authority provide an additional level of security. These certificates verify the creator of the certificate and certify that the product is truly from that vendor. Certificates that are signed by a Certificate

Authority protect servers by making it difficult to impersonate a trusted entity (the certified vendor). However, self-signed certificates are appropriate if you require the encryption that an SSL certificate provides without requiring proof of the certificate source.

NOTE

After upgrading to DX NetOps Spectrum 10.3, when you configure OneClick for SSL, you will see a warning message to migrate JKS to PKCS12 format. Please ignore this warning and do not migrate to PKCS12 format.

NOTE

The tomcat bundled with DX NetOps Spectrum 10.3, requires at least one trusted cert in a keystore, for it to work.

Follow these steps:

1. On the OneClick web server host, change to the *$SPECROOT*/Java/bin directory.
2. Generate a private self-signed certificate in the custom cacerts file by issuing the following command:

   ```
   ./keytool -genkey -alias tomcatssl -keyalg RSA
   -keystore c:/win32app/Spectrum/custom/keystore/cacerts
   ```

   The keytool prompts with a series of questions and uses the values that you specify to perform the following actions:
   - Create an issuer name for your organization (This name is an X.500 Distinguished Name that is intended to be unique across the Internet. For more information, see the keytool utility at http://java.sun.com).
   - Generate the self-signed certificate using the issuer name.

     NOTE

     In case the keystore is not saved to $SPECROOT/custom/keystore, it is overwritten during an upgrade.
3. Enter your answers to the following questions:

   ```
   Enter keystore password:
   ```

   If you change the default password for the Tomcat web server, specify the custom password in the *$SPECROOT*/tomcat/conf/server.xml configuration file.

   ```
   What is your first and last name?
   ```

   Enter the common name (with the fully qualified domain name) of your website. For example, www.ca.com.

   ```
   What is the name of your organizational unit?
   ```

   Enter a small organization name, such as the name of a division, business unit, or department. For example, Purchasing.

   ```
   What is the name of your organization?
   ```

   Enter a large organization name, such as ABCSystems, Inc.

   ```
   What is the name of your City or Locality?
   ```

   Enter your city name, such as Hyderabad.

   ```
   What is the name of your State or Province?
   ```

   Enter the full name, such as Andhra Pradesh.

   ```
   What is the two-letter country code for this unit?
   ```

   Enter the two-letter country code. For example, IN.

   ```
   Is CN=www.ca.com, OU=Purchasing, O="ABCSystems, Inc.", L=Hyderabad, ST=Andrapradesh, C=IN correct?
   ```

   Enter Yes.

   ```
   Enter key password for <tomcatssl> (RETURN if same as keystore password):
   ```

   Enter key password for <tomcatssl>. Press Enter to use the same password as the keystore password.

   WARNING

   After adding the tomcatssl key, ensure you take a backup of the $SPECROOT/custom/keystore/cacerts file, in case the keystore gets corrupted.

4. (Optional) If you require a certificate that is signed by a Certificate Authority, request the certificate from the Certificate Authority and then import it.

   NOTE
   Before proceeding with this step (Step 4), as a best practice, skip to Step 5 and set up SSL. You can then test to determine whether the information that you provided in the previous step was correct. If HTTPS works, you can continue with this step.

   As part of certificate configuration, generate a Certificate Signing Request (CSR) file from the system that runs the secure OneClick web server. The Java Development Kit (JDK) that is included with OneClick provides a keytool utility that you can use to generate the CSR file. Use the information that you provided in the previous step. Use the same alias name as tomcatssl.
5. Request and import the Certificate Authority-signed certificate as follows:
6. On the OneClick web server host, change to the *$SPECROOT*/Java/bin directory.
   a. Generate the CSR file by entering the following command:

      ```
      ./keytool -certreq -alias tomcatssl
      -keystore $SPECROOT/custom/keystore/cacerts -file filename.csr
      ```

      NOTE
      You are prompted for a password. Use the same password that you provided earlier.The contents of the .csr file that is generated are used to request the secure certificate from the Certificate Authority (the next step).

      Request a secure certificate from a Certificate Authority. Verify the following examples:

      VeriSign: http://www.verisign.com

      TrustCenter: http://www.trustcenter.de

      thawte: http://www.thawte.com

      Instructions are available at these websites.

      Import the Certificate Authority-signed certificate into the keystore that is used by the OneClick web server. For more information, see Import a Certificate Authority-Signed Certificate.
7. Configure the secure socket on the server that hosts the OneClick web server. For more information, see Configure the Secure Socket on the OneClick Web Server Host.
8. If you are running Report Manager, configure OneClick to be launched from Report Manager using SSL. For more information, see Configure OneClick and Report Manager for Secure Sockets Layer.

Import a Certificate Authority-Signed Certificate

If you have obtained a Certificate Authority-signed SSL certificate, import it into the keystore that the OneClick web server uses.

A chain (root) certificate from the Certificate Authority must also exist in the keystore. By default, OneClick includes chain certificates from many popular vendors. Click List on the SSL Certificates administration page to view the aliases for these certificates. This information helps you determine whether to obtain one and import it.

Follow these steps:

1. If necessary, download a chain (root) certificate from the Certificate Authority from which you obtained the signed certificate.
2. If you downloaded a chain certificate in the previous step, import it into the keystore used by the OneClick web server:
   a. On the OneClick web server host, change to the *$SPECROOT*/Java/bin directory.
   b. Enter the following command:

      ```
      ./keytool -import -alias root -keystore $SPECROOT/custom/keystore/cacerts -trustcacerts -file
       root_chain_certificate_filename
      ```

NOTE
You are prompted for a password for the Tomcat web server. The alias name does not have to be 'root'. You can supply a more descriptive name for the type of root certificate that you are importing. The alias name cannot already exist.

3. Import the Certificate Authority-signed SSL certificate into the keystore used by the OneClick web server:
   a. If necessary, on the OneClick web server host, change to the *$SPECROOT*/Java/bin directory.
   b. Enter the following command:

```
./keytool -import -alias tomcatssl -keystore $SPECROOT/custom/keystore/cacerts -trustcacerts -file
 your_certificate_filename
```

NOTE
You are prompted for a password for the Tomcat web server. Use the same alias that you used when you generated the private self-signed certificate. See Name Resolution Requirements for more information.

NOTE

keytool can import X.509 v1, v2, and v3 certificates, and PKCS#7 formatted certificate chains consisting of certificates of that type. Please verify that the certificate from CA is of this type.

(Optional) Log in Using Non-Fully Qualified Domain Name

SSL security forces you to use the fully qualified domain name of your OneClick server for login. For example: `https://oneclick.ca.com/spectrum` . To log into the non-fully qualified domain name (for example: `https://oneclick/spectrum`), or a DNS entry that is different than the local OneClick server name, use a SAN (Subject Alternate Name) with the -ext option:

```
./keytool -genkey -alias tomcatssl -keyalg RSA -keysize 2048 -ext SAN=dns:oneclick -
keystore c:/win32app/Spectrum/custom/keystore/cacerts
```

Modify JVM Arguments when SSL is Enabled

Perform the procedure described in the Post Upgrade Tasks section on the OneClick WebApppage, in case you enabled SSL in OneClick or changed the OneClick ports after you upgraded to DX NetOps Spectrum 10.4 or higher.

NOTE
To disable the non-HTTPS connector port, see the KB Article: Block access to HTTP on port 80 (Windows) or port 8080 (Linux) in Spectrum OneClick.

Configure the Secure Socket on the OneClick Web Server Host

Configure the secure socket on the server that hosts the OneClick web server. Consider this task as the final step in configuring the OneClick web server for SSL.

NOTE
DX NetOps Spectrum supports the use of SSL v3.

Follow these steps:

1. Shut down the OneClick web server.
2. Open $SPECROOT/tomcat/conf/server.xml in your preferred text editor.
3. Locate the following section in the server.xml file:

```
<!-- Define a SSL Coyote HTTP/1.1 Connector on port 8443 -->
<!--
 <Connector
  port="8443"
  enableLookups="true" disableUploadTimeout="true" tcpNoDelay="true"
```

```
acceptCount="100" scheme="https" secure="true" SSLEnabled="true"
clientAuth="false" sslProtocol="TLS"
sslEnabledProtocols="TLSv1.2"
ciphers="TLS_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256,
  TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384,
  TLS_ECDHE_ECDSA_WITH_AES_128_CBC_SHA,
  TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA,
  TLS_ECDHE_ECDSA_WITH_AES_128_CBC_SHA256,
  TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA384,
  TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256,
  TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384,
  TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA,
  TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA,
  TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA256,
  TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA384,
  TLS_DHE_RSA_WITH_AES_128_GCM_SHA256,
  TLS_DHE_RSA_WITH_AES_256_GCM_SHA384,
  TLS_DHE_RSA_WITH_AES_128_CBC_SHA,
  TLS_DHE_RSA_WITH_AES_256_CBC_SHA,
  TLS_DHE_RSA_WITH_AES_128_CBC_SHA256,
  TLS_DHE_RSA_WITH_AES_256_CBC_SHA256"
keystoreFile="custom/keystore/cacerts"
keystorePass="changeit">

</Connector>
-->
```

By default the <Connector> element in the section is commented out.

> **NOTE**
> The preceding XML fragment is Windows-specific, with 443 as the default port where the OneClick web server listens for SSL communications. End users can omit the port from the URL for accessing the OneClick home page:

```
https://<fully_qualified_host_name>/spectrum
```

On a UNIX-based installation, the OneClick web server is not run as root, and the default port is 8443 (because it must be greater than 1024). As a result, end users must specify the port number in the web browser when they enter the URL to access the OneClick home page:

```
https://<fully_qualified_host_name>:8443/spectrum
```

4. Remove the comments around the Connector definition. Perform the following actions:
   a. Remove "<!--" from the line preceding to <Connector.
   b. Remove "-->" from the end of the section (after </Connector>).
5. Replace the <*SPECROOT*> variable in the value for the keystoreFile attribute with the fully qualified path to the directory where DX NetOps Spectrum is installed. You can use the cacerts file for the keytool commands to generate the certificates. Verify the following examples:
   – **Windows**

     ```
     C:/win32app/SPECTRUM/custom/keystore/cacerts
     ```

   – **UNIX**

     ```
     /usr/SPECTRUM/custom/keystore/cacerts
     ```

6. Save and close the server.xml file.
7. If you have DX NetOps Spectrum integrated with CA Performance Center, perform the following steps to enable the communication between SSL enabled OneClick and CA Performance Center:
   a. Open the "axis2.xml" file in an editor from "$SPECROOT/tomcat/webapps/axis2/WEB-INF/conf".

b. Locate the following section in axis2.xml:

```
<transportReceiver name="http"
                        class="org.apache.axis2.transport.http.AxisServletListener">
        <parameter name="port">8080</parameter>
</transportReceiver>
```

c. Change the section as follows:

```
<transportReceiver name="https"
                        class="org.apache.axis2.transport.http.AxisServletListener">
        <parameter name="port">8443</parameter>
</transportReceiver>
```

If you need to configure both HTTP and HTTPS, it is necessary to explicitly configure the port numbers in axis2.xml, such as in the following example:

```
<transportReceiver name="http"
 class="org.apache.axis2.transport.http.AxisServletListener">
<parameter name="port">8080</parameter>
</transportReceiver>

<transportReceiver name="https"
 class="org.apache.axis2.transport.http.AxisServletListener">
<parameter name="port">8443</parameter>
</transportReceiver>
```

8. Start the OneClick web server.
   You can find instructions on configuring SSL and configuration parameters. For more information, see http://tomcat.apache.org/tomcat-9.0-doc/ssl-howto.html.

   NOTE
   To disable the non-HTTPS connector port, see the KB Article: Block access to HTTP on port 80 (Windows) or port 8080 (Linux) in Spectrum OneClick.

Configure OneClick and Report Manager for Secure Sockets Layer

If you are running Report Manager and you have configured OneClick to use the Secure Sockets Layer (SSL) protocol to encrypt communications between OneClick clients and the OneClick web server, you must also configure OneClick to be launched from Report Manager using SSL.

Report Manager allows you to create reports on the inventory, performance, change history, and fault history of the network assets managed by DX NetOps Spectrum. For more information, see Report Manager.

Follow these steps:

1. Enable write permissions on the following file:
   `<$SPECROOT>\tomcat\webapps\spectrum\repmgr\js\repmgr.js`
2. Open the file that you modified in the previous step, and locate the launchOneClick function.
3. Locate the following line in the launchOneClick function:
   `url = "http://"+servername+contextApp+"/oneclick.jnlp";`
4. Change "http" to "https" as follows:
   `url = "https://"+servername+contextApp+"/oneclick.jnlp";`
5. Save and close the file.

   WARNING
   This file is overwritten during an upgrade. Repeat this procedure after an upgrade.

NOTE
You can launch OneClick in the context of a specific report (for example, in the context of a device that is listed in an asset report). However, this type of launch cannot be configured to use SSL.

Unable to connect to OneClick using https after upgrading to 10.3

Symptom:

After upgrading to DX NetOps Spectrum 10.3, unable to connect to OneClick using the https connection.

This problem occurs due to the migration of JKS to PKCS12 format. After generating the SSL key, the following message appears, which recommends to migrate JKS to PKCS12 format:

```
The JKS keystore uses a proprietary format. It is recommended to migrate to PKCS
12 which is an industry standard format using "keytool -importkeystore -srckeyst
ore c:/win32app/SPECTRUM/custom/keystore/cacerts -destkeystore c:/win32app/SPECT
RUM/custom/keystore/cacerts -deststoretype pkcs12".
```

Solution:

We recommended to ignore this warning message and do not migrate to PCKS12 format. In case you have already migrated, then replace the backed up keystore while migrating to PKCS12 format and restart Tomcat.

Follow these steps:

1. While migrating to PKCS12 format, the old keystore gets backed up as /usr/Spectrum/custom/keystore/cacerts.old
2. Remove or backup the file /usr/Spectrum/custom/keystore/cacerts and rename cacerts.old to cacerts at /usr/Spectrum/custom/keystore/
3. Restart tomcat.

Error when logging into OneClick web configured for SSL

Symptom:

After configuring the DX NetOps Spectrum OneClick server for SSL, an error is thrown when attempting to connect from a browser (Chrome, FireFox, IE or Safari).

This error occurs due to the URL being used to point the browser at the OneClick server. The URL contains either an IP address or hostname that does not match that which was used to generate the certificate that was added to the OneClick server keystore. Or alternately, the DNS lookup does not resolve to the correct name/IP.

Solution:

Follow these steps:

1. When generating the private, self-signed certificate, you use the following command:
   ```
   ./keytool -genkey -alias tomcatssl -keyalg RSA -keystore $SPECROOT/custom/keystore/cacerts
   ```
   This command then asks a number of questions, the second of which is: **What is your first and last name?**
   This refers to the common name (singular hostname) or the FQDN of the OneClick server . So when logging in with the browser, you need to refer to this hostname in the URL (not the IP address) for the HTTPS connection to work and the certificate to be validated by the browser.
2. Import the certificate signed by your CA:
   ```
   $SPECROOT/Java/bin> ./keytool -import -alias tomcatssl -keystore $SPECROOT/custom/keystore/cacerts -trustcacerts -file <PATH>/<FILENAME.cer>
   ```
3. Enter the keystore password. The certificate reply was installed in the keystore. If your DNS is not resolving the hostname of the OneClick server, then modify your hosts file (In Windows: ~\win32\drivers\etc\hosts, in Linux/etc/

hosts) file to include both the singular and FQDN hostnames of the OneClick server so as to get around the problems with your DNS. Then in the browser, target the OneClick server URL using:

```
https://<HOSTNAME>:443/spectrum
```

Errors Connecting to the Secure OneClick Web Server from a OneClick Client Using SSL

Symptom:

I am encountering errors when I try to connect to the secure OneClick web server from a OneClick client using SSL.

Solution:

Verify the following:

- The fully qualified domain name of the host on which the OneClick web server is running was specified in the private key you generated for signing the security certificate used for authentication. When you generated the key, you should have entered the fully qualified domain name at the following prompt: “What is your first and last name?”
- Both the Certificate Authority chain (root) certificate *and* the security certificate were imported into the cacerts file in the custom directory on the secure OneClick web server.

Errors Launching OneClick Client from Report Manager Using SSL

Symptom:

I am encountering errors when I launch a OneClick client from Report Manager using SSL.

Solution:

Verify that you have completed the configuration procedure described in Configure OneClick and Report Manager for Secure Sockets Layer.

Enable ModSecurity Web Application Firewall

To prevent malicious remote clients from accessing OneClick server (Tomcat), and for full HTTP traffic logging, you must enable the ModSecurity Web Application Firewall (WAF). ModSecurity is deployed in DX NetOps Spectrum environment using the reverse proxy method. If you edit the "httpd.conf" file and set the configuration shown in this method is achieved by using a dedicated Apache server as a reverse proxy for Tomcat, and by adding the open-source ModSecurity module to it. With this implementation, you get a proper web application firewall. When you install the OneClick server on Windows, the "apache" folder is created in the $SPECROOT directory. This folder includes the following items:

- Apache HTTP server 2.4.35 package is required to install and to start the Apache server.

  NOTE

  In the 10.3.1 release, Apache HTTP is upgraded from 2.4.12 to 2.4.35. After upgrade to 10.3.1, you must re-enable the ModSecurity firewall. For existing configuration, you can refer to the "conf.old" available in the $SPECROOT/apache directory.
- Open source ModSecurity 2.9 package that is required to run the Apache server as a reverse proxy.
- Open source ModSecurity core rule set 2.2.9 package for the firewall capability.

When you install the OneClick server on Linux, a pre-built Apache server 2.4.35 with ModSecurity 2.9 and 2.2.9 core rule set is created in the $SPECROOT directory.

NOTE

- You can enable ModSecurity only with any of the following two Apache setups:
  - The Apache setup of DX NetOps Spectrum environment on your OneClick host.
  - An existing Apache setup on your OneClick host.
- Enabling ModSecurity with an Apache setup that is running outside the OneClick host is not supported.

This page contains the following topics:

How ModSecurity Works

When ModSecurity is enabled in the reverse proxy deployment, the following firewall architecture is enabled:

- Apache server becomes an HTTP router that is designed to stand between the OneClick server and its clients.
- Clients connect only to the Apache server.
- Apache forwards and gets the request from Tomcat for clients.
- Access to the Tomcat server for clients is disabled.

This architecture is configured by setting the following attributes and directives in the "httpd.conf" file that is located at "$SPECROOT\apache\conf" as shown here:

```
Listen 80
<VirtualHost *:80>
  ProxyPreserveHost On
  ProxyPass /spectrum http://localhost:8081/
  ProxyPassReverse /spectrum http://localhost:8081/
</VirtualHost>

For this example, assume that the tomcat server was listening at port 80. To enable
 ModSecurity,
Tomcat server port is assigned to the Apache server. A free port 8081 is assigned to the
 Tomcat
server by adding port 8081 in the server.xml file that is located at "$SPECROOT\tomcat
\conf".
```

If you edit the "httpd.conf" file and set the configuration shown in the example, the Apache server runs as a proxy of the Tomcat server as follows:

- Tomcat port 80 is assigned to the Apache server.
- Apache server becomes the virtual host that is mapped to the OneClick url. As a result, the client request with the url "http://<hostname><:80>/spectrum" connects to the Apache server.
- The directive **ProxyPass** instructs the Apache server to pass all client requests to the Tomcat server which now listens at 8081.
- The directive **ProxyPassReverse** rewrites the HTTP Header in the response of Tomcat to make it look for clients as if it came from Apache.

In DX NetOps Spectrum environment, ModSecurity is enabled using the "configApacheModsec.sh" script. This script is located at "$SPECROOT\apache\bin". It enables ModSecurity by performing the following functions:

1. Lets you assign the port of Tomcat server to the Apache server, and lets you assign another free port to the Tomcat server.
2. Updates the newly assigned port to the Tomcat server in the "server.xml" file.
3. Configures the "httpd.conf" file based on these port assignments.
4. Installs and starts the Apache service with ModSecurity.

If the Tomcat server port is assigned to the Apache server, clients can use the existing OneClick url to connect to the Apache server. Otherwise, you need to assign a free port to the Apache server. In this case, clients can connect to the Apache server using the OneClick url only when they use the newly assigned port to the Apache server in that url. You must provide to clients the updated OneClick url which contains the newly assigned port to the Apache server. Based on

whether you want the clients to use the existing OneClick url or not, you can enable ModSecurity using any one of the following two methods:

- Enable ModSecurity Using the Tomcat port for Apache
- Enable ModSecurity Using a Free Port for Apache

> **NOTE**
> When the ModSecurity is enabled, the OneClick Console default customization options like the branding (logos, images) are disabled. To configure the ModSecurity to load resources from non-default location, see Modify Apache ModSecurity Configuration To Enable OneClick Console Customization.

Enable ModSecurity Using the Tomcat port for Apache

By default, Apache listens on port 8080. When you assign the existing tomcat port to Apache, the clients can use the existing url without changing the port number. In this case, the Tomcat server is assigned another port, which is disabled for external clients. Internal client is the client that accesses from the OneClick server host itself. For the following procedure assume that the existing Tomcat port is 80.

Follow these steps:

1. On Windows, launch the "Services.msc" program, or execute the following command at the command prompt to stop the "SpectrumTomcat" service:
   $SPECROOT\NT-Tools\SRE\bin\bash.exe "$SPECROOT\\tomcat\\bin\\stopTomcat.sh"
   On Linux, execute the following command at the bash prompt (from **$SPECROOT\tomcat\bin**) to stop the SpectrumTomcat service:
   ./stopTomcat.sh
   The "SpectrumTomcat" service stops, and the Tomcat port 80 is now free to be assigned to the Apache server.
2. On Linux, execute the following command at the bash prompt (from **$SPECROOT\apache\bin**) to enable ModSecurity:
   ./configApacheModsec.sh enable On Windows, execute the following command at the command prompt to enable ModSecurity:
   $SPECROOT\NT-Tools\SRE\bin\bash.exe "$SPECROOT\\apache\\bin\\configApacheModsec.sh" "enable"
   You are prompted to confirm whether tomcat is running in SSL mode or not.
   If Tomcat is running in SSL mode, follow the steps in Enable ModSecurity in SSL Mode. The script displays the following message, and does not enable ModSecurity:
   Screenshots for SSL mode
   Windows

```
pangy01-w2k8vm1%/c/win32app/Spectrum/apache/bin > ./configapachescriptfinal.sh enable
Is Tomacat running on SSL(Y/N) :
y
Disable SSL in SpectrumTomcat and run the script
```

   Linux

```
[root@cumulus-rh7vm5 bin]# ./configApacheModsec.sh enable
Is Tomacat running on SSL(Y/N) :
y
Disable SSL in SpectrumTomcat and run the script
[root@cumulus-rh7vm5 bin]#
```

   Screenshots for non-SSL mode
   Windows
   If Tomcat is running in non-SSL mode, the script prompts you to select whether you want to assign the tomcat port to Apache or not.

```
Do u want to assign Tomcat Port  to Apache(Y/N):
y
Please enter some free port for Tomcat:
8081
Apache Service is started.
```

Linux

```
[root@cumulus-rh7vm5 bin]# ./configApacheModsec.sh enable
Is Tomacat running on SSL(Y/N) :
n
Do u want to assign Tomcat Port 8080 to Apache(Y/N):
y
Please enter some free port for Tomcat:
8081
Apache Service is started.
[root@cumulus-rh7vm5 bin]#
```

3. Press the 'y' key, and then press Enter.
   Port 80 is assigned to Apache. The script prompts you to input a free port for Tomcat.
4. Enter a new port for Tomcat, and then press Enter.
   For example, enter 8081.
   The script applies the following configuration in the httpd.conf file:

```
Listen 80

<VirtualHost *:80>

ProxyPreserveHost On

ProxyPass          /spectrum http://localhost:8081/spectrum
ProxyPassReverse   /spectrum http://localhost:8081/spectrum
</VirtualHost>
```

   You get the "Apache Service is started" message at the command prompt.
5. On Linux, execute the following command at the bash prompt to start the "SpectrumTomcat" service:
   ./startTomcat.sh
   On Windows, Launch "Services.mcs" program, or execute the following command at the command prompt to start the SpectrumTomcat service:
   $SPECROOT\NT-Tools\SRE\bin\bash.exe "$SPECROOT\\tomcat\\bin\\startTomcat.sh
6. On Linux, execute the following command at the bash prompt to verify that the Apache service has started:

```
[root@scrh63-vm3 bin]# ps -eaf | grep httpd
root      4356     1  0 02:53 ?        00:00:00 /usr/Spectrum/apache/bin/httpd -d /usr/Spectrum/apache/ -k start
daemon    4357  4356  0 02:53 ?        00:00:01 /usr/Spectrum/apache/bin/httpd -d /usr/Spectrum/apache/ -k start
daemon    4358  4356  0 02:53 ?        00:00:01 /usr/Spectrum/apache/bin/httpd -d /usr/Spectrum/apache/ -k start
daemon    4359  4356  0 02:53 ?        00:00:01 /usr/Spectrum/apache/bin/httpd -d /usr/Spectrum/apache/ -k start
daemon    4489  4356  0 02:56 ?        00:00:01 /usr/Spectrum/apache/bin/httpd -d /usr/Spectrum/apache/ -k start
root      5959 20286 11 04:26 pts/1    00:00:00 grep httpd
```

7. On Windows, launch the "Services.msc" program to verify that the Apache service has started.

When clients use the existing url "http://<hostname:80>/spectrum", they connect to the Apache server and get the response from it. To disable the Tomcat port 8081 for external clients, the Loopback address is added in the server.xml file that is located at "$SPECROOT\tomcat\conf".

Enable ModSecurity Using a Free Port for Apache

When you do not assign the existing tomcat port to Apache, the clients have to use the url with a newly assigned port to the Apache server. In this case also, the existing tomcat port is disabled for external clients. For the following procedure assume that the existing Tomcat port is 80.

Follow these steps:

1. On Linux, execute the following command at the bash prompt (from **$SPECROOT\apache\bin**) to enable ModSecurity:
   ./configApacheModsec.sh enable
   On Windows, execute the following command at the command prompt to enable ModSecurity:
   $SPECROOT\NT-Tools\SRE\bin\bash.exe "$SPECROOT\\apache\\bin\\configApacheModsec.sh" "enable"
   You are prompted to confirm whether tomcat is running in SSL mode or not.
   If Tomcat is running in SSL mode, follow the steps in Enable ModSecurity in SSL Mode. The script displays the following message, and does not enable ModSecurity:
   Screenshots for SSL mode
   Windows

```
pangy01-w2k8vm1%/c/win32app/Spectrum/apache/bin > ./configapachescriptfinal.sh enable
Is Tomacat running on SSL(Y/N) :
y
Disable SSL in SpectrumTomcat and run the script
```

   Linux

```
[root@cumulus-rh7vm5 bin]# ./configApacheModsec.sh enable
Is Tomacat running on SSL(Y/N) :
y
Disable SSL in SpectrumTomcat and run the script
[root@cumulus-rh7vm5 bin]#
```

   Screenshots for non-SSL mode
   If Tomcat is running in non-SSL mode, the script prompts you to select whether you want to assign the tomcat port to Apache or not:

   Windows

```
pangy01-w2k8vm1%/c/win32app/Spectrum/apache/bin > ./configapachescriptfinal.sh enable
Is Tomacat running on SSL(Y/N) :
n
Do u want to assign Tomcat Port 80 to Apache(Y/N):
n
Assign a new port for Apache
8082
Apache service is Registered Successfully.
Apache Service is started.
```

   Linux

```
[root@cumulus-rh7vm5 bin]# ./configApacheModsec.sh enable
Is Tomacat running on SSL(Y/N) :
n
Do u want to assign Tomcat Port 8080 to Apache(Y/N):
n
Assign a new port for Apache
8082
Apache Service is started.
[root@cumulus-rh7vm5 bin]#
```

2. Press the 'n' key, and then press Enter.
   The script prompts you to enter a free port for the Apache server as shown in the earlier image. In this example, 8080 is assigned to the Apache server.
   The script applies the following configuration in the "httpd.conf" file:

```
Listen 8080
<VirtualHost *:8080>

ProxyPreserveHost On

ProxyPass           /spectrum http://localhost:8080/spectrum
ProxyPassReverse    /spectrum http://localhost:8080/spectrum
</VirtualHost>
```

   You get the "Apache Service is started" message at the command prompt.
   Note: If the CA PC integration is enabled, and if apache is running in a non SSL mode, then the following script is applicable in the httpd-ssl.conf or httpd.conf file, for the integration to work. You may replace 8443, with the actual tomcat port that is configured.

```
ProxyPass /axis2 https://localhost:8443/axis2

ProxyPassReverse /axis2 https://localhost:8443/axis2
```

3. On Linux, execute the following command at the bash prompt to verify that the Apache service has started:

```
[root@scrh63-vm3 bin]# ps -eaf | grep httpd
root      4356     1  0 02:53 ?        00:00:00 /usr/Spectrum/apache/bin/httpd -d /usr/Spectrum/apache/ -k start
daemon    4357  4356  0 02:53 ?        00:00:01 /usr/Spectrum/apache/bin/httpd -d /usr/Spectrum/apache/ -k start
daemon    4358  4356  0 02:53 ?        00:00:01 /usr/Spectrum/apache/bin/httpd -d /usr/Spectrum/apache/ -k start
daemon    4359  4356  0 02:53 ?        00:00:01 /usr/Spectrum/apache/bin/httpd -d /usr/Spectrum/apache/ -k start
daemon    4489  4356  0 02:56 ?        00:00:01 /usr/Spectrum/apache/bin/httpd -d /usr/Spectrum/apache/ -k start
root      5959 20286 11 04:26 pts/1    00:00:00 grep httpd
```

4. On Windows, launch the "Services.msc" program to verify that the Apache service has started.

When clients use the existing url "http://<hostname:80>/spectrum", they cannot connect to Apache server. Clients must use the updated url "http://<hostname:8082>/spectrum" to connect to the Apache server and get the response from it.
To disable the Tomcat port 80 for external clients, the Loopback address is added in the server.xml file that is located at "$SPECROOT\tomcat\conf".

