> To migrate the self-monitoring device pack, follow the instructions in the Self-Monitoring Device Pack Migration section.

Verify Prerequisites

Before you migrate the device packs, confirm that the following criteria are met:

1. The installed version of CA Infrastructure Management is Release 2.3.3 or earlier.
2. The CA Performance Management 2.3.4 or later installation file is available.
3. DX NetOps Mediation Manager Release 20.2 is installed. A MultiController is installed on a dedicated server within the CA Infrastructure Management environment.
4. A LocalController is installed in every Data Collector that has a device pack installed.
5. Perform the following steps to check if IP address of the system in which the LocalController is installed appears in the runtime.xml file:
   a. Open the runtime.xml file from $CAMM_INSTALL/LC.
   b. Check if IP address is mentioned against the “myAddress” attribute.
   c. If IP address is not mentioned, replace the hostname with IP address and save the file.

Migrate Device Pack Generated by the Device Pack Generator

Migrate the device packs that are generated by the device pack generator by using the migratePMtoCAMM script.

Follow these steps:

1. Log in to the host where Data Collector is installed.
2. Navigate to $CAMM_INSTALL_DIR/tools.
3. Execute the migratePMtoCAMM migration script.
   The options to execute the migration script appear.

4. Execute the migratePMtoCAMM migration script with the option “d”
5. Type the device pack to migrate and press Enter.
   The device pack migrates successfully.

   NOTE

   The successfully migrated device pack is listed in Web UI. If the device pack is not available in Web UI or any error message is in the migration script output, please contact CA Support.
6. Upgrade the current version of CA Infrastructure Management to CA Performance Management 2.3.4 or later.
7. In CAMM Web UI, Click Device Packs and the Advanced option of the migrated device pack.
8. Select Repository, Control, and open the <*DevicePackName*>-Inventory.xml file in deviceConfig.
9. Confirm that “<Type>com.torokina.tim.plugin.inventory.InventoryListUpdateFunction</Type>“ is a single statement in <Acquisition desc="Inventory Update"> tag
10. Save <*DevicePackName*>-Inventory.xml file.
11. Start the device pack Engine followed by CAPM Presenter from the DX NetOps Mediation Manager Web UI.

    WARNING

    If the device pack did not start, contact CA Support.

Migrate Device Pack Existing in the Repository

Execute the migratePMtoCAMM script to migrate the device packs. Execute the script on every Data Collector where a device pack is installed.

Follow these steps:

1. Log in to the host where Data Collector is installed.
2. Navigate to $CAMM_INSTALL_DIR/tools.
3. Execute the migratePMtoCAMM migration script.
   The options to execute the migration script appear.
4. Execute the migratePMtoCAMM migration script with one of the following options: a, d, or t

   NOTE

   To migrate the CANECeNodeB, CACRBT, or CACRBTUSER device pack, execute the script with the option d.
5. Specify the device pack to migrate.
6. (For Test mode) Do one of the following steps:
   - To install the device pack Engine in the system where migratePMtoCAMM was executed, do the following step:
     - Copy the Engine_<*devicepack*>.zip file from MigratedIMDevicepacks directory and manually deploy in the system where the corresponding LocalController is running.
   - To install the device pack Engine in a system where migratePMtoCAMM was not executed, do the following steps:
     - Copy the files in the <*CAMM_Install dir*>/Components directory in the system where migratePMtoCAMM was executed.
     - Log in to the other system where you want to install the device pack Engine.
     - Create the Engine_<*devicepack*> directory in the <*CAMM_Install dir*>/Components directory.
     - Paste the copied files in the Engine_<*devicepack*> directory.
7. Upgrade the current version of CA Infrastructure Management to CA Performance Management 2.3.4 or later.
8. (For Test mode) Follow one of the steps to install CAPM Presenter. But, do not start the CAPM Presenter.
   - Copy the Presenter zip file from MigratedIMDevicepacks directory and install it in the LocalController that is on Data Collector.
   - Install CAPM Presenter from the DX NetOps Web UI.

WARNING

The PRESENTER_ID of the Engine must match with the COMPONENT_ID of the CAPM Presenter.

The number of CAPM Presenters depends on the number of complex device packs. If the amount of data to be processed is very large, the performance of the single CAPM Presenter is impacted. For the workaround, see the Frequently Asked Questions section.

9. (For Test and Deploy modes) Start the device pack Engine followed by CAPM Presenter from the DX NetOps Mediation Manager Web UI.

WARNING

If the device pack did not start, contact CA Support.

Self-Monitoring Device Pack Migration

You should migrate the self-monitoring device pack through the Web UI if you migrate the device pack from CA Infrastructure Management 2.3.3 and earlier to CA Performance Management 2.3.4 and above as specified in the Device Pack Migration section.

Follow these steps:

1. Launch the DX NetOps Mediation Manager web UI:
   http://<*PrimaryMCMachineIP*>:<*web-port*>
   Where <*web-port*> is the port number that is configured during the DX NetOps Mediation Manager Installation and <*PrimaryMCMachine IP*> is the IP address or hostname of the primary MultiController system.
2. Enter your login credentials.
3. Make sure that you are in the CA Performance Management environment.
4. Select Device Packs from the DX NetOps MM Cluster node in the Dashboard.
5. Select Install.
   The Device Pack Installation dialog appears.
6. Specify the destination from the LocalController drop-down.
7. Perform one of the following steps:
   – If the device pack to install is in the Device Pack repository that is shipped with the current release of DX NetOps Mediation Manager, select Device Pack Repository.
   – If the device pack to install is in the local system, click Browse and locate the device pack.
8. Select ENGINE_ CAMM_IM_SelfMonitoring.zip and click Next.
   Cert and Views of the selected device pack are deployed and the dialog to configure CAPM Presenter appears.
9. Provide the parameters in Global External Variables and Component Configuration and click Next.

WARNING

- The PRESENTER_ID of the Engine must match with the COMPONENT_ID of the CAPM Presenter.
- To update the text in COMPONENT ID, append text or numeral with underscore. Do not modify the existing text in COMPONENT ID.

NOTE

If you already installed a CAPM Presenter, you can skip the CAPM Presenter installation by clearing the check box at the top of the dialog. For more information about specific Device Pack configuration files, see the corresponding Engine readme file by selecting ReadMe from the Web UI.

   CAPM Presenter and Engine are deployed.
10. Click Finish when the installation is complete.
    The self-monitoring device pack is migrated.

11. Start CAMM_IM_SelfMonitoring from the Web UI.

Using

Use the Web Manager to select an environment that is integrated with DX NetOps and to manage the components and device packs deployed. Check the browser requirement in the Release Notes section to know the browser compatibility.

How to access and use DX NetOps?

- To start the application, type http://<*PrimaryMCMachineIP*>:<*web-port*> in a browser.Where <*PrimaryMCMachine IP*> is the IP address or hostname of the primary MultiController system, <*web-port*> is the port number that is configured during the DX NetOps Mediation Manager installation. **Default:** 8080.
- To log in the application, type the login credentials and click LOG IN.
  User ID: admin; **Password:** camm
- To manage the components or device packs or to modify the settings, click the corresponding tabs.
- To log out the application, click Log Out at the top right-corner.

Select Environment, Language, and Help

Contents

Environment Selection

The data that are collected and processed by DX NetOps is rendered in another environment. CA eHealth and CA Performance Management are the two environments that can be integrated with DX NetOps. The options in the Web interface dependDX NetOps on the environment selected.

You are prompted to select the environment when you log in to the web interface for the first time. However, you can change or update the environment anytime.

Selecting the Environment

After you install DX NetOps Mediation Manager, perform the following steps to select an environment.

1. Launch DX NetOps Mediation Manager and click the environment name that appears at the top-right corner.
2. Select the environment.
3. (for CA Performance Management) Specify the CA Performance Center details.
4. Click Save.

Changing or Updating the Environment

The name of the current environment appears at the top-right corner of the Management tab. To change the existing environment in which DX NetOps is installed or to update the parameters of the environment, click the environment name and specify the parameters.

> **NOTE**
>
> When no environment is selected, Change/Update Environment appears on the top-right corner.

Language Selection

DX NetOps supports the following languages:

- Chinese Simplified
- Chinese Traditional
- English
- French
- Japanese

Changing the Language

The name of the current language appears at the top-right corner of the Web UI. To change the existing language in which DX NetOps is installed, click the language and select a new language from the dialog.

Open API

The API link redirects to the page that has instructions to perform the following read-only operations using REST over HTTP:

- GET the installed and supported device packs
- GET the discovered devices
- GET the last performance poll data

Help Selection

DX NetOps provides link to access the device pack information file [DPInfo file] and also three channels to resolve their issues - Wiki, Support, and Communities.

Follow these steps:

1. Click Help at the top-right corner.
2. Select one of the following options:
   a. Click DX NetOps MM Wiki to access DX NetOps documentation in Wiki.
   b. Click Device Pack ReadMe to access the DPInfo file.
   c. Click About DX NetOps MM to access CA Support site and DX NetOps user communities.

Manage Controllers

MultiController (MC) and LocalController (LC) are the two controllers that manage the environment configuration. Use this page to start, monitor, or stop the controllers.

The following information describes the options in the Controllers tab of the DX NetOps Mediation Manager Web UI:

Start or Stop Starts or stops a LocalController or MultiController. To start or stop a controller, select the corresponding check box of the controller, and click Start or Stop.

RefreshRefreshes the page and not individual controllers.

GroupGroups the controllers that are based on the selected criteria. To group the controllers, click Group and select a criteria from the drop-down.

LoggerDisplays the logs. To view the log details of a controller, click the

(Logging) icon that is available in the corresponding row.

(Advanced)
Provides performance metrics for the Java Virtual Machine (JVM) and the system where the controller is running.

SubscribeRecords the log. This button appears in the Logging area when you click

for a particular controller.

ClearClears the log. This button appears in the Logging area when you click

for a particular controller.

FocusPins the logging area. This button appears in the Logging area when you click

for a particular controller.

OptionsProvides options to change the settings that are done in My Settings page for the Logging section.

Manage Device Packs

Device Pack collect information from a non-SNMP device and forward it to the Network Management System. Use this page to install, start, monitor, upgrade, manage, stop, or remove a device pack in your system.

The following information describes the options in the Device Packs tab of the DX NetOps Mediation Manager Web UI:

Install or Remove

Installs or removes the device packs from the existing repository. The default path that is used during the installation is $CAMM_HOME/MC/repository/device packs. If you used a different path during the installation, browse and select your device pack path.

To install a subcomponent, click Install, and specify the options in the Device Pack Configuration dialog.

To remove a subcomponent, click the corresponding check box of the subcomponent and click Remove.

Upgrade

Upgrades the version of the device pack.

To upgrade a subcomponent, click the corresponding check box of the subcomponent and click Upgrade.

Move

Moves the Engine from one LocalController to another.

Refresh

Reloads the page. It does not refresh the individual subcomponent.

GroupGroups the controllers that are based on the selected criteria. To group the controllers, click Group and select a criteria from the drop-down.

LoggerDisplays the logs. To view the log details of a controller, click the

(Logging) icon that is available in the corresponding row.

(Advanced)
Provides performance metrics for the Java Virtual Machine (JVM) and the system where the controller is running.

SubscribeRecords the log. This button appears in the Logging area when you click

for a particular controller.

ClearClears the log. This button appears in the Logging area when you click

for a particular controller.

FocusPins the logging area. This button appears in the Logging area when you click

for a particular controller.

OptionsProvides options to change the settings that are done in My Settings page for the Logging section.

Move Device Pack Engine

Use the Move feature to move a device pack Engine from one LocalController to another.

Follow these steps:

1. Select one or multiple Engines and click Stop.
2. Click Move, specify the LocalController as new destination, and click Move.
3. Do one of the following steps:
   - In the destination LocalController, if you want to prevent the download and process of the already polled data, continue from Step 4.
   - In the destination LocalController, if downloading and processing the already polled data is acceptable, continue from Step 7.
4. Browse to the following location in the destination LocalController: /opt/CA/CAMM/COMPONENTS/ENGINE_<*devicepack name*>
5. Create the tmp, input, performance, and inventory folders in the following order:
   /opt/CA/CAMM/COMPONENTS/ENGINE_<d*evicepack name*>/tmp/input/performance
   /opt/CA/CAMM/COMPONENTS/ENGINE_<*devicepack name*>/tmp/input/inventory
6. Cut the .historyFile.inventory from the following locations in the source LocalController and paste them in the corresponding folders [created in step 5] in the destination LocalControllers:
   /opt/CA/CAMM/COMPONENTS/ENGINE_<*devicepack name*>/tmp/input/performance
   /opt/CA/CAMM/COMPONENTS/ENGINE_<*devicepack name*>/tmp/input/inventory

   WARNING

   Perform steps 4 through 6 before the next poll. After the poll, the tmp, input, performance, and inventory folders are created automatically and the previous history files are downloaded causing unwanted memory usage.
7. Select the moved Engine in the Manage Device Packs tab and click Start.

Manage Settings

Launch the Web UI, click My Settings, and use the options to specify the settings to establish connection, collect logs, and send notification messages.

Connection

Use the following parameters to specify the settings to establish connection between MultiController and device:

RetriesSpecifies the number of times MultiController attempts to connect the server.

IntervalSpecifies the time lag between the two attempts.

Logging

Use the following parameters to specify the settings for recording the logs:

Refresh Rate Specifies how frequent the log page refreshes.

Buffer Size Specifies the character size of the log page.

Max Line Number Specifies the maximum line number to be accommodated in log.

Syntax Highlight Indicates if a syntax that appears in the log to be highlighted in different color.

Notification

Use the settings in the Notification area to continuously monitor the components and receive alerts when an anomaly is detected. For every component, you can select the anomaly for which you need notification. When an anomaly occurs, you will receive an email that contains the possible cause and solution.

Use the following parameters to receive notification if anomalies are detected in the DX NetOps Mediation Manager components:

Server Properties

Contains the following details of the server.

SMTP Server Address
Specifies the hostname or IP address of the SMTP server.