Preventing Clickjack attack using ModSecurity

Clickjacking (User Interface redress attack) is a malicious practice of manipulating an activity of a website user by concealing hyperlinks beneath legitimate clickable content, thereby causing the user to perform actions of which they are unaware. It is a browser security issue that is a vulnerability across a variety of browsers and platforms. A clickjack takes the form of embedded code or a script that can execute without the user's knowledge, such as clicking on a button that appears to perform another function.

Defending Clickjacking with X-Frame-Options

You can use the X-Frame-Options HTTP response header to indicate whether or not a browser should be allowed to render a page in a <frame> or <iframe>.

Follow these steps to update the 'httpd.conf' file for protecting DX NetOps Spectrum from Clickjack attack:

1. Open the "$SPECROOT\apache\conf\httpd.conf" file with any text editor
2. Add the following X-Frame Options Response Header and save the file:
   ```
   Header always append X-FRAME-OPTIONS "SAMEORIGIN"
   ```
3. Restart the Apache server.

Cache-Controling using ModSecurity

Using ModSecutiy you can control the cache by defining a mod_headers in 'httpd.conf' file. This allows a server to return control how, and for how long, the browser and other intermediate caches can be cached for an individual response.

Follow these steps:

1. Open the "$SPECROOT\apache\conf\httpd.conf" file with any text editor
2. Add the following configuration and save the file:
   ```
   <IfModule mod_headers.c> Header set Cache-Control "no-cache, no-store, must-revalidate,max-age=0" Header
    set Pragma "no-cache" Header set Expires 0 </IfModule>
   ```
3. Restart the Apache server.

After updating the 'httpd.conf' file with the above cache configuration, you can observe that all the calls going from DX NetOps Spectrum are controlled with the cache. The cache control directives are displayed in the responsive headers.

Disable ModSecurity

On Linux, execute the following command (from **$SPECROOT\apache\bin**) at the bash prompt to disable ModSecurity:

```
[root@scrh63-vm3 bin]# ./configApacheModsec.sh disable
Apache Service is unregistered Successfully.
```

On Windows, use the command prompt with the following syntax to disable ModSecurity:

```
C:\win32app\Spectrum\NT-Tools\SRE\bin\bash.exe "C:\\win32app\\Spectrum\\apache\\bin\
\configApacheModsec.sh" "disable"
```

If you enabled ModSecurity using the Tomcat port for the Apache server, the script disables ModSecurity by making the following changes:

- The Apache service is stopped, uninstalled, and the configuration that is applied to the "httpd.conf" file becomes inapplicable.
- Port 80 is assigned back to the Tomcat server, and port 8080 is assigned back to the Apache server.
- The Loopback address is removed and port 80 is added back in the server.xml file. As a result, external clients can directly access the Tomcat server using port 80.

If you enabled ModSecurity using the default port for the Apache server, the script disables ModSecurity by making the following changes:

- The Apache service is stopped, uninstalled, and the configuration applied to "httpd.conf" file becomes inapplicable.
- The Loopback address is removed from the "server.xml" file.

WARNING

In this case, you must add the existing port number (which is 80 in this example) in the server.xml file.

Finally, you get the following message at the command prompt:

```
Apache Service is unregistered Successfully
```

Enable ModSecurity in SSL Mode

To enable ModSecurity in SSL mode, the Apache server is first configured to run in SSL mode. The following configuration tasks are performed to execute Apache in SSL mode:

- Editing the "$SPECROOT\apache\conf\extra\httpd-ssl.conf" file to configure the virtual host configuration (setting the Apache SSL port, proxypass and proxypassreverse directives) to map the OneClick url with the Apache SSL port.
- Uncommenting the "#Include conf/extra/httpd-ssl.conf" directive in the httpd.conf file so that the Apache server runs in the SSL mode when it is started.
- Configuring the log file paths in the "$SPECROOT\apache\conf\extra\httpd-ssl.conf" file for logging SSL logs.
- Configuring the paths of SSL certificate files (server.crt and server.key), and generating those files using the "openssl" command.

After performing these configurations enable ModSecurity in SSL mode by manually installing and starting the Apache service.

NOTE

- Do not use the "configApacheModsec.sh" script to enable ModSecurity in SSL mode.
- To enable ModSecurity in SSL mode, the Tomcat server must also run in SSL mode. If the Tomcat server is running in non-SSL mode, disable that mode and enable SSL mode. To configure Tomcat in SSL mode, follow the instructions provided in the Configure OneClick for Secure Sockets Layer section.

Follow these steps to Enable ModSecurity in SSL Mode:

1. Change the "httpd-ssl.conf" and the "httpd.conf" file from read-only mode to write mode.

   NOTE

   Before proceeding to step 2, search for the following attribute and comment / hide it in the "httpd.conf" file to avoid creating multiple host configuration.

   Listen 80
   <VirtualHost *:80>

   ProxyPreserveHost On
   ProxyPass /spectrum http://localhost:8081/
   ProxyPassReverse /spectrum http://localhost:8081/
   </VirtualHost>

2. Find the "<VirtualHost _default_:443>" tag then change it to "<VirtualHost *:443>" in the "httpd-ssl.conf". Add the following virtual host configuration in between <VirtualHost *:443> and </VirtualHost> tags as shown in the following example:

```
<VirtualHost *:443>
  ProxyPreserveHost on
  SSLEngine on
  SSLProxyEngine on
  SSLProxyVerify none
  SSLProxyCheckPeerCN off
  SSLProxyCheckPeerName off
  SSLProxyCheckPeerExpire off
  ProxyPass /spectrum https://localhost:8443/spectrum
  ProxyPassReverse /spectrum https://localhost:8443/spectrum
```

```
</VirtualHost>

*This configuration indicates that ModSecurity on httpd (Apache Web Server) is
 running in SSL mode on port TCP/443 and Tomcat is also running in SSL mode on port
 TCP/8443 locally.
```

NOTE
To ensure that the CA NIM customization functionality works in 10.4.1 when OneClick is in the SSL mode and ModSecurity is enabled, you must add the following configuration:

```
ProxyPass /ca-nim-sm https://localhost:8443/ca-nim-sm

ProxyPassReverse /ca-nim-sm https://localhost:8443/ca-nim-sm
```

NOTE
If the CA PC integration is enabled and Apache is running in an SSL mode, then the following script is applicable in the httpd-ssl.conf or httpd.conf file, for the integration to work. You may replace 8443, with the actual tomcat port that is configured.

```
ProxyPass /axis2 https://localhost:8443/axis2

ProxyPassReverse /axis2 https://localhost:8443/axis2
```

3. Edit the "httpd.conf" file to:
   a. Include the "httpd-ssl.conf" file in the "httpd.conf" file by removing the '#' symbol in front of the "Include conf/extra/httpd-ssl.conf" directive in the "httpd.conf" file.
   b. Load the module "mod_ssl.so" in the "httpd.conf" file by removing the '#' symbol in front of the "LoadModule ssl_module modules/mod_ssl.so" directive in the "httpd.conf" file.
   c. Replace the default path (<$SPECROOT>) with the absolute path (C:/win32app/Spectrum) for ServerRoot.
4. Replace the default path (<$SPECROOT>) with the absolute path (C:/win32app/Spectrum) for DocumentRoot, Errorlog, and TransferLog in the "httpd-ssl.conf" file.
5. Execute the following command on Windows to generate the "server.crt" and the "server.key" file:
   $SPECROOT\NT-Tools\SRE\bin\bash.exe "$SPECROOT\\apache\\conf\\openssl req -newkey rsa:1024 -keyout server.key -nodes -x509 -out server.crt"
   Execute the following command on Linux to generate the "server.crt" and the "server.key" file:
   $SPECROOT\Apache\conf>openssl req -newkey rsa:1024 -keyout server.key -nodes -x509 -out server.crt
   You are prompted to enter the following details.
   a. Enter your Country Name in the (2 letter code) [XX] format, and press Enter.
   b. Enter your State or Province Name, and press Enter.
   c. Enter your Locality Name, and press Enter.
   d. Enter your Organization Name, and press Enter
   e. Enter your Organizational Unit Name, and press Enter.
   f. Enter your Common Name in the following format, and press Enter.
      <host_name>@domain.com
   g. Enter your Email address in the following format:
      id@domain.com
      You are prompted to verify whether the information that you provided is correct or not.
   h. Type 'yes', and press Enter.
6. Do the following edits to the httpd-ssl.conf file to update the path of the server.crt and server.key certificate files:
   a. Find the "SSLCertificateFile "c:/Apache24/conf/server.crt" line, and update the path to "$SPECROOT/apache/conf/server.crt".
   b. Find the "SSLCertificateKeyFile "c:/Apache24/conf/server.key" line, and update the path to "$SPECROOT/apache/conf/server.key".

7. On Linux, execute the following command at the bash prompt to enable ModSecurity in SSL mode:
   ```
   #./httpd -d /$SPECROOT/apache -k start
   ```
8. On Windows, execute the following commands as an admin user and not as a DX NetOps Spectrum user, at the bash prompt to enable ModSecurity in SSL mode:
   ```
   C:\$SPECROOT\apache\bin>httpd.exe -k install

   C:\$SPECROOT\apache\bin>httpd.exe -k start
   ```
   ModSecurity is enabled with the Apache server running at the default SSL port 443. Now, clients must use the "https://<hostname><:443>/spectrum" url to connect to the Apache server. Execute the following steps to disable the existing Tomcat port (SSL) for the external clients, so that the tomcat cannot be accessed directly from external clients:
   a. Find the "<!-- Define a SSL Coyote HTTP/1.1 Connector on port 443 -->" segment in the server.xml file.
   b. Add the "address=127.0.0.1" attribute in the next <Connector /> tag segment.

      NOTE

      - On Linux, execute the "**./httpd -d /$SPECROOT/apache -k stop**" command at the bash prompt to disable ModSecurity in SSL mode.
      - On Windows, execute the "**httpd.exe -k stop**" command at the bash prompt to disable ModSecurity in SSL mode.
      - On Windows, execute the "**httpd.exe -k uninstall**" command at the bash prompt to uninstall the Apache server.

      After disabling ModSecurity, change the "httpd-ssl.conf" and the "httpd.conf" file from write mode to read-only mode.

Import Third-Party SSL Certificate

You can also import the SSL certificate of a third-party organization. When you raise a request for a third party SSL certificate, that particular third party organization gives the following files:

- server.crt (server certificate)
- server.key (private key)

NOTE

Restrict the access to these files to only the root user.

Follow these steps:

1. Download the "server.crt" and "server.key" files from the third party, and save it in the filesystem of the Apache server host.
2. Locate the following line in the httpd.conf file, and remove the '#' character in this line to load the "mod_ssl.so" module:
   ```
   #LoadModule ssl_module modules/mod_ssl.so
   ```
   Save the file.
3. Locate the following line in the httpd-ssl.conf file, and remove the existing path in the SSLCertificateFile "c:/Apache24/conf/server.crt" statement:
   ```
   #   Server Certificate:
   #   Point SSLCertificateFile at a PEM encoded certificate.  If
   #   the certificate is encrypted, then you will be prompted for a
   #   pass phrase.  Note that a kill -HUP will prompt again.  Keep
   #   in mind that if you have both an RSA and a DSA certificate you
   #   can configure both in parallel (to also allow the use of DSA
   #   ciphers, etc.)
   #   Some ECC cipher suites (http://www.ietf.org/rfc/rfc4492.txt)
   #   require an ECC certificate which can also be configured in
   ```

```
#   parallel.
SSLCertificateFile "c:/Apache24/conf/server.crt"
#SSLCertificateFile "c:/Apache24/conf/server-dsa.crt"
#SSLCertificateFile "c:/Apache24/conf/server-ecc.crt"
```

Specify the absolute path to the downloaded "server.crt" file using the following syntax:

```
SSLCertificateFile "<absolute path to the downloaded server.crt>"
```

4. Locate the following line in the httpd-ssl.conf file, and remove the existing path in the SSLCertificateKeyFile "c:/Apache24/conf/server.key" statement:

```
#   Server Private Key:
#   If the key is not combined with the certificate, use this
#   directive to point at the key file.  Keep in mind that if
#   you've both a RSA and a DSA private key you can configure
#   both in parallel (to also allow the use of DSA ciphers, etc.)
#   ECC keys, when in use, can also be configured in parallel
SSLCertificateKeyFile "c:/Apache24/conf/server.key"
#SSLCertificateKeyFile "c:/Apache24/conf/server-dsa.key"
#SSLCertificateKeyFile "c:/Apache24/conf/server-ecc.key"
```

   Specify the absolute path to the downloaded "server.key" file using the following syntax:

```
SSLCertificateFile "<absolute path to the downloaded server.key>"
```

   Save the file.
5. Locate the following line in the "httpd.conf" file, and remove the '#' character in this line to include the "httpd-ssl.conf" file:

```
#Include conf/extra/httpd-ssl.conf
```

   Save the file.
6. Restart the Apache server.

How to enable ModSecurity in an Existing Apache Setup

If an Apache service is already running on your OneClick server host, perform the following steps to enable ModSecurity:

1. Stop the Apache service.
2. Access the following folders which are required to enable ModSecurity, and copy them to your existing Apache setup:
   $SPECROOT\apache\modsecurity-crs
   $SPECROOT\apache\modules
3. Find the "Dynamic Shared Object (DSO) Support" segment in the "$SPECROOT\apache\conf\httpd.conf" file.
4. Compare the "LoadModule" directives of your existing httpd.conf file with the "LoadModule" directives present in the "$SPECROOT\apache\conf\httpd.conf" file .
   The "LoadModule" directive includes a module that enables a functionality. To enable ModSecurity, you must include ModSecurity modules in your existing "httpd.conf" file.
5. Copy the "LoadModule" directives that are present in the "httpd.conf" of the DX NetOps Spectrum environment, and paste them in your existing "httpd.conf" file.
6. Read the following topics to understand how to enable ModSecurity:
   - How ModSecurity Works.
   - Enable ModSecurity Using the Tomcat port for Apache.
   - Enable ModSecurity Using a Free Port for Apache.
7. Configure the httpd.conf file as explained in these topics, and start the Apache service.

How ModSecurity Blocks Malicious Clients

The "httpd.conf" file includes ModSecurity core rule set configuration files (base rules) that are located at "$SPECROOT\apache\modsecurity-crs\base_rules". The core rule set thresholds and parameters of these base rules are configured

in "modsecurity_crs_10_setup.conf" file that is located at "$SPECROOT\apache\modsecurity-crs\". The "httpd.conf" file includes this core rule set configuration file and all the base rules. These base rules provide a strong firewall capabilities to the Apache server. The following table lists each base rule and its corresponding firewall capabilities:

ModSecurity Base Rule	Firewall Capability
modsecurity_crs_20_protocol_violations.conf	Some protocol violations are common in HTTP attacks. Validating HTTP requests eliminates a large number of application layer attacks. The purpose of this rules file is to enforce HTTP RFC requirements that state how the client is supposed to interact with the server. Identify Invalid URIs.
modsecurity_crs_21_protocol_anomalies.conf	All HTTP web requests include Host, User-Agent and Accept headers. In legitimate HTTP requests these headers exists, but are not empty. This rule checks if these headers exist, and also if they are empty. If the headers are empty, such HTTP requests without common headers are blocked.
modsecurity_crs_23_request_limits.conf	This rule defines limitations on the number of arguments and argument lengths in HTTP requests. For example, an HTTP request with 400 arguments, can be suspicious. You can define the length in this rule. HTTP requests violating this length are blocked.
modsecurity_crs_30_http_policy.conf	This rule set sets limitations on the use of HTTP by clients. Very few requests require the breadth and depth of the HTTP protocol. Many HTTP attacks abuse such valid but rare HTTP use patterns. You can restrict such patterns and usages with this rule.
modsecurity_crs_35_bad_robots.conf	Bad robots detection is based on checking elements easily controlled by the client. As such a determined attack can bypass those checks. Therefore bad robots detection should not be viewed as a security mechanism against targeted attacks but rather as a nuisance reduction. This rule eliminates most of the random attacks against your website. For example, you can prevent a security scanner from scanning your server.
modsecurity_crs_40_generic_attacks.conf	This rule checks against HTTP requests contaning OS Command Injection Attacks. These rules look for attempts to access OS commands such as "curl", "wget", and "cc". These commands are used in injection attacks to force the victim web application to initiate a connection to a hacker site to download, compile, and install malicious tool kits such as those to participate in Botnets.
modsecurity_crs_41_sql_injection_attacks.conf	This rule blocks HTTP requests that contain sql injection attacks.
modsecurity_crs_41_xss_attacks.conf	This rule blocks cross-site scripting attacks coming from unknown and malicious web requests. If these script attacks are not blocked, the malicious scripts can access cookies, session tokens, or other sensitive information retained by the browser.
modsecurity_crs_42_tight_security.conf	This rule detects Path Traversal Attack in the HTTP requests, and blocks such http requests.

modsecurity_crs_45_trojans.conf	This rule detects access to known Trojans already installed on a server. Uploading of Trojans is part of the Anti-Virus rules and uses external Anti Virus program when uploading files. Detection of Trojans access is especially important in a hosting environment, where the actual Trojan upload may be done through valid methods and not through hacking. Trojans detection is based on checking elements controlled by the client.
modsecurity_crs_47_common_exceptions.conf	This rule is used as an exception mechanism to remove common false positives.
modsecurity_crs_49_inbound_blocking.conf	This rule denies access or redirects the malicious requests based on anomaly score settings specified in the 10 config file.
modsecurity_crs_50_outbound.conf	
modsecurity_crs_59_outbound_blocking.conf	This rule checks the overall anomaly score, and the configured action for those threshold violations, and prevents outbound data leakages.
modsecurity_crs_60_correlation.conf	This rule is used in post processing after the response has been sent to the client (in the logging phase). Its purpose is to provide inbound and outbound correlation of events to provide a more intelligent designation as to the outcome, or result of the transaction, that is to confirm whether it was a successful attack, or not.

NOTE

You cannot disable a specific ModSecurity base rule.

ModSecurity Logs

When ModSecurity is enabled, the following types of log files are generated:

Install Log

The "install.log" is created when you first enable ModSecurity using the script. Install log logs the following type of information:

- – Domain name, ServerName, ServerAdmin, and ServerRoot details of the Apache server.
  – The value of the ServerSslPort.
  – The port number with which Apache is installed.
  – The names and locations of all the configuration files which are loaded for the Apache server.

Error Log

The "error.log" file is generated when an error or any malicious attempt is encountered on Apache. All error logs (Apache error logs + ModSecurity Error logs) are generated in this file. It means all Apache error logs, warnings, fatal errors, and the ModSecurity error logs are found in this log file.

Audit Log

The "audit.log" file contains the detailed information about all of the HTTP client intrusions that are detected by ModSecurity. When ModSecurity detects a malicious event, and finds that the event is logged into the error log file, an audit log entry for the same event is logged in this log file. It is the most useful piece of information the system collects, because it contains the actual client request including the client header and data payload about the attack or event.

Debug Log

The "debug.log" file logs all of the ModSecurity errors and exceptions that are useful for debugging.

NOTE

During DX NetOps Spectrum uninstallation on Windows, the uninstaller removes the "apache" folder only when the Apache service is stopped using the "Services.msc" program.

Modify Apache ModSecurity Configuration To Enable OneClick Console Customization

When you configure the Apache ModSecurity firewall, the OneClick Console does not show branding, custom logos, and custom images.

The following configuration helps you to allow Apache ModSecurity firewall to read the custom files and show branding, custom logos, and custom images in OneClick Console. The configuration should be done in the OneClick web server.

Follow these steps:

1. Stop the Apache Service.
2. Open the "httpd.conf" file that is located at "$SPECROOT\apache\conf" (or when "https/ssl" is enabled, open ./extra/httpd-ssl.conf) ./apache/conf/**httpd.conf** ./apache/conf/extra/**httpd-ssl.conf**
3. Modify the **ProxyPass** and **ProxyPassReverse** entries as shown below:

```
..
<VirtualHost _default_:443>
ProxyPreserveHost On
SSLEngine on
SSLProxyEngine on
SSLProxyVerify none
SSLProxyCheckPeerCN off
SSLProxyCheckPeerName off
SSLProxyCheckPeerExpire off

# disable default
#ProxyPass / https://localhost:8080/
#ProxyPassReverse / https://localhost:8080/
# enable local entries
ProxyPass /spectrum https://localhost:8080/spectrum
ProxyPass /spectrum/common https://localhost:8080/spectrum/common
ProxyPass /customimages https://localhost:8080/customimages
ProxyPass /customimages/maps https://localhost:8080/customimages/maps

ProxyPassReverse /spectrum https://localhost:8080/spectrum
ProxyPassReverse /customimages/ https://localhost:8080/customimages
ProxyPassReverse /spectrum/common https://localhost:8080/spectrum/common

 ProxyPassReverse /customimages https://localhost:8080/customimages

 ProxyPassReverse /customimages/maps https://localhost:8080/customimages/maps
```

4. Restart the Apache Server.

Troubleshooting with ModSecurity

'httpd.exe - System Error' message appears when ModSecurity is configured on Windows 2012

Symptom: After Modsecurity is configured on Windows version 2012, there is a 'httpd.exe-System Error' window that appears.

Resolution: 'The program can't start because api-ms-win-crt-runtime-l1-1-0.dll is missing from your computer' system error message appears when ModSecurity is configured on Windows 2012. Try reinstalling the program to fix thisModsecurity should be installed (httpd.exe -k install) and started (httpd.exe -k start) by logging in as an ‘administrator’ only. Refer to the following article and repair the Visual C++ 2015 Redistributable package.

'Forbidden - You don't have permission to access /spectrum/sdn/do/sdnGatewayConfig on this server' message' appears blocking access to DX NetOps Spectrum specific urls.

Symptom: An error message 'Forbidden - You don't have permission to access/spectrum/sdn/do/sdnGatewayConfig on this server' appears when a user is trying to access DX NetOps Spectrum url.

Resolution: Perform the following steps to resolve this issue:

1. Navigate to the **C:\win32app>Spectrum>apache>logs>error** file, which displays the injection attack information blocking links in DX NetOps Spectrum from being accessed.
2. Select the Id which displays the restricted access information and add it to the whitelist configuration file in this format:
3. Navigate to the following location to find the whitelist.conf file: **C:\win32app>Spectrum>apache>modsecurity-crs>activated_rules>whitelist.conf**, which allow for entries with the Id to permit access to DX NetOps Spectrum specific links.

Configure OneClick to Communicate through a Web Proxy Server

If you use a web proxy server that relays HTTP and HTTPS requests (such as the iPlanet and Microsoft proxy servers), OneClick honors the proxy settings used by Java Web Start. OneClick supports both HTTP and HTTPS proxies and also supports proxy authentication. An administrator must configure the OneClick web server to communicate through a proxy server.

All clients connecting through a proxy must configure the proxy settings in the Java Web Start preference console. See the Fresh Install section for more information about the Java Web Start proxy settings. To connect through an HTTP 1.1 proxy, that console setting might be the only required change.

> **NOTE**
> The following changes are not necessary to connect to a proxy that supports HTTP 1.1.

For HTTP 1.0 proxy support, configure the OneClick web server to communicate through a proxy server.

Follow these steps:

1. Open the <$*SPECROOT*>/tomcat/conf/server.xml file for editing using your preferred text editor.
2. Add the following attribute to any active Connector elements:

   ```
   maxKeepAliveRequests="1".
   ```

   Setting this attribute to 1 disables keepalives.
3. Save the changes to the server.xml file.
4. Stop and restart the OneClick web server.

Troubleshoot Proxy Issues

A failed attempt to launch a OneClick client with a proxy results in the normal conditions described in Step 1 and Step 2 and the failure in Step 3:

1. A web browser can access the OneClick web server and load the OneClick home page at *http://<hostname>:<portnumber>*/spectrum/index.jsp (through the proxy).
2. Java Web Start can access the OneClick web server and download the needed OneClick files.
3. The OneClick client *cannot* access the OneClick web server and fails with a “Can't connect to ...” error.

> **NOTE**
> If the procedures in this article do not enable OneClick to communicate through the proxy server in your environment, consider disabling web proxies. For more information, see the Fresh Install section for information.

Troubleshoot Poor OneClick Client Performance

Platform: Windows

Symptom:

The OneClick clients take a long time to start up. Once the clients have started, users experience long wait times for the user interface to react to mouse clicks and navigation tasks. They are so slow that we can hardly use them.

Solution:

This behavior results from the default setting for the "javaws.reuseConnections" Java System property, which is "false". In previous versions, the default value was "true". A change was made to facilitate out-of-the-box connectivity for users with web proxies or load balancers in their environment. Without reusing connections, SSL certificate verification is performed for every request from client to server. This work is expensive, in terms of round-trip times.

Change the value of the "javaws.reuseConnections" Java Runtime System property to "true".

To change the property setting, edit the oneclick.jnlp file.

Follow these steps:

1. Navigate to the following directory:
   ```
   <$SPECROOT>/tomcat/webapps/spectrum/
   ```
2. Open the oneclick.jnlp file for editing using your preferred text editor.
3. Add the following line, immediately below the "<resources>" line:
   ```
   <property name="javaws.reuseConnections" value="true"/>
   ```
4. Restart all open OneClick clients.

Firewalled Environments

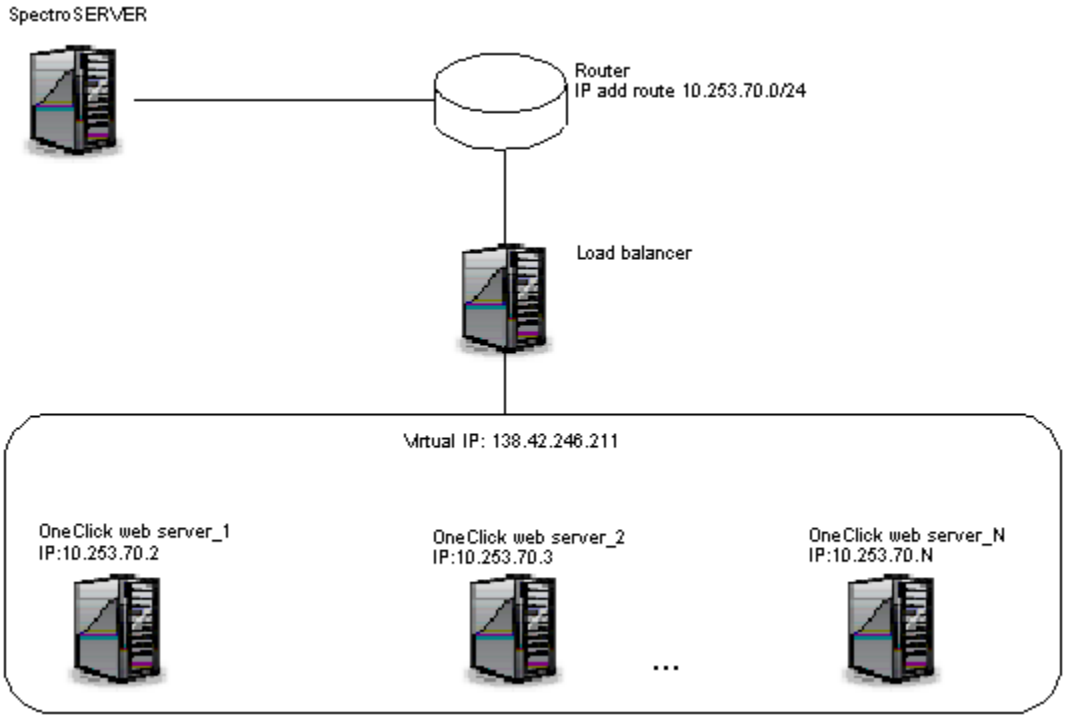
The OneClick web server must communicate with processes on the SpectroSERVER host system to gather data for display to OneClick clients. For the most part, this communication is initiated by the OneClick web server, which establishes connections to specific TCP ports for sending requests and receiving responses. The SpectroSERVER uses bidirectional IIOP (Internet Inter-ORB protocol) to communicate with its CORBA clients. Port 14001 must be open on the firewall to allow the Tomcat web server to receive communications from the SpectroSERVER.

If you use network address translation (NAT) on your network, it is not necessary to perform any additional configuration steps for the OneClick web server to communicate with the SpectroSERVER. However, because SpectroSERVER communication is based on resolving an advertised host name to an IP address, you must configure name resolution on your systems appropriately. Consider a SpectroSERVER host (hostname: “spectrumss”) that is behind a NAT firewall with a private IP address of 192.168.0.2 and a public address of 128.113.0.2. Hosts on the private side of the NAT must resolve “spectrumss” to 192.168.0.2. Hosts on the public side must resolve “spectrumss” to 128.113.0.2.

Load Balancers

To achieve load balancing, identically configured OneClick web servers are accessed through an external load balancing device that employs host/session persistence and any load-balancing mode.

The following figure illustrates a supported load-balancing configuration for multiple OneClick servers.



Check OneClick Web Server Status

You can configure your load balancer to check the status of each OneClick server by using the following HTTP GET statement during periodic server health checks:

```
http://<hostname>:<portnumber>/spectrum/stable
```

A successful GET returns the contents of the "stable" file. The presence of the stable file indicates that the SpectrumTomcat process is in a stable state. Failure to retrieve the file indicates that the SpectrumTomcat process is not running or is unstable.

How to Log the Actual Client IP Address in a Load Balancing Environment

In a load balancing environment, the load balancer performs SNAT (Source Network Address Translation). As a result, you see the IP Address and the host name of the load balancer instead of the actual client in the logs. You can view the logs when you select Client Log in OneClick.

Configure the load balancer to insert the true source IP address into the HTTP request header field "X-Forwarded-For". You can then see the IP Address and hostname of the actual client that logged in to your OneClick console, instead of the load balancer.

More information about load balancer setup is available on the Internet. For example, see Configuring F5 BIG-IP Load Balancer and Configuring Cisco ACE Load Balancer.

OneClick Administration Pages

Access the OneClick Administration Pages

The OneClick Administration Pages are accessible from the OneClick home page. Only OneClick users with OneClick web administration privileges can access these web pages.

To access the OneClick Administration Pages, click **Administration** in the OneClick home page.

About the OneClick Administration Pages

The Administration Pages provide a navigation panel to select specific features to configure and a contents panel on the right that displays the configuration information for each feature. The menu bar contains the following options:

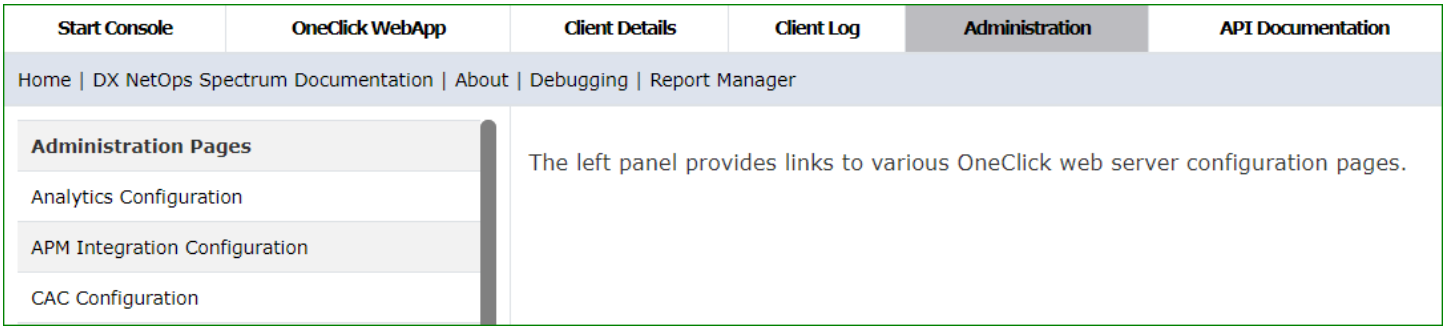
- **Home**
  Opens the OneClick home page.
- **DX NetOps Spectrum Documentation**
  Opens the documentation page.
- **About**
  Opens a window that shows product information like product version, customer support, community link and patent details.
- **Debugging**
  Opens the Debugging page, which contains links to and information about the debugging tools that are included with the product.

  WARNING
  Only use the debugging tools with the help of CA Support.
- **Report Manager**
  Opens the Report Manager Admin Tools pages.

  NOTE
  For more information about administering Report Manager, see Install Report Manager.

The administrative pages that are listed in the navigation panel reflect any OneClick add-on applications that are installed.

The navigation panel and the other OneClick web page links remain available from any OneClick administration page.



Analytics Configuration Page

The Analytics Configuration page lets you configure the integration between DX NetOps Spectrum and Analytics platform/ CA Digital Operational Intelligence.

The Analytics Configuration page contains the following settings:

- **Analytics Server URL**
  Specifies the analytics server URL and port number. This configuration is used to enable launch in context into the Analytics platform from the OneClick page.
  Example**:** http://analyticsserver:port

  NOTE

  Enabling 'HTTPS' is not supported in this release.
- **Analytics Elastic Server URL**
  Specifies the analytics elastic server URL and port number. This configuration is used to fetch the Analytics data to display in the OneClick page for a selected device. For example**:** http://analyticselasticserver:port

  NOTE

  Enabling 'HTTPS' is not supported in this release.

DX NetOps Spectrum Data Publisher

The DX NetOps Spectrum Data Publisher utility allows you to publish inventory and alarms data from DX NetOps Spectrum to Analytics platform/CA Digital Operational Intelligence.

You can download the '*SpectrumDataPublisher.tar*' file and set up the integration between DX NetOps Spectrum and Analytics platform/CA Digital Operational Intelligence.

CAC Configuration Page

Use the CAC Configuration page to configure OneClick to use Common Access Cards (CAC).

NOTE
For more information, see Common Access Card Authentication.

Email Configuration Page

Use the Email Configuration page to configure OneClick to integrate with your existing email system. Operators can then email alarm-related information from OneClick to assigned troubleshooters and other individuals.

The default SMTP Server Host entry for the mail server is "mailhost", which is a common DNS alias for the mail server. If your environment does not use this alias, you can add an entry for “mailhost” to the /etc/hosts file on the OneClick web server.

InsideView Configuration(beta)

Use the InsideView Configuration(beta) section to configure the SpectroSERVER Health View. Spectrum Performance View provides a real-time health dashboard for the distributed DX NetOps Spectrum environment. The administrator can run this tool to get the performance trends; it is disabled by default. SpectroSERVER tracks performance statistics such as Operating System Metrics (for example, CPU, memory, threads, and so on) and other internal metrics such as total models, traps, events, alarms, and so on. These metrics are retrieved every minute and are stored as an event on the SpectroSERVER Performance model.

You can **start** or **stop** InsideView from this page.

NOTE
HTTPS is currently not supported.

Enter the following details and click **Save**.

- **Protocol**
  Specifies the appropriate protocol.
  Default: HTTP
- **Initial Sync Days**

Specifies the interval at which OneClick must sync with Spectruminsideview. The minimum value must be one minute.
Default: 45

- **Poll Timer**
  Specifies the interval between two polls.
  Optimal Interval to avoid Overload: Five minutes
  Default: 5
- **Throttle Size**
  Specifies the throttle size.
  Default: 1000
- **LogLevel: INFO**
  Specifies the DEBUG, INFO, ERROR, WARN.
  Default: ERROR
- **Log File Size**
  Specifies the size of the log file in bytes.
  Default: 10000000
- **LogFileCount: 5**
  Specifies the maximum number of log backup files.
  Default: 5

Reload EvFormat/PCause Configuration

The EvFormat/PCause Configuration page lets you reload modified Event Format or Probable Cause files into the OneClick server.

You can also reload the EvFormat/PCause files from the command line if desired. Use the command line to reload EvFormat/PCause files from any server.

Follow these steps:

1. Obtain and install GNU wget.

   NOTE
   GNU wget is a simple freeware utility.
2. Run the following command:

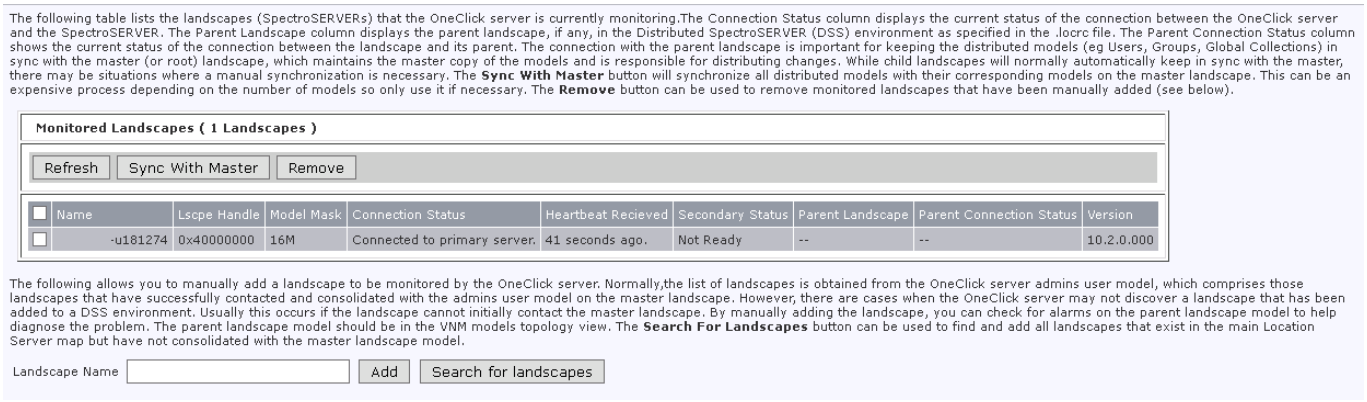
   ```
   wget http://ochost:ocport/spectrum/admin/ecds.jsp?reload=Reload --user username --password password
   ```

   – **ochost**
   Specifies the hostname of the OneClick web server.
   – **ocport**
   Specifies the port number of your OneClick web server.
   – **username**
   Specifies an administrator username for the OneClick web server.
   – **password**
   Specifies an administrator password for the OneClick web server.

Landscapes Page

Use the Landscapes page to view the status for all the landscapes (SpectroSERVERs) that the OneClick server is currently monitoring. You can identify information related to a distributed SpectroSERVER (DSS) setup, including any parent and child landscapes. You can perform a manual synchronization between all distributed models with their corresponding models on the master landscape using the Sync With Master button.

You can manually add or remove landscapes monitored by this OneClick server. You can remove only landscapes that you have manually added.



From 10.2, the value displayed in the Model Mask column is based on the Landscape Handle type you opt for during installation. The value is 16M if you select Huge Landscape handle type, and 1M if you select Legacy Landscape Handle type, during installation.

> **WARNING**
>
> Please ensure that the Model Mask is consistent for all landscapes (SpectroSERVERs) in a Distributed SpectroSERVER (DSS) environment.

LDAP Configuration Page

Use the LDAP Configuration page to configure the OneClick webserver to use an external LDAP server for user authentication.

This administration page includes the following settings and functionality:

- **LDAP Server Settings**
  Server settings to identify a primary and secondary LDAP server by IP address and port number, use SSL, add an SSL certificate, and specify timeout values when attempting to connect to or query the LDAP server.
- **Save LDAP Passwords to DX NetOps Spectrum Database**
  Lets you give access to OneClick users if the LDAP server is down, based on their last known correct LDAP password.
- **User Name Lookup**
  Configure OneClick lookups of usernames, either as a User by Search or a User by Pattern lookup.
- **Test LDAP Configuration**
  Once you have configured the OneClick interface with an external LDAP server, lets you test the configuration.

  > **NOTE**
  > If three consecutive LDAP-based login failures occur, a critical alarm is generated on the VNM that is hosting the Location Server for the OneClick web server.

Primary LDAP Query Authentication Enhancement

10.3.2 now includes a community winning idea to, withdraw from the primary LDAP querying, going forward, for an improved user experience. DX NetOps Spectrum login authentication is now the primary authentication for allowed users who have enabled the LDAP integration. If this initial DX NetOps Spectrum login authentication fails, then the LDAP authentication takes place. DX NetOps Spectrum super users are by default allowed to log in with their DX NetOps Spectrum password, regardless of an LDAP account or the LDAP server availability.

LDAP User Group Authentication

From 10.4.2, you can log in to DX NetOps Spectrum when it is integrated with LDAP even if the user is not present in DX NetOps Spectrum. The user is automatically created in DX NetOps Spectrum during the first login. However, only those

users who are part of the configured LDAP user groups in DX NetOps Spectrum can log in automatically. In DX NetOps Spectrum, the administrator must manually create a user group in all the landscapes with the same group name and required privileges as present in LDAP.

IMPORTANT
Review the following points:

- The user model is created in DX NetOps Spectrum in all the available landscapes in which the user group is present.
- If any landscape is down when the user logs in, then you must manually create the user in the landscape when the landscape is available.
- If the user is removed from the LDAP server, then the user must be manually removed from the DX NetOps Spectrum user group in every landscape.
- If the user is moved from one user group to another in the LDAP server, then you must do it manually in the DX NetOps Spectrum groups. However, login of the user is not affected for the user even if the user is not moved in DX NetOps Spectrum.
- If the user is part of the multiple groups in the LDAP server and matched with the multiple groups configured in DX NetOps Spectrum, then the first matching group is considered for the user authentication. In this case, the order in which the LDAP server returns the user group names is random. Therefore, matching is not always the same.

Follow these steps:

1. Log in to OneClick Console.
2. Create a user group with the same name as present in the LDAP server.
3. Copy the **`ldap-grps-mappings-config.xml`** file from the `$SPECROOT\tomcat\webapps\spectrum\WEB-INF\ldap\config` directory to the `$SPECROOT\tomcat\custom\ldap\config` directory.
4. Edit the **`ldap-grps-mappings-config.xml`** file.
5. Set the property **`LDAPGroups authEnabled`** to **true** as shown in the following example:

   ```
   <LDAPGroups authEnabled="false">
   To
   <LDAPGroups authEnabled="true">
   ```

   NOTE
   If the LDAP groups are configured and the `LDAP groups authEnabled` property is not set to true, the LDAP user cannot be authenticated in DX NetOps Spectrum.
6. Add the group search tag and the search string for each LDAP group.

   ```
   <Group searchTag="memberOf" searchString="CN=group_name,CN=Users,DC=company,DC=local"/>
   ```

   NOTE
   Ensure that DX NetOps Spectrum contains the user group with the same name as in the LDAP server.
7. Save the file.
8. Restart the OneClick server.

MySQL Password Page

OneClick has its own MySQL Server users and passwords: a basic user (OC_user) and an administrative user (OC_admin). Both are used to access the MySQL reporting database on behalf of DX NetOps Spectrum applications such as Report Manager and Service Manager, but the administrative user can also grant privileges to other users for this database. For greater security, DX NetOps Spectrum provides the MySQL Password page which lets you change the passwords of the OneClick MySQL users.

WARNING
Do not attempt to manually change the MySQL user passwords using a MySQL client connection. Storage of the passwords in OneClick depends on MySQL connectivity. As a result, the only safe way to change the passwords is through the OneClick MySQL Password Administration page.

The MySQL Password page contains the following settings:

- **Default User**
  Specifies the credentials for the default OneClick MySQL Server user (OC_user) that DX NetOps Spectrum uses to access the reporting database used in OneClick web applications.
  - **Current Password**
    Specifies the current password for the OC_user MySQL user.
  - **New Password**
    Specifies a new password for the OC_user MySQL user.
  - **Confirm New Password**
    Confirms the new password for the OC_user MySQL user.
- **Admin User**
  Specifies the credentials for the administrative OneClick MySQL Server user (OC_admin) that DX NetOps Spectrum uses to access the reporting database used in OneClick web applications and grant privileges to other users for this database.
  - **Current Password**
    Specifies the current password for the OC_admin MySQL user.
  - **New Password**
    Specifies a new password for the OC_admin MySQL user.
  - **Confirm New Password**
    Confirms the new password for the OC_admin MySQL user.

OneClick maintains the MySQL server user credentials so that it can connect to MySQL. OneClick stores this password in an encrypted form for security purposes.

OneClick Client Configuration Page

OneClick uses the Java Web Start framework developed to launch the OneClick Console from the OneClick home page in a browser. To determine how to launch the OneClick Console (for example, the location of necessary JAR files), the Java Web Start framework relies on several Java Network Launching Protocol (JNLP) configuration files for the launch parameter values.

The OneClick Client Configuration page lets you configure settings associated with the OneClick client. These settings are used by the JNLP files which are located in the directory at the following location:

```
C:\win32app\SPECTRUM\tomcat\webapps\spectrum
```

Any modifications that you make to the JNLP files are saved to custom files in the following directory:

```
$SPECROOT\custom\common\config
```

- **Supported JRE Versions**
  Specifies which versions of JRE can be installed on the client to start OneClick. If none of the specified versions are installed, the user cannot start the OneClick Console from the OneClick home page and, instead, receives an error message. Multiple JRE versions can be specified as needed. When multiple JRE versions are specified, Java Web Start processes precedence from the top of the list to the bottom of the list.
  - **Allow new versions**
    Allows OneClick clients to run any JRE version beyond the specified required JRE, including both major and minor JRE releases. Please be advised, as with any custom JRE configuration, using a JRE version other than the version which is provided to you could result in undesirable application behavior.

    NOTE
    DX NetOps Spectrum supports a documented minimum JRE version level, and supports running the OneClick user interface in that minimum version, or in any later version, unless noted otherwise in the product documentation. We also test with new JRE versions as they become available and update

the product documentation, the online Support knowledge base, or both, if specific JRE versions are incompatible.

- **Java Memory Usage**
  The Java Memory Usage section lets you set the minimum and maximum size of the object heap for the Java Virtual Machine used by OneClick clients. For more information, see Configure OneClick Client Memory Settings.
  - **Minimum Client Memory Usage (megabytes)**
    The minimum amount of memory, in megabytes, that must be available on the client to start OneClick.
    Default: 96
  - **Maximum Client Memory Usage (megabytes)**
    The maximum amount of memory, in megabytes, that OneClick can use on the client.
    Default: 1024
- **OneClick Client Inactivity**
  Lets you configure OneClick to check clients for inactivity and time inactive clients out. This feature is disabled by default. If enabled, when timeout occurs, users can enter their username and password to continue using the OneClick client. Inactivity is determined by the absence of keyboard or mouse activity is detected for the specified amount of time.

Enable Inactive OneClick Client Timeout

You can configure DX NetOps Spectrum to check OneClick clients for inactivity and time out those clients that have been inactive for a specified amount of time. This setting can enhance network security. For example, if a user leaves the OneClick client running unattended on a desktop, it times out.

Follow these steps:

- Click Administration in the OneClick home page.
  The Administration Pages open.
- Click OneClick Client Configuration.
  The OneClick Client Configuration page opens.
- Complete the settings in the OneClick Client Inactivity section as needed:
  - **OneClick Client Inactivity Timeout (minutes)**
    Specifies the number of minutes of inactivity to allow before timing out (logging off) a OneClick client.
    Default: 0 (Disabled)
  - **Applet Inactivity Timeout (minutes)**
    Specifies the number of minutes of inactivity to allow before timing out (logging off) an applet.
    Default: 0 (Disabled)

    NOTE
    If you have OneClick clients that are dedicated to network monitoring and inactivity is likely, you can remove the Inactivity Timeout privilege for a user. The user cannot receive a timeout if the timeout setting has been specified.
- Click Save.
  Timeout of inactive OneClick clients is now enabled.

Performance Center Integration Configuration Page

The Performance Center Integration Configuration page lets you configure event sharing between DX NetOps Spectrum and CA Performance Center.

The Performance Center Integration Configuration page contains the following settings:

- **Event Polling Interval**
  Specifies how frequently DX NetOps Spectrum queries the Performance Center Event Manager component for events. If you modify this value, the new polling interval takes effect at the next polling cycle.

Default: 60 seconds

- **Event Polling**
  Enables or disables event polling.

  NOTE
  For more information, see CA Performance Management and DX NetOps Spectrum.

SDN Gateway Integration Configuration Page

The SDN Gateway Integration page lets you configure CA Virtual Network Assurance to view both virtual network data and traditional physical infrastructure data. The CA VNA collects data from all your SDN environments and delivers that information to DX NetOps Spectrum.

DX NetOps Spectrum and CA VNA integration lets you access SDN inventory via a single point of integration. The integration uses VNA Client API (uses webSocket) to connect to VNA and UDM (Unified Data Model) to access the data.

The SDN Gateway data source contributes the following item types to DX NetOps Spectrum:

- Topology
- SFC View
- Inventory updates (includes SDN entities and their status information)

For more information about SDN, see the CA Virtual Network Assurance documentation.

Service Desk Configuration Page

You can view, configure, test, and save DX NetOps Spectrum and supported Service Desk application integration settings using the Service Desk Configuration administration page.

NOTE
Before configuring OneClick to connect to CA Service Desk Manager and ServiceNow, download and install the integration components on your Service Desk/ MDR server.

You can create and modify CA Service Desk Manager server and admin user parameters, enable and disable the DX NetOps Spectrum and CA Service Desk Manager integration, and add and remove DX NetOps Spectrum alarms that generate CA Service Desk tickets. For more information on integrating DX NetOps Spectrum with supported Service Management applications including CA Service Desk Manager, see How to Install and Configure the Integration.

Single Sign-On Configuration Page

The Single Sign-On Configuration page lets you enable and select a Single Sign-On option for DX NetOps Spectrum. DX NetOps Spectrum supports Single Sign-On using CA Embedded Entitlements Manager (CA EEM) or CA SiteMinder®.

When you save changes to these configuration settings, the OneClick server is automatically restarted in order to apply the changes. If you encounter errors during the restart, see Start and Stop the OneClick Web Server from an Administration Web Page for troubleshooting tips.

DX NetOps Spectrum Configuration Page

You can view and set the following DX NetOps Spectrum configuration parameters:

- Main Location Server Name
- Backup Location Server Name
- Admin User Name
- SpectroSERVER Polling Interval (sec)
- SpectroSERVER Request Timeout (sec)
- The properties of the object request broker (ORB) used by the OneClick web server for CORBA-based communication with the SpectroSERVER
- Use Secure CORBA (SSL) for DX NetOps Spectrum Communication
  The default value is No. Select Yes to enable Secure SSL.
  You will be prompted to restart the OneClick Server. Please restart the OneClick server to enable secure communication. For more information about additional Firewall rule requirements to make this SSL communication work, see the How to Configure CORBA SSL Ports KB Article.

  NOTE
  You can also restart the OneClick server so that any modifications that require a restart can take effect. If you encounter errors during the restart, see Start and Stop the OneClick Web Server from an Administration Web Page for troubleshooting information.

For more information about the implementation of Common Object Request Broker Architecture (CORBA) in DX NetOps Spectrum, see the Development API Reference .

SPM Data Export Page

The SPM Data Export page lets you change the following settings for SPM (Service Performance Manager) Data Export:

- **SPM Data Export Enabled**
  Specifies whether SPM Data Export is enabled or disabled. You must enable it to modify all the other settings.
- **Log File Cycle Time (min)**
  Specifies when (in minutes) the SPM log file is saved and closed, and a new file is opened for logging.
- **Log File Directory**
  Sets the full path to the directory where SPM log files are stored. The directory structure specified must be created prior to saving.
- **Choose Test Result to export**
  Lets you specify whether you want to export the minimum, maximum, or/and average value of the IP SLA tests. Based on the selected option, the corresponding data is exported. You can view the same result in the SPMResult file, which is created in the specified directory. These values are picked up from the SPM result events that are created for these tests. By default, the average value is exported.
- **Landscape Filter**
  Specifies which landscapes SPM data is obtained from.
- **Restart OneClick Server**
  Restarts the OneClick server so that any setting changes that require a server restart can take effect.

SPM Template Naming Page

This page allows you to specify the naming convention for tests created on test hosts that have had a SPM test template applied to them:

- **IP Address**
  The test name consists of the template name and the IP address of the test target, which may be the test host or a particular device.
- **Model Name**
  The test name consists of the template name and the model name of the test target, which may be the test host or a particular device.

NOTE
For information about working with SPM test templates, see Service Performance Manager.

SSL Certificates Page

You can use the SSL Certificates page to view and add SSL certificates used by the OneClick web server.

- **File with Certificate**
  Uploads the new key certificate you want the OneClick webserver to use.
- **Alias Name**
  Specifies a short name for the certificate. This name should be consistent with some of the other commands that may need to be used with it. For example: “ldap” when setting up ldap; “ssl” or “tomcat” when setting up web server SSL.

  NOTE
  For LDAP configuration information, see LDAP Configuration. For OneClick SSL configuration, see Name Resolution Requirements.
- **Overwrite**
  Specifies whether to overwrite an existing certificate with this new certificate. To overwrite an existing certificate, you must load the new certificate with the same alias name of the existing certificate.
  - **Yes**
    Overwrites the existing certificate.
  - **No**
    Does *not* overwrite the existing certificate.
- **List**
  Opens a list of certificates already added to the Keystore. Certificates are listed by alias name.
- **Save**
  Saves your changes and prompts you to restart the OneClick web server.

UIM Configuration

The UIM Configuration page allows you to set up and configure the DX NetOps Spectrum integration with CA UIM. You need to specify details for the following fields to enable the integration.

- **UIM Server Host Name**
  Indicates the IP address/hostname of the UIM Server.
- **UIM Server Port**
  Indicates the server port number of CA UIM.
- **UMP Server Host Name**
  Indicates the IP address/hostname of UMP.
- **UMP Server Port**
  Indicates the server port number of UMP.
- **UMP Server Protocol**
  Indicates the network protocol of the CA UMP server.
- **UIM Group Name**
  Indicates the group name that is available in UIM Server.
- **SpectroSERVER** drop-down list
  Allows you to select the SpectroSERVER where the new UIM Host models are to be created.
- To enable the integration(s), select the required options in the UIM Integrations section:

1. – **VMWare Management** - enables integration of VMWare from CA UIM
   – **Server Management** - enables integration of Servers from CA UIM
   – **DX NetOps Spectrum-UIM Bidirectional Management** - enables the DX NetOps Spectrum-CA UIM bidirectional integration, allowing inventory and alarm synchronization.

Watch Reports

The Watch Reports page lets you generate reports about multiple watches. A *watch* is a mechanism for adding thresholds for model attributes. Watches let you monitor network elements, such as routers, with a high level of detail. They also provide current data that can be used with other DX NetOps Spectrum tools in network analysis.

> **NOTE**
> For more information, see Watches.

Web Server Logs Configuration Page

You can use the Web Server Logs Configuration page to view and set OneClick server log file rotation settings. The OneClick web server log files are located in the following <$SPECROOT>/tomcat/logs directory.
Tomcat Log: C:\win32app\Spectrum\tomcat\logs
Webtomcat Log: C:\win32app\Spectrum\webtomcat\logs

You can set an alarm notification when the log file directory becomes larger than a specified size in megabytes. You can view the current size of the log file directory. You can specify the age in days at which a log file is deleted from the directory.

Purge Tomcat and Webtomcat Log Files

From 10.4.2.1, when the Alarm logs directory exceeds the set threshold, an alarm is displayed with the threshold value. Irrespective of the file size when the threshold value set for `Purge log files older than` is reached, the old log files are deleted.

Web Server Memory Page

You can use the Web Server Memory page to view and set the maximum amount of memory the OneClick server uses. Any changes you make require you to restart the OneClick server. You can also view the percentage of the maximum memory allocation the OneClick server is currently using.

> **NOTE**
> You can also restart the OneClick server so that any modifications that require a restart can take effect. If you encounter errors during the restart, see Start and Stop the OneClick Web Server from an Administration Web Page for troubleshooting information.

Web Server Performance

The **Web Server Performance** page displays the '**Infer Pipes in Global Collections**' option. By default, this option is set to "**Yes**". This option creates pipes between devices that are connected through Wide Area (WA) Links, even when the link is not contained in the Global Collection.

You can disable this option if the GC topology rendering is slow.