SMTP Server Port
Specifies the port to use for SMTP requests.

Email To
Specifies the primary email addresses to which the generated alert messages are sent. Separate multiple addresses by comma.
Format: user1@mydomain.com, user2@mydomain.com

Email CC
(Optional) Specifies the secondary email addresses to which the generated alert messages are sent. Separate multiple addresses by comma.
Format: username1@mydomain.com, username2@mydomain.com

Email From
(Optional) Specifies the email address from which the alert messages are sent to the addresses listed in Email To and Email CC. If no address is specified, email will be sent from the CAMM_Notification@ca.com address.
Format: sendername@mydomain.com

Enable Authentication
(Optional) Select the check box if the email server provided needs any authentication.

Username
Specifies a username to use when the email server challenges an SMTP request.

Password
Specifies a password to use when the email server challenges an SMTP request. The SMTP Username parameter is required.

Test
Tests the server details by sending an autogenerated email.

> **WARNING**
> Proceed further only if the test is successful.

DX NetOps MM Components

Lists the DX NetOps Mediation Manager components. Expand a node and click a component. From the <*component name*> Anomalies dialog, select the following anomalies:

MC stopped Notifies when the MultiController stopped working.

Error file created Notifies when an error file is created. The file contains “STD-OUT” or “STD-ERROR”. This file contains error messages, such as any third-party-library errors, that cannot be logged in regular log file.

Exception or error message is logged Notifies about an event that affects the natural functioning of the component and error message is logged.

Engine stopped Notifies when the Engine stopped working.

LC stopped Notifies when the LocalController stopped working.

Presenter stopped Notifies when the Presenter stopped working.

DX NetOps MM DC stopped Notifies when the Data Controller stopped working.

DX NetOps MM DC Queue size growing Notifies when the threshold limit of the Data Collector file collection is exceeded.

Programming

DX NetOps data can be classified as the data that are collected from the non-SNMP devices and the data that are processed by the DX NetOps components. These data are stored in corresponding XML files. Though you can manually access the files from the system where DX NetOps is installed, it is not recommended. So, the files are accessed through the Web-based UI to know the product status or to perform various operations.

API using REST over HTTP can be used only for DX NetOps for CA Performance Management. This feature helps in sharing the data among applications and easily integrating with Network Management System [NMS].

You can use API for the following purposes:

- Read the list of all supported device packs
- Read the default configuration of device pack components
- Read the list of all installed components
- Read the data from installed components
- Installing components
- Upgrading components
- Start or Stop the components

Access API using REST over HTTP

The URL and the other information are as follows:

API Hyperlink

- If you are logged in DX NetOps, click the API hyperlink on the top-right corner.
- Follow the instructions in the home page.

API Usage

In DX NetOps 2.5, only the GET method is supported for OpenAPI. The services that are provided through the GET method can also be accessed through a browser.

Follow these steps:

1. Open your web browser and navigate to the following address: http://<*base URL*>/<*relative URL*>
   base URL: http://<*CAMM_HOST*>:<*WebServerPort*>/tim-web/rest
   relative url: See the Supported Services for the list of relative URLs.

2. Type the login credentials, which is same as that of DX NetOps Web UI.

   NOTE
   Alternatively, to communicate with the DX NetOps API, create the REST client application or use any tool that contains the REST client functionality.

Supported Services

The supported services and the corresponding relative URLs are as follows:

Service Description	Relative URL
Get installed device packs	/devicepacks
Get supported device packs	/devicepacks/all
Get all discovered devices by one device pack	/devicepacks/<*id*>/devices
Get performance poll data of one device packs within this range	/devicepacks/<*id*>/data/performance

Example: http://<*PrimaryMCHostName*>:<*WebServerPort*>/tim-web/rest/devicepacks

Read the List of all Supported Device Packs

You can get the list of all the supported device packs in the CA Performance Management environment. This section provides you sample request URL and the corresponding response.

Scenario:

- Primary MultiController is installed at camm.ca.com with the default web server port number (8880).
- Two LocalControllers are connected to the primary MultiController.

HTTP Method: GET

Request URL

Format: http://<*CAMM_HOST*>:<CAMM_WEB_PORT>/tim-web/rest/devicepacks

Read the Default Configuration of Device Pack Components

You can get the Engine or Presenter configuration supported in the CA Performance Management environment. This section provides you sample request URL and the corresponding response.

HTTP Verb: GET

Scenario:

- Primary MultiController is installed at camm.ca.com with the default web server port number (8880).
- Two LocalControllers are connected to the primary MultiController.

Get Configuration of the Supported Engine

Request URL

Format: http://<*CAMM_HOST*>:<*WebServerPort*>/tim-web/rest/devicepack/<*devicePackID*>/engine/configuration

Read the Data from Installed Components

You can get data, such as the discovered devices, poll data, and Engine and Presenter configurations for the device packs installed in the CA Performance Management environment. This section provides you sample request URL and the corresponding response.

HTTP Method: GET

Get the Discovered Devices

Scenario:

- Primary MultiController is installed at camm.ca.com with the default web server port number (8880).
- Two LocalControllers are connected to the primary MultiController.
- CAGuavus device pack is installed.

Request URL

Format: http://<*CAMM_HOST*>:<*WebServerPort*>/tim-web/rest/components/<componentID>/data/inventory

For the given scenario: http://camm.ca.com:8880/tim-web/rest/components /CAGuavus /data/inventory

Sample response

```
<response url="/components/ENGINE_CAGuavus/data/inventory" version="2.x.y.z">

    <data>

        <inventory id="CAGuavus:Guavus_AZUSCA21NSA_A_GV_HPC7_20"/>

        <inventory id="CAGuavus:Guavus_FSLAB"/>

        <inventory id="CAGuavus:Guavus_AZUSCA21NSA_A_GV_HPC7_21"/>

        <inventory id="CAGuavus:Guavus_MIDM"/>

        <inventory id="CAGuavus:Guavus_ALL_DC"/>

        <inventory id="CAGuavus:Guavus_smlabgvsgp1"/>

        <inventory id="CAGuavus:Guavus_smlabgvuip2"/>
```

```
        <inventory id="CAGuavus:Guavus_smlabgvuip1"/>

Upgrade Components

You can upgrade a device pack (Engine, CERT, and Presenter) with the default or customized configurations in the CA Performance Management environment. This section provides you sample request URL and the corresponding response.

NOTE

CERT is automatically deployed in Data aggregator while upgrading the Engine.

HTTP Verb: PUT

Scenario:

- Primary MultiController is installed at camm.ca.com with the default web server port number (8880).
- Two LocalControllers are connected to the primary MultiController.
- CAGuavus device pack is installed and needs to be upgraded.

Request URL

Format: http://<*CAMM_HOST*>:<*WebServerPort*>/tim-web/rest/devicepacks/<*Devicepack_Name*>

For the given scenario: http://camm.ca.com:8880/tim-web/rest/devicepacks/CAGuavus

Sample Request Body:

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>

Start or Stop the Components

You can start or stop the installed device pack in the CA Performance Management environment. This section provides you sample request URL and the corresponding response.

HTTP Method: POST

Scenario:

- Primary MultiController is installed at camm.ca.com with the default web server port number (8880).
- Two LocalControllers are connected to the primary MultiController.
- CAGuavus device pack and PRESENTER_CAPM are installed.

Start the Device Pack Engine on all LocalControllers

Request URL

Format: http://<*CAMM_HOST*>:<*WebServerPort*>/tim-web/rest/components/<*component_id*>?action=start

For the given scenario: http://camm.ca.com:8880/tim-web/rest/components/ENGINE_CAGuavus?action=start

Sample response

```
<response url="/components/ENGINE_CAGuavus?action=start" version="2.x.y.z">
 <components>
  <component id="ENGINE_CAGuavus" status="started"/>
  <status>Successfully Started</status> </components>
 <status>
  <code>200</code>
  <message>Success!</message>
 </status>
</response>
```

Stop the Device Pack Engine on all LocalControllers

Request URL

Format: http://<*CAMM_HOST*>:<*WebServerPort*>/tim-web/rest/components/<*component_id*>?action=start

For the given scenario: http://camm.ca.com:8880/tim-web/rest/components/ ENGINE_CAGuavus ?action=stop

Sample response

```
<response url="/components/ENGINE_CAGuavus?action=stop" version="2.x.y.z">
 <components>
  <component id="ENGINE_CAGuavus" status="stopped"/>
  <status>Successfully Stopped</status>
 </components>
 <status>
  <code>200</code>
  <message>Success!</message>
 </status>
</response>
```

Start the Presenter on all LocalControllers

Request URL

Format: http://<*CAMM_HOST*>:<*WebServerPort*>/tim-web/rest/components/<*component_id*>?action=start

For the given scenario: http://camm.ca.com:8880/tim-web/rest/components/PRESENTER_CAPM?action=start

Sample response

```
<response url="/components/PRESENTER_CAPM?action=start" version="2.x.y.z">
 <components>
  <component id="PRESENTER_CAPM" status="started"/>
  <status>Successfully Started</status> </components>
 <status>
  <code>200</code>
  <message>Success!</message>
 </status>
</response>
```

Stop the Presenter on all LocalControllers

Request URL

Format: http://<*CAMM_HOST*>:<*WebServerPort*>/tim-web/rest/components/<*component_id*>?action=start

For the given scenario: http://camm.ca.com:8880/tim-web/rest/components/ PRESENTER_CAPM ?action=stop

Sample response

```
<response url="/components/PRESENTER_CAPM?action=stop" version="2.x.y.z">
 <components>
  <component id="PRESENTER_CAPM" status="stopped"/>
  <status>Successfully Stopped</status>
 </components>
 <status>
  <code>200</code>
  <message>Success!</message>
```

```
  </status>
</response>
```

Read List of LocalControllers

You can get the list of LocalControllers in the CA Performance Management environment. This section provides you sample request URL and the corresponding response.

Scenario:

- Primary MultiController is installed at camm.ca.com with the default web server port number (8880).
- One LocalController is connected to the primary MultiController.

HTTP Verb: GET

Request URL

Format: http://<*PrimaryMCHostName*>:<*WebServerPort*>/tim-web/rest/lc

For the given scenario: http://camm.ca.com:8880/tim-web/rest/lc

Sample response

```
<response url="/lc" version="2.x.y.z">

    <lcs>

        <lc id="LC-127.0.0.1" status="started"/>

    </lcs>

    <status>

        <code>200</code>

        <message>Success!</message>

    </status>

</response>
```

Configuring

This section deals with configuring the components in DX NetOps and EMS Integration Profiles for DX NetOps for Infrastructure Management.

Generic Executor Configuration

The Generic Executor typically requires no configuration after the initial installation. Only one Generic Executor is required per server unless you require the components to run with different user IDs.

The Generic Executor configuration is installed in the Generic Executor directory, named GE_<*userid*>, in the DX NetOps MM HOME directory. The <*userid*> is the user name that you specified during the installation.

The Generic Executor directory contains a file that is named LocalConfig-ge.xml.

When the Generic Executor assumes the role of a component, it executes using the same user ID configured in the LocalConfig-ge.xml.

Example of a LocalConfig-ge.xml file for UNIX

```
<?xml version="1.0" encoding="UTF-8"?>
<AppDaemon>
    <Names>
    </Names>
    <Paths>
        <Path name="tim.base">/opt/CA/CAMM</Path>
        <Path name="appHome">${tim.base}/GE_camm</Path>
        <Path name="configBase">${appHome}/tmp</Path>
    </Paths>
    <Binding>
        <Port>29560</Port>
        <UserId>camm</UserId>
    </Binding>
</AppDaemon>
```

Example of a LocalConfig-ge.xml file for Windows

For a Windows user, the primary Generic Executor configuration file is slightly different:

```
<?xml version="1.0" encoding="UTF-8"?>
<AppDaemon>
    <Names>
    </Names>
    <Paths>
        <Path name="tim.base">/opt/CA/CAMM</Path>
        <Path name="appHome">${tim.base}/GE_camm</Path>
        <Path name="configBase">${appHome}/tmp</Path>
    </Paths>
    <Binding>
        <Port>29560</Port>
        <UserId>camm</UserId>
    </Binding>
    <CompanyItems>
       <Item>
        <Name>MC</Name>
        <Config>${tim.base}/MC/LocalConfig-mc.xml</Config>
        <Port>29599</Port>
    </Item>
       <Item>
        <Name>LC</Name>
        <Config>${tim.base}/LC/LocalConfig-lc.xml</Config>
        <Port>29598</Port>
    </Item>
    </CompanyItems>
</AppDaemon>
```

The <*CompanyItems*> section added to the Generic Executor configuration file defines the locations and service ports for MultiController and LocalController. With <CompanyItems> defined, the Generic Executor checks these items every

one minute and if they are not running, the Generic Executor starts them automatically. This configuration enables the MultiController and the LocalController to start without external intervention.

The <*CompanyItems*> feature is disabled after installation by default. You can execute the camm.init.install command to enable it.

NOTE
Only the primary Generic Executor requires the <*CompanyItems*> section. Other Generic Executors must not contain this section.

How the Generic Executor Works

The Generic Executor is a reusable entity and is the foundation of DX NetOps components. When a server starts, it is mandatory that at least one Generic Executor component exists and is started.

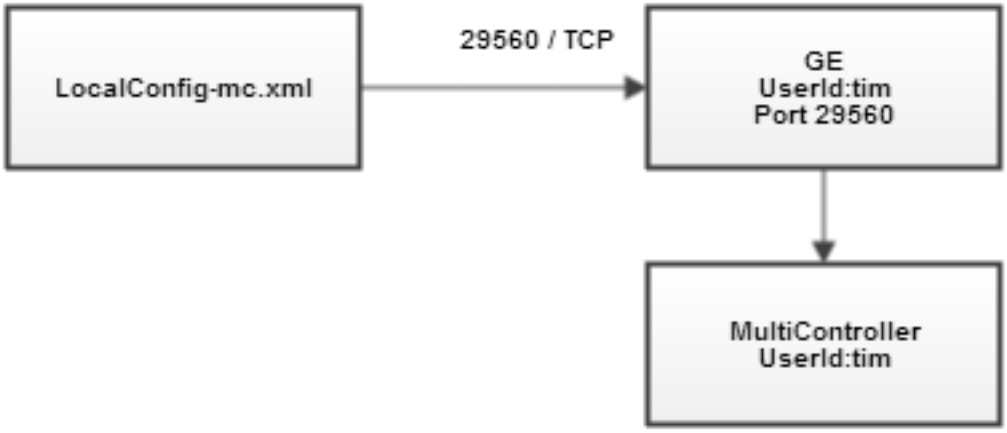
By default, the LocalConfig-ge.xml file contains the User ID of the CAMM_USER and the TCP port information. The following diagram illustrates the Generic Executor on TCP port 29560 and the CAMM_USER who installed DX NetOps:

Figure 88: How the Generic Executor Works_1--XML

If you require a MultiController to run on a server, you need a LocalConfig-mc.xml configuration file for the MultiController and the TCP port for the Generic Executor.

The following diagram illustrates how the LocalConfig-mc.xml file is sent to the Generic Executor on TCP port 29560, and the Generic Executor starts a new process for the MultiController:

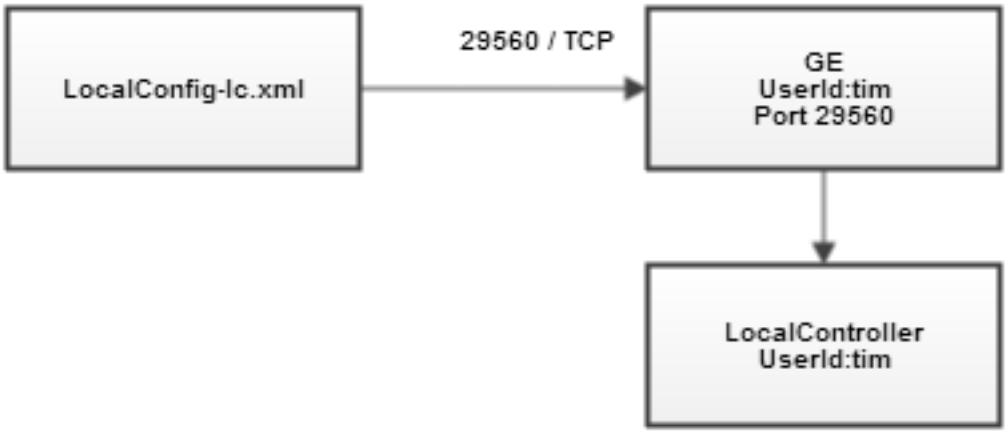
Figure 89: How the Generic Executor Works_2--XML



If a LocalController must run on a server, only a LocalConfig-lc.xml configuration file for the LocalController and the TCP port for the Generic Executor are required.

The following diagram illustrates how the LocalConfig-lc.xml file is sent to the Generic Executor on TCP port 29560, and the Generic Executor starts a new process for the LocalController:

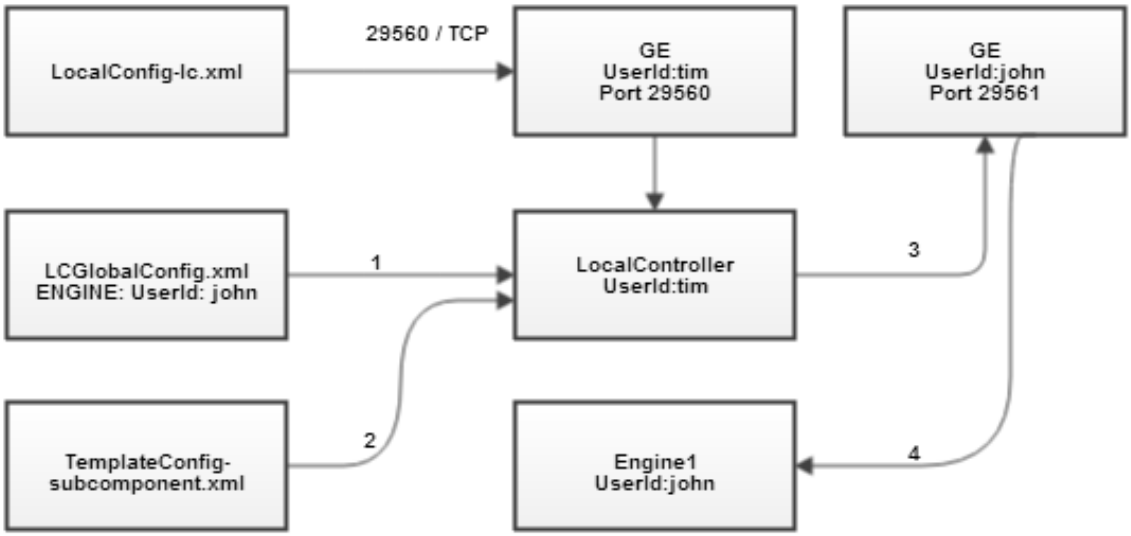
Figure 90: How the Generic Executor Works_3--XML



When the LocalController starts, it reads the LCGlobalConfig.xml file from its repository. The LCGlobalConfig.xml file contains the subcomponents and port information.

If an Engine is required to run on a server, the LocalController uses the LCGlobalConfig.xml file to determine which user ID it must run as. In the LocalController directory, the LocalController looks up the ExecutorMap.xml file. This action allows the LocalController to locate a Generic Executor running as the required user ID. The TemplateConfig-subcomponent.xml file is then combined with the specific configuration from the LCGlobalConfig.xml file. The combination is sent to the TCP port of the Generic Executor.

Figure 91: How the Generic Executor Works_4--XML



Generic Executor Configuration Options

The installer requires the following options for the configuration:

- **tim.base**
  Specifies the base directory of DX NetOps.
- **appHome**

Specifies the base directory of the DX NetOps Generic Executor.

- **configBase**
  Specifies the temporary directory for storing configurations of components that the Generic Executor executes now.
- **Port**
  Specifies the TCP port on which the Generic Executor listens.
  Default: TCP 29560
- **UserId**
  Specifies the User ID that owns the Generic Executor process and its subprocesses.

Generic Executor Startup Sequence

You can manually start the Generic Executor process (or service on Windows) using the startall or startall.bat script. However, if camm.init.install is executed, the Generic Executor starts automatically on system startup.

Add Another Generic Executor

Add another Generic Executor if you require a component to execute as a different User ID.

Follow these steps:

1.
2. Add a user to the LocalController that requires the additional user ID. The new user must be a member of the same group that owns the CAMM_HOME directory.

   NOTE
   Repeat this procedure for any standby LocalControllers.
3.
4. Log in as the new user.
5.
6. Execute the following command to add the new Generic Executor:

   ```
   (For UNIX) shell# /opt/CA/CAMM/tools/camm.ge.install -p <Port number>
   (For Windows) > %TIM_HOME%/tools/camm.ge.install.bat -p <Port number>
   ```

   Where, TIM_HOME is the DX NetOps installation directory and <*Port number*> is the port number to install the Generic Executor.
   The additional Generic Executor is added.

   NOTE
   A configuration file in the LocalController directory that is named ExecutorMap.xml is modified to provide a map between the required User ID and the TCP port.

When the Engine subcomponent is started, the LocalController references the User ID provided in the LCGobalConfig for that component. If the User ID is not the default User ID, the ExecutorMap is referenced and the TCP port for the alternative Generic Executor starts the subcomponent.

This reference is useful when the Engine uses user or host-based RSA key authentication to SFTP or SCP the information.

Enable SSL Communication Between Components

The TLS 1.0 had some known cryptographic design flaws. With this release, we enhanced the remote service to accept connections using TLS 1.2 encryption.

Use the validateSSL.sh script in **CAMM_Home/tools** directory to enable SSL communication between DX NetOps Mediation Manager components. You can either use the Signed Certificate and Key issues by Certificate Authority (CA) or external Keystore with CA Signed certificate, to initialize the SSL communications between the DX NetOps Mediation Manager components. When you select any option to enable SSL, the DX NetOps Mediation Manager stops the connected components. Perform the following steps on both MultiController and LocalController. You must restart the components manually for the change to take effect.

Follow these steps:

1. Run the `validateSSL.sh` script from the `<CAMM_Home>/tools` directory. The script prompts you to select the certificate.

   ```
   Please select any one from the below options:
    1. Do you have an existing signed certificate and key?
    2. You have a Keystore file and want to validate the keystore?
   ```
2. Select the option that suits your certificate validation.
3. At the prompt, specify the location and filename of the keystore.

   ```
   Specify the location and filename of the Keystore:
   ```

   For Example: /opt/SSLs/myserver.keystore
4. Specify the keystore and SSL certificate password when prompted.

   ```
   Please enter the Password for Keystore
   Please enter the Password for SSL Certificate>
   ```

   The script validates the keystore and displays the certificate information.
5. (Optional) Run the following command to validate the password encryption.

   ```
   cat ../GE_root/Keystore_Details.xml
   ```

   The script displays the encrypted Keystore details.
6. From the MultiController or LocalControlle, start the controller using the `./startall` command.
7. Navigate to the log directory on your MultiController or LocalController, to view the status.
8. Use the `cat <Log_Filename>.log` command to view status.
9. In the log file look for the following status.

   ```
   INFO: Initializing SSLContext with config file/opt/CA/CAMM/tools/myserver.keystore
   ```

   All further communication between the DX NetOps Mediation Manager components use the new SSL encryption.

MultiController Configuration

The MultiController contains the centralized license file and maintains a heartbeat with the components in the cluster.

The configuration for LocalControllers, Engines, and Presenters in the cluster is also located in the repository of the MultiController.

The MultiController listens for heartbeat operations from cluster members on TCP port 29599.

During the console installation, you can configure only the mandatory settings to install a basic MultiController. However, you can manually edit the MC or LocalConfig-mc.xml file.

Sample LocalConfig-mc.xml file (basic configuration)

```
<?xml version="1.0" encoding="UTF-8"?>
<LocalConfig>
      <Description>Configuration for Multi Controller</Description>
      <Names>
```

```
            <Name name="mainClass">com.torokina.tim.mc.Main</Name>
            <Name name="appName">CAMM-Multi-Controller</Name>
            <Name name="appShortName">MC</Name>
            <Name name="primaryMcAddress">127.0.0.1</Name>
            <Name name="secondaryMcAddress"></Name>
            <Name name="primaryMcPort">29599</Name>
            <Name name="secondaryMcPort">-1</Name><
            <Name name="myMode">primary</Name>
            <Name name="myAddress">127.0.0.1</Name>
            <Name name="mcPort">29599</Name>
            <Name name="otherMcAddress"></Name>
            <Name name="otherMcPort">-1</Name>
            <Name name="heartbeatFrequency">15</Name>
            <Name name="heartbeatTimeout">180</Name>
            <Name name="repositoryFrequency">15</Name>
      </Names>
      <Paths>
            <Path name="license">${tim.base}/license.lic</Path>
      </Paths>
<LocalConfig>
```

Sample LocalConfig-mc.xml file (hidden logging and cleanups configuration)

```
    <Logging>
        <LogLevel>INFO</LogLevel>
        <LogDirectory>${logbase}</LogDirectory>
        <ObjectLogging>
          <ObjectToLog>
            <ObjectName>com.torokina.tim.config</ObjectName>
            <ObjectLogLevel>TRACE</ObjectLogLevel>
          </ObjectToLog>
        </ObjectLogging>
    </Logging>
    <CleanUps>
        <CleanUp>
            <CleanUpName>clean-temporary-directory</CleanUpName>
            <CleanUpAction>delete</CleanUpAction>
            <CleanUpTarget>${tmp}</CleanUpTarget>
            <Parameter>
                <ParameterName>expire</ParameterName>
                <ParameterValue>3d</ParameterValue>
            </Parameter>
        </CleanUp>
        <CleanUp>
            <CleanUpName>archive-log-directory</CleanUpName>
            <CleanUpAction>archive</CleanUpAction>
            <CleanUpTarget>${logbase}</CleanUpTarget>
            <Parameter>
                <ParameterName>expire</ParameterName>
                <ParameterValue>3d</ParameterValue>
            </Parameter>
        </CleanUp>
        <CleanUp>
            <CleanUpName>clean-log-directory</CleanUpName>
```

```
            <CleanUpAction>delete</CleanUpAction>
            <CleanUpTarget>${logbase}</CleanUpTarget>
            <Parameter>
                <ParameterName>expire</ParameterName>
                <ParameterValue>7d</ParameterValue>
            </Parameter>
        </CleanUp>
    </CleanUps>
```

Specifying any of these fields in the correct XML structure in the LocalConfig-mc.xml file overwrites the default content. For example, the following configuration changes the default log level to FINEST.

Changing the default log level to FINEST

```
<?xml version="1.0" encoding="UTF-8"?>
<LocalConfig>
      ... ...
      <Logging>
        <LogLevel>FINEST</LogLevel>
        <LogDirectory>${logbase}</LogDirectory>
      </Logging>
      ... ...
</LocalConfig>
```

Sample LocalConfig-mc.xml (MultiController runtime) file

```
<?xml version="1.0" encoding="UTF-8"?>
<Runtime>
   <Names>
      <Name name="mainClass">com.torokina.tim.mc.Main</Name>
      <Name name="appName">CAMM-Multi-Controller</Name>
      <Name name="appShortName">MC</Name>
      <Name name="primaryMcAddress">127.0.0.1</Name>
      <Name name="secondaryMcAddress"/>
      <Name name="primaryMcPort">29599</Name>
      <Name name="secondaryMcPort">-1</Name>
      <Name name="myMode">primary</Name>
      <Name name="myAddress">127.0.0.1</Name>
      <Name name="mcPort">29599</Name>
      <Name name="otherMcAddress"/>
      <Name name="otherMcPort">-1</Name>
      <Name name="heartbeatFrequency">15</Name>
      <Name name="heartbeatTimeout">180</Name>
      <Name name="repositoryFrequency">15</Name>
      <Name name="lcPort">29598</Name>
      <Name name="manageable">469</Name>
   </Names>
   <Paths>
      <Path name="license">${tim.base}/license.lic</Path>
      <Path name="apphome">${tim.base}/${appShortName}</Path>
      <Path name="runtimeConfig">${apphome}/runtime.xml</Path>
      <Path name="tmp">${apphome}/tmp</Path>
      <Path name="logbase">${apphome}/logs</Path>
      <Path name="basedir">${tim.base}</Path>
   </Paths>
```

```
</Runtime>
```

The runtime.xml file is merged with the hidden configuration and then starts the MultiController component.

MultiController Configuration Options

Use the following options to configure MultiController:

- **Path**
  Lets you specify the path information for the following items:
  - **basedir**
    Specifies the DX NetOps base directory.
  - **apphome**
    Specifies the DX NetOps MultiController application home directory.
  - **tmp**
    Specifies the DX NetOps MultiController temporary files directory.
  - **logbase**
    Specifies the DX NetOps MultiController log directory.
  - **runtimeConfig**
    Specifies the DX NetOps MultiController runtime XML configuration that the Generic Executor provides.
- **Java**
  Lets you specify options for using Java.
  - **CommandPath**
    Specifies the full path to the Java executer that the Generic Executor calls to start the MultiController.
  - **ClassPath/JarBase**
    Lets you create a list with one or more entries to add to ClassPath.
  - **Options**
    Specifies the command-line options parsed to Java.
  - **Environment**
    Specifies the environment variables that execute the MultiController component.
  - **MainClass/Class**
    Specifies the main Java class to execute.
  - **MainClass/Args**
    Specifies the arguments parsed to the Java class.
- **Runtime**
  Lets you specify runtime options.
  - **Binding/BindAddress**
    Specifies the IP address to which the MultiController component binds.
    Value: Use IP address 0.0.0.0 for all MultiController components. For two or more IP addresses, use a comma-separated list.
    The MultiController binds to TCP port 29599.
  - **Binding/MyAddress**
    Specifies the IP address that the MultiController uses to identify itself.

    NOTE
    The IP address must be a valid IP address on this host.
  - **MultiControllerConfig/Mode**
    Specifies the operating mode of the MultiController.
    Value: Specify either Primary or Secondary.
  - **MultiControllerConfig/MCAddresses/Other**
    Specifies the IP address of the other MultiControllers in the cluster.
  - **MultiControllerConfig/Heartbeat/ParameterName == frequency**

Specifies the frequency of heartbeat messages that are sent to other MultiControllers.
  - **MultiControllerConfig/Heartbeat/ParameterName == timeout**
    Specifies the period that this MultiController waits for heart beats from the LocalController components. If the MultiController does not receive a heartbeat from a LocalController for 180 seconds, the MultiController triggers a failover to the first available LocalController.
- **Logging**
  Lets you specify logging options.
  - **LogLevel**
    Specifies the logging level in the output log files.
    Value: Specify DEBUG, TRACE, INFO, WARNING, or ERROR.
  - **LogDirectory**
    Specifies the logging level in the output log files.
    Value: Specify DEBUG, TRACE, INFO, WARNING, or ERROR.
  - **ObjectLogging/ObjectToLog/ObjectName**
    Specifies the Java class name on which to enable logging.
  - **ObjectLogging/ObjectToLog/ObjectLogLevel**
    Specifies the logging level for a Java class.
- **Cleanup**
  Lets you specify cleanup options.
  - **CleanUpName**
    Specifies the descriptive name of the cleanup.
  - **CleanUpAction**
    Specifies the cleanup action.
    Value: Specify Delete or Archive.
  - **CleanupTarget**
    Specifies the directory to clean up.
    Value: Can specify using a DX NetOps variable such as ${camm.variable}.
  - **Parameter/ParameterName - Parameter/ParameterValue**
    Specifies a parameter to expire and its expiration time in the format of <n><unit>. For example:
    10d = 10 days
    10h = 10 hours
    10m = 10 minutes

Start and Stop the MultiController Manually

The init.camm script automatically starts the MultiController process. You can use the cammCtrl utility to manually stop or start the MultiController component independently.

Follow these steps:

1. Log in as the CAMM_USER and go to the DX NetOps MM home directory.
2. Execute the following command to start the MultiController:
   ```
   /opt/CA/CAMM# tools/startall -c mc
   ```
3. Execute the following command to stop the MultiController:
   ```
   /opt/CA/CAMM # tools/stopall - c mc
   ```

LocalController Configuration

The LocalController is an essential service that is installed on each server in the cluster.

The LocalController performs the following key functions:

- Facilitates communication between subcomponents running on the local server and the remote MultiControllers.
- Monitors the performance and availability of Engines and Presenters and restarts any failed components.
- Listens for heartbeat operations from cluster members. By default, the LocalController listens on port 29598 or TCP.
- Sends heartbeat information to the MultiControllers.
- Starts, stops, and restarts local Engines and Presenters.

During the GUI installation, you can configure only the mandatory options that are required to install a basic LocalController. However, you may manually edit the LC or LocalConfig-lc.xml file.

Sample LocalConfig-lc.xml file (basic configuration)

```
<LocalConfig>
      <Names>
            <Name name="mainClass">com.torokina.tim.lc.Main</Name>
            <Name name="primaryMcAddress">127.0.0.1</Name>
            <Name name="secondaryMcAddress"></Name>
            <Name name="primaryMcPort">29599</Name>
            <Name name="secondaryMcPort">-1</Name>
            <Name name="myAddress">127.0.0.1</Name>
            <Name name="appName">CAMM-Local-Controller</Name>
            <Name name="appShortName">LC</Name>
            <Name name="lcPort">29598</Name>
            <Name name="heartbeatFrequency">15</Name>
            <Name name="heartbeatTimeout">180</Name>
      </Names>
      <Paths>
            <Path name="dsLocalConfig">${basedir}/DS/LocalConfig-ds.xml</Path>
      </Paths>
</LocalConfig>
```

Sample LocalConfig-lc.xml file (hidden logging and cleanups configuration)

```
    <Logging>
        <LogLevel>INFO</LogLevel>
        <LogDirectory>${logbase}</LogDirectory>
        <ObjectLogging>
          <ObjectToLog>
            <ObjectName>com.torokina.tim.config</ObjectName>
            <ObjectLogLevel>TRACE</ObjectLogLevel>
        </ObjectToLog>
        </ObjectLogging>
    </Logging>
    <CleanUps>
        <CleanUp>
            <CleanUpName>clean-temporary-directory</CleanUpName>
            <CleanUpAction>delete</CleanUpAction>
            <CleanUpTarget>${tmp}</CleanUpTarget>
            <Parameter>
                <ParameterName>expire</ParameterName>
                <ParameterValue>3d</ParameterValue>
            </Parameter>
        </CleanUp>
        <CleanUp>
            <CleanUpName>archive-log-directory</CleanUpName>
            <CleanUpAction>archive</CleanUpAction>
```

```
            <CleanUpTarget>${logbase}</CleanUpTarget>
            <Parameter>
                <ParameterName>expire</ParameterName>
                <ParameterValue>3d</ParameterValue>
            </Parameter>
        </CleanUp>
        <CleanUp>
            <CleanUpName>clean-log-directory</CleanUpName>
            <CleanUpAction>delete</CleanUpAction>
            <CleanUpTarget>${logbase}</CleanUpTarget>
            <Parameter>
                <ParameterName>expire</ParameterName>
                <ParameterValue>7d</ParameterValue>
            </Parameter>
        </CleanUp>
    </CleanUps>
```

Sample LocalConfig-lc.xml file (LocalController runtime)

```
<?xml version="1.0" encoding="UTF-8"?>
<Runtime>
   <Names>
      <Name name="mainClass">com.torokina.tim.lc.Main</Name>
      <Name name="primaryMcAddress">127.0.0.1</Name>
      <Name name="secondaryMcAddress"/>
      <Name name="primaryMcPort">29599</Name>
      <Name name="secondaryMcPort">-1</Name>
      <Name name="myAddress">127.0.0.1</Name>
      <Name name="appName">CAMM-Local-Controller</Name>
      <Name name="appShortName">LC</Name>
      <Name name="lcPort">29598</Name>
      <Name name="heartbeatFrequency">15</Name>
      <Name name="heartbeatTimeout">180</Name>
      <Name name="mcPort">29599</Name>
      <Name name="manageable">996</Name>
   </Names>
   <Paths>
      <Path name="dsLocalConfig">${basedir}/DS/LocalConfig-ds.xml</Path>
      <Path name="apphome">${tim.base}/${appShortName}</Path>
      <Path name="runtimeConfig">${apphome}/runtime.xml</Path>
      <Path name="tmp">${apphome}/tmp</Path>
      <Path name="logbase">${apphome}/logs</Path>
      <Path name="basedir">${tim.base}</Path>
   </Paths>
</Runtime>
```

LocalController Configuration Options

Use the following options to configure LocalController.

- **Path**
  Lets you specify the path information for the following items:
  – **basedir**

Specifies the DX NetOps base directory.
  - **apphome**
    Specifies the DX NetOps LocalController application home directory.
  - **tmp**
    Specifies the DX NetOps LocalController temporary files directory.
  - **logbase**
    Specifies the DX NetOps LocalController log directory.
  - **runtimeConfig**
    Specifies the DX NetOps LocalController runtime XML configuration file that the Generic Executor provides.
- **Java**
  Lets you specify options for using Java.
  - **CommandPath**
    Specifies the full path to the Java executer that the Generic Executor calls to start the LocalController.
  - **ClassPath/JarBase**
    Lets you create a list with one or more entries to add to ClassPath.
  - **Options**
    Specifies the command-line options parsed to Java.
  - **Environment**
    Specifies the environment variables that execute the MultiController component.
  - **MainClass/Class**
    Specifies the main Java class to execute.
  - **MainClass/Args**
    Specifies the arguments parsed to the Java class.
- **Runtime**
  Lets you specify runtime options.
  - **Binding/BindAddress**
    Specifies the IP address to which the LocalController component binds.
    Value: Use IP address 0.0.0.0 for all LocalController components. For two or more IP addresses, use a comma-separated list.
  - **Binding/MyAddress**
    Specifies the IP address that the LocalController uses to identify itself.

    NOTE
    This IP address must be a valid IP address on this host.
  - **Binding/BindPort**
    Specifies the IP address that the LocalController uses to identify itself.

    NOTE
    This IP address must be a valid IP address on this host. By default, the LocalController binds to TCP port 29598.
  - **LocalControllerConfig/Mode**
    Specifies the operating mode of the LocalController.
    Value: Specify either Active or Standby.
  - **LocalControllerConfig/MCAddresses/Primary**
    Specifies the IP address of the primary MultiController in the cluster.
  - **LocalControllerConfig/MCAddresses/Secondary**
    Specifies the IP address of the secondary MultiController in the cluster.
  - **LocalControllerConfig/Heartbeat/ParameterName == frequency**
    Specifies the frequency of the heartbeat messages sent to the MultiController.
  - **LocalControllerConfig/Heartbeat/ParameterName == timeout**

Specifies how long this LocalController waits for the heart beats from subcomponents (Engines and Presenters). If the LocalController does not receive a heartbeat from a subcomponent for 180 seconds, the LocalController restarts.

- **Logging**
  Lets you specify logging options.
  - **LogLevel**
    Specifies the logging level in the output log files.
    Value: Specify DEBUG, TRACE, INFO, WARNING, or ERROR.
  - **LogDirectory**
    Specifies the logging level in the output log files.
    Value: Specify DEBUG, TRACE, INFO, WARNING, or ERROR.
  - **ObjectLogging/ObjectToLog/ObjectName**
    Specifies the Java class name on which to enable logging.
  - **ObjectLogging/ObjectToLog/ObjectLogLevel**
    Specifies the logging level for a Java class.
- **Cleanup**
  Lets you specify cleanup options.
  - **CleanUpName**
    Specifies the descriptive name of the cleanup.
  - **CleanUpAction**
    Specifies the cleanup action.
    Value: Specify Delete or Archive.
  - **CleanupTarget**
    Specifies the directory to clean up.
    Value: Can specify using a DX NetOps variable such as ${camm.variable}.
  - **Parameter/ParameterName - Parameter/ParameterValue**
    Specifies a parameter to expire and its expiration time in the format of <n><unit>. For example:
    10d = 10 days
    10h = 10 hours
    10m = 10 minutes

Start and Stop the LocalController Manually

The init.camm script automatically starts the LocalController process. You can use the cammCtrl utility to manually stop or start the LocalController component independently.

Follow these steps:

1. Log in as the CAMM_USER and go to the CAMM home directory.
2. Execute the following command to start the LocalController:
   ```
   /opt/CA/CAMM# tools/startall  - c lc
   ```
3. Execute the following command to stop the LocalController:
   ```
   /opt/CA/CAMM # tools/stopall  - c lc
   ```

Engine and Presenter Configuration

The installation and configuration of the Engine and the Presenter is achieved using the Device Pack installation program provided with each device pack.

High Availability Configuration

High availability refers to a system or component that is continuously operational for a desirably long time and ensures operational continuity. For DX NetOps to be highly available, the main components must be operational always. This is achieved by the failover processing. This section deals with the failover processing and the configuration settings for the high availability.

Failover is a backup operational mode available in a multi-server architecture. In failover, when a primary component becomes unavailable because of failure or scheduled down time, the secondary components assume the functions of the primary components. In DX NetOps, there are three types of failover operations:

- MultiController Failover
- LocalController Failover
- Subcomponent Failover

MultiController Failure

In a multiserver architecture, when the secondary MultiController is started, it sends heartbeat messages to the primary MultiController and also periodically synchronizes the secondary MultiController repository with that of the primary MultiController. When the heartbeat to the primary MultiController fails, the secondary MultiController assumes that the primary MultiController is down. The secondary MultiController waits till the timeout period expires. If the primary MultiController did not respond after the timeout period, secondary MultiController assumes the role of the primary. When the primary MultiController resumes its function, the secondary MultiController sends all the information back to the primary MultiController.

Failover Settings

The parameters for the failover settings are in the LocalConfig-mc.xml file. If needed, change the following default values:

heartbeatFrequency

The time period in which the secondary MultiController sends the heartbeat messages to the primary MultiController. If the heartbeat messages to the primary MultiController is failed for more than six consecutive times, the secondary MultiController takes the active role.
<Name name="heartbeatFrequency">30</Name>
Default: 30 seconds

repositoryFrequency
The time period in which the secondary MultiController synchronizes its repository with the primary MultiController.
<Name name="repositoryFrequency">15</Name>
Default: 15 seconds

When the primary MultiController fails, the LocalController contacts the secondary MultiController according to the following failover settings in LocalConfig-lc.xml file. If needed, change the following default values:

heartbeatFrequency
The time period by which the LocalController sends the heartbeat messages to the primary MultiController.
<Name name="heartbeatFrequency">30</Name>
Default: 30 seconds

heartbeatTimeout
The time period by which the LocalController waits to send heartbeat to the primary MultiController. If the LocalController cannot send the heartbeat message to MultiController for 600 seconds, the LocalController switches to the standby mode. Note: In the standby mode, a LocalController does not have any Subcomponent running.
<Name name="heartbeatTimeout">600</Name>
Default: 600 seconds

LocalController Failure

A LocalController sends heartbeat messages to the MultiController. If the MultiController did not receive heartbeat from the LocalController, missed heartbeat is logged. If the missed heartbeat time exceeds the timeout period, the LocalController is placed in the expiry list and MultiController triggers the first standby LocalController.

> **NOTE**
>
> MultiController runs expiry check for LocalControllers every 10 seconds. If any LocalController is found in the expiry list, MultiController moves its repository to the standby LocalController present in the environment. If no standby LocalController is available, MultiController does not perform the swap operation.

In the case of LocalController failover, the LocalController where Sub Components were running comes back, but the Subcomponents do not switch back.

Failover Settings

The parameters for the failover settings are in the LocalConfig-lc.xml file. If needed, change the following default value:

heartbeatTimeout
The time MC waits for the heartbeat message from a LC.
<Name name="heartbeatTimeout">600</Name>
Default: 600 seconds

Subcomponent Failure

A LocalController monitors its running subcomponents (Engine and Presenter). If LocalController does not receive a response from a Subcomponent for 10 seconds (default), it restarts the Subcomponent.

To change the default failover settings, contact CA Support.

Log Files Configuration

The following sections describe how to configure log files in DX NetOps.

Configure the logging properties for all the DX NetOps components using the logging.properties file, which is created in the default log directory when the component is started. The logging.properties file is preconfigured to generate log files in the default log directory. However, you can edit the logging.properties file to redirect the log files in to another directory. Once the logging.properties file is modified, restart the component to load the modified logging properties. All logs (application logs and STD-ERROR/STD-OUTPUT logs) are generated in the directory that is specified in the logging.properties file.

logging.properties File - Examples by Component

The following examples describe the different logging.properties files:

MultiController example logging.properties file