Select "**No**" from the drop-down list, and then click the **Save** button.

This will prevent the pipes from being drawn between devices that are connected via WA links when the link is not contained in the Global Collection.

Web Server Performance Graph

The **Web Server Performance Graph** page is designed to view OneClick Server Performance data in a graphical format. This option allows DX NetOps Spectrum Administrators to monitor real-time OneClick Server performance information directly from the OneClick web page.

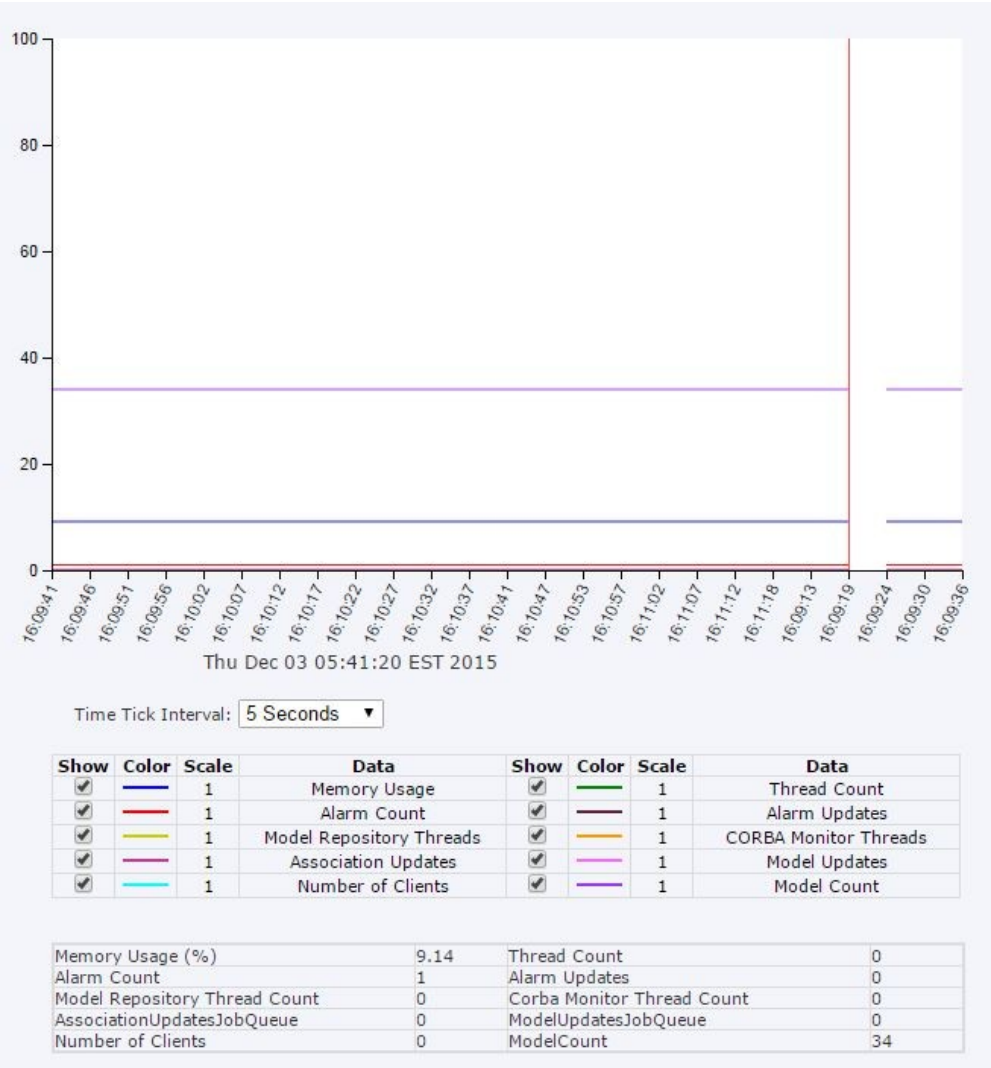
Using this live graph, DX NetOps Spectrum Administrators can diagnose OneClick performance issues. The default refresh time interval for the graph is set to 5 seconds. You can modify the refresh interval time using the 'Time Tick Interval' drop-down list. In this graph, X-axis shows time interval, and Y-axis shows performance data.

NOTE
In 10.1, only real-time monitoring is supported.

Only Administrators can access the Web Server Performance Graph page.

Follow these steps:

1. Log in to OneClick as an Administrator.
2. Click Administration, Debugging.
3. Select the ‘Web Server Performance Graph’ in the left panel.



Metrics:

Following are the available metrics for Web Server Performance Graph. You can select or clear the check box available for each of these metrics to show or hide the performance details of these metrics.

- **Memory Usage (%)** - Percentage of system memory being used by OneClick Server.
- **Thread Count** - Total number of threads spawned by OneClick Server.
- **Alarm Count** - Number of alarms being processed.
- **Alarm Updates** - Number of alarm updates being processed.
- **Model Repository Thread Count** - Number of model repository threads.
- **CORBA Monitor Thread Count** - Number of CORBA monitor threads.
- **Association Updates Job Queue size** - Size of association updates job queue.
- **Model Updates Job Queue size** - Size of model updates job queue.
- **Number of Clients** - Number of OneClick clients.
- **Total Model Count** - Count of total models.

The GIS View

The GIS (Geographical Information System) View displays device models geographically on the Google maps. You can view the model name and model handle details of a device when mouse over on that device in this view. When you click the device in this view, it displays the device details in OneClick. The condition of the device model is also highlighted. For example, a device model with the critical condition is displayed in red color. By default, the map focuses on the USA.

NOTE

The GIS View feature does not work if you integrate DX NetOps Spectrum with CA SiteMinder SSO.

You can configure the default location by entering your favorite location in gisGC.config file. The source of input for GIS View is Global Collection (GC) or list of IP addresses. The default primary source is GC. You can configure the default source to IP address list by modifying the 'UseGisGCconfig=no' in gisGC.config file.

Enter the IP addresses for which you want DX NetOps Spectrum to display GIS view in the following files:

For GC:

```
$SPECROOT/tomcat/webapps/spectrum/console/gisGC.config
```

WARNING
We recommend using a unique name for GC

For IP addresses list:

```
$SPECROOT/tomcat/webapps/spectrum/console/gisIPAddressList.config
```

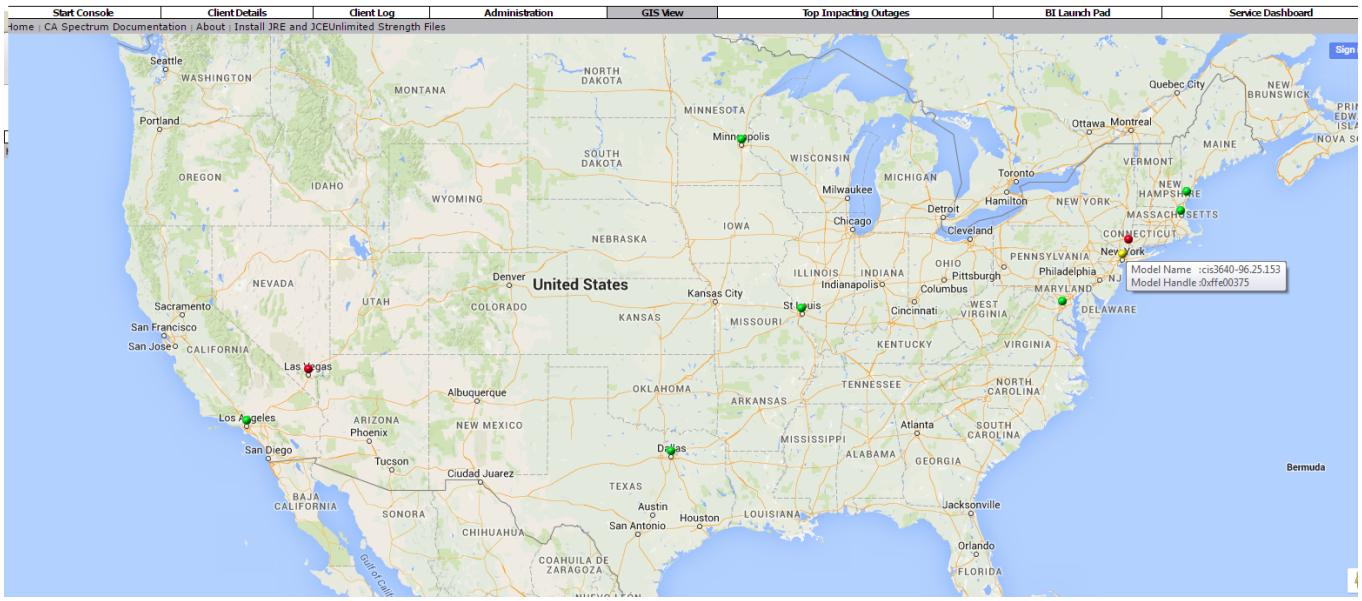
NOTE

- The free version of Google's APIs allows you to view limited number of devices (as per Google API policy) in GIS View.
- Google requires an API key, to enable the Google Maps usage embedded in Websites. You must request for the API key from Google APIs page, and then update the following file with new API key. (applies for both free and enterprise use)

  ```
  $SPECROOT\tomcat\webapps\spectrum\console\googleAPIKEY.config
  ```

  UseLicense=Yes
  API_KEY=<new_api_key>
  Replace the "<new_api_key>" with the API key obtained from Google APIs. Save and close the file.
- We recommend to configure hundred or less devices for GIS View.

The following image shows how the GIS View looks like:



User Administration in OneClick

This section discusses the ways in which user administration is performed in Oneclick.

About OneClick User Administration

User administration involves creating and managing OneClick user accounts. As the OneClick system administrator, you must create a user account for each new user you want to access the system.

As you create new user accounts in OneClick, you can add them within user groups or as stand-alone users. When you have multiple users with similar needs, consider creating user groups to manage their user accounts. When you have users with unique needs, you may want to create user accounts independent of user groups.

Best Practices for Creating and Managing User Accounts

This section describes some best practices for creating and managing user accounts in OneClick.

> **WARNING**
> OneClick includes a default Administrator user with full privileges. This user is the Installation Owner account that you created during SpectroSERVER installation. You cannot delete this user from the Users tab. However, you can delete this account from the Results list that is displayed after a search using the Locater tab. You can also delete this user by removing the landscape of the main location server from the user account. *Do not remove this default Administrator user. Deleting this user produces undesirable results, such as preventing access to OneClick for all other users*.

The benefits of creating and managing individual user accounts include:

- Simplest method
- Best for environments with a small number of users
- Best for users with unique OneClick access requirements
- Individual user accounts can be moved to a user group later if needed

Creating and Managing User Accounts Within a User Group

The benefits of creating and managing user accounts within user groups include:

- Best for environments with a large number of users. Lets you group multiple users by geographic area, function, department, and so on.
- Ability to grant all users within a group the same access and privileges at one time. You can define a minimum set of privileges that all users within the group should have. Then, you can customize the individual privileges of any user in the group.

Consider the following example of creating a user group:

Task:

Within OneClick, you want to grant network operators one set of minimal privileges that enable them to monitor the network. You also want to grant one of these network operators the additional privilege of modeling the network in OneClick.

Solution:

By creating one user group you can easily satisfy this requirement. To configure this requirement in OneClick, you would do the following:

1. Create one user group and place all the user accounts for the network operators in the user group.
2. Grant everyone in the group minimal monitoring privileges.
3. Grant only the one network operator in the group the modeling privilege.

Who Can Perform User Administration?

The OneClick administrator must configure user administration in OneClick. Initially, this configuration must be performed by the user who installed DX NetOps Spectrum (the Installation Owner user). During the installation, DX NetOps Spectrum creates a user account for the Installation Owner. Using this account, this initial user has administrative access to all OneClick features, including user management.

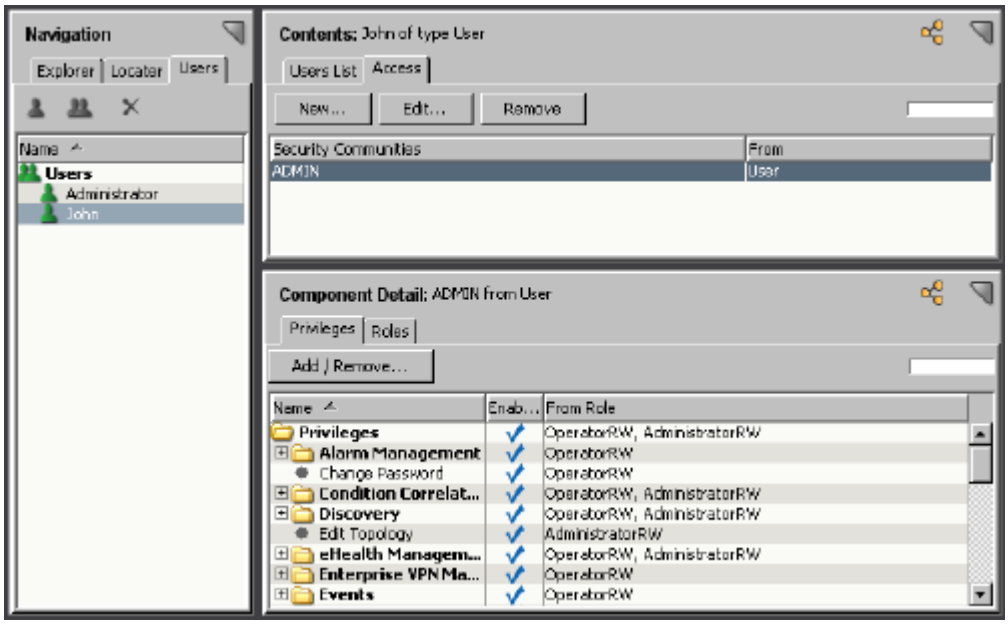
If you are not the initial user but are responsible for user administration, the Installation Owner user must create an administrator account for you. Your account must include an Administrator license and the appropriate user management privileges.

Licenses and Privileges

OneClick includes a set of Administrator licenses and Operator licenses. These licenses determine the privileges that a system administrator can assign to a OneClick user. The privileges that are available with a given license are enabled by default. As the system administrator, you can choose to leave these privileges enabled or you can individually disable them, customizing license privileges.

OneClick User Administration Interface

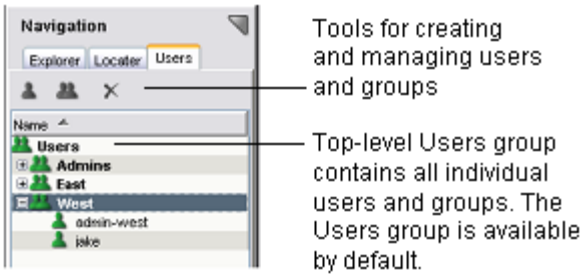
As the OneClick system administrator, you create and manage users within OneClick using options available from the Users tab, as shown in the following image.



Users Tab

The Users tab displays a hierarchical list of users and user groups under the top-level Users group. Initially, after installing DX NetOps Spectrum, the Users tab lists only the top-level Users group and the initial DX NetOps Spectrum user who installed DX NetOps Spectrum (the Installation Owner user) under the Users group.

From the Users tab, you can create and manage user accounts using the tools on the toolbar above the list of users and user groups.



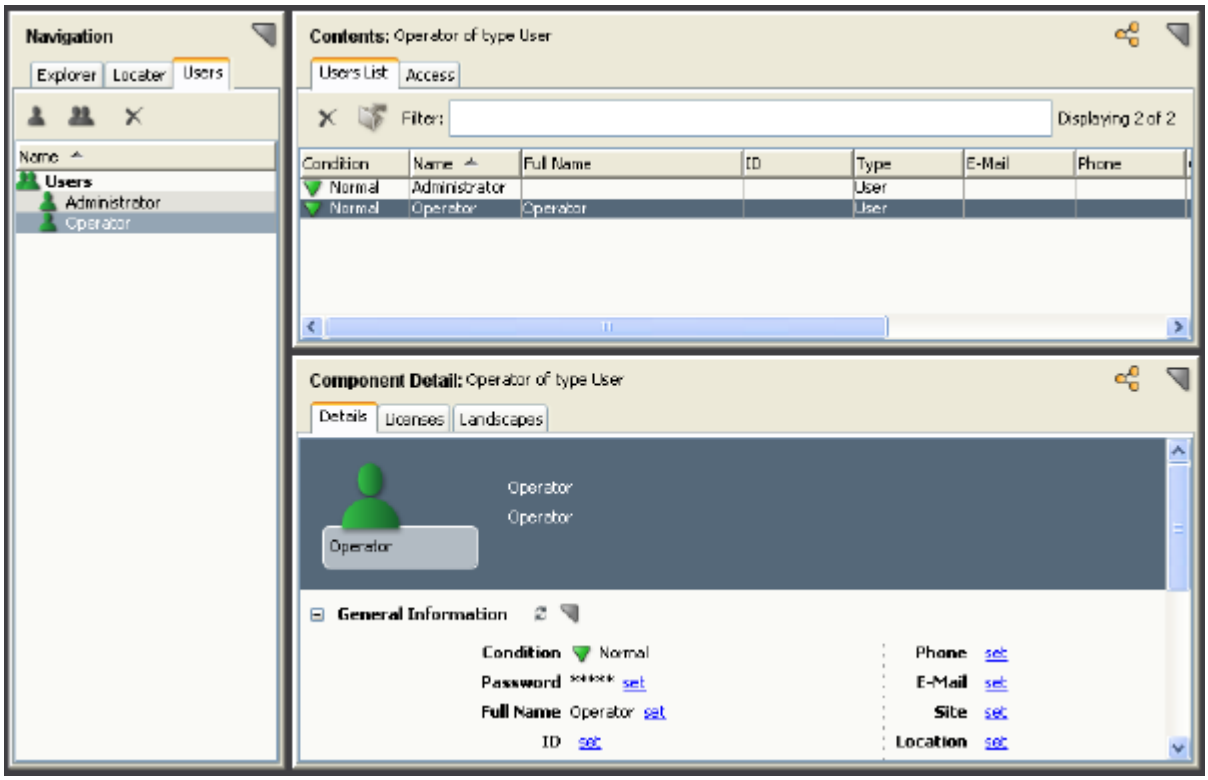
To manage an existing user or user group in OneClick, select it on the Users tab of the Navigation panel. When you select a user or user group on the Users tab, the Users List and Access tabs appear in the Contents panel.

Users List Tab

The Users List tab displays a list of users and user groups for the current landscape along with information about each entry displayed in columns. You can customize this table view by selecting the columns display and by changing the sort order of the table based on the content of a column.

> **NOTE**
> See the Using OneClick section for more information about customizing table views.

When you select the Users List tab, the Details, Licenses, and Landscapes tabs appear in the Component Detail panel, as shown in the following image.



- **Details tab**
  Lets you view information about the selected user or group in the Details tab of the Component Detail panel. The following subviews are available for both users and user groups:
  - **General Information**
    Specifies general information for the selected user or group. Values for certain attributes such as contact information can be set by clicking a ‘set’ link and entering a new value.
  - **Advanced**
    Specifies the following attributes, used for troubleshooting issues with distributed models:
  - **Master Model Handle**
    Specifies the model on the master (or root) landscape that maintains the master copy and is responsible for distributing changes.
  - **Home Model Handle**
    Exists on the landscape that is designated as the home. The master model is typically the home except if the master model was not explicitly created, in which case, a 'hidden' model is implicitly created on the master landscape and one of the other landscapes is designated as the home. The home is not used for distribution but is maintained for legacy purposes.
  - **Duplicate Model Handle List**
    Contains the models from all other landscapes, excluding the home, on which this distributed model exists.
  - **Synchronize Now**
    Synchronizes all the distributed models with the master. In general this will be done automatically but is provided as a button in case it needs to be done manually.

  The following subview is only available when a group is selected:
  - **User Inherited Attributes**
    Specifies the attributes that users will inherit from the selected group.

  The following subview is only available when a user is selected:
  - **LDAP Configuration**
    Specifies whether OneClick users can log in locally if they are not present in the LDAP directory.

NOTE
Super users with passwords set in OneClick can log in locally regardless of this setting.

- **Licenses tab**
  Lets you view and edit licenses for the selected user or group.
- **Landscapes tab**
  Lets you view and edit landscape membership for the selected user or group.

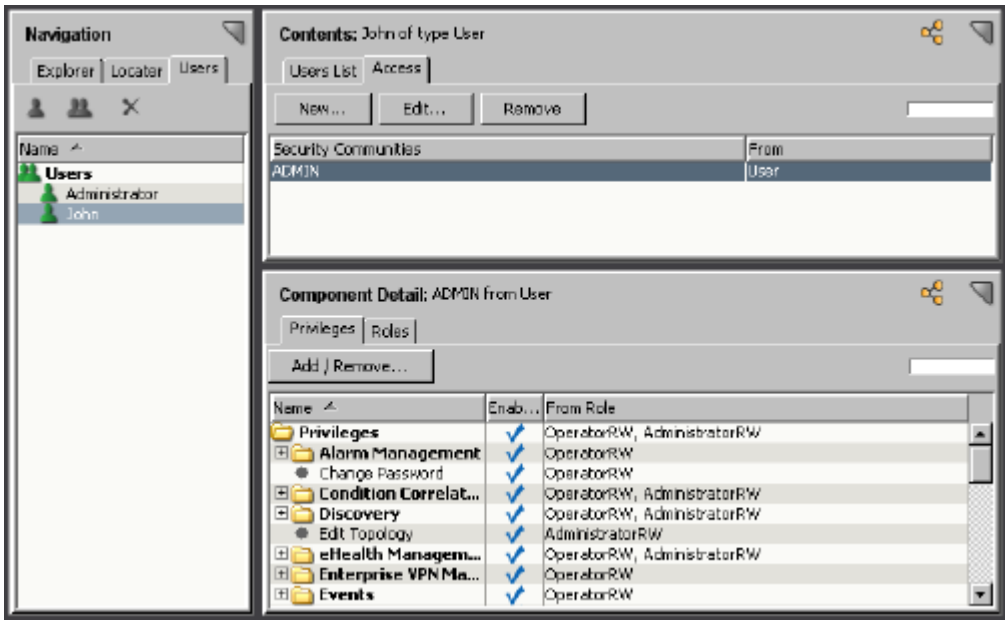
From the Users List tab, you can also do the following:

- Delete the selected user or group.
- Export the Users List tab.

Access Tab

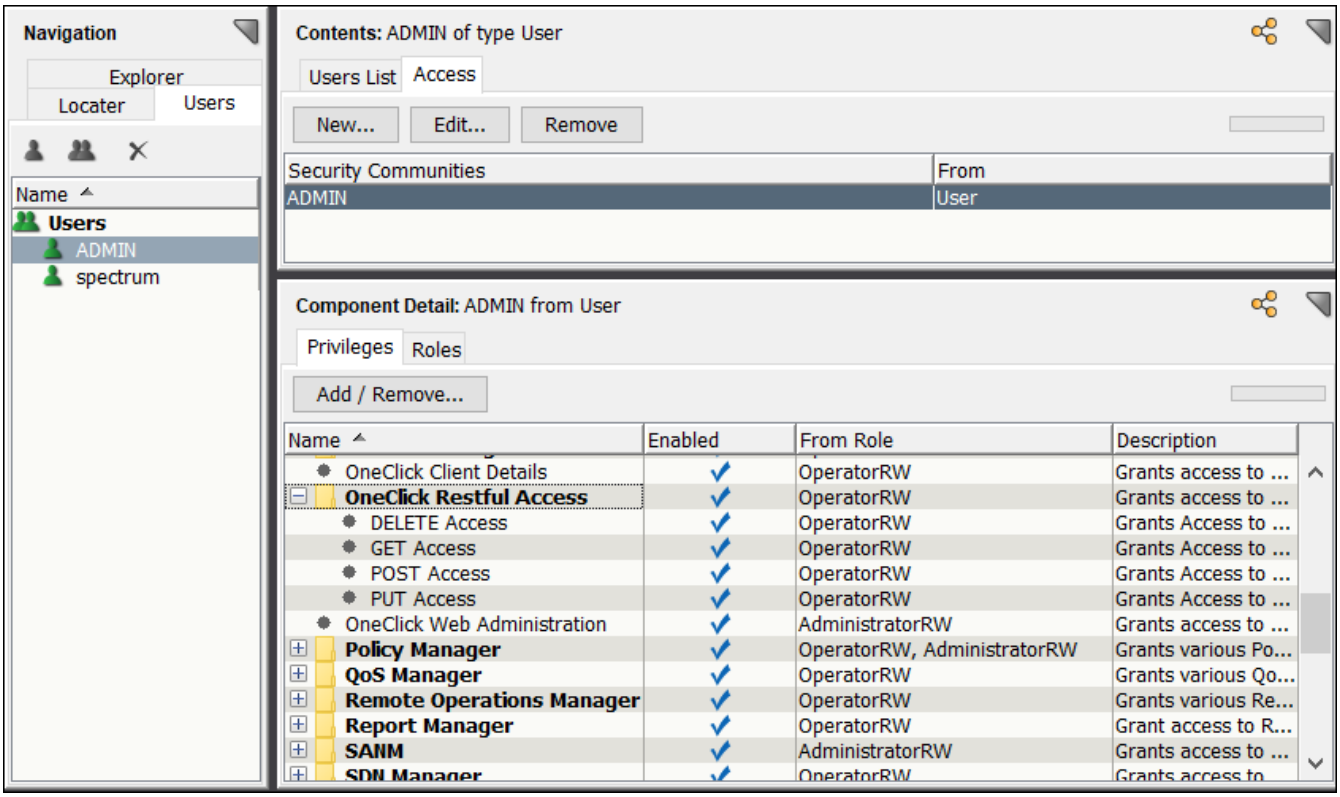
The Access tab in the Contents panel displays the list of security communities assigned to the selected user or user group. Security communities are a tool you can use to limit user access to specific sets of models and views in OneClick. The source of each assigned security community is displayed either from an individual user or a user group.

When you select the Access tab, the Privileges and Roles tabs appear in the Component Detail panel, as shown in the following image.



View and Change Privileges

Access groups appear on the Access tab for a selected user as shown in the following image.



With an access group selected for a user, the available privileges appear in the Privileges tab of the Component Detail panel.

The example Component Detail label shows that these privileges are associated with the selected ADMIN access group at the user level (ADMIN from User). A checkmark is displayed in the Enabled column for each privilege granted to this user. The From Role column shows that all of these enabled privileges are being granted by the OperatorRW role.

Clicking Add/Remove lets you enable and disable privileges for this user at the selected ADMIN access group. You cannot use Add/Remove at the user level to manage privileges for an access group that is inherited from a user group.

Effects of Customizing Privileges

In OneClick you can customize the privileges assigned to an individual user account and/or a user group. When you edit privileges for an individual user account, the changes only affect that user. When you edit the privileges assigned to a user group, the change affects all users within that user group. Users within a group automatically inherit privileges from the group but also retain all assigned individual-level privileges.

You can add privileges to an access group at the user level for users that are members of a group. You can also edit privileges for an access group at the user group level. You cannot remove privileges at the user level that are granted to the user by a user group.

Effects of Removing Privileges Granted by a Role for a User

When you customize the privileges granted by a role for a user, the user is removed from the role. The user retains any privileges granted by the role that is not removed. The role itself does not change. If the privilege is added back for the user, the user does not regain membership in the role.

Customizing the privileges granted by one of the default DX NetOps Spectrum roles (such as AdministratorRW or OperatorRW) for a user -- which also results in the removal of the role from the user and the direct assignment of the remaining, enabled privileges -- has additional consequences:

- If you later create a custom privilege for the default role, which is an assignment specified in the XML file that defines the privilege, the privilege is not automatically granted to the user.
- If you later upgrade DX NetOps Spectrum, any new privileges available in the newer version of DX NetOps Spectrum that are associated with the default role are not automatically granted to the user.

In either situation, to grant the custom or new privileges to the user, you must either explicitly add them to the user or reassign the default role to the user.

Example: For a new privilege role called "SPECTRA", restrict and allow access to some global collections.

Solution: First, create a community name called "SPECTRA". After creating it, select the "global collections" and other required privileges during the privileges selection. And, do the following:

- For each global collections that SPECTRA should see, set the Security String: ADMIN|SPECTRA
- For other global collections that SPECTRA should not see, set the Security String: ADMIN

Manage Users Within User Groups

An excellent way to manage multiple users in OneClick is with user groups. After you have created a user group, you can configure it to provide a minimum set of user privileges for all users within that user group. Each user account you place within this group automatically inherits the group-level privileges.

Inheritance Details for Users in User Groups

Users within a user group inherit the following values from the user group:

- Security community
- Legacy SNMP community string
- Access groups
- Privilege roles
- Attributes specified by the administrator

The following special considerations apply to users contained within user groups:

- Any changes made at the group level are automatically inherited by users within the group.
- Membership in DX NetOps Spectrum landscapes is not inherited from the user group. This must be set at the individual user level.

Specify Inherited Attributes

You can specify the attributes that you want users to inherit from the groups to which they belong.

Follow these steps:

1. Click the Users tab in the Navigation panel.
   The Users List opens in the Contents panel.
2. Select the group containing the users whose inherited attributes you want to specify.
   The Details tab displays the User Inherited Attributes subview.
3. Expand the User Inherited Attributes subview.
   The list of attributes currently applied to users in this group is displayed.
4. Click Edit the Common Attributes
   icon 
   The Common Attributes Editor opens.
5. Double-click the attributes in the Available Attributes list that you want users to inherit.
   The attributes are moved to the Selected Attributes list.

6. Click Save.
   The Common Attributes Editor closes and the selected attributes appear in the User Inherited Attributes list; users in this group will now inherit the values of these attributes.

Create User Accounts and User Groups

When you create a new user or user group, OneClick assigns an Operator license and the OperatorRW privilege role to the new user or user group by default. When you create a new user or group you can choose to assign an Administrator license in addition to the Operator license. When you assign an Administrator license to users or groups, the users automatically inherit all of the privileges associated with both the OperatorRW and the AdministratorRW privilege roles.

To start administering user accounts in OneClick, create users with OneClick default settings. When you create a user or a user group, OneClick assigns an Operator license and the ADMIN security community by default. You can selectively replace the ADMIN security community by modifying users to give them access only to the devices and containers that they manage.

By default, no security is applied to models. To restrict access to a model, add a security string to that model. You can create administrators by adding the ADMIN security string to a universe model and verifying that the appropriate users have access to the ADMIN security community.

Create a new user account or user group using the default privileges that the operator or administrator license provides.

Follow these steps:

1. In the Users tab of the Navigation panel, take *one* of the following steps:
   - **Create a stand-alone user.** Select the top-level Users node and click the Create New User button.
     The Create User dialog opens.
   - **Create a user group.** Select the top-level Users node and click the Create New User Group button.
     The Create Group dialog opens.
   - **Create a user within a group.** Select an existing user group in which you want to create a user and click the Create New User button.
     The Create User dialog opens.
2. Specify the appropriate user information for the user or user group.
   - **Name**
     Specifies the user name for the new user or group. For OneClick users that are present in the configured LDAP directory, this name must match the LDAP user logon name of the user.
   - **Full Name (Create User only)**
     Specifies the full name of the user.
   - **Web Password (Create User only)**
     Specifies a web password for this user. This password is used by OneClick to authenticate this user. For OneClick users that are present in the configured LDAP directory, this password is not used.
   - **Confirm Web Password (Create User only)**
     Confirms the web password you entered when you enter it again in this field.
3. In the Licenses tab, select the licenses that you want to assign to this user or group in the appropriate Member Of check box. By default, new users receive an Operator license and the OperatorRW privilege role.
4. Click the Landscapes tab to configure landscapes for this user or group.

   NOTE
   By default, all available landscapes are selected. In a distributed environment, you can choose additional landscapes in which you want this user to be present. At least one landscape must be selected.
5. Click the Access tab to edit the default model security setting for this user or group.

At least one security community, such as the default ADMIN community, must be specified here. By default, the user or user group receives the read/write ADMIN access group, which gives them access to all models.

6. (Optional) Create additional access groups for the user.

   NOTE
   Models have blank security strings by default. We recommend adding security strings to individual models or containers and using the corresponding security communities to selectively grant user access to models.

7. Click OK in the Create User or Create Group dialog.
   The new user or group is created and displayed in the Users tab of the Navigation panel.

About Creating, Editing, and Assigning Roles and Privileges

You can individually disable and enable privileges for a user or user group. You can also use roles to grant a set of privileges to a user or user group. You can use the default privilege roles in OneClick, or you can create your own custom privilege roles; however, you cannot edit the default privilege roles themselves. After users are assigned a license category, they can have access privileges provided by the predefined roles.

There are six default roles:

- **AdministratorRW**
  (Read/write) Grants privileges required to set up DX NetOps Spectrum and its users, as well as perform all network management tasks. This is the least restrictive role. Some examples include the ability to perform device discovery, model management, topology configuration, eHealth integration management, device certification, and user configuration.
- **AdministratorRO**
  (Read-only) Grants privileges required to access DX NetOps Spectrum modeling and attribute information. Some examples include the ability to view SNMP community strings and SNMPv3 security profiles.
- **OperatorRW**
  (Read/write) Grants privileges required to perform most typical tasks for network management using DX NetOps Spectrum. Some examples include alarm management tasks, Service Performance Manager tasks, and most Network Configuration Manager tasks.
- **OperatorRO**
  (Read-only) Grants privileges that allow the user to monitor network activity and perform limited network management tasks. Some examples include the ability to snooze alarms and to view topology information.
- **Service ManagerRW**
  (Read/write) Grants privileges that allow access to the Service dashboard, as well as the ability to edit Service Outages.
- **Service ManagerRO**
  (Read-only) Grants privileges that allow access to the Service dashboard.

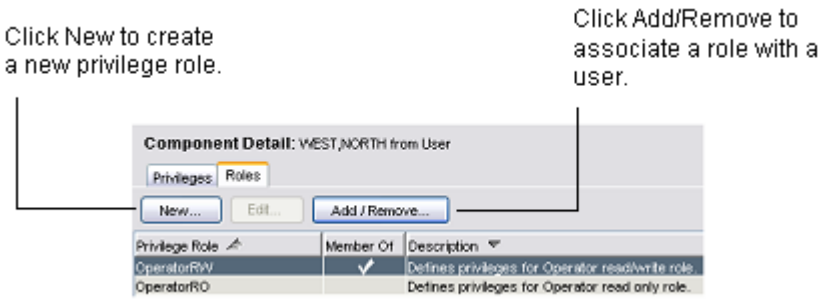
If these predefined roles do not meet your requirements, you can create custom roles. Although you cannot modify the predefined roles, you can modify individual privileges.

Note: When you upgrade to a newer version of DX NetOps Spectrum, any new privileges available in the newer version are automatically added to the appropriate default roles. However, you will need to explicitly add them to any custom roles you may have created, as applicable.

When you edit privileges for an individual user, the changes only affect that user. When you edit the privileges granted by a user group, the changes affect all of the users within that user group. Users within a user group inherit privileges from the group level.

To edit privileges and roles, you modify settings in the Privileges tab and/or the Roles tab for a selected user, as shown in the following image.

In addition to editing individual privileges, you can also grant multiple privileges at one time by assigning a privilege role using the Roles tab, as shown in the following figure.



The default roles included with OneClick and the custom roles that you create are reusable and can be assigned to one or more users. The OperatorRW privilege role automatically grants the privileges provided with the Operator license.

Create and Assign Roles to Users or User Groups

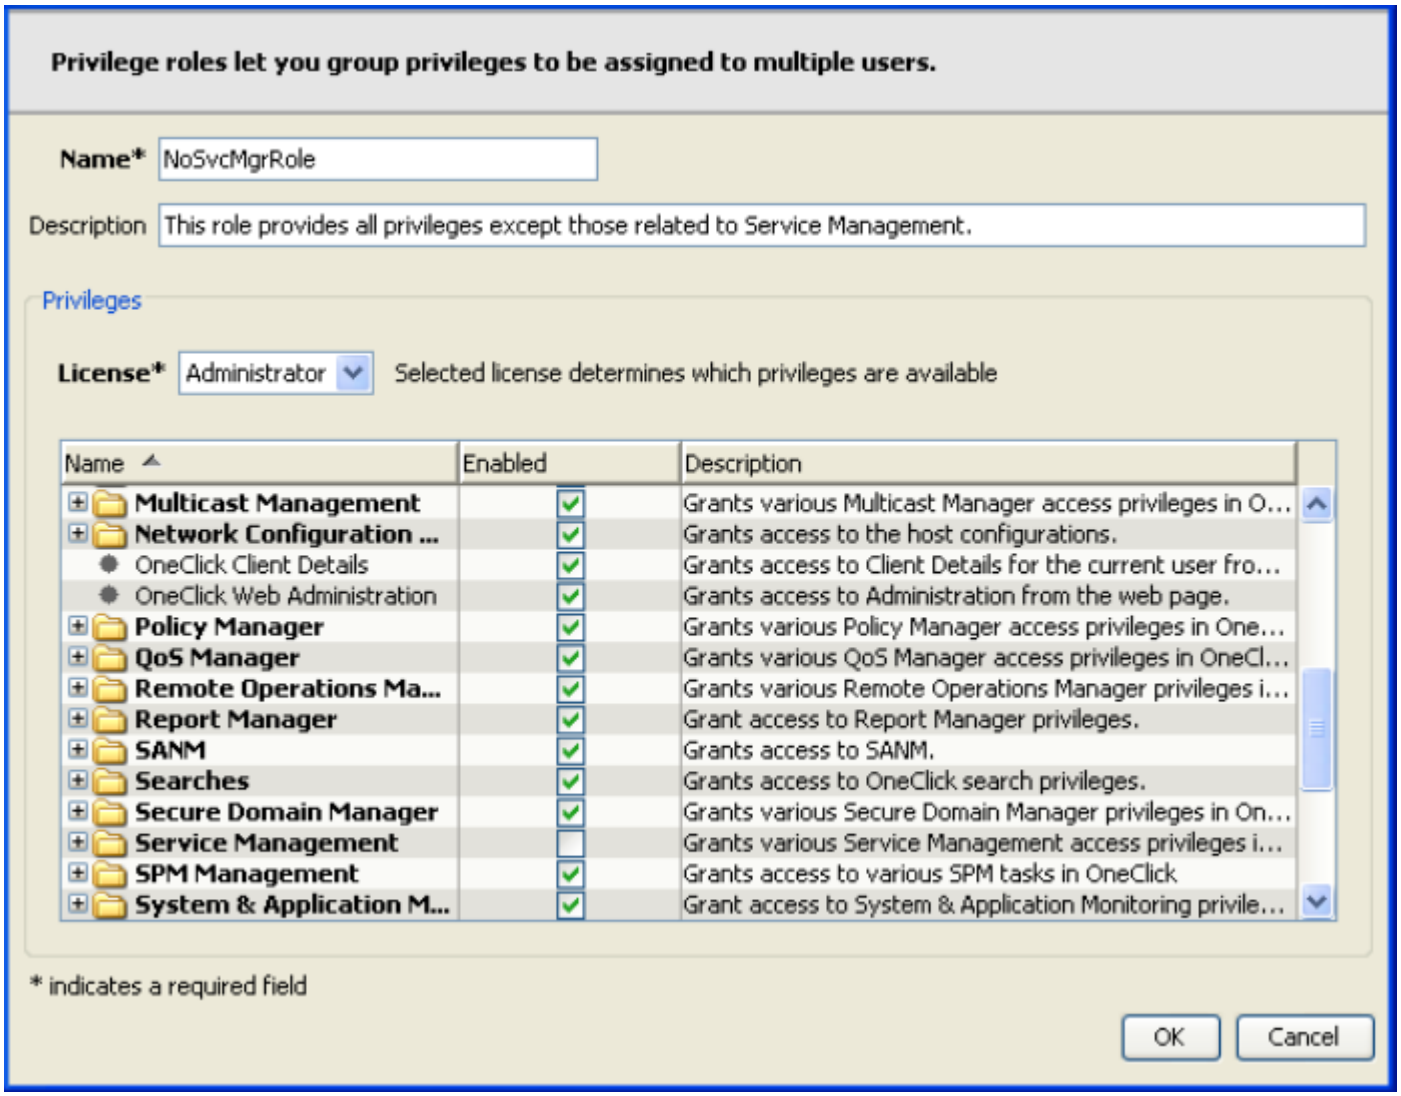
You can create a custom privilege role and then associate it with a user or group. The role has no effect until it is associated with a user account or user group.

You can create a custom privilege role.

Follow these steps:

1. Select a user in the Users tab of the Navigation panel.

   NOTE
   To create an Administrator-licensed privilege role, select a user with the Administrator license. To create a privilege role based on the Operator license, select a user with the Operator license.
2. Click the Access tab in the Contents panel.
   The Privileges and Roles tabs appear in the Component Detail panel.
3. Click the Roles tab, and click New.
   The Add Privilege Role dialog opens.



1. Type a descriptive name for the new role in the Name field.
2. (Optional) Type a full description of this role in the Description field.
3. Select the appropriate license from the License drop-down list.

   NOTE
   The license chosen here determines the privileges that can be enabled with this role.
4. Select the privileges you want this role to grant by selecting or clearing the Enabled check boxes.
5. Click OK.
   The new role appears as an option in the Roles tab of the Component Detail panel. This role is now ready to be used with any user or user group that has the appropriate license.

You can also assign a privilege role. Assigning a privilege role lets you assign an existing role to a user.

Follow these steps:

1. Select the user you want to apply the role to in the Users tab of the Navigation panel.
2. Click the Access tab and select an access group.
   The Privileges and Roles tabs appear in the Component Detail panel.
3. Click the Roles tab and click the Add/Remove button.

The Assign Roles dialog opens.

NOTE
For users in a group, this step must be done at the group level. Assigning a role at the group level affects all users in the group.

4. Move the role you want to assign to the Exists in/Create in column using the arrow buttons.
5. Click OK.
   The role is automatically assigned to the access group selected in Step 2.

Create a Super User

As the OneClick administrator, you can easily grant all possible privileges and access to a user. A *super user* in DX NetOps Spectrum has all available DX NetOps Spectrum license roles, privileges, and access in OneClick. Because access groups and privilege roles do not apply to super users, the Access tab is disabled when a user designated as super user is selected in OneClick.

When you install DX NetOps Spectrum, the initial DX NetOps Spectrum user that is created is a super user. This initial user (also referred to as the Installation Owner user) remains a super user and must always exist in DX NetOps Spectrum. The existence of this account is verified each time the SpectroSERVER starts. The value for the initial_user_model_name setting in the *$SPECROOT*/SS/.vnmrc file stores the setting for the initial DX NetOps Spectrum super user. The default password for the initial user is ‘spectrum’.

NOTE
Consider creating an administrator user with user management privileges to manage users. This user is in addition to the user that installed OneClick (the initial user) and can even manage the initial user account. To ensure that a OneClick administrator has all possible privileges, set the value of 'Is Super User' for that administrator (user) to *true*.

Follow these steps:

1. Select a user from the Users List in the Contents panel.
   The Details tab displays information about the user account.
2. Click set in the 'Is Super User' field, and select Yes from the list.
3. Press Enter.
   The user account is now a super user.

Manage User Access with LDAP Configuration

For environments where LDAP is used for authentication, you can allow or restrict local logins from OneClick users who are not present in the LDAP directory. For example, non-LDAP users, such as non-employees who provide support, training, or troubleshooting with no access to LDAP, require log-in access to OneClick.

NOTE
Super users with passwords set in OneClick can log in locally, regardless of this setting.

Follow these steps:

1. Select the user or user group to edit in the Users tab of the Navigation panel.
2. Navigate to the Details tab of the Component Detail panel for that user or user group.
3. Expand the LDAP Configuration subview.
4. Set the option to 'Allow User to Log In if either the LDAP Password is Invalid or the User does not exist in LDAP' to Yes.

NOTE
For security reasons, we recommend saving the LDAP user password to the DX NetOps Spectrum database. If the option to 'Allow User to Log In if either the LDAP Password is Invalid or the User

does not exist in LDAP' is enabled, you can use the LDAP password for user authentication against the DX NetOps Spectrum database.

Non-LDAP users can log in to OneClick even when they are not present in the designated LDAP directory. Setting this option to No prevents the user from logging in without an LDAP account.

WARNING
If LDAP is configured to search for User by Pattern and no match is found during lookup, your attempt to log in fails. In such cases, verify that LDAP is configured to authenticate User by Search.

Change Details Displayed for a User or User Group

You can modify user or group attributes from the Component Detail panel.

Follow these steps:

1. Select the user or user group to edit in the Users tab of the Navigation panel.
2. Navigate to the Details tab of the Component Detail panel for that user or group.
3. Use the 'set' link to edit attributes such as the password and security string of an existing user or group.

Change the Licenses of a User or Group

The default settings for a new user account include an Operator license that offers operator privileges. To perform administrative tasks such as user management, discovery, and modeling in OneClick, users must have administrator privileges. The default Operator license does not provide any administrative privileges.

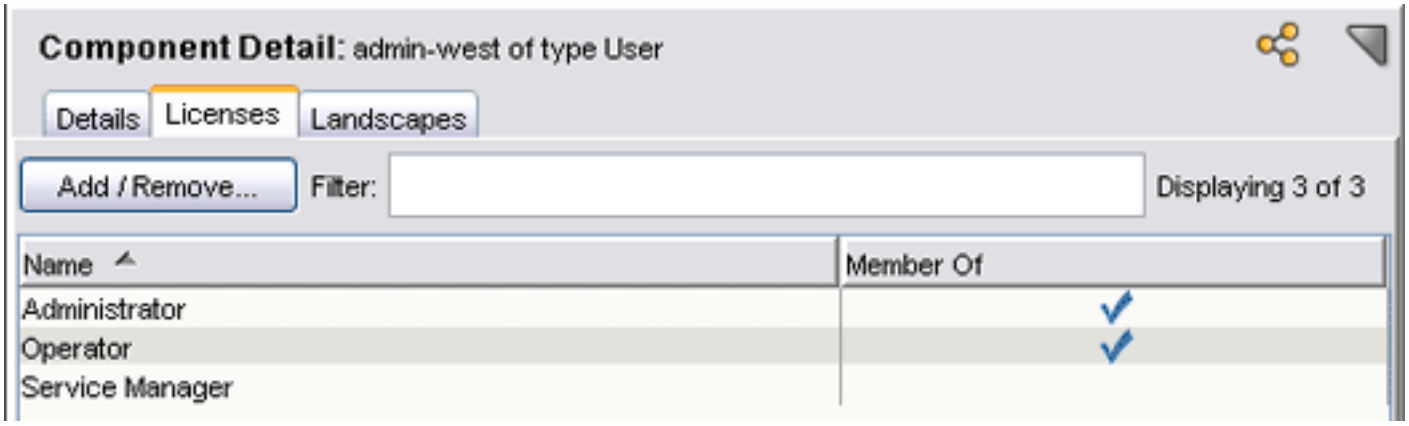
Example: A user group of operators in a Network Operations Center (NOC staff group) with OperatorRW should also see the modeling information of Component detail pane.

Solution: Users in the NOC staff group cannot access the modeling information as this privilege is included in the Administrator license only. To give them access to modeling information, add the Administrator license to this group.

The Administrator license provides the privileges required to perform the following OneClick administrative tasks:

- User Management
- Collection Management
- Discovery
- Topology Editing
- Pipe Management
- Create and Destroy Models
- Search Management

If you are configuring a user account that requires administrator privileges, you must assign the account an Administrator license. You do this by clicking the Add/Remove button in the License tab of the Component Detail panel, shown in the following figure.



When a user logs in, that user consumes assigned licenses from the pool of available licenses. For example, when a user with both Operator and Administrator licenses logs in, one of each license is used.

You can change the licenses that are assigned to a user or to a user group.

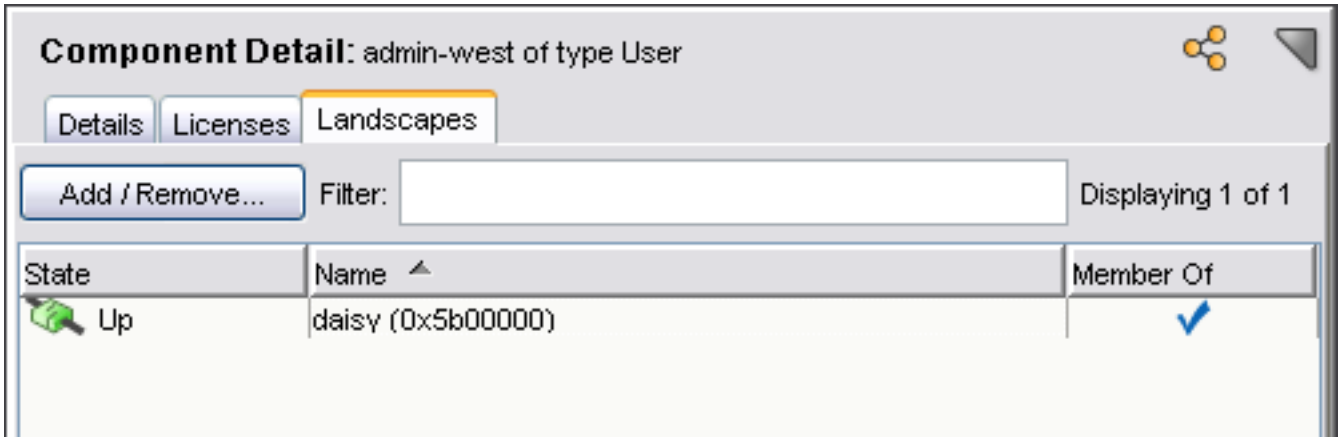
Follow these steps:

1. Select the user or user group in the Users tab of the Navigation panel.
2. Click the Licenses tab of the Component Detail panel.
3. Click the Add/Remove button to select licenses for this user or group.

Change the Landscapes for a User

In a distributed DX NetOps Spectrum environment, you can change the landscape membership of users and groups. Use the Landscapes tab of the Component Detail panel. A distributed environment has multiple SpectroSERVERs, each with its own DX NetOps Spectrum landscape. For a OneClick user to have access to an additional DX NetOps Spectrum landscape, the user must be a member of that landscape.

The following image displays the Landscapes tab for a fictitious admin-west user. This tab displays the state and name of each known DX NetOps Spectrum landscape. The check marks in the Member Of column indicate landscapes in which the user is present.



Tips

- You cannot edit membership in landscapes that are in the “down” state.
- We recommend changing user group landscape membership while the group contains no users. Add users to the group once the empty user group is a member of the desired landscapes.

Follow these steps:

1. Click the Landscapes tab of the Component Detail panel.
2. Click the Add/Remove button.
3. Choose the landscapes where you want this user or group to be present.
4. Click OK.

Change Individual Privileges for a User or User Group

User and user group privileges can be added and removed individually.

Follow these steps:

1. Navigate to the Access tab of the Contents panel for the selected user.
2. Select the access group whose privileges you want to modify.
3. Navigate to the Privileges tab of the Component Detail panel for the selected access group.
4. Click the Add/Remove button.
5. Enable or disable the privileges that you want for this access group by selecting or clearing the Enabled check box.

Locate and Review Role Usage

You can search for user roles, review whether they are in use, and determine the users or user groups that are using them. Reviewing this information is helpful if you are trying to delete a user role. You cannot delete user roles that are in use. However, you can verify whether the user is still valid. You can then remove users and groups that are no longer valid from the role and delete the role itself.

Follow these steps:

1. Click the Locater tab in the Navigation panel.
2. Expand the Roles folder and double-click All Roles.

   NOTE
   Enter landscape information if prompted.

   The search results appear in the Contents panel. The Role In Use column indicates whether the role is currently being used. Roles that are in use have a "Yes" hyperlink.
3. (Optional) Click Yes to review the users or user groups that are using this role.
   The Role in Use dialog displays the users and user groups that are currently using this role.
4. Click Close.
   The Role in Use dialog closes.

Unassign Roles

You can unassign roles from user groups and users as needed.

Follow these steps:

1. Select the user or user group whose role you want to remove in the Users tab of the Navigation panel.
2. Click the Access tab in the Contents panel, and select an access group.
   The Privileges and Roles tabs appear in the Component Detail panel.
3. Click the Roles tab, and click Add/Remove.
   The Assign Roles dialog opens.

   NOTE
   For users in a group, this step must be performed at the group level. Unassigning a role at the group level affects all users in the group.

4. Move the role you want to unassign to the 'Does not exist in/Delete from' column using the arrow buttons.
5. Click OK.
   The role is automatically unassigned from the selected access group.

Delete Unused User Roles

You can delete user roles when they are no longer used by any users or by any user groups.

Follow these steps:

1. Locate the unused user role that you want to delete.
   The search results appear in the Contents panel. Roles that are in use have a "Yes" hyperlink in the "Role in Use" column.
2. Select the unused role to delete.
3. Click Delete.
   The confirm delete dialog opens.
4. Click Yes.
   The user role is deleted.

Move Existing Users to User Groups

You can move existing users to user groups. However, you cannot move the user account under which you are logged in.

Follow these steps:

1. Right-click a user in the Users tab or on the Users List tab.
2. Click Move To Group.
   The Select User Group dialog opens.
3. Select the destination group, and click OK.

Remove Users from User Groups

When you remove a user from a group, the user automatically appears as an individual user. Removing users from groups causes them to lose any privileges that were inherited from the user group level.

Follow these steps:

1. In the Users tab of the Navigation panel, right-click a user.
2. Select Remove From Group.
   The user is removed from the group. This user now appears under the top-level Users group in the Users tab of the Navigation panel.

   NOTE
   After removing a user from a group, verify that the user has the desired access groups and privileges.

Delete Users or User Groups

Users and groups can be deleted from OneClick as necessary. When you delete a user group, any users contained in that group are then organized under the top-level Users node.

WARNING
OneClick includes a default Administrator user with full privileges. This user is the Installation Owner account that you created during SpectroSERVER installation. You cannot delete this user from the Users tab. However, you can delete this account from the Results list that is displayed after a search using the Locater tab. You can also delete this user by removing the landscape of the main location server from the user account. *Do not*

remove this default Administrator user. Deleting this user produces undesirable results, such as preventing access to OneClick for all other users.

To delete a user or user group

1. Select the User or User Group for deletion in the Users tab.
2. Click

(Delete).
The user or group is deleted.

About Using Security Communities to Manage User Access to Models and Devices

Security communities limit user access to specific sets of models and views that use the same security string. Only users with membership in a security community that matches the security string on a model can access the model. You can assign security communities to an individual user or to a user group. All users in a user group inherit the privileges of the security communities assigned to the group.

WARNING
By default, no security is applied to models. Until you apply security to a model, all DX NetOps Spectrum users can see it.

To limit user access to models, create a security community with the desired privileges, and assign it to specific users and user groups. Then selectively apply the security string to the models that those users manage.

Restricted View of Community Names

By default, the Operator Read Only privilege role restricts users from viewing community names. You must enable this privilege for specific Operator Read Only users as needed.

From the Access tab, Privileges tab, you can view, create, edit, and remove security community assignments from a user or user group.

NOTE
You cannot configure security communities for super users. If you select a user who is a super user, the Access tab is disabled.

Use Security Communities to Manage User Access to Models and Devices

You can use security communities to manage user access to data. The Users tab lets you view the currently assigned privileges for community names.

Follow these steps:

1. In the Users tab, select the user or group for which you want to view privileges to a community name.
2. Select the community name in the Security Community list in the Access tab.
3. In the Privileges tab of Component Detail panel, select Model Management, View Attributes, Community Names.

You can add or remove community names from a user’s view.

Follow these steps:

1. In the Users tab, select the user or group for which you want to change community name viewing privileges.
2. In the Security Community list on the Access tab, select the community name that you want to change the user's access to.
3. Click Add/Remove in the Privileges tab in the Component Detail panel.

The Add/Remove Privileges dialog opens.
4. Click Model Management, View Attributes, Community Names.
5. Change the existing privilege by selecting or clearing the Enabled check box.
6. Click OK.
   The change is implemented.

Or you can create a role that adds the community name privilege. You must then assign the new role to a user or group.

Follow these steps:

1. In the Navigation panel, click the Users tab, and select the user or user group to which you want to assign a security community.
2. In the Contents panel, click the Access tab.
3. Click New in the Access tab.
   The New dialog opens.
4. Enter the name of the new security community that you want to create.

   NOTE
   Do not use spaces when naming security communities.
5. Click Add.
6. Enter any additional security communities that you want to share the same privileges.
7. Click OK.
8. (Optional) Click New again to create security communities for the selected user or user group that will not share the same privileges as the security communities you just created.
   The new security communities appear in the Access tab.

Perform the following procedure in conjunction with assigning new security communities to specific models or model types. Security communities do not provide or limit access to data in OneClick until they are assigned. You must also assign privileges or privilege roles to the security communities that you have created.

Follow these steps:

1. In the Navigation panel, click the Users tab, and select the user or user group to which you want to assign a security community.
2. In the Contents panel, click the Access tab.
3. Select the security community you want to edit.
4. Click Edit in the Access tab.
   The Edit dialog opens.
5. Do *one* of the following:
   – To add an entry to the selected security community, enter the name of the new entry in the first field, and click Add.
   – To remove an entry from the selected security community, select the entry from the list, and click Remove.
   – To modify an existing entry for the selected security community, select the entry from the list. Make modifications to the security community entry in the first field, and click Modify.
6. Click OK.
   The modifications to the selected security community appear in the Access list.