```
com.torokina.common.logging.apache.FileHandler.directory=/opt/CA/CAMM/MC/logs
handlers=com.torokina.common.logging.apache.FileHandler
com.torokina.common.logging.apache.FileHandler.level=INFO
.level=INFO
com.torokina.common.logging.apache.FileHandler.prefix=CAMM-Multi-Controller-
```

LocalController example logging.properties file

```
com.torokina.common.logging.apache.FileHandler.directory=/opt/CA/CAMM/LC/logs
```

```
handlers=com.torokina.common.logging.apache.FileHandler
com.torokina.common.logging.apache.FileHandler.level=INFO
.level=INFO
com.torokina.common.logging.apache.FileHandler.prefix=CAMM-Local-Controller-
```

Delivery System example logging.properties file

```
com.torokina.common.logging.apache.FileHandler.directory=/opt/CA/CAMM/DS/logs
handlers=com.torokina.common.logging.apache.FileHandler
com.torokina.common.logging.apache.FileHandler.level=INFO
.level=INFO
com.torokina.common.logging.apache.FileHandler.prefix=CAMM-Delivery-System-
```

ENGINE_CAMM example logging.properties file

```
com.torokina.common.logging.apache.FileHandler.directory=/opt/CA/CAMM/COMPONENTS/ENGINE_CAMM/logs
handlers=com.torokina.common.logging.apache.FileHandler
com.torokina.common.logging.apache.FileHandler.level=INFO
.level=INFO
com.torokina.common.logging.apache.FileHandler.prefix=CAMM-ENGINE_CAMM-
```

Generic Executor example logging.properties file

By default the Generic Executor does not create a logging.properties file in its log directory. All logs are generated in the ~GE/logs directory. The following example shows how you can create the logging.properties file in the logs directory to redirect the Generic Executor logs (non-Windows platforms only):

```
#Properties for Logger
#Tue May 07 04:08:45 EDT 2013
com.torokina.common.logging.apache.FileHandler.directory=/opt/CA/CAMM/GE/logs
handlers=com.torokina.common.logging.apache.FileHandler
com.torokina.common.logging.apache.FileHandler.level=INFO
.level=INFO
com.torokina.common.logging.apache.FileHandler.prefix=CAMM-Generic-Executor-
```

Configuring Log File Cleanup

By default the cleanup action for each component is configured to run on the *logbase* directory. If the log files are redirected to another directory, modify the cleanup configuration for successful *Archive* or *Delete* actions.

Define cleanup actions in the *LocalConfig* xml-element in the configuration files. For the DX NetOps components, define the cleanup actions in the respective configuration files:

- **MultiController:** LocalConfig-mc.xml
- **LocalController:** LocalConfig-lc.xml
- **Delivery Service:** LocalConfig-ds.xml
- **Subcomponents (ENGINE or PRESENTER):** TemplateConfig-subcomponent.xml

> **NOTE**
> You can find the TemplateConfig-subcomponent.xml file in the <camm.base>/LC directory.

The following examples describe two sample cleanup configurations.

Example: Cleanup configuration file (*Delete* action) for the Delivery Service component

```
<LocalConfig>
<Description>Configuration for Delivery Module</Description>
 ...
```

```
...
<CleanUps>
 <!-- SAMPLE  DELETE  ACTION -->
 <CleanUp>
  <CleanUpName>Delete</CleanUpName>
  <CleanUpAction>delete</CleanUpAction>
  <CleanUpTarget>${apphome}/.local</CleanUpTarget> <!-- Directory Name -->
  <Parameter>
   <ParameterName>expire</ParameterName>
   <ParameterValue>7d</ParameterValue> <!-- 1y0m3d1h -->
  </Parameter>
  <Parameter>
   <ParameterName>includeDir</ParameterName>
   <ParameterValue>true</ParameterValue><!-- true/false -->
  </Parameter>
  <Parameter>
   <ParameterName>recursive</ParameterName>
   <ParameterValue>true</ParameterValue><!-- true/false -->
  </Parameter>
  <Parameter>
   <ParameterName>match</ParameterName>
   <ParameterValue>^[\d]+\.xml$</ParameterValue>
   <!-- Regular Pattern -->
  </Parameter>
 </CleanUp>
```

Example: Cleanup configuration file (*Archive* action) for the Delivery Service component

```
 <!-- SAMPLE  ARCHIVE  ACTION -->
 <CleanUp>
  <CleanUpName>Archive</CleanUpName>
  <CleanUpAction>archive</CleanUpAction>
  <CleanUpTarget>${logbase}</CleanUpTarget> <!-- Directory Name -->
  <Parameter>
   <ParameterName>expire</ParameterName>
   <ParameterValue>7d</ParameterValue> <!-- 1y0m3d1h -->
  </Parameter>
  <Parameter>
   <ParameterName>includeDir</ParameterName>
   <ParameterValue>true</ParameterValue><!-- true/false -->
  </Parameter>
  <Parameter>
   <ParameterName>recursive</ParameterName>
   <ParameterValue>true</ParameterValue><!-- true/false -->
  </Parameter>
  <Parameter>
   <ParameterName>match</ParameterName>
   <ParameterValue>CAMM-.*\.log</ParameterValue>
   <!-- Regular Pattern -->
  </Parameter>
  <Parameter>
   <ParameterName>achiveHome</ParameterName>
   <ParameterValue>${logbase}</ParameterValue> <!-- folder path -->
  </Parameter>
```

```
    <Parameter>
     <ParameterName>achivePrefix</ParameterName>
     <ParameterValue>Archive-</ParameterValue> <!-- prefix string -->
    </Parameter>
    <Parameter>
     <ParameterName>achiveSuffix</ParameterName>
     <ParameterValue>.zip</ParameterValue> <!-- suffix string -->
    </Parameter>
   </CleanUp>
  </CleanUps>
 <LocalConfig>
```

You can include any of the cleanup actions in the component configuration file. The Generic Executor performs all the cleanup actions. The Generic Executor stores cleanup files in the {camm.base }/GE_<User>/cleanup directory, where camm.base is the DX NetOps installation directory. Once the component configuration file is modified, restart the related component so that the modified configurations can take effect.

EMS Integration Profiles Configuration

EMS integration profiles specify how EMS inventory discovery operates in your Data Aggregator environment.

With EMS integration profiles, you specify the status, data collector, device pack, EMS IP, and Backup EMS IP. Specify one IP domain for each EMS integration profile you create. The IP domain that you specify is for the target EMS server, which manages multiple devices (typically 1,000 devices at a time). Data Aggregator processes the inventory data from the EMS server constantly and all at once. (With SNMP or ICMP, polling is done device-by-device.)

NOTE

- After you install the device pack, the EMS Integration Profiles option becomes visible in the user interface.
- Do not add the same EMS integration profile more than once for the same Data Collector.

Add EMS Integration Profiles

You can create EMS integration profiles to specify how EMS inventory discovery operates in your Data Aggregator environment.

NOTE
You must be logged in as an administrator to perform this task.

Creating EMS integration profiles without first setting the scope to a tenant puts the profile in the global space, accessible by all tenants. Running a discovery using a profile in the global space lets anyone see the discovery results, whether they set the scope to a tenant.

Therefore, set the scope to a tenant *before* you create an EMS integration profile to make that profile accessible only to a specific tenant. After you set the scope to a tenant, the tenant indicator appears at the top right of the page. You can then manually synchronize the tenant with CA Infrastructure Management, or wait for the automatic synchronization to occur. You cannot create the EMS integration profile until the tenant is synchronized with Data Aggregator.

NOTE
For more information about setting the scope to a tenant and synchronizing a tenant, see the *CA Performance Center Administrator Guide*.

Follow these steps:

1. Select Admin, Data Source Settings, and click a Data Aggregator data source in the CA Performance Center user interface.
2. Click EMS Integration Profiles from the Monitoring Configuration menu.

The EMS Integration Profiles page opens, displaying a list of available discovery profiles.

3. Click New.
   The Add EMS Discovery Profile dialog opens.
4. Enter the required information in the fields. The configuration fields that display depend on the device pack you select. Each device pack has unique global variables that you configure.

   NOTE
   For information about unique global variables for each product, see the CA Support site.
5. Click Save.
   The EMS integration profile is created.
   The inventory discovery does *not* run automatically when you click Save and the Enabled option is selected. The inventory discovery only runs when one of the following conditions is met:
   - The inventory poll schedule is reached.
   - The EMS integration profile is manually started.

   NOTE
   To edit EMS integration profile information, select an EMS integration profile in the Add EMS Discovery Profile dialog, click Edit, and update the information in the dialog. However, if you edit the information in the Inventory_Poll_Rate and Performance_Poll_Rate fields, the changes are not applied. If there is a change in the information for these two fields, delete and recreate the EMS integration profile.

Start EMS Discovery Manually

EMS Integration Profiles discover devices and their components in your network. You can manually start an EMS Integration profile to begin discovery.

NOTE
Alternatively, you can wait until the inventory poll schedule is reached for discovery to begin automatically.

Follow these steps:

1. Select Admin, Data Source Settings, and click a Data Aggregator data source in the CA Performance Center user interface.
2. Click EMS Integration Profiles from the Monitoring Configuration menu.
   The EMS Integration Profiles page opens, displaying a list of available discovery profiles.
3. Select one or more EMS integration profiles that you want to run a discovery on, and click Start.

   NOTE
   You can only run a discovery on an EMS integration profile that has a status of 'READY'.

   A confirmation dialog opens.
4. Click Yes.
   The Discovery starts. The Status column for the selected Discovery profiles indicates 'Started'.
   A confirmation dialog opens.
5. Click OK.
   Devices and all of their associated interfaces are discovered and polling begins. You are returned to the EMS Integration Profiles page.
   If discovery hangs for more than 10 minutes, Data Aggregator stops it. Data Aggregator considers a discovery to be hanging when no new devices are discovered within 10 minutes *and* the state for the selected discovery profiles have not changed within 10 minutes. An audit event is generated on the discovery instance item. If no devices were discovered successfully, the Status column for the selected discovery profiles indicates 'FAILURE'. If at least one device but not all devices were discovered successfully, the Status column indicates 'PARTIAL_FAILURE'.
   The discovered devices and components can take up to 5 minutes to synchronize with CA Performance Center. When the synchronization is complete, the discovered devices and components appear in the Inventory tab in CA Performance Center.

View EMS Discovery Results

You can view a summary of the number of all manageable EMS devices that were discovered.

Follow these steps:

1. Select Admin, Data Source Settings, and click a Data Aggregator data source in the CA Performance Center user interface.
2. Click EMS Integration Profiles from the Monitoring Configuration menu.
   The EMS Integration Profiles page opens, displaying a list of available discovery profiles.
3. Select an EMS integration profile instance for which you want to view discovery results, and click History.
   The EMS History results display as follows:
   - The Device table shows the monitored devices and time of creation for each.
   - The Element table shows the monitored interfaces and time of creation for each.

Start or Stop EMS Discovery Services

"Start" services are used for discovery on the EMS servers to review the inventory continuously. Although discovery can be scheduled, you can manually start, stop, or restart services on demand. For example, you can restart discovery after an EMS server has been down and brought back up, or after upgrading a device pack installation.

Stopping a service deletes any inactive data poll but waits for any active data polling to complete without any interruption. No EMS files are deleted. This action also disables any new polling from occurring as long as it is in the stopped state. The service remains in the stopped state until you start it again.

Restarting Data Collector has no effect on the status of any EMS integration profile.

> **NOTE**
> You must be logged in as an administrator to perform this task.

Follow these steps:

1. Select Admin, Data Source Settings, and click a Data Aggregator data source in the CA Performance Center user interface.
2. Click EMS Integration Profiles from the Monitoring Configuration menu.
   The EMS Integration Profiles page opens, displaying a list of available discovery profiles.
3. Select a profile, and click Start or Stop.
   A confirmation dialog opens.
4. Click Yes to confirm the action.
   The service starts or stops, depending on your choice. This service remains in the started or stopped state until you change it manually.

Add Event Rules

Event rules can be added using the Data Aggregator monitoring profiles dialog.

> **NOTE**
> For more information, see the *Data Aggregator Administrator Guide* or online help.

Administrating

This section deals with the migrating, monitoring, and customizing device packs.

Self-Monitoring Device Pack

Self-monitoring device pack monitors the state of its own components and the existing device packs.

Self-Monitoring Device Pack in DX NetOps Mediation Manager for Performance Management

NOTE
The information in this section applies only to DX NetOps for Performance Management 2.3.4. If you are using DX NetOps for Infrastructure Management 2.3.3 or the earlier releases, contact CA Support and request a Program Temporary Fix (PTF) to install the Self-Monitoring Device Pack. For example, if you are using DX NetOps for Infrastructure Management 2.3.2, request for PTF_2.3.2_09.

Self-monitoring device pack can monitor the state of its own Engine and the Engine of the existing device packs. To install the self-monitoring device pack in Data Collector for DX NetOps Mediation Manager for Performance Management, follow the procedure in the Installing section and select Engine_CAMM_IM_SelfMonitoring.zip to install the Engine. To monitor the device packs in multiple Data Collectors, install Self-Monitoring Device Pack in all Data Collectors.

The following types of reports in CA Performance Center are used to monitor the status of the Engine:

- Reports for All Engines
- Reports for the Selected Engine

Reports for All Engines

The following reports are available to monitor the status of all Engines.

- **JVM Memory Usage**
  Indicates the percentage of the average Java virtual machine (JVM) memory usage by all Engines.
- **Number of Threads used per Poll**
  Indicates the number of threads that all Engines use in a poll.
- **Number of Engines**
  Indicates the total number of Engines on a Data Collector that the Self-Monitoring Device Pack monitors.
- **Number of Devices Polled**
  Indicates the total number of devices that all Engines poll.

Reports for a Selected Engine

The following reports are available to monitor the status of a selected Engine:

- **JVM Memory Usage**
  Indicates the percentage of the JVM memory usage by the selected Engine
- **Number of Devices Polled**
  Indicates the total number of devices that the selected Engine polls.
- **Number of Threads used per Poll**
  Indicates the total number of threads that the selected Engine uses.
- **Files Processed during Conversion and Calculation**
  Indicates the total number of processed files, files that are failed, and successfully processed files during the Conversion and Calculation phase.
- **Files Processed during Filter**
  Indicates the total number of processed files, processed files that are failed, and successfully processed files during the Filter phase.
- **Processed Files to be Delivered to Data Aggregator**
  Indicates the total number of processed files, successfully processed files, and processed files that are not delivered to Data Aggregator.
- **Time Taken in each Phase**
  Indicates the time that is taken (in seconds) by the Engine during each phase. The Engine processes the data in the following phases sequentially:

- **Data acquisition:** The Engine connects to the Element Management Server (EMS) or the device to gather raw data by using protocols, such as SFTP, FTP, COPY, and HTTP. Data that are collected is written in a text file and processed in the next phase.
- **Conversion and Calculation:** The Engine converts the received file to the DX NetOps MM XML format. From each file, the Engine identifies key elements, such as Metric Family, Metrics, Device, Device IP, and Delta time.
- **Filter:** If required, the Engine performs filtering actions, such as removal of unwanted device or unwanted metric family. After the filtering process, the Engine generates a new file in same format for every input file.
- **Delivery system:** The files that are collected from previous phase are sorted by timestamp and sent to Data Aggregator for further processing.

  NOTE

  The processed files in the last phase are deleted if the Log level is not in the DEBUG mode.

- **Time Taken to Complete a Poll**
  Indicates the time that is taken (in seconds) by the selected Engine to complete a poll.
- **Size of Processed Files per Poll**
  Indicates the total size (in KB) of the processed files per poll.

The following custom dashboard reports are available to monitor the status of the selected Engine:

- **Number of Polled Items**
  Indicates the number of polled device components in the selected Engine.
- **Number of Metrics Polled**
  Indicates the number of metrics polled by the selected Engine.
- **Metrics Polled per Second**
  Indicates the number of metrics polled per second.
- **Average Size of Processed Files per Poll**
  Indicates the average size (in KB) of the processed files per poll.

Self-Monitoring Device Pack in CA Mediation Manager

Similar to a device pack, the self-monitoring device pack in CA Mediation Manager consists of Engine, Presenter, and Cert. Use the self-monitoring device pack to monitor the state of the LocalController and the components of device packs (Engine and Presenter). To install the self-monitoring device pack, follow the procedure in the Installing section and install ENGINE_CAMM, PRESENTER_CAMM, and CERT_CAMM. To monitor the device packs in multiple LocalController, install self-monitoring device pack in the corresponding LocalController.

The following types of reports in CA eHealth are used to monitor the status of a device pack:

- Reports for LocalController
- Reports for the Selected Engine
- Reports for the Selected Presenter

Reports for LocalController

The following reports are available to monitor the status of a LocalController:

EngineRSPercentIndicates (in percentage) the running status of the Engine.

EnginePollSpercentIndicates (in percentage) the last successful polling by the Engine.

TotalEngineMemoryUsageIndicates the total memory usage by all Engines

TotalEnginesIndicates the number of Engines that the self-monitoring device pack monitors.

TotalDevicesIndicates the number of devices that are being polled by all Engines.

PeakEngineCPUUsageIndicates the peak CPU usage among the Engines.

TotalPresentersIndicates the number of Presenters that the self-monitoring device pack monitors.

EngineDASPercentIndicates (in percentage) the successful data acquisition by the Engine.

PresenterRSPercentIndicates (in percentage) the running status of the Presenter.

Reports for Selected Engine

The following reports are available to monitor the status of the selected Engine:

pollDuration
Indicates the time taken by the selected Engine for the specific poll.

State
Indicates the state of the data delivered by the Engine to Delivery Service.

laststatus
Indicates the last poll status of the selected Engine.

Memory Usage
Indicates the memory usage (in percentage) by the selected Engine.

CPU Usage
Indicates the CPU usage (in percentage) by the selected Engine.

DAStatus
Indicates the data acquisition status by the selected Engine.

maxThreadNum
Indicates the number of threads the selected Engine uses.

deviceCount
Indicates the number of devices that the Engine monitors.

Reports for the Selected Presenter

The following reports are available to monitor the selected Presenter:

State
Indicates the state of the Presenter that the self-monitoring device pack monitors.

Memory Usage
Indicates the memory usage (in percentage) by the Presenter.

CPU Usage
Indicates the CPU usage (in percentage) by the Presenter.

avgProcessTime
Indicates the time taken by the selected Presenter to process the data.

maxThreadNum
Indicates the number of threads the selected Presenter uses.

avgQueueTime
Indicates the waiting time for the data to be processed by the selected Presenter.

Average Queue Size
Indicates the queue size for the selected Presenter.

How to Customize a Device Pack

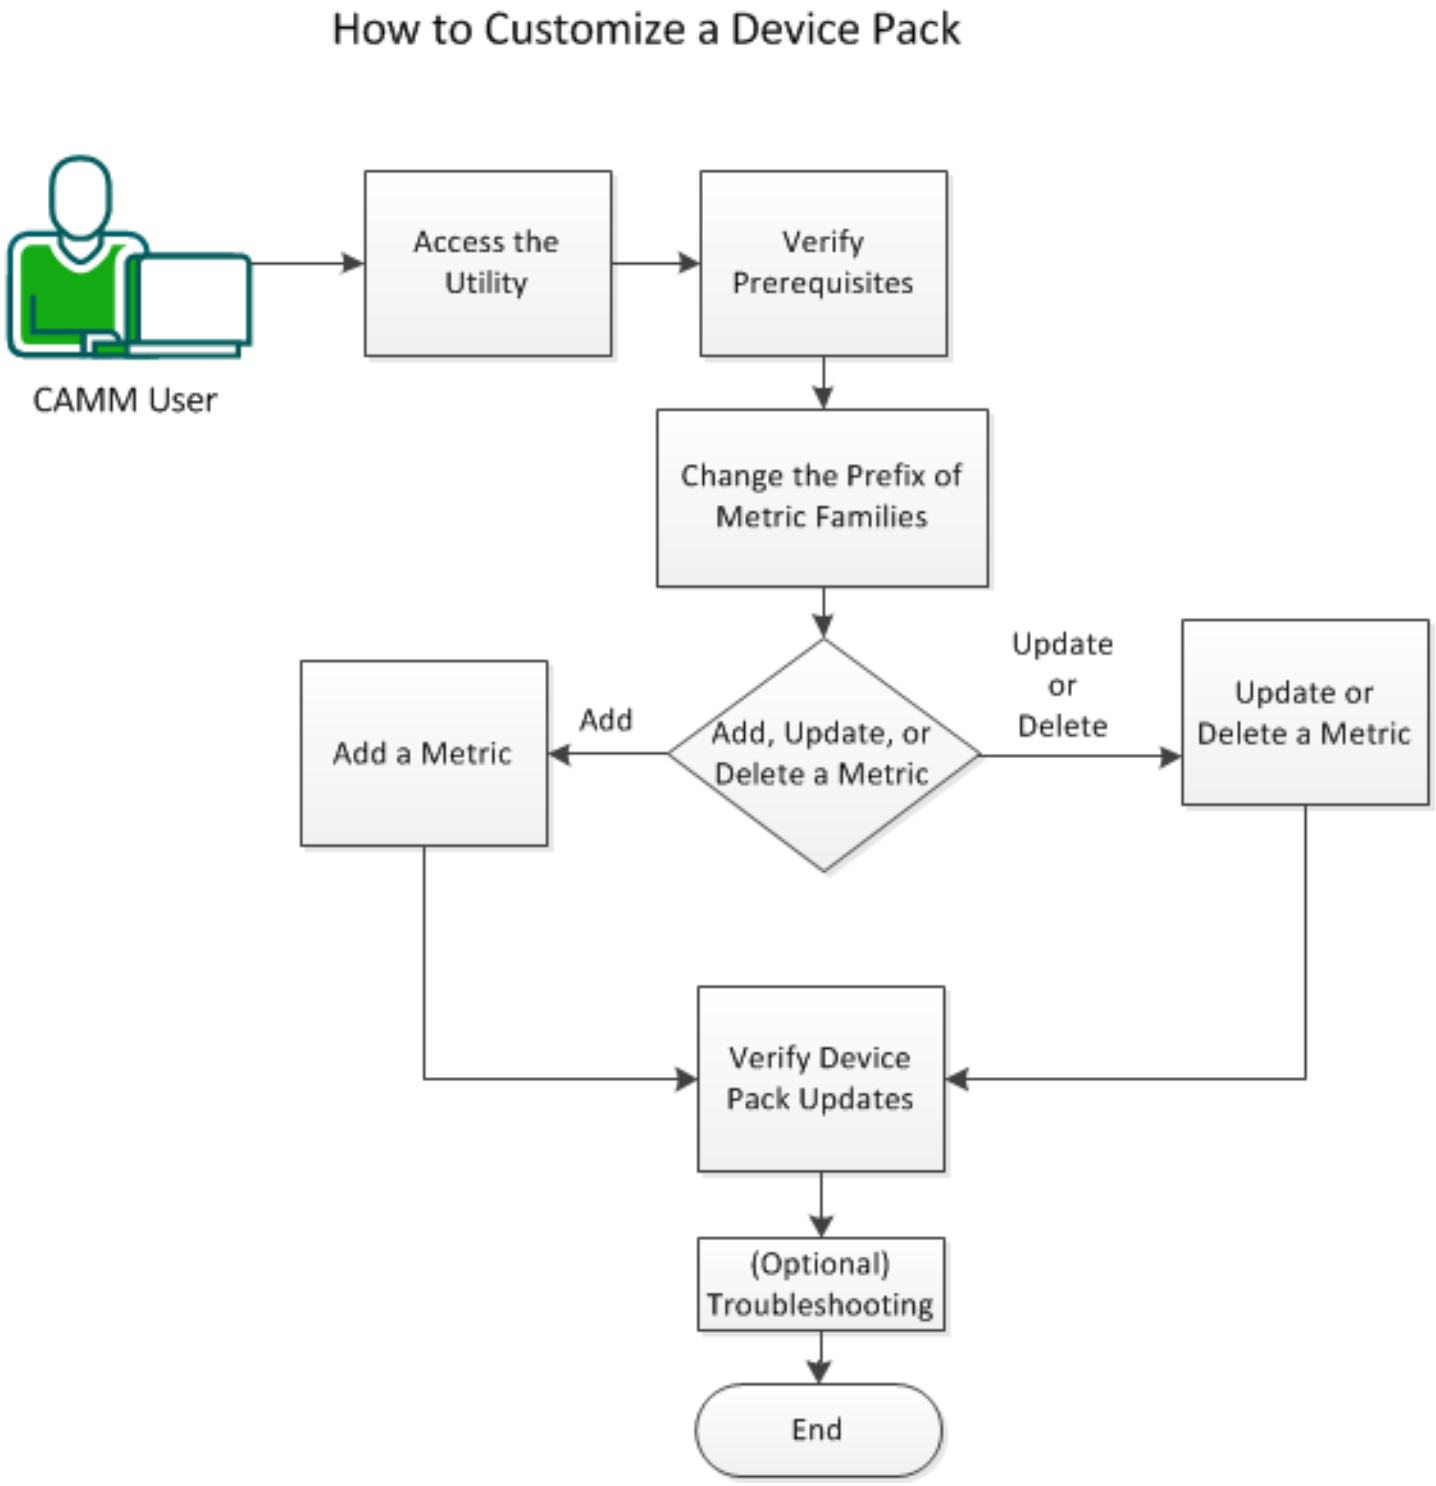
When a device is upgraded with a new metric, Data Aggregator cannot recognize the new metric by default. Therefore, in CA Performance Center, you cannot generate a report for the new metric. Additionally, when a metric is updated or deleted in a device, you cannot generate the metric-based report in CA Performance Center.

You can use the Device Pack Customization tool to customize the vendor certification and the metric family of the device by adding, deleting, or updating a metric of a device pack. You can add a prefix to a metric family name of a device pack. You can also create a key performance indicator (KPI) metric to derive new metrics from the existing metrics. If the device pack was upgraded, you can pull and merge the previous customization with the upgraded device pack.

Data Aggregator recognizes the new or updated metric and you can generate the metric-based report in CA Performance Center.

The following diagram shows the work flow for this task:

Figure 92: How to customize a device pack



Install the Device Pack Customization Tool

Install the Device Pack Customization tool in CA Performance Center. The installation process supports only the console mode.