   NOTE
   To enable the changes that you made in the preceding procedure, the modified security communities must match the security string attributes that are already applied to models. Or they must match security string attributes that you plan to apply as part of an overall device access and security policy.

You can remove a security community assignment from a user or user group.

Follow these steps:

1. In the Navigation panel, click the Users tab, and select the user or user group whose security community you want to remove.
2. In the Contents panel, click the Access tab, and then select the security community to remove.
3. Click Remove in the Access tab, and then click Yes to confirm your selection.
   The security community is removed from the Access tab for the selected user or user group. This user or user group no longer has access to the relevant models.

Manage Users From the Client Details Page

The OneClick Client Details page lets administrators perform these user management tasks:

- Send messages to logged in clients.
- Manage OneClick licenses by administratively logging off selected users.

> **NOTE**
> This page is not automatically updated with the latest client information. To ensure that you have the latest information, use the Reload function of your web browser to reload the page.

To view the Client Details page:

1. Navigate to http://*<webserver>*/spectrum/index.jsp in a web browser.
   The OneClick home page opens.
2. Click the Client Details link.
   The Client Details page opens, displaying a Client(s) Logged On table.

To send a message to clients using the Client Details page:

1. In the Client(s) Logged On table, select the check boxes next to the user names of the clients to whom you want to send a message, and click Send Message.
   The Enter Message dialog opens.
2. Enter a message and click Send.
   Your message is sent to the clients you selected.

To log clients off using the Client Details page:

1. In the Client(s) Logged On table, select the check boxes next to the user names of the clients that you want to log off, and click Log off Clients.
   A confirmation dialog opens.
2. Click OK.
   The clients are logged off. They receive a message indicating the administrator who logged them off.

> **NOTE**
> Operators can also access the Client Details page, but only to view or log off their own clients.

Manage OneClick Licenses by Limiting Concurrent User Logins

Each time a user launches a OneClick client, that client consumes one instance of each OneClick license assigned to the user. By default, OneClick users can launch unlimited clients with a single set of login credentials. As a result, a single user can consume all of the available OneClick licenses by launching clients repeatedly without exiting from other clients.

The DX NetOps Spectrum administrator can restrict the number of concurrent OneClick licenses that a user or user group can consume at one time. You can distribute the available OneClick licenses among multiple users. In addition, you can set the maximum number of logins to zero to effectively lock out a user without destroying the user account.

You can set maximum login restrictions at both the user and the user group level. The maximum login value is not inherited from the user group. The process that DX NetOps Spectrum uses to manage the different values for users and groups includes verification of the user's maximum login count. If that count has been exceeded, a message appears.

Otherwise, DX NetOps Spectrum then verifies the maximum login count specified for the relevant user group. Therefore, all users in a group can log in multiple times until the maximum values are reached. The total count of all users in the group cannot exceed the group total.

By default, users or user groups can launch as many clients as there are licenses. You can modify the setting for maximum logins in the Details tab of the Component Detail panel for a selected user or user group.

To restrict users to one concurrent login:

1. Navigate to the Details tab of the Component Detail panel for a given user selected on the Users tab.
2. Click set in the Maximum Logins field.
3. Type **1** and click Save.
   This user is now restricted to one concurrent login only.

To restrict users from launching a OneClick client:

1. Navigate to the Details tab of the Component Detail panel for a given user selected on the Users tab.
2. Click set in the Maximum Logins field.
3. Type **0** and click Save.
   This user can no longer launch a OneClick client.

To let users launch an unlimited number of OneClick clients:

1. Navigate to the Details tab of the Component Detail panel for a given user in the Users tab.
2. Click set in the Maximum Logins field.
3. Click Unlimited.

NOTE

The steps mentioned are true while navigating via the explorer tab in OneClick. However, by default in the Topology view, all users can see (but not access) all containers, even if they do not have the required security community access. All containers remain visible by default, so that the ***Neighbors*** tab functions effectively.

To avoid users being able to see other users' containers, place a unique security string in the container that contains the shared containers. The unique security string removes the Topology view of this container, from users who do not have the required security community. Users can still navigate via the explorer view and the topology view outside of the shared containers.

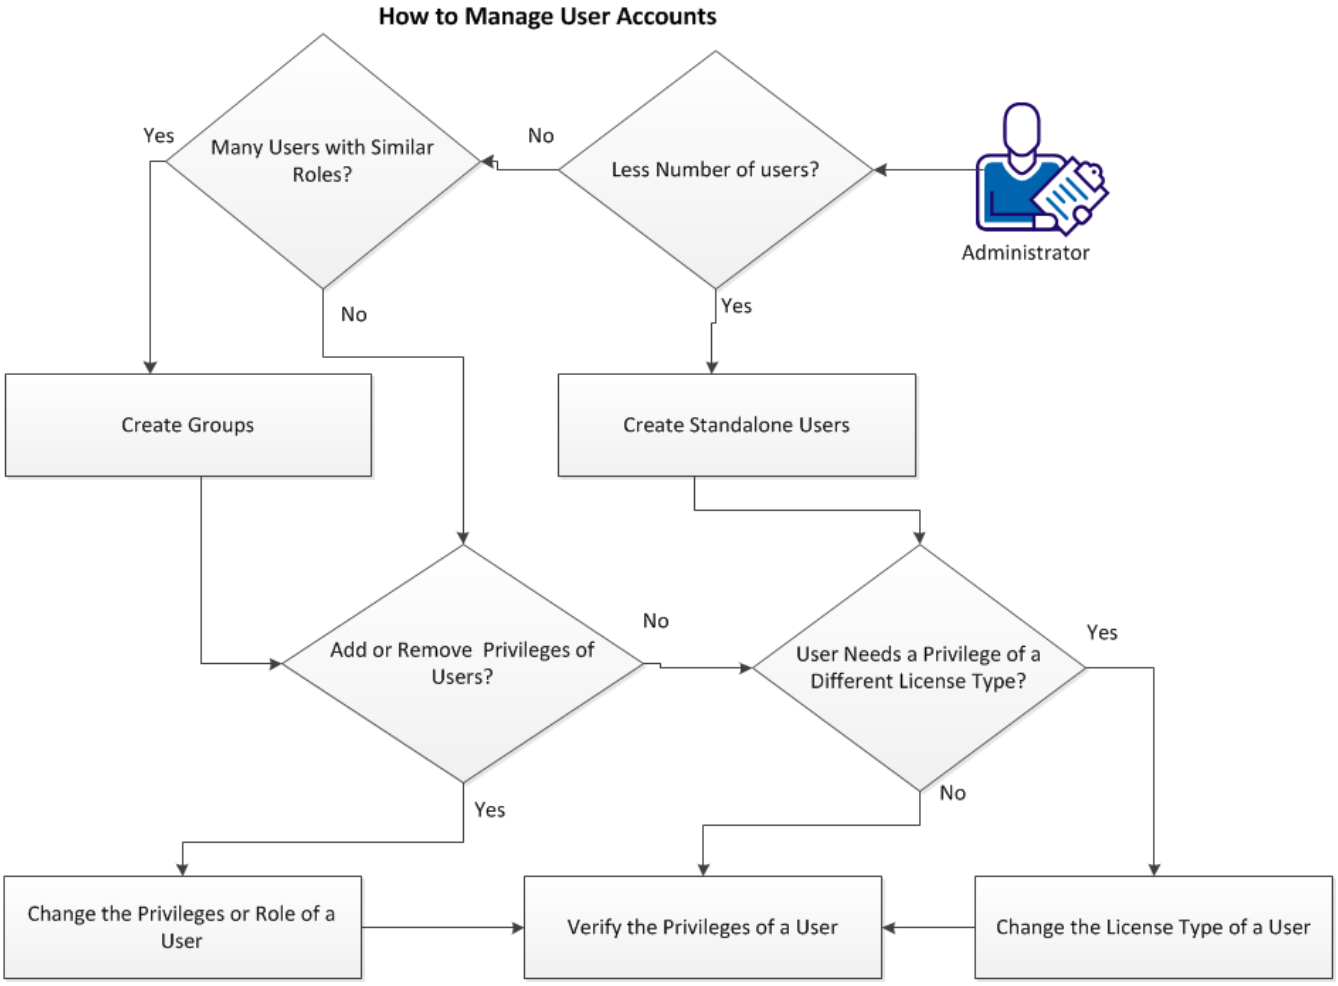
How to Manage User Accounts

This scenario describes how a DX NetOps Spectrum administrator creates and manages user accounts that let different users access DX NetOps Spectrum. Managing user accounts means assigning them the required license, role, and privileges so that each unique product operator has the required level of access to DX NetOps Spectrum.

As a DX NetOps Spectrum administrator you are responsible for managing user accounts of different users. Users log in to OneClick console to access DX NetOps Spectrum. When you install DX NetOps Spectrum with your credentials, you become the installation owner and also the administrator with full privileges. Privileges are components and tools within DX NetOps Spectrum to which a user is granted access based on the license type. Administrator, Operator, and Service Manager are the three types of licenses which you can assign to a new user.

Each license can have Read and Write, or Read only access to DX NetOps Spectrum. These licenses determine which privileges you can assign to a user. The privileges available with a given license are enabled by default. You can keep the privileges enabled or you can customize them. As you create new user accounts in OneClick, you can add them within user groups or as stand-alone users. When you have multiple users with similar needs, consider creating user groups to manage their user accounts. When you have users with unique needs, create user accounts independent of user groups.

The following diagram shows how to manage user accounts of DX NetOps Spectrum users:



Verify the Prerequisites

Before you discover devices in your network, verify the following prerequisites:

- DX NetOps Spectrum is installed on your host.
- You are logged in to the OneClick console as an administrator.
- The OneClick console displays your DX NetOps Spectrum landscape with your host name on the Navigation panel.
- On the Navigation panel, the Users tab exists.
  The Users tab appears when you are logged in as an administrator. You manage user accounts through the Users tab.

Create Standalone Users

When you are not the only user of your DX NetOps Spectrum environment and someone wants access, you create a login user account for that person on the OneClick console. Creating standalone users is best when you have less number of users with unique privileges.

Follow these steps:

1. Log in to the OneClick console.
2. From the Navigation pane, select Users.

3. On the toolbar, Click Creates a new user
   The Create User dialog opens.
4. Enter the Name, Web Password, and confirm the Web Password.
5. Click Licenses, and select Administrator, Operator, or the Service Manager as the license type.
6. Click Landscapes, and select the landscape to which you want the user to belong.
   By default, the user belongs to the administrators landscape.
7. Select Details, and enter the details of the user and click OK.

The new user account is created under Users in the OneClick console.

Create Groups

User groups are best suited for environments with many users. A user group lets you group multiple users by geographic area, role, or department. You can grant all users within a group the same access and privileges at one time. You can define a minimum set of privileges that all users within the group must have. Later, you can customize the individual privileges of any user in the group.

NOTE
Users in a group inherit the license and privileges of the group.

Follow these steps:

1. Log in to the OneClick console.
2. From the navigation pane, select Users.
3. Click Creates a new group.
   The Create Group dialog opens.
4. Enter a Name for the new group.
5. Under Licenses, Select Administrator, Operator, or Service Manager as the license type.
6. Click Landscapes, and select the landscape to which you want the group to belong.
   By default, the group belongs to the administrators landscape.
7. Under Landscapes, select the required landscape, and click OK.

NOTE
By default, your local landscape is selected. In such a case, you can ignore this step.

The new group is created under Users in the OneClick console.

Create Users Within a Group

You create users within that group after creating a group for multiple users. By default, the Users within the group inherit the license and privileges from the group. You can change the privileges and license of any user within the group.

Follow these steps:

1. Log in to the OneClick console.
2. Select Users from the Navigation pane.
3. Right-click the group that you created, and select New User.
   The Create User dialog opens.
4. Enter the Name, Web Password, confirm the Web Password, and click OK.

The new user account is created within the group in the OneClick console.

Change the Privileges or Role of a User

When a stand-alone user or a user within a group wants extra privileges, you can add these privileges to the user. You can also remove some privileges of any user. You can change the Role of a user to Read only, or Read and Write for

any given License type. For example, a user with an operator license can be assigned either the OperatorRW (Read and write) or the OperatorRO (Read Only).

NOTE
By default, for any license type you get the Read and Write Role.

Follow these steps:

1. Log in to the OneClick console.
2. From the Navigation pane, click Users, and select the stand-alone user, or a user within a group by expanding the group.
3. Select Access from the Contents pane.
4. Select the Security community of the user.
5. From the Component Detail pane, select Privileges.
   Under Privileges, you can add or remove a Privilege from the list of privileges. The list also shows the privileges that are enabled for the user.
6. Click Add / Remove.
   The Add / Remove Privileges dialog opens.
7. Select the Privileges that you want to enable for the user, and click OK.
8. To change the Role of the User, Select Roles from the Component Detail pane and click Add / Remove.
   The Assign Role dialog opens.
9. Select the required Role from the right pane and move it in the left pane, and click OK.

The extra Privileges are enabled or disabled for the user. The required role is also assigned to the user.

Change the License Type of a User

Some Privileges like the Discovery are enabled only for the Administrator license. When you want to enable a Privilege that does not belong to the operator license change the license type of the user to Administrator. You can change the license type of a stand-alone user or of a user within a group.

Follow these steps:

1. Log in to the OneClickconsole.
2. Select Users from the Navigation pane.
3. Right-click the stand-alone or a user from a group, and select Component detail.
   The Component Detail dialog opens.
4. Select Licenses, and click Add / Remove.
   The Select Licenses dialog opens.
5. Select the required license from the right pane and move it in the left pane, and click OK.

The required license is granted to the user, and all the privileges belonging the license type are enabled for the user.

Verify the Privileges of a User

You have changed the Privileges of a user. Now, you can verify the overall privileges that are enabled for that user.

Follow these steps:

1. Log in to the OneClick console.
2. Select Users from the Navigation pane.
3. Select a stand-alone user or a user within a group.
4. Select Access from the Contents pane.

NOTE
When you select a user within a group and click Access, select the Security Community of the user from the contents pane.

5. Check the privileges that are enabled for the user under Privileges from the Component Detail pane.

You have verified the Privileges of the user.

Troubleshooting User Administration

Error: "The user xxxxxx already exists" when trying to create a user in DX NetOps Spectrum

Symptom:
When you delete a user and try to recreate the user in DX NetOps Spectrum, you may see the following error:

"SPC-OCC-11916 The user xxxxxx already exists."

However, this user is not seen in the Users tab.

Cause:
The entire user model did not get completely deleted. This is seen most often in a Distributed SpectroSERVER (DSS) environment.

Resolution:
Do the following on each primary SpectroSERVER in the environment:

1. Log into the SpectroSERVER system as the user that owns the DX NetOps Spectrum installation
2. (Windows) start a bash shell by running "bash -login"
3. cd to the $SPECROOT/vnmsh directory
4. Enter the following command to start a Command Line Interface (CLI) session
   ./connect
5. Enter the following command, where <xxxxxx> is the User model deleted, to search for any leftover models related to the User model that was deleted:
   ./show models | grep <xxxxxx>
6. If a User model or AccessGroup model for the <xxxxxx> is found, delete the model using the following CLI command where <MH> is the model handle of the model:
   ./destroy model -n mh=<MH>
7. After checking each SpectroSERVER system using steps 1-6 above, log out of OneClick and then restart tomcat on the OneClick server to clear the OneClick cache.
8. Log into OneClick and recreate the User model

For more information, see Command Line Interface section.

Error: No Privilege for the User to Access OneClick Rest API

Symptom:

During integration of DX NetOps Spectrum with other products, I see an error "No Privilege for the User to Access OneClick Rest API"

Resolution:

As an administrator, you can allow or restrict access to the OneClick RESTful APIs. You can set API type-level access for GET, POST, PUT and DELETE.

Follow these steps:

1. From the OneClick Console, select the **Users** tab in the **Navigation** panel.
2. Select the user to change the access.
3. Select the **Access** tab, in the **Contents** panel.
   By default, the **Security Community** is selected.
4. Select the **Privileges** tab in the **Components Details** panel.
5. Select **Add/Remove**.
6. Expand the **OneClick Restful Access** option.
7. Change the privileges as required and click **OK**.

Configuring Additional OneClick Applications

This chapter discusses DX NetOps Spectrum add-on application administration and configuration in OneClick from the perspective of a OneClick administrator. This includes managing and configuring other DX NetOps Spectrum applications.

Configure Service Performance Manager (SPM) Data Export Parameters in OneClick

By default, SPM Data Export is disabled in OneClick. To configure SPM data export in OneClick, enable SPM data export logging. Set the time period when data is written to each log file. Then create and specify the directory for the output log file. At the end of the interval that you set, the file is saved, and a new file is created for incoming data. By default, when SPM data export is enabled, 60 minutes of data is captured before the SPM log file is saved and a new file is opened.

> **NOTE**
> By default, when SPM data export is enabled, OneClick attempts to save SPM data files to the /tmp directory. You must first create the /tmp directory or create an alternate location for the SPM log files.

Follow these steps:

1. Click Administration in the OneClick home page.
   The Administration Pages open.
2. Click SPM Data Export in the list on the left.
   The SPM Data Export Configuration page opens.
3. For SPM Data Export Enabled, click Yes.
4. For Log File Cycle Time (min), enter the elapsed time in minutes when the current SPM log file will be saved and closed and a new file opened for logging. The default value for this logging interval is 60 minutes.
5. For Log File Directory, enter the fully qualified file path for the directory where OneClick will store SPM log files.

   > **NOTE**
   > Create the directory structure for OneClick to save the data files in. By default OneClick attempts to save the data files in /tmp which you must create first if it does not exist.
6. For Landscape Filter, specify the DX NetOps Spectrum landscapes from which OneClick exports data in a distributed environment. Use the left arrow to move the landscapes from which to export data to the Show Landscapes list. Move any landscapes from which data is not exported to the Hide Landscapes list. By default, all available landscapes are included.
7. Click Save.
   You are prompted to commit your changes and restart the OneClick web server. The OneClick web server must be restarted for the changes to take effect.
8. Click OK.
   Your changes are saved and the OneClick web server is restarted.

Display Topology Tab Contents in a Web Page

You can use a topology applet to make the contents of your Topology tab available from a web page. Specify the container-based model handle whose topology you want to view.

> **NOTE**
> You can determine the model handle of the container to use from the Attributes tab. For more information, see the Modeling and Managing Your IT Infrastructure section.

To display Topology tab contents in a web page, type the following URL into your web browser:

```
http://<hostname>:<portnumber>/spectrum/topology.applet?mh=<model handle>
```

- **<model handle>**
  Specifies the container-based model handle that you want to view the topology of.

The portion of the Topology tab that you specified is now accessible from this web page. From here, you can drill into other containers and return to the starting point.

To display Topology tab contents within an existing web page, take one of the following steps:

- Embed the topology applet into the web page using an iframe:

```
<iframe src="http://<hostname>:<portnumber>/spectrum/topology.applet?mh=<model handle>" width="830"
 height="530"/>
    Your browser does not support embedded objects, <a href="http://<hostname>:<portnumber>/spectrum/
topology.applet?mh=<model handle>">click here</a> to go to included content.
</iframe>
```

  > **NOTE**
  > This method works best for Internet Explorer browsers.

- Embed the topology applet into the web page using the following syntax to avoid using iframes:

```
<div>
<object data="http://<hostname>:<portnumber>/spectrum/topology.applet?mh=<model handle>" type="text/html"
 width="830" height="530">
    Your browser does not support embedded objects, <a href="http://<hostname>:<portnumber>/spectrum/
topology.applet?mh=<model handle>"> click here</a>to go to included content.
</object>
</div>
```

  > **NOTE**
  > This method works best for Firefox browsers.

The portion of the Topology tab that you specified is now accessible in a web portlet. From here, you can drill into other containers and return to the starting point.

Model Security in OneClick

This section describes model security and how to configure it in OneClick.

How Are Models Secured in OneClick

Model security in OneClick lets you control user access to models. Secure a model by setting the security string on that model. By default, users can access all models.

Secure modeled network elements in OneClick using the following process:

1. Apply a security string to a modeled element that you want to secure. For example, set the security string of a LAN container model to lan1. For more information, see Using Security Strings to Secure Modeled Elements.
2. The security string that is set on the model in Step 1 must appear in an entry on the Access tab of a given user account for that user to access that secured model. For more information, see Use Security Communities to Manage User Access to Models and Devices.
3. To prevent a user from accessing secured models, modify the access group in the Access tab for that user. For more information, see Scenarios for Implementing Model Security.

NOTE

The steps mentioned are true while navigating via the explorer tab in OneClick. However, by default in the Topology view, all users can see (but not access) all containers even if they do not have the required security community access. All containers remain visible by default, so that the ***Neighbors*** tab functions effectively.

To avoid users being able to see other users' containers, place a unique security string in the container that contains the shared containers. The unique security string removes the Topology view of this container, from users who do not have the required security community. Users can still navigate via the explorer view and the topology view outside of the shared containers.

Using Security Strings to Secure Modeled Elements

Set the security string on a model to prevent users without a matching entry on their Access tab from accessing the model. By default, the security string is empty.

The procedure that follows provides the basic steps to configure model security. It does the following:

- Secures a model with a security string
- Gives a user access to that secured model
- Prevents unauthorized users from accessing secured models

NOTE
This procedure assumes you have already modeled elements in your OneClick environment. For more information, see the Modeling and Managing Your IT Infrastructure section.

Follow these steps:

1. Select the modeled element, such as a device model, that you want to secure in the Topology tab.
2. Click the Information tab in the Component Detail panel.
3. Expand the DX NetOps Spectrum Modeling Information subview, click set in the Security String field, type a security string, and press Enter.
   This model is now inaccessible for users who lack an Access tab entry with this security string.
4. To give a user access to this secured model:
   a. Select the user on the Users tab of the Navigation panel, and click the Access tab of the Contents panel.
   b. (Optional) Remove any access groups that this user no longer requires by selecting access groups and clicking Remove.

      NOTE
      When you remove an access group from a user account, any privileges that are assigned with that access group are also removed.
   c. Click New in the Access tab of the Contents panel.
      The New access group dialog opens.
   d. Enter the security community from Step 3, and click OK.
5. Verify that this user has adequate privileges. To perform this step, assign the appropriate privileges to the access group that you added:

a. Select the access group.
b. In the Privileges or Roles tab for the selected access group, assign the privileges you want this user to have for this security community. For example, in the case of an operator user, you might assign the OperatorRW privilege role using the Roles tab.

When this user logs on, models that have a security string that matches the access group entry that you added and all unsecured models appear on the Topology tab. This user also sees any container models that contain models that are accessible to this user account.

NOTE

The steps mentioned are true while navigating via the explorer tab in OneClick. However, by default in the Topology view, all users can see (but not access) all containers, even if they do not have the required security community access. All containers remain visible by default, so that the ***Neighbors*** tab functions effectively.

To avoid users being able to see other users' containers, place a unique security string in the container that contains the shared containers. The unique security string removes the Topology view of this container, from users who do not have the required security community. Users can still navigate via the explorer view and the topology view outside of the shared containers.

How to Customize Security String Inheritance

Use the following process to customize security string inheritance:

1. Add relations for security string roll down.
2. Define security string roll down overrides for model types.

Relations for Security String Roll Down

DX NetOps Spectrum will roll security strings down from the left model to the right model, from the following relations:

- Application
- Can_Assign
- CollectsChassis
- Collects
- Contains
- HASPART
- Manages
- Organizes
- Owns
- Provides

NOTE
For specific details about how to use the Model Type Editor to create new model types, see the Model Type Editor section.

To add new relations that security strings will roll down

1. Stop the SpectroSERVER if it is running, and verify that there are no other programs running that can access the SpectroSERVER database.
2. Open the Spectrum Control Panel, and click Configure, Model Type Editor.
   The Model Type Editor opens, and the Root model type is set as the current model type. The Root model type is the model type at the highest point in the model type hierarchy.

3. In the Model Type View, find the Security_Model model type.
4. Create a new model type, whose base model type is Security_Model.
5. In the newly created model type, add new attributes of type Relation Handle.
6. Set the default value of each new attribute to the Relation Handle of the relation that you want security strings to roll down.

Define Security String Roll Down Overrides for Model Types

When joining the security strings of two models for a security string roll down, the AND operator is used by default, unless the model type on the right side of the association has a predefined override.

DX NetOps Spectrum provides an override for the Container model type. When rolling down a security string to a model on the right side of a security relation whose model type is derived from Container, the OR operator is used. The only exception to this override is the WA_Link model type, which is derived from the Container model type. When rolling down a security string to a model on the right side of a security relation whose model type is WA_LINK, the AND operator is used.

Define security string roll down overrides in the Model Type Editor.

> **NOTE**
> For specific details about how to use the Model Type Editor and create new model types, see the Model Type Editor section.

Follow these steps:

1. Stop the SpectroSERVER if it is running, and verify that there are no other programs running that can access the SpectroSERVER database.
2. Open the Spectrum Control Panel, and click Configure, Model Type Editor.
   The Model Type Editor opens, and the Root model type is set as the current model type. The Root model type is the model type at the highest point in the model type hierarchy.
3. In the Model Type View, find the Security_Model model type.
4. Create a new model type, whose base model type is Security_Model.

   > **WARNING**
   > Create a new model type rather than modify the Security_Model model type directly since changes to the Security_Model type could be overwritten when installing future DX NetOps Spectrum upgrades.
5. In the newly created model type, take the following steps:
   a. Modify the default value of the Security_String_Mtypes (0x12967) attribute, adding the model types for which you want to define an override.
   b. Modify the default value of the Security_String_Operators (0x12968) attribute, defining the override operators (0 maps to AND, 1 maps to OR) for the model types that were added to the Security_String_Mtypes attribute. The value of instance x in the Security_String_Operators attribute should be the override operator for the model type identified by the value of instance x of the Security_String_Mtypes attribute.
6. Save your changes and close the Model Type Editor.

   > **NOTE**
   > Overrides that are defined on model types that are derived from the Security_Model model type take precedence over any overrides that are defined directly on the Security_Model model type.

Model Security Scenarios

The following scenarios provide examples of both simple and more complex model security use cases.

Secure a model in a remote office from local users

To help you understand security strings in OneClick, a simple example follows:

You want to secure a single model in a remote office so that local OneClick users cannot access it. Setting the security string of the model (to “remote,” for example) would secure it. Non-administrator users who lacked an access group with an entry of "remote" would not be able to access that model. Users with only an access group entry of "local", for example, would not have access to this model.

Secure administrative access to a branch office network

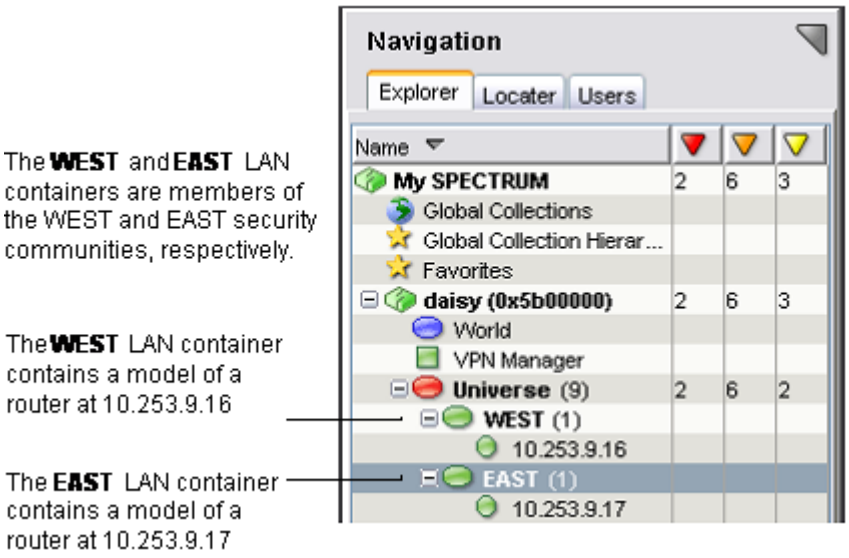
As a complete example of a security implementation in OneClick, consider an East Coast office and a West Coast office. Network administrators in the East coast office must have read/write access to the East Coast office’s network in OneClick. They must also have read-only access to the West Coast network. The inverse is true for the West Coast administrators.

The following procedure can be used to create a solution to this requirement. It can also be modified to suit your needs.

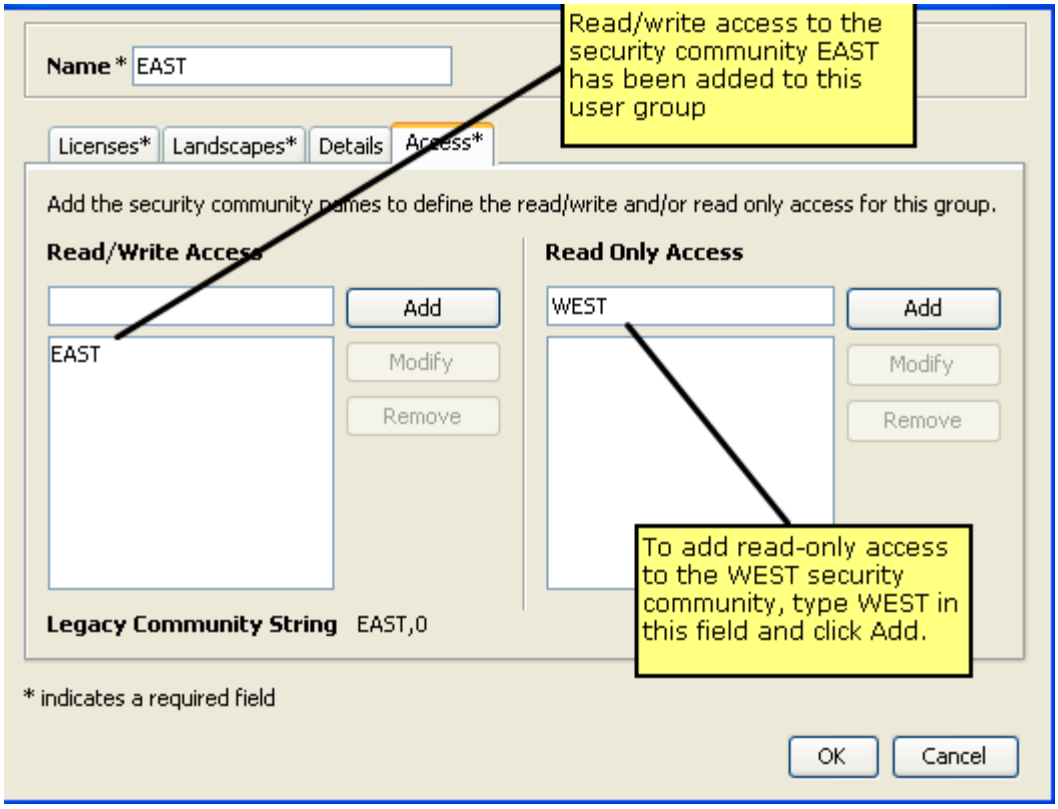
1. Create two LAN containers in OneClick representing the two networks. Name one LAN container WEST, and name the other EAST.
2. Populate each container with different modeled network assets.
3. Set the security string on each LAN container. On the Information tab of the Component Detail panel for a selected LAN container, set the security string:
   a. Set the security string for the EAST LAN container to EAST. This step effectively creates a security community named EAST.

   a. Set the security string for the WEST LAN container to WEST. This step effectively creates a security community named WEST.

These security strings filter down from the LAN container level to its contained models. A security string set at the container level is automatically set for all its contained models.
When this task is complete, the Explorer tab of the Navigation panel resembles the following image to the OneClick Administrator user:



4. Create user groups to correspond with the EAST and WEST network containers:
   a. Create an EAST user group. In the Create Group dialog, create an access group with read/write privileges for the EAST security community:



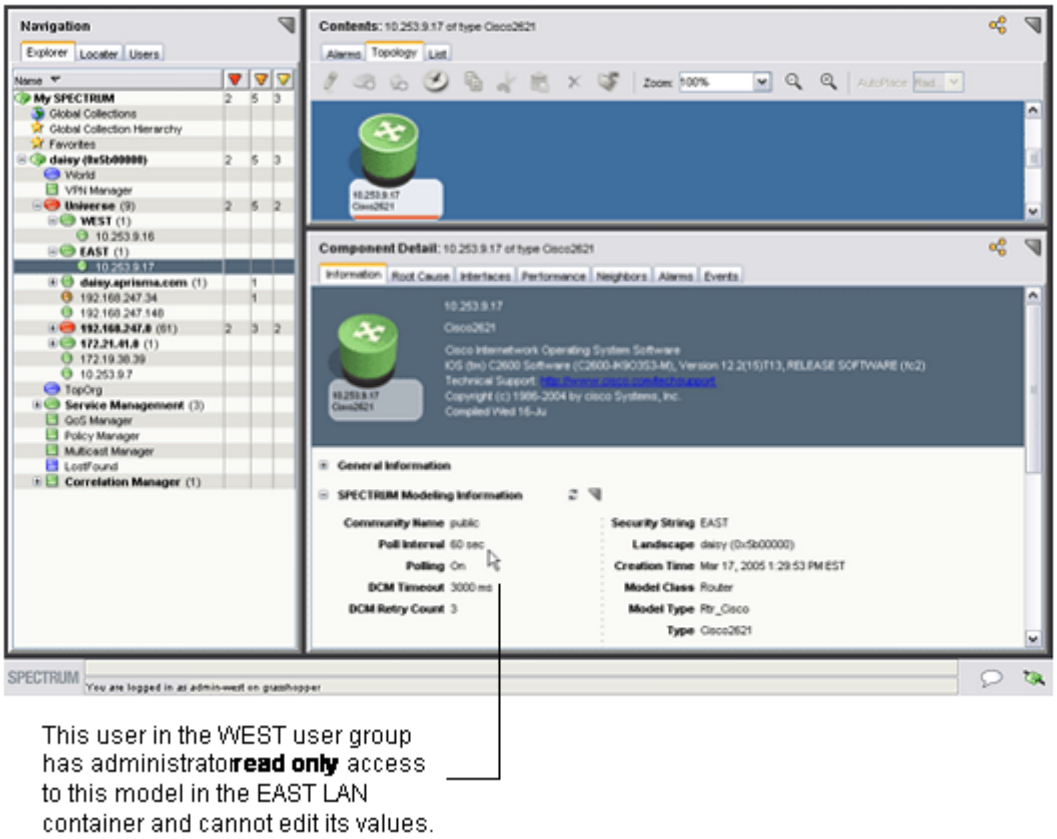
Create a WEST user group. In the Create Group dialog, create an access group with read-only privileges for the EAST security community.

Create a user inside the EAST user group and another user inside the WEST user group.

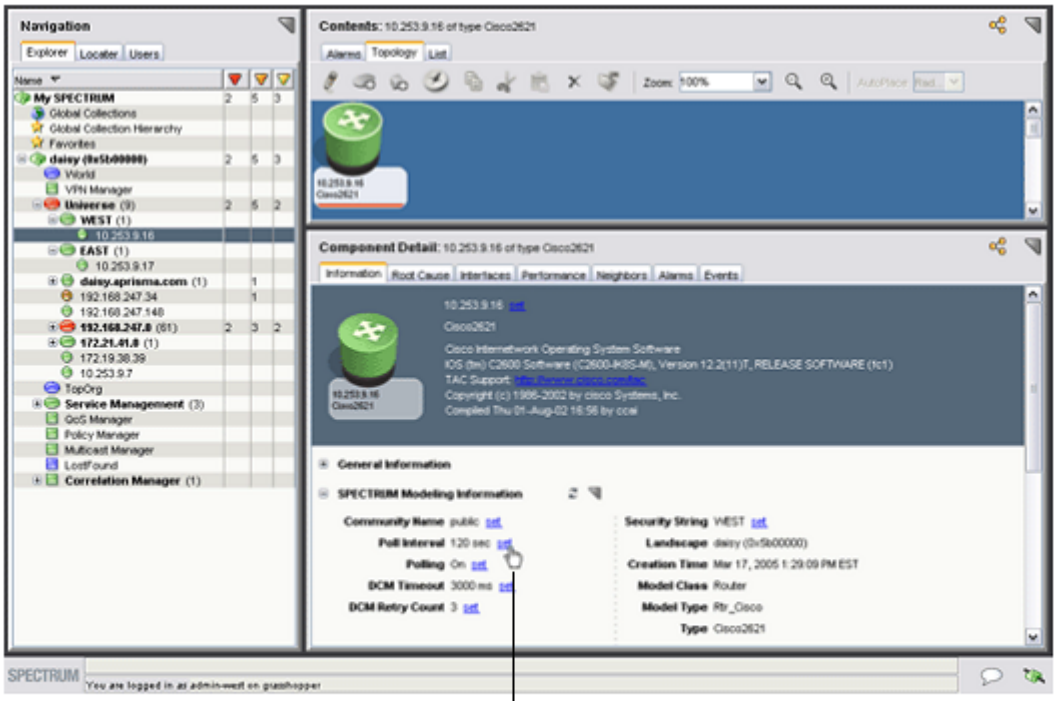
Note on the Access tab that the access groups (security community) are filled in from the User Group level (not editable here at the User level).

To test the changes, log in to OneClick as the user you created inside the WEST user group and navigate to the EAST LAN container.

When viewing models inside the EAST LAN container, users in the WEST user group have Administrator read-only rights as shown in the following image. For example, the image illustrates the fact that this user at this model cannot edit the values in Modeling Information.



1. Navigate to the WEST LAN container. Note that this user in the WEST user group has Administrator read/write privileges for models inside the WEST LAN, as shown in the following image. The image shows that this user at this model can edit the values in Modeling Information.



1. If you log in to OneClick as the user that you created inside the EAST user group and navigate to the WEST LAN container, the inverse situation is true: users in the EAST user group have Administrator read-only rights to the models inside the WEST LAN container. And they have read/write rights to the models in the EAST LAN.

Setting Preferences for Users and Groups

This chapter describes preferences in OneClick and how to use the Set Preferences dialog to set preferences for users and groups.

Set Preferences Dialog

Preferences in OneClick control the appearance of the OneClick console and the behavior of some user interface options. For example, Preferences control the fonts that are used in tables and the sort order of columns in user interface. You can configure the privileges for users and user groups in OneClick and can also set preferences for users and groups. For more information, see User Administration in OneClick. The Set Preferences dialog lets you set, lock, and save preferences for multiple users and groups.

NOTE
Selecting View, Preferences from the main OneClick menu opens user-level preference editing for the current user. The Alarm Filter dialog that is accessed from this menu can be launched from a button on the Alarms toolbar or from within the Set Preferences dialog.

The Set Preferences dialog organizes OneClick preference settings into the following groups of tasks:

- Alarms Tab
- Events Tab
- Explorer Tab
- General
- Interfaces Tab
- List Tab
- Locater Tab
- Topology Tab
- VPN Manager

If you select the top-level preferences group in the navigation panel, all available preferences and the tools to edit them are displayed in the content panel. Selecting a preference or preference group in the navigation panel displays the preference or preference group in the content panel.

The left panel of the Set Preferences dialog also lets you lock preferences for the selected user or user group. When you launch the Set Preferences dialog in the context of setting preferences for users and groups, the Set Preferences dialog displays the name of the user or group that is edited at the base of the navigation panel.

Access the Set Preferences Dialog

You can access the Set Preferences dialog to set preferences for a user or user group or to set preferences globally for all users.

User or User Group

Follow these steps:

1. On the Users tab, right-click a user or user group to set preferences.
2. Select Set Preferences from the menu.
   The Set Preferences dialog opens.
   You can now set the preferences for a user or user group.

All Users (Globally)

Follow these steps:

1. Right-click the top-level user group (Users) on the Users tab.
2. Select Set Preferences from the menu.
   The Set Preferences dialog opens.
   You can now set the preferences for all users.

About Setting or Locking Preferences

The OneClick administrator can set and lock user preferences at the global level (all users) or at the user group level. Users cannot lock their own preferences. If a preference is set and locked for a user or group, the user or members of the user group cannot change the preference.

Note: A locked preference can only be unlocked and edited at the level where it is locked. If a preference is locked at the global or user group level, the preference cannot be unlocked or edited at the user level. If the Set Preferences dialog is launched in the context of a given user and a preference is locked at the global or group level for that user, the administrator cannot change the preference status. The lock check box is disabled.

The following OneClick administrator privileges control the access to set user and group preferences:

- The Set User Preferences privilege grants access to set preferences for particular users and groups. This privilege is controlled by the user/group model security string. For more information, see the Glossary.
- The Set Global Preferences privilege grants access to set preferences at the global level.

The following figure shows preferences for the alarm count columns in the Explorer tab. These preferences are edited to display all alarms for the user group administration. No user in this group can change this preference because it is locked at the user group level. Locked preferences display a small padlock icon.

Set or Lock User Preferences

You set or lock user preferences for users or user groups.

Follow these steps:

1. Right-click the desired user or user group in the Users tab and click Set Preferences.
   The Set Preferences dialog opens.
2. Navigate to the preference you want to set in the hierarchy in the navigation panel.
3. Make changes to the preference in the right panel.
4. Select the check box in the Locked column to lock any corresponding preferences.
   Locking a preference group also locks all preferences that are contained by the preference group. The Locked At column shows the level at which the preference is locked (user, user group, or all users). The Locked By column displays the administrator who locked it.

Alarm Filter Preferences

In addition to being available from a button on the Alarms toolbar, the Alarm Filter dialog can also be launched from the Set Preferences dialog using the Alarms tab, Alarm Filter preference. The right panel displays the Set Alarm Filter button. Access to the alarm filter can be administratively locked. If the alarm filter preference is locked, the filter button in the Alarms toolbar is not available.

You can create multiple alarm filters that are selectable using the Available Filters drop-down in the Alarm Filter dialog. You can configure the available filters for a user or user group and then lock it so the filters cannot be changed but the user can still select from the list of available filters. The Available Filters drop-down is also available on the Alarms tab.

NOTE
For more information about creating alarm filters, see the Using OneClick section.

Export Individual Alarm Filter Preferences

You can also export individual alarm filter preferences to other users and user groups. The exported filters are added to the user's or user group's existing filters; they replace existing filters. You cannot import individual alarm filters. Instead, all filters from the importing user or user group are added to the existing filters; they replace existing filters.

NOTE

When exporting preferences in bulk you can only export all alarm filters. You are not given a choice to select individual alarm filters when exporting preferences in bulk. The exported filters replace existing filters.

How the Filter Preferences Work

You can set up either group level filters or user specific filters but not both. When you create alarm filter preferences at user level, you do not get new or modified alarm filters from the group since user preferences take priority over group preferences.

If user has own alarm filter preferences and want to view only group level preferences at user level, do one of the following actions:

- Lock the group level alarm filters or
- Reset the user specific alarm filter preferences

Reset Preferences

The Reset Defaults button in the Set Preferences dialog lets you reset preference values back to the default. Resetting the preference automatically applies to the selected user or user group. When you reset the preference, the following occurs:

- For a user, it defaults to:
  - The setting on the User Group if the user is in a group and the preference is set for the group
  - Otherwise, the global setting for all users if set
  - Otherwise, the factory default setting
- For a User Group, it defaults to:
  - The global setting for all users if set
  - Otherwise, the factory setting
- For all users (the top-level Users node), it defaults to:
  - The factory setting

You cannot reset preferences that are locked. If you are modifying the preferences for a user and a given preference is locked at the user's group level, you cannot edit, import, or reset that preference.

Import and Export Preferences

Preferences can be imported from a user or user group and exported to other users and user groups.

Follow these steps:

1. Right-click the desired user or group in the Users tab, and click Set Preferences.
   The Set Preferences dialog opens.
2. Select the preferences to import or export.
   Selecting a preference group selects all of the preferences that it contains. If the top-level Preferences folder is selected, all preferences are selected.
3. Take *one* of the following steps:
   - Click Import to import preferences.
   - Click Export to export preferences.
4. Verify that the preferences you want to import or export are selected in the dialog, and click OK.
   The Select User/Group dialog displays the available users and user groups.
   - When exporting preferences, select a user or user group to which to export. Selecting the top-level Users node specifies all users (global). You only see users/groups for which you have the Set User Preferences privilege. If you lack the Set Global Preferences privilege, you do not see the top-level Users node.
   - When importing preferences, select a single user or group from which to import.
   - For both import and export, you only see the users and user groups that you have permission to view.

NOTE
For both import and export, the lock state of each preference is also transferred. For example, importing a locked preference from another user also locks that preference for the target user. If you export a preference that is locked at a higher level for the target user/group, the preference setting is not saved.

Managing Searches

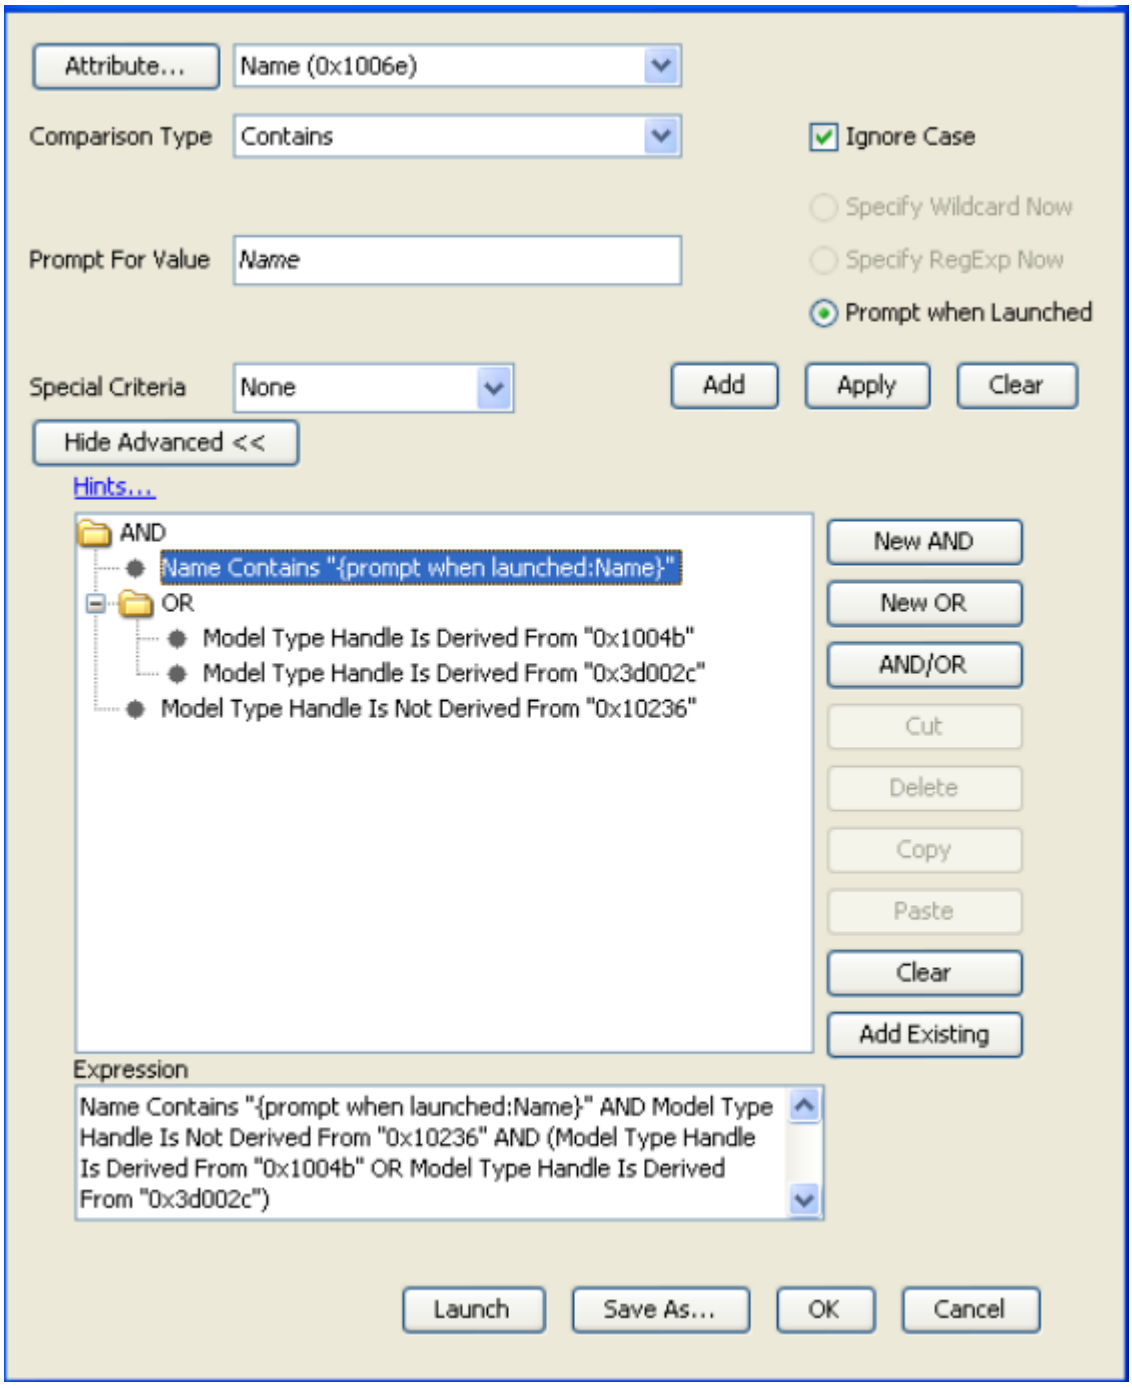
About Searches

You can create custom searches based on attribute values and various comparison criteria. This section describes how to create and manage custom searches. In general, these search management tasks are privileges that are granted only to OneClick administrators, not OneClick operators.

NOTE
While OneClick operators cannot create and manage searches, they can launch them. For information about how operators can use searches, see the Using OneClick section.

Create Search Dialog

The Create Search dialog contains several options and settings for creating simple and complex searches. The following image is an example of the Create Search dialog.



The options and settings available in the Create Search dialog depend on the type of search you are creating.

- **Attribute**
  Specifies an attribute of a device to filter.

  NOTE
  If you choose an alphabetic attribute value, you can either clear (ignore) or select (include) the Ignore Case check box.
- **Comparison Type**

Specifies the type of comparison to be made against the value specified in the Attribute field. Options can include Matches Pattern, Equal To, Not Equal To, Contains, Does Not Contain, Starts With, or Does Not Start With. Only the comparison types appropriate to the attribute's data type are available.

- **Ignore Case**
  Specifies whether the comparison should be case-sensitive. Selecting the Ignore Case check box makes the comparison not case-sensitive. This selection is only available when it is appropriate for the data type of the attribute you selected.
- **Attribute Value**
  Enter or select the desired attribute value you want to use in the comparison.

  NOTE
  Depending on the attribute type you select, you may be able to search for empty attribute values by leaving this field blank.

  Remove the "Allow PCRE searches" privilege for operators if you do not want them to run regular expression searches. Operators without this privilege will only be able to run wildcard searches for applicable searches.
- **Prompt for Value/Prompt When Launched**
  To create a search that prompts users to enter an attribute value when they run the search, select the Prompt when Launched option and then enter the prompt to display in the Prompt for Value field. This feature lets you create searches that are flexible enough to meet the different search requirements of OneClick users.
  Consider the following implementation examples:
  - If you want to create a search that locates any particular device type, you could create a search with a string comparison type (contains, does not contain, begins with, and so on) that prompts users to provide a particular device name when they run the search.
  - If you want to create a search that locates any device type with a particular Condition attribute value, you could create a search that prompts users to provide a particular condition value when they run the search.

Note: You can clear all fields at any time by clicking Clear.

- **Special Criteria**
  Constrains the search criteria in one of the following ways:

  NOTE

  The Special Criteria options cannot be used for 'Interface Attributes' and 'Device Attributes'. To search only devices or interfaces, use the 'None' option in the Special Criteria.

  - **None**
    Specifies that the search criteria will not be restricted to returning only devices or their interfaces.
  - **Interfaces of Devices**
    Specifies that you want the search to return only the interfaces of the devices it finds in the results list.
  - **Devices Only**
    Specifies that you want the search to return only devices in the results list.
- **Show Advanced**
  Opens the Advanced section of the Create Search dialog. The Advanced section in the Create Search dialog lets you create complex search criteria with any combination of nested AND clauses and OR clauses. This is represented in a tree structure grouped by logical operator (AND and OR) nodes. Each logical operator node can contain any number of attribute criteria nodes and other logical nodes. All nodes directly underneath a logical node are combined using the logical operator.
  - **Add**
    Adds a new attribute criteria node to the selected AND node or OR node with the information you entered into the Attribute, Comparison Type, and Attribute Value fields.
  - **Apply**

Applies the information entered in the Attribute, Comparison Type, and Attribute fields to the selected attribute criteria node.

- **New AND**
  Adds a new AND operator node to the selected AND node or OR node.
- **New OR**
  Adds a new OR operator node to the selected AND node or OR node.
- **AND/OR**
  Toggles the selected AND node or OR node. That is, if the logical operation is currently AND, clicking this button changes it to OR and vice versa.
- **Cut**
  Removes the selected node. It can be pasted below another node.
- **Paste**
  Pastes the last removed node below the selected AND node or OR node.
- **Clear**
  Removes all the nodes below the root node.
- **Add Existing**
  (Optional) Adds existing attribute-based, action-based, or relation-based searches to your custom search.

  NOTE
  Adding an existing search to your custom search copies the existing search and embeds it, as it is now, into your custom search. If the existing search is later modified, your custom search will not change because it contains only a copy of that existing search, as it was when you copied it and added it to your custom search.

- **Expression**
  Displays a textual representation of the search criteria as you create it.

Create Simple Searches

You can create searches that use complex criteria, such as a combination of AND clauses and OR clauses. A simple search contains only a single expression. You can also save searches for later use and organize them in folders.

Follow these steps:

1. Select the Locater tab in the Navigation panel.
2. Do one of the following in the Locater tab:
   - If you want to create a new search from a blank template, click the create a new search icon  .
   - If you want to create a new search based on an existing search, select a search and click the copy the selected search  .

     NOTE
     Some searches cannot be copied and used as the basis for another search. For example, Devices > By IP Address cannot be copied. However, you can create a new advanced search and can copy *any* predefined search criteria into that search. For more information, see Add Existing Searches to Custom Searches.

The Create Search dialog opens.

- Complete the fields in the dialog as desired.
- Click Save As.

The Save Search dialog opens.

- Enter a name and a description for the search.
- (Optional) Select the appropriate privilege if you want to limit access to the search to users who have a specific custom privilege. The privilege can be either assigned directly to the user or inherited from a role or user group.

  NOTE
  For more information about custom privileges, see the OneClick Customization section.
- Select a folder for the search.

  NOTE
  The Locater folder is the top-level folder.
- Click OK.
  The search is saved in the selected folder.
- (Optional) Click Launch to run the search.
  The search results appear in the Results tab of the Contents panel.
- Click OK.

Create Advanced Searches

Use the Advanced options in the Create Search dialog to create complex search criteria. You can build a search with many combinations of nested AND clauses and OR clauses.

Follow these steps:

1. Select the Locater tab in the Navigation panel.
2. Take one of the following steps on the Locater tab:
   - To create a search from a blank template, click the create a new search icon  .
   - To create a search from an existing search, select a search and click the copy the selected search icon  .

     NOTE
     Some searches cannot be copied and used as the basis for another search. For example, Devices > By IP Address cannot be copied. However, you can create a new advanced search and can copy *any* predefined search criteria into that search. For more information, see Add Existing Searches to Custom Searches.

The Create Search dialog opens.

- Complete the fields in the dialog as desired.
- Click Show Advanced to create complex search criteria that include a combination of AND clauses and/or OR clauses.
  The compound expression tree, logical operator buttons, and Expression field appear.
- Click Add to move the single expression that you created in Step 3 to the compound expression tree.
  The single expression appears in the compound expression tree.
- Click one of the following logical operator buttons to build a compound expression:
  - New AND
  - New OR
  - AND/OR

  The selected operator is inserted into the compound expression tree.
- Repeat Step 3, Step 5, and Step 6 for each compound expression that you want to build.
- (Optional) Add existing predefined search criteria.
- Click Save As.

The Save Search dialog opens.

- Enter a name and a description for the search.
- (Optional) Select the appropriate privilege from the Privilege drop-down list. Privileges limit access to the search to users with a specific custom privilege. Custom privileges can either be assigned directly or they can be inherited from a role or user group.

  NOTE
  For more information, see the OneClick Customization section.
- Select a folder in which to save the search from the Save In Folder section.

  NOTE
  The Locater folder is the top-level folder.
- Click OK.
  The Save Search dialog closes and you return to the Create Search dialog.
- (Optional) Click Launch to run the search.
  The search results appear in the Results tab of the Contents panel. The applicable entities have been excluded from the results list based on the compound search expressions you specified.
- Click OK.
  The Create Search dialog closes and you have now created an advanced search.

Add Existing Searches to Custom Searches

You can add existing attribute-based, action-based, or relation-based searches to any custom search you create. This lets you include predefined search criteria from existing searches including special searches such as All Devices and Devices By IP Address Range.

NOTE
Adding an existing search to your custom search copies the existing search and embeds it, as it is now, into your custom search. If the existing search is later modified, your custom search will not change because it contains only a copy of that existing search, as it was when you copied it and added it to your custom search.

To add an existing search to your custom search

1. Click the Locater tab in the Navigation panel.
2. Click the create a new search icon 
   The Create Search dialog opens.
3. Complete the fields at the top of the dialog as desired.
4. Click Show Advanced.
   The compound expression tree, logical operator buttons, and Expression field are displayed.
5. Click Add Existing.
   The Add Existing Search dialog opens.
6. Select the existing search that contains the criteria you want to copy and add to the current search and click OK.
   The Add Existing Search dialog closes and the criteria you selected is added to the compound expression.
7. (Optional) Click set next to the criteria you added to modify prompt information as desired.
   The Search dialog opens.
8. Do *one* of the following depending on whether you want to prompt users for a value:
   - Select 'Prompt the user' to configure how you want to prompt users:
   - **Prompt text**
     Specifies the text you want to prompt users with when they run the search.
   - **Default value**

Specifies a default value for this prompt.
  - **Note:** The default value is not shown to users until they run this search.
  - Select 'Specify value now' to enter the prompt value yourself now; users are not prompted to enter anything when they run this search.
9. Click OK.
10. Save the search as described Create Advanced Searches.
    You have now created a custom search that includes the addition of an existing search.

Search Recommendations

The following provides search criteria recommendations when defining advanced searches. The order of the criteria can affect the search performance.

The order of attribute criteria is based on two categories: *storage of information* and *data type.*

- **Storage of information**
  Attributes should be ordered from least CPU (quickest access) to most CPU (slowest access), as follows:
  - Memory flag (least CPU/quickest access)
  - Database flag
  - Calculated
  - External flag (most CPU/slowest access)
- **Data type**
  Attributes should be ordered from quickest comparison to slowest comparison, as follows:
  - Integer, counter, enumeration, model type handle (quickest comparison)
  - IP address, octet string
  - Text string (slowest comparison)

Combining the two categories of criteria, the overall attribute placement for complex searches of AND/OR order from top to bottom is as follows:

1. Memory flag
   a. Integer, counter, enumeration, model type handle
   b. IP address, octet string
   c. Text string
2. Database flag
   a. Integer, counter, enumeration, model type handle
   b. IP address, octet string
   c. Text string
3. Calculated
   a. Integer, counter, enumeration, model type handle
   b. IP address, octet string
   c. Text string
4. External Flag
   a. Integer, counter, enumeration, model type handle
   b. IP address, octet string
   c. Text string

Example

You would like to define a search based on the following search criteria (in no particular order):

- ifDesc
- Topology model name string
- Network address
- Model type handle

How should these attributes be ordered for best performance?

Using the recommended ordering logic, the following is the recommended order:

1. Model type handle (memory flag : model type handle)
2. Network address (memory flag/database flag : IP address)
3. Topology model name string (calculated flag : text string)
4. ifDesc (external flag : text string)

Edit Searches

You can edit a custom search that you have saved. The predefined searches cannot be modified.

Follow these steps:

1. In the Locater tab, select the search from the available searches, and click the edit the selected search  .
2. Edit the search using the controls that are described in Create Search Dialog. Select an attribute criteria node to see its information. You can then modify the attribute criterion.
3. Click Apply to change the selected node. Or click the Add button to create a new attribute criteria node.
4. Click OK.
   The modified search is saved.

Delete Custom Searches

NOTE
You cannot delete preconfigured folders and searches, but you can delete custom searches.

Follow these steps:

1. On the Locater tab, to organize, rename, or delete your searches, click  .
   The Organize Searches dialog opens.
2. Navigate to the custom search, and select it.
3. Click Delete.
4. Click OK.
   The custom search is deleted.

Organize Custom Searches

NOTE
You can organize your custom searches in a folder hierarchy. Predefined folders and searches cannot be edited.

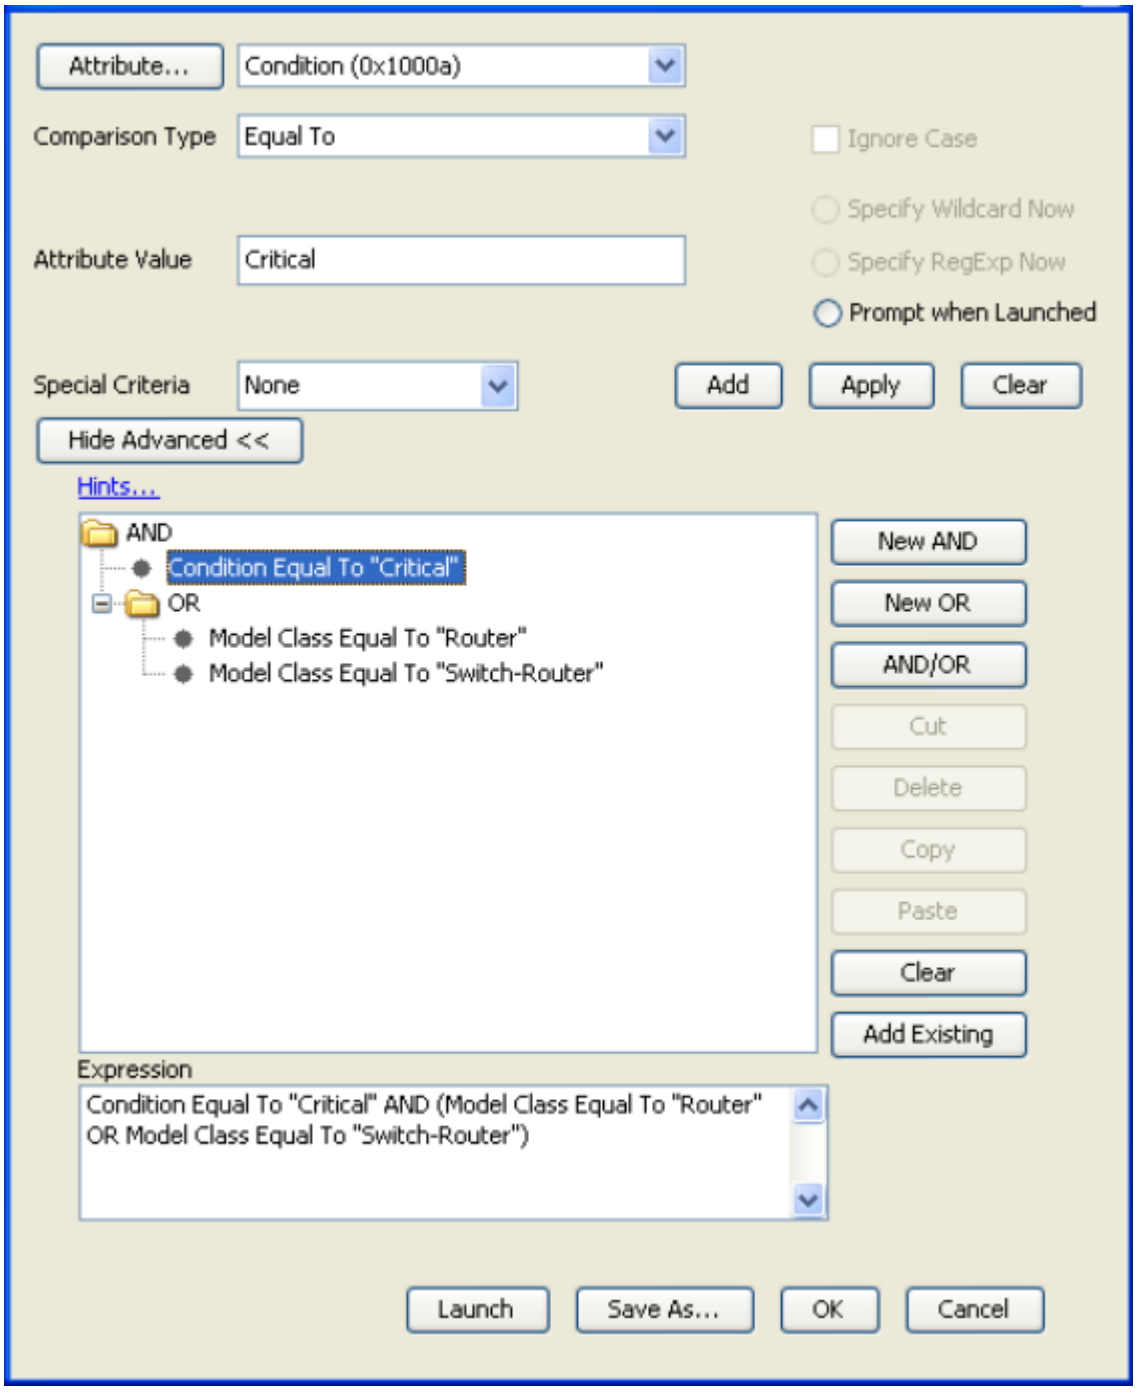
Follow these steps:

1. On the Locater tab, to organize, rename, or delete your searches, click  .
   The Organize Searches dialog opens.

2. Use the dialog to create a hierarchy of folders.
3. Move the searches that you have created into the new folders.
4. Use the Organize Searches dialog to rename or delete your custom folders and searches.
5. Click OK.
   Your custom searches are organized.

Example Search Find Devices In Critical Condition

Create a compound search that finds all routers or switch routers with a status of "Critical." The following image shows an example of the Create Search dialog after the appropriate compound expressions have been added:



The following procedure provides an example of a useful compound search.

Follow these steps:

1. Select the Locater tab in the Navigation panel.
2. On the Locater tab, to create a new search,

   click 
   The Create Search dialog opens.

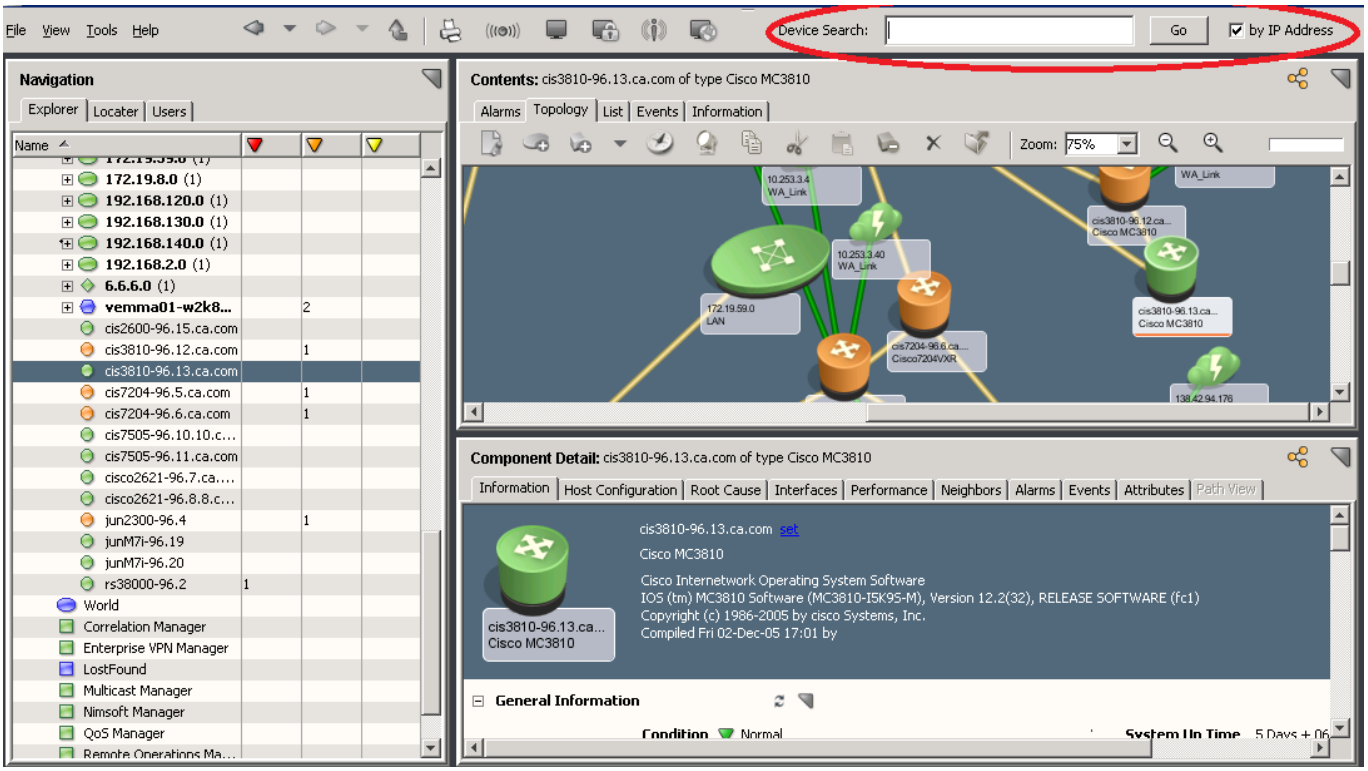
3. Complete the fields as follows:
   - **Attribute**
     Condition (0x1000a)
   - **Comparison Type**
     Equal To
   - **Ignore Case**
     N/A
   - **Attribute Value**
     Critical
4. Click the ‘Show Advanced’ button.
   The compound expression box and logical operator buttons appear.
5. Click Add to move the single expression created in Step 3 to the compound expression tree.
   The single expression appears in the compound expression tree in text string format in the Expression field at the bottom of the Create Search dialog.
6. Click the ‘New OR’ button.
   The OR operator is inserted into the compound expression tree, beneath the expression: Condition Equal To “Critical.”
7. Complete the fields on top of the Create Search dialog, using the following parameters:
   - **Attribute**
     Model Class (0x11ee8)
   - **Comparison Type**
     Equal To
   - **Ignore Case**
     N/A
   - **Attribute Value**
     Router
8. Click Add to move this expression to the compound expression tree.
   This expression (Model Class Equal To “Router”) is inserted into the compound expression tree, beneath the OR operator.
9. Complete the fields on top of the Create Search dialog, using the following parameters:
   - **Attribute**
     Model Class (0x11ee8)
   - **Comparison Type**
     Equal To
   - **Ignore Case**
     N/A
   - **Attribute Value**
     Switch-Router
10. Click Add to move this expression to the compound expression tree.
    This expression (Model Class Equal To “Switch-Router”) is inserted into the compound expression tree, beneath the OR operator.
11. (Optional) Click Save As to save this search in the Locater tab. You can then run it at any time.
12. Click Launch to run the search immediately.

The search results appear in the Results tab of the Contents panel.

About OneClick Quick Device Search

OneClick allows you to directly find a device model without going to the Locater Search. Enter the full IP address of the device in the device search bar of the OneClick console. You can also find a device by its redundant IP addresses, if that device has **Redundancy Preferred Addresses**. To find a device by its full name or a string, uncheck the "by IP Address" check box and enter the full name or a string.

The following image shows how the device search bar looks like:



Searching by a String

A search result that includes a list of all devices containing the matching string in their names is displayed. The search result includes device name, IP address, and the device landscape.
When you double-click the required device from the search result, the device is highlighted in the navigation panel.

Searching by Full Device Name or IP Address

The exact device is highlighted in the navigation panel. In a DSS environment when the device exists in multiple landscapes, you get the search result with the same information.

Select the device belonging to the required landscape.

In both cases, alarms and other information of the device are displayed in the Contents and Component Detail pane.

NOTE

Ensure to enter a valid IP address when you find by IP address. Only a valid IPv4 address enables the search.

Troubleshooting OneClick

This section discusses some of the most common problems while working with OneClick.

Non-LDAP Users Cannot Log In

Error binding: javax.naming.AuthenticationException: [LDAP: error code 49 - 80090308: LdapErr: DSID-0C0 903A9, comment: AcceptSecurityContext error, data 52e, v1db1]; remaining name

Reason:

The 'Allow user to login if no LDAP user is found' option is enabled, but your non-LDAP users cannot log in. This error occurs when LDAP is configured using "User by Pattern."

Action:

Reconfigure LDAP to use "User by Search."

Memory Resources Not Available

The memory resources required to complete the operation were not available.

Reason:

You are attempting to export very large (4000x4000 pixels and greater) Topology view images from OneClick.

Action:

Either reduce the image size by zooming out in the Topology view or increase the OneClick client memory settings as described in Configure OneClick Memory Settings.

OneClick Web Server Shuts Down

OneClick Web Server Shuts Down

Symptom:

I upgraded to VMware 2.0 and it runs an Apache Tomcat server of its own. After I install the OneClick web server, the OneClick web server shuts down when it attempts to bind to port 8005. Then, I receive the following error message:

```
- StandardServer.await: create[8005]:
java.net.BindException: Address already in use: JVM_Bind
```

Solution:

By default, Apache Tomcat uses port 80 on Windows platforms and port 8080 on Linux platform. If SSL is configured, Apache Tomcat uses port 443. Apache Tomcat also uses the default server shutdown port 8005. When installing the OneClick web server, be sure that other applications on the same computer do not use these ports. Or, you can change the ports on the instance of Apache Tomcat that DX NetOps Spectrum uses.

Blank Panels in OneClick Clients

Symptom:

In a fault-tolerant environment, I am seeing OneClick clients display blank panels after failover to the secondary SpectroSERVER has occurred. OneClick clients display three empty (gray) panels but the connection status shows that the failover switch has occurred.

Solution:

The blank panels occur because user privileges are not in sync between the primary and secondary servers, and the privileges are lost during failover. All user models must be created and completely configured on the primary SpectroSERVER before the primary server's database is copied to the secondary SpectroSERVER. If they are not, any actions done to User models (user associations made to license roles, access groups, and so on) will not be in sync with the secondary server until an online backup occurs. For more information, see the discussion about online backups in the Database Management section.

OneClick Web Server Shuts Down

Symptom:

I upgraded to VMware 2.0 and it runs an Apache Tomcat server of its own. After I install the OneClick web server, the OneClick web server shuts down when it attempts to bind to port 8005. Then, I receive the following error message:

```
- StandardServer.await: create[8005]:
java.net.BindException: Address already in use: JVM_Bind
```

Solution:

By default, Apache Tomcat uses port 80 on Windows platforms and port 8080 on Linux platforms. If SSL is configured, Apache Tomcat uses port 443. Apache Tomcat also uses the default server shutdown port 8005. When installing the OneClick web server, be sure that other applications on the same computer do not use these ports. Or, you can change the ports on the instance of Apache Tomcat that DX NetOps Spectrum uses.

> **NOTE**
> We recommend that you do *not* install the OneClick web server on a computer where an instance of Apache Tomcat is already running.

Using the getSpectrumInfo Script

getSpectrumInfo is a script used to gather information about your DX NetOps Spectrum environment. The collected data is written to a file that can conveniently be sent to CA Support. The following lists some of the data that is included:

- host information
- configuration files
- installation logs
- SpectroSERVER logs
- Tomcat logs

To use the getSpectrumInfo script

1. Log in to the system for which you want to collect environment data. You will need write permissions to the DX NetOps Spectrum installation directory to create the output file.
2. Prepare to enter the script, as follows:
   - On Windows:
     - From the Start, Run menu, type **cmd**, and click OK.
       The DOS prompt appears.
     - Enter **bash - login** to start a bash shell.
     - Navigate to the DX NetOps Spectrum installation directory.
   - On UNIX platforms, navigate to the DX NetOps Spectrum installation directory.
3. Enter the following command to run the script:
   ```
   ./bin/support/getSpectrumInfo.sh [full|lite|mini]
   ```
   You can use the following parameters on the command:
   full - The complete set of environment data, including all of the Install-Tools/LOGS directory, is collected. The getSpectrumInfo.sh command without any parameters defaults to this option. The output file created can be large.

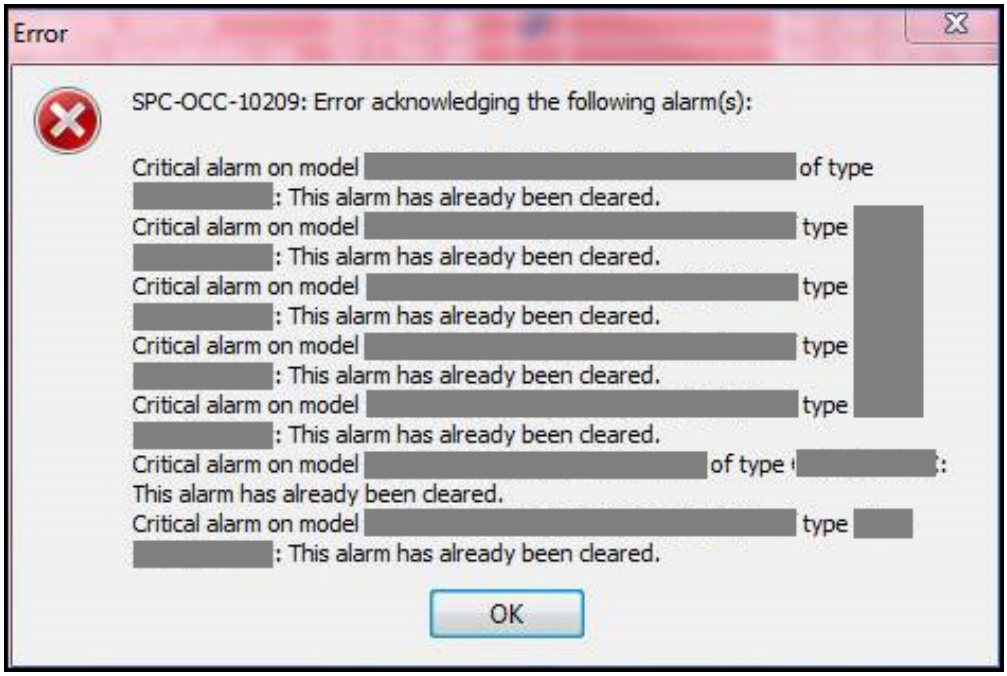
lite - A subset of environment data, including selected files from the Install-Tools/LOGS directory, is collected.
mini - Only the minimum environment data is collected.
The getSpectrumInfo script begins and displays informational messages as it runs. When it completes, a zipped file is created in the DX NetOps Spectrum installation directory in the following format:

```
logs-hostname-YYMMDD-nnnn.tar.gz
```

4. Contact CA Support for where to upload the file.

Unable to acknowledge or clear alarms in OneClick Console

Issue:
In OneClick, when an alarm is manually acknowledged or cleared, you may observe the following errors:



Environment:
All supported platforms.

Probable Cause:
This could happen when the SpectroSERVER and the OneClick Server has synchronization issue.

Resolution:
To resolve the synchronization issue, please schedule restart of the OneClick Web Server.

To know how to restart the OneClick Web Server, see Start and Stop the OneClick Web Server from the Command Line section.

Error Message in the Landscape Configuration Section

Running SpectroSERVER process using '**root**' user instead of '**spectrum**' user on linux machines may result in the following error message "*The user running the parent server does not have a user model in the local landscape*" on the landscape page found in the administration tab on the oneclick console.

Run 'ps -ef | grep -i spectro' to check if the SpectroSERVER process is owned by '**root**' user or other user instead of '**spectrum**' user (You can check the value of '**initial_user_model_name**' parameter in $SPECROOT/SS/.vnmrc file to check for the '**spectrum**' user) to resolve the issue.

Follow the steps mentioned to fix the issue:

1. Launch Spectrum Control Panel using '**root**' or other user who is currently owning the SpectroSERVER process. Stop SpectroSERVER process thoroughly by clicking [**Stop SpectroSERVER**] button.

2. Change the ownership of VNM.OUT, RCPD.OUT etc. under $SPECROOT/SS directory back to '**spectrum**' user using 'chown' command. Make sure when you run 'ls -l' under $SPECROOT/SS directory all files and directories are owned by '**spectrum**' user except the SpectroSERVER file. The SpectroSERVER file should be owned by '**root**' user and have the following attributes:

```
-rwsr-x---   1 root     spectrum     12841 Nov 21 01:16 SpectroSERVER
```

3. Launch Spectrum Control Panel using '**spectrum**' user and start SpectroSERVER process by clicking [**Start SpectroSERVER**] button.

System Customizations for OneClick

This section lists the parameters that can be edited in the context.xml file and the web.xml file to customize the server and client environment.

context.xml Customization Parameters

The context.xml file, located in the <$SPECROOT>/webapps/spectrum/META-INF directory, contains many OneClick customization parameters. You must restart the OneClick web server after making changes to this file.

- **maxProcessors**
  Controls the maximum number of OneClick clients that can be running:
  ```
  <parameter>
      <name>maxProcessors</name>
      <value>75</value>
  </parameter>
  ```
- **locServerName**
  Provides the hostname of the DX NetOps Spectrum location server:
  ```
  <parameter>
      <name>locServerName</name>
      <value>snowball</value>
  </parameter>
  ```
- **orbAgentName**
  ```
  <parameter>
      <name>orbAgentName</name>
      <value>snowball</value>
  ```

```
</parameter>
```

- **orbAgentPort**

```
<parameter>
    <name>orbAgentPort</name>
    <value>14000</value>
</parameter>
```

- **adminUserName**

```
<parameter>
    <name>adminUserName</name>
    <value>admin</value>
</parameter>
```

- **smtpHostName and smtpPort**

  Configure these parameters to set the host name of your mail server and the port that it uses, respectively:

```
<parameter>
    <name>smtpHostName</name>
    <value>mailhost</value>
</parameter>
<parameter>
    <name>smtpPort</name>
    <value>25</value>
</parameter>
```

- **useSecondarySS**

  A value of false prevents failover:

```
<parameter>
    <name>useSecondarySS</name>
    <value>true</value>
</parameter>
```

web.xml Customization Parameters

The web.xml file contains additional customization parameters. It is located in the following directory:

```
<$SPECROOT>/tomcat/webapps/spectrum/WEB-INF directory
```

You must restart the OneClick web server after making changes to this file.

To configure the OneClick web server to use a path to SG-Support other than the default, edit the value of the com.aprisma.spectrum.root.install parameter in the following section of the web.xml file:

```
<context-param>
    <param-name>com.aprisma.spectrum.root.install</param-name>
    <param-value>/usr/SPECTRUM/WebApps/SG-Support</param-value>
    <description>
    This parameter defines the absolute path to the directory where
    SG-Support was installed for the Spectrum core product. This
    directory should be <$SPECROOT>/SG-Support.
    </description>
</context-param>
```

HTTP method vulnerability

HTTP offers several methods that can be used to perform actions on the web server. Many of these methods are designed to aid developers in deploying and testing HTTP applications. These HTTP methods can be used for nefarious purposes by intruders if the web server is misconfigured and can make the server vulnerable.

The following restricted methods are not used by DX NetOps Spectrum. So they can be disabled safely.

Add the following methods to $SPECROOT/tomcat/conf/web.xml, towards the end of the file (that is, above the </web-app> end tag) for restricting/disabling these methods. Restart the OneClick server after this change.

<security-constraint>
<web-resource-collection>
<web-resource-name>restricted methods</web-resource-name>
<url-pattern>/*</url-pattern>
<http-method>TRACE</http-method>
<http-method>PUT</http-method>
<http-method>DELETE</http-method>
<http-method>HEAD</http-method>
<http-method>OPTIONS</http-method>
</web-resource-collection>
<auth-constraint />
</security-constraint>
<filter>
<filter-name>CorsFilter</filter-name>
<filter-class>org.apache.catalina.filters.CorsFilter</filter-class>
<init-param>
<param-name>cors.allowed.methods</param-name>
<param-value>GET,POST,CONNECT</param-value>
</init-param>
</filter>
<filter-mapping>
<filter-name>CorsFilter</filter-name>
<url-pattern>/*</url-pattern>
</filter-mapping>

Dynamic Host Configuration Protocol (DHCP) Support

In a DHCP environment, the IP addresses of certain devices change based on the DHCP lease. Prior to 10.3, DX NetOps Spectrum was not able to monitor these types of devices properly.
Starting From 10.3, you can run DNS Lookup to resolve the original IP address of the devices in DHCP environment.

DNS Lookup

Starting from the 10.3 release, you can trigger DNS lookup to resolve the correct IP address for the following issues:

- Device Contact Lost
- Duplicate IP or model
- Management Agent Lost
- Device IP swap (Schedule DNS Lookup)

To enable DNS lookup in DX NetOps Spectrum, follow these steps:

1. Log in to OneClick console.

2. Click the Explorer tab.
3. Select the device model on which you want to enable the DNS lookup.
4. Click the 'Attributes' tab in the Component Details panel.
5. *Search for the 'do_dns_lookup' attribute.*
6. Change the attribute value to 'Yes'.Default: No
   The DNS lookup feature is enabled for the selected model.

   NOTE

   Though the '*do_dns_lookup'* attribute is set on a device, if the ‘IP redundancy’ is also enabled, it does not trigger the DNS Lookup.