Follow these steps:

1. Log in to the host where CA Performance Center is installed.
2. Copy the installation file, DevicePackCustomizationTool_<*version*>.zip, to a folder in CA Performance Center and unzip it.
3. Execute **java -jar dptool-installer-bin.jar**.
4. Press Enter repeatedly to scroll through the license agreement. At the end of the agreement, type **Yes** and press Enter to accept the license agreement.
5. Provide the CA Performance Center user name, password, and HTTP port number.
   Default: admin, admin, 8181
6. Delete the following files from the specified location:
   – dpcustomizationProcessor.jar in the <dataaggregator> /opt/IMDataAggregator/apache-karaf-2.x.y/deploy folder in Data Aggregator
   – dpcustomizationserver.war in the /opt/CA/PerformanceCenter/PC/webapps folder in CA Performance Center.
7. Type **Yes** to confirm the deletion of files.
   The device pack customization tool is successfully installed.
8. Access the tool from the following URL:
   ```
   http://<PC Hostname>:<PC Port#>/dpcustomization/login.htm
   ```
   Where <*PC Hostname*> is the CA Performance Center hostname and <*PC Port#*> is the port number that is configured for CA Performance Center.

Verify Prerequisites

The prerequisites for adding a new metric using the Device Pack Customization Tool are as follows:

- The Engine polls the device correctly.
- The Engine recognizes the new metric.

Check if the Engine Polls the Device Correctly

Make sure that the Engine polls the device correctly.

Follow these steps:

1. Log in to Data Collector.
2. Change the working directory to $DC_INSTALL/apache-karaf-2.3.0/data/log.
   $DC_INSTALL is the path where Data Collector is installed. This defaults to /opt/IMDataCollector
3. Execute the following command:
   ```
   grep ERROR ems.log
   ```
   If the Engine polls the device correctly, output has no error.

Check if the Engine Recognizes the New Metric

After confirming that the Engine polls the device correctly, check if the Engine recognizes the new metric. This section is applicable only if you use CA Performance Management release 2.3.3 or earlier.

Follow these steps:

1. Log in to Data Collector.

2. Open the org.ops4j.pax.logging.cfg file from $DC_INSTALL/apache-karaf-2.3.0/etc/ where $DC_INSTALL is the path where Data Collector is installed. This defaults to /opt/IMDataCollector.
3. Search for “# EMS Integration logging”.
4. Replace INFO to DEBUG only in the following lines:
   log4j.logger.com.ca.im.dm.mediation=INFO, ems
   log4j.logger.com.ca.im.dm.ems=INFO, ems
   log4j.logger.com.ca.im.data-mgmt.common.ems=INFO, ems
   log4j.logger.com.ca.im.data-collection-manager=INFO, ems
   log4j.logger.com.torokina=INFO, ems

   NOTE
   This change allows the Engine to dump the XML files that have information about the device and polled metrics.
5. Wait for the next performance poll.
6. After the next performance poll, change the working directory to:
   $DC_INSTALL/apache-karaf-2.3.0/MediationCenter/Queue.Pol/queue-<DevicePackName>.
7. Execute the following command:
   ```
   grep  - r <metric-name> .
   ```
   If the Engine recognizes the new metric, for each occurrence of <metric-name> from the XML files in the working directory, the <metric-name> is returned.

   WARNING
   You cannot execute the command if you miss the period at the end of the command.
8. Revert the changes in step 4.

   WARNING
   If you do not revert the changes in step 4, the Engine does not delete the temporary files and the disk may run out of space.

Merge Old Customizations

After you update a device pack, use the Merge option to absorb the old device pack customization to the updated device pack.

Follow these steps:

1. Log in to the Device Pack Customization tool.
2. Click File, Open, and select the device pack that was updated.
3. Click Merge.

Merge Old Customizations

After you update a device pack, use the Merge option to absorb the old device pack customization to the updated device pack.

Follow these steps:

1. Log in to the Device Pack Customization tool.
2. Click File, Open, and select the device pack that was updated.
3. Click Merge.

Customize a Device Pack

You can customize a device pack by performing one or both the following activities:

- Add or modify the prefix of a metric family.
- Add, update, or delete a metric in a metric family.

NOTE

- Whenever you update to the latest version of CA Performance Management, close the current session of Device Pack Customization Tool and launch the session again.
- Customization for the following device packs are supported, only if you use CA Performance Management 2.4 and above:
- – CAEXFOBrixWorx
- – CAAlcatelXMSIMS
- – CACamiantMPE
- – CAEricssonMME
- – CAEricssonSGW
- – CANokiaIMS
- – CANetAppFiler

Follow these steps:

1. Log in to the Device Pack Customization tool.
2. Click File, Open, and select a device pack to customize.
3. Click Customize.
   The metric families of the selected device pack appear in a tabbed page. Now, you can customize a metric family prefix or customize a metric.

Add or Update a Metric to a Device Pack

You can add or update a metric to a metric family of a device pack.

Follow these steps:

1. Click File, Open, and select a device pack.
2. Click Customize.
3. Double-click a metric family from the panel on the left-side.
   The metrics of the selected metric family appear in a tabbed page.

   NOTE
   - Hover the mouse over the column headers to view the corresponding tooltip. - Click the down arrow in Metric Name, Columns, and select or clear the check boxes to display or hide specific columns.
4. (Only to add a metric) Click Add, type the values for the following parameters and, and click Add:
   Name
   Specifies the metric name.

   WARNING

   See Step 7 in Check if the Engine Recognizes the New Metric. Provide the metric name that the Engine recognized. For a KPI metric, provide a unique name. The value can be a string consisting only of alphanumeric characters and _ (underscore) and must not be empty.

Documentation
Specifies the description of the metric.

5. (Only to update a metric) Double-click a row.
6. Provide the parameters in the fields of the following attributes:

Type
Specifies the supported data type of the metric.

Deltaed
Indicates whether Data Aggregator performs the delta calculation on the metric value.

Values: Yes, No

Effect of updating: When set to Yes, Data Aggregator performs the delta calculation by using the current and previous values of the metric.

Is dbColumn
Stores the value in the database table. IsDBColumn is used for metric attributes. Set the value to true when Polled is set to true.

Values: true, false

Effect of updating: If set to true, the data for this attribute or metric is stored in the database.

Baseline
Indicates whether to calculate a mean value for this attribute or not. If it is set to true, a corresponding BaselineList definition must be defined.

> **NOTE**
> Baseline requires that Standard Deviation is set to true.

Minimum
Indicates whether to calculate the minimum of this attribute during the rollup or not. Creates a 'min_' column in the database table.

Values: true, false

Effect of updating: If the value is set to true, the minimum value of the attribute is calculated and reported.

Maximum
Indicates whether to calculate the maximum of this attribute during the rollup or not. Creates a 'max_' column in the database table.

Values: true, false

Effect of updating: If the value is set to true, the maximum value of the attribute is calculated and reported.

Standard Deviation
Indicates whether to calculate the standard deviation of this attribute during the rollup or not. Creates a 'std_' column in the database table.

Values: true, false

Effect of updating: If the value is set to true, the standard deviation of the attribute is calculated and reported.

Variance
Indicates whether to calculate the variance of this attribute during the rollup or not. Creates a 'var_' column in the database table.

> **NOTE**
> This field is not supported for custom metric families.

Percentile
Indicates whether to calculate the nth percentile of this attribute during the rollup or not. Creates a 'pct_' column in the database table.

Values: 0 (zero), 95

Effect of updating: If the value is set to 95, the 95th percentile of the attribute is calculated and reported. Zero means that no calculation is performed, and the reporting field is not available.

Polled

Indicates whether the Data Aggregator collects the metric data during each poll cycle.

Values: true, false

Effect of updating: When set to True, Data Aggregator collects the metric data during each polling cycle. When set to False, the data is collected only upon discovery of an item.

Rollup Strategy

Specifies the operation that is performed every cycle during the rollup of the individually polled values. When Polled and IsDBcolumn are set to true, this parameter is required.

Values: Sum (a summation for counters), Avg (an average for gauges)

Effect of updating: The specified strategy is used to perform rollup calculations.

Units

Expresses the metric in reports by the specified standard of measurement.

KPI Expression

(Only for the KPI metric) Specifies the Key Performance Indicator (KPI) formula..

7. Click Update, Save.
   The metric appears in the metric family. The new and updated metric appears in a different color when you refresh the tool.

Provide KPI Expression

You can create a key performance indicator (KPI) metric to derive new metrics from the existing metrics. Currently, you can add a KPI metric only as a gauge. The Device Pack Customization tool supports only the addition, subtraction, and multiplication operators. Parentheses can be used in expressions. You can use the arithmetic operations to derive new metrics.

Example: (val1+val2)*5(val3)

> **NOTE**
> The Device Pack Customization tool does not support the division operator ("/" slash).

You can also use the SNMP functions to create a KPI metric. The Device Pack Customization Tool supports the following SNMP functions:

- **snmpProtectedDiv**
  Divides two values. Use the snmpProtectedDiv function instead of the division operator.
  Example: snmpProtectedDiv(OUTPUTERRORS, IFSPEED)
- **snmpMax**
  Compares two values and returns the maximum value.
  Example: snmpMax(val1, val2)
- **snmpRound**
  Rounds off the decimal value to the nearest integer.
  Example: snmpRound(IFSPEED).

Change the Prefix of Metric Families

Change the prefix of metric families of a device pack for an easier identification of the metric families during report generation.

Follow these steps:

1. Log in to the Device Pack Customization tool.
2. Click File, Open, and select a device pack.
3. Click Customize.

The metric families of the selected device pack appear in a tabbed page.
4. Click Edit.
5. Type the old prefix, if any.
6. Type the new prefix and click Update.
7. Click Save in the top-right corner of the Metric Families section.
   Example 1
   Old Prefix: <blank>
   New Prefix: CAZTMSC
   Effect of changing the prefix: CAZTMSC<*Metric Family Name*>
   Example 2
   Old Prefix: CAZTMSC
   New Prefix: ZTMSC<space>
   Effect of changing the prefix: ZTMSC <*Metric Family Name*>

NOTE

If you create reports-based on Select View Context in CA Performance Center, make sure that the metric family name with the prefix does not exceed the following limits:

- 128 characters in Infrastructure Management 2.3.1 and Infrastructure Management 2.3.3.
- 50 characters for Infrastructure Management 2.3.2.
- If the metric family name exceeds the character limit, the prefix is not added to any metric family name.

Delete a Metric in a Device Pack

You can delete metrics of a metric family in a device pack.

NOTE
Though you can delete a metric that is shipped with the device pack and associated with a report in CA Performance Center, you can view reports for the data that are collected before deleting the metric.

Follow these steps:

1. Click File, Open and select a device pack.
2. Click Customize.
3. Double-click a metric family from the panel on the left-side.
   The metrics of the selected metric family appear in a tabbed page.
4. Select a metric family.
5. Select a metric to delete and click Delete.
6. Click Save.

Verify Device Pack Updates

When you add, update, or delete a metric by using the Device Pack Customization Tool, the changes automatically appear in CA Performance Center. However, you can verify if the device pack is updated.

Follow these steps:

1. Access CA Performance Center from the following URL:
   http://<*PC Hostname*>:<*PC Port#*>
   Where <PC Hostname> is the CA Performance Center hostname and <PC Port#> is the port number configured for CA Performance Center.

2. Click Admin, Data Source Settings, Data Aggregator@<*DAHost Name*>, where <*DAHostname*> is the host name of <*caimda*>.
   The Monitored Devices page appears.
3. Click Monitoring Configuration, Metric Families.
   The Metric Families list appears.
4. Enter the device pack or Metric Family name in the Search View box at the bottom of the Metric Families list and press Enter.
   The metrics list appears.
5. Confirm if the metric is added, updated, or deleted.

Troubleshooting the Device Pack Customization Tool

The following information describes troubleshooting the Device Pack Customization Tool:

Metric families or metrics do not appear in the Device Pack Customization Tool

Symptom:

When I select a device pack in the tool, metric families or metrics are not listed.

Solution:

Capture the log and send it to Technical Support at http://ca.com/support.

New metric does not appear immediately in CA Performance Center

Symptom:

When I add a metric through the Device Pack Customization Tool, it does not appear immediately in CA Performance Center.

Solution:

Sometimes, a delay is experienced based on the refresh time. Wait for 15 minutes and if the problem persists, capture the log, and send it to Technical Support at http://ca.com/support.

Error 404

Symptom:

When I access the Device Pack Customization Tool, 'The Page cannot be found' message appears.

Reason:

The tool was not installed properly.

Solution:

Manually copy the jar file of the tool to the /opt/IMDataAggregator/apache-karaf-2.3.0/deploy directory in Data Aggregator. Also, make sure that Data Aggregator is not connected to CA Performance Center when the installer is running. If the problem persists, contact Technical Support at http://ca.com/support.

Uninstalling

This section provides steps to uninstall DX NetOps, uninstall a device pack in DX NetOps, and uninstall device packs in DX NetOps for Performance Management.

Uninstall DX NetOps Mediation Manager

The following procedure describes how to uninstall DX NetOps software.

Follow these steps:

1. (Optional) Stop the DX NetOps cluster using the following command:
   - Windows systems:
     ```
     %CAMM_HOME%/tools/stopall.bat
     ```
   - Unix systems:
     ```
     $CAMM_HOME/tools/stopall
     ```
2. (Optional) Wait for all DX NetOps components to stop.

   NOTE
   Uninstaller stops DX NetOps before it proceeds to remove DX NetOps.
3. Run the following command:
   - Windows systems:
     ```
     "%JAVA_HOME%/bin/java"  -jar
     %CAMM_HOME%/_CAMM_installation/uninstaller.jar
     ```
   - UNIX systems:
     ```
     "$JAVA_HOME/bin/java"  -jar
     $CAMM_HOME/_CAMM_installation/uninstaller.jar
     ```

   The Uninstall dialog appears.
4. Click Uninstall.
   The Uninstaller stops DX NetOps and starts the removal process. When the removal processing is complete, the Uninstall Complete window appears.
5. Click Done.
   DX NetOps is uninstalled.

Uninstall a Device Pack in DX NetOps Mediation Manager

A device pack can be removed from DX NetOps through the Web UI. You can remove both Engine and Presenter.

Follow these steps:

1. From the Web UI, select the Component (Engine or Presenter) that you want to uninstall.
2. Click Remove.
   The Remove Sub-Components dialog appears.
3. Select Yes.
   The device pack is uninstalled.

Uninstall a Device Pack in DX NetOps Mediation Manager for Performance Management

You can uninstall a device pack when you do not want to poll data for that device. This procedure completely removes the device pack from your system when followed sequentially.

NOTE
You cannot uninstall the device pack views. You can only reinstall or upgrade the device pack views.

Uninstall Device Packs in DX NetOps for CA Performance Management 2.3.4 and later

Remove Engine, CAPM Presenter, and Certification of device pack from DX NetOps through the Web UI.

Follow these steps:

1. Launch the web UI, click the Device Packs tab, select the subcomponent that you want to uninstall.
2. Click Remove.
   The Remove Sub-Components dialog appears.
3. Select Yes.

Frequently Asked Questions

Some of the frequently asked questions when working with DX NetOps or DX NetOps for Performance Management are as follows:

DX NetOps Mediation Manager

Contents

What are the default ports used by the DX NetOps components?

The default ports that are used by the components are as follows:

Component	Port	Type
MultiController	29599	TCP
LocalController	29598	TCP
Generic Executor	29560	TCP
Web Manager	8880	HTTP

Scripts to start, stop, and check the status of the components

How do I stop or start the services of all the components of DX NetOps?
Execute the following command to start the services of all components:

```
$CAMM_HOME/tools/startall
```

Execute the following command to stop the services of all components:

```
$CAMM_HOME/tools/stopall
```

Where $CAMM_HOME is the installation directory.

How do I stop or start the services of the individual components of DX NetOps?
Execute the following command to start the services of a component:

```
$CAMM_HOME/tools/startall -c <component>
```

Execute the following command to stop the services of a component:

```
$CAMM_HOME/tools/stopall -c <component>
```

Where $CAMM_HOME is the installation directory and <component> is GE, MC, LC, or WEB.
Example: $CAMM_HOME/tools/stopall -c MC

How can I manage a subcomponent of DX NetOps (for example, start, stop, restart, add, delete, or update a subcomponent)?
The functions and the corresponding commands for the subcomponent are as follows:
Execute the following command to start a subcomponent:

```
$CAMM_HOME/tools/cammSubCtrl -ma <MCaddress> -id <subcomponent_id>_CAMM
```

Execute the following command to stop a subcomponent:

```
$CAMM_HOME/tools/cammSubCtrl -ma <MCaddress> -id <subcomponent_id> -s
```

Example: $CAMM_HOME/tools/cammSubCtrl - ma 10.134.116.183 - id ENGINE_CAMM - s
Execute the following command to restart a subcomponent:

```
$CAMM_HOME/tools/cammSubCtrl -ma <MCaddress> -id <subcomponent_id> -r
```

Execute the following command to add a subcomponent:

```
$CAMM_HOME/tools/cammSubCtrl -ma <MCaddress> -la <LCaddress> --add -f <dpack file>
```

Execute the following command to delete a subcomponent:

```
$CAMM_HOME/tools/cammSubCtrl -ma <MCaddress> -la <LCaddress> --delete -id <subcomponent_id>
```

Execute the following command to update a subcomponent:

```
$CAMM_HOME/tools/cammSubCtrl -ma <MCaddress> -la <LCaddress> --update  -f <dpack file>
```

Where $CAMM_HOME is the installation directory.
<subcomponent> is ENGINE or PRESENTER.
mcaddress is the MultiController IP address (**Default:** Localhost).
lcaddress is the LocalController IP address (**Default:** Localhost).
subcomponent_id is the identifier of the subcomponent.

Manage Logs

Where are the log files of the DX NetOps components located?
The locations of the log files are as follows:

- **MultiController:** $CAMM_HOME/MC/logs/CAMM-Multi-Controller-<timestamp>.log
- **LocalController:** $CAMM_HOME/LC/logs/CAMM-Local-Controller-<timestamp>.log
- **Generic Controller:** $CAMM_HOME/GE_<username>/logs/*.log
- **Web:** $CAMM_HOME/WEBCAMM/logs/*.log
- **Engine:** $CAMM_HOME/COMPONENTS/ENGINE_<DEVICE_PACK>/logs directory
- **Presenter:** $CAMM_HOME/COMPONENTS/PRESENTER_<DEVICE_PACK>/logs directory

How do I increase the log level of a subcomponent?
Select a subcomponent in the web interface and change the Log Level option for the subcomponent from INFO to FINEST.

> **WARNING**
> Increasing the log level significantly increases the details being logged. As a result, more disk space is used. Monitor the disk space and revert to default settings when the problem is resolved.

Reports

What should I do if there are frequent gaps in reports though data is generated during the specified time?

This problem occurs if there is an offset in time between the system from which the input files are obtained and the system in which the Engine processes the input files. To avoid this problem, ensure that the time zone and time, accuracy up to seconds, are synchronized between the two systems.

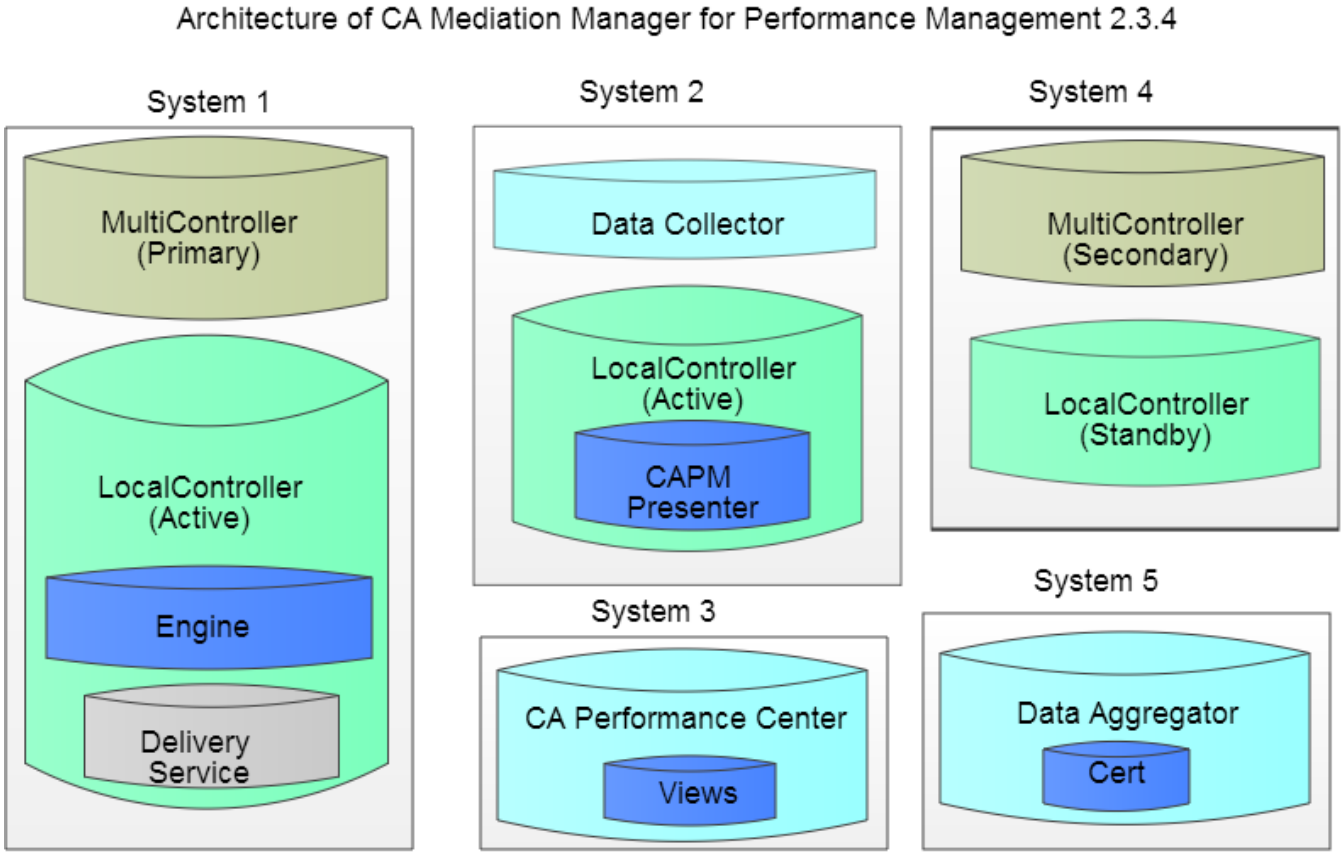
DX NetOps Mediation Manager for Performance Management

Contents

Architecture, Components, System Requirements

1. **How to distribute Primary MultiController, active LocalController, and a standby LocalController in a multiserver installation?**Install Primary MultiController and an active LocalController with Engine and Delivery Service in one system. A standby LocalController can be installed in any system that has sufficient RAM and CPU spaces. The following diagram shows one of the possible scenarios:

   Figure 93: DX NetOps MM for PM with 5 systems



2. **Is it mandatory to install Primary MultiController in the system that has CA Performance Center?**No. Install the Primary MultiController in the system that has CA Performance Center only if it has enough memory to accommodate new device packs and MultiController.
3. **Is there a system requirements guideline to install DX NetOps Mediation Manager for Performance Management?**Refer to the Sizing Guidelines document available at the CA Support site.
4. **How can I improve the performance of CAPM Presenter?**
   The number of CAPM Presenters that are required for your environment depends on the number of complex device packs that you intend to deploy. If the amount of data to be processed is very large, the performance of a CAPM Presenter can be impacted. In such deployments, install multiple CAPM Presenters. In DX NetOps Mediation Manager, you can use the same installation file of a subcomponent and can install multiple subcomponents by changing the name of the subcomponent. Therefore, install multiple CAPM Presenters by using the same Presenter zip file, which is created after migrating the device pack. Similarly, install multiple Engines and provide the path of the corresponding CAPM Presenter and host names.

Example 1:
To collect data from nine hosts (named H1 through H9), install multiple Engines and CAPM Presenters, and distribute the host names accordingly. One of the scenarios is as follows:

- Engine 1 contacting CAPM Presenter 1 and Hosts: H1, H2, and H3
- Engine 2 contacting CAPM Presenter 2 and Hosts: H4, H5, and H6
- Engine 3 contacting CAPM Presenter 3 and Hosts: H7, H8, and H9

Example 2:

- Engine 1 contacting CAPM Presenter 1 in Data Collector 1 and Hosts: H1, H2, H3, H4, and H5
- Engine 2 contacting CAPM Presenter 2 in Data Collector 2 and Hosts: H6, H7, H8, and H9

> **NOTE**
> All three Engines are of the same device pack but have different COMPONENT_ID parameters. All three CAPM Presenters are installed from the same zip file and have same COMPONENT_IDs as their Engine.

Scripts to start, stop, and check the status of the components

1. **How do I start, stop, or check the status of the CA Performance Center services?**Execute the following commands to stop the services:

   ```
   /etc/init.d/caperfcenter_console stop;
   /etc/init.d/caperfcenter_eventmanager stop;
   /etc/init.d/caperfcenter_devicemanager stop;
   /etc/init.d/caperfcenter_sso stop;
   ```

   Execute the following commands to start the services:

   ```
   /etc/init.d/caperfcenter_devicemanager start
   /etc/init.d/caperfcenter_sso start
   /etc/init.d/caperfcenter_eventmanager start
   /etc/init.d/caperfcenter_console start
   ```

   Execute the following commands to check the status of the services:

   ```
   /etc/init.d/caperfcenter_sso status
   /etc/init.d/caperfcenter_devicemanager status
   /etc/init.d/caperfcenter_eventmanager status
   /etc/init.d/caperfcenter_console status
   ```

2. **How do I start, stop, or check the status of the Data Aggregator services? How do I start, stop, or check the status of the Data Aggregator services?**
   Execute the following commands to start the services:

   ```
   /etc/init.d/dadaemon start
   ```

   Execute the following commands to stop the services:

   ```
   /etc/init.d/dadaemon stop
   ```

   Execute the following commands to check the status of the services:

   ```
   /etc/init.d/dadaemon status
   ```

3. **How do I start, stop, or check the status of the Data Collector services?**
   Execute the following commands to start the services:

   ```
   /etc/init.d/dcmd start
   ```

   Execute the following commands to stop the services:

   ```
   /etc/init.d/dcmd stop
   ```

   Execute the following commands to check the status of the services:

   ```
   /etc/init.d/dcmd status
   ```

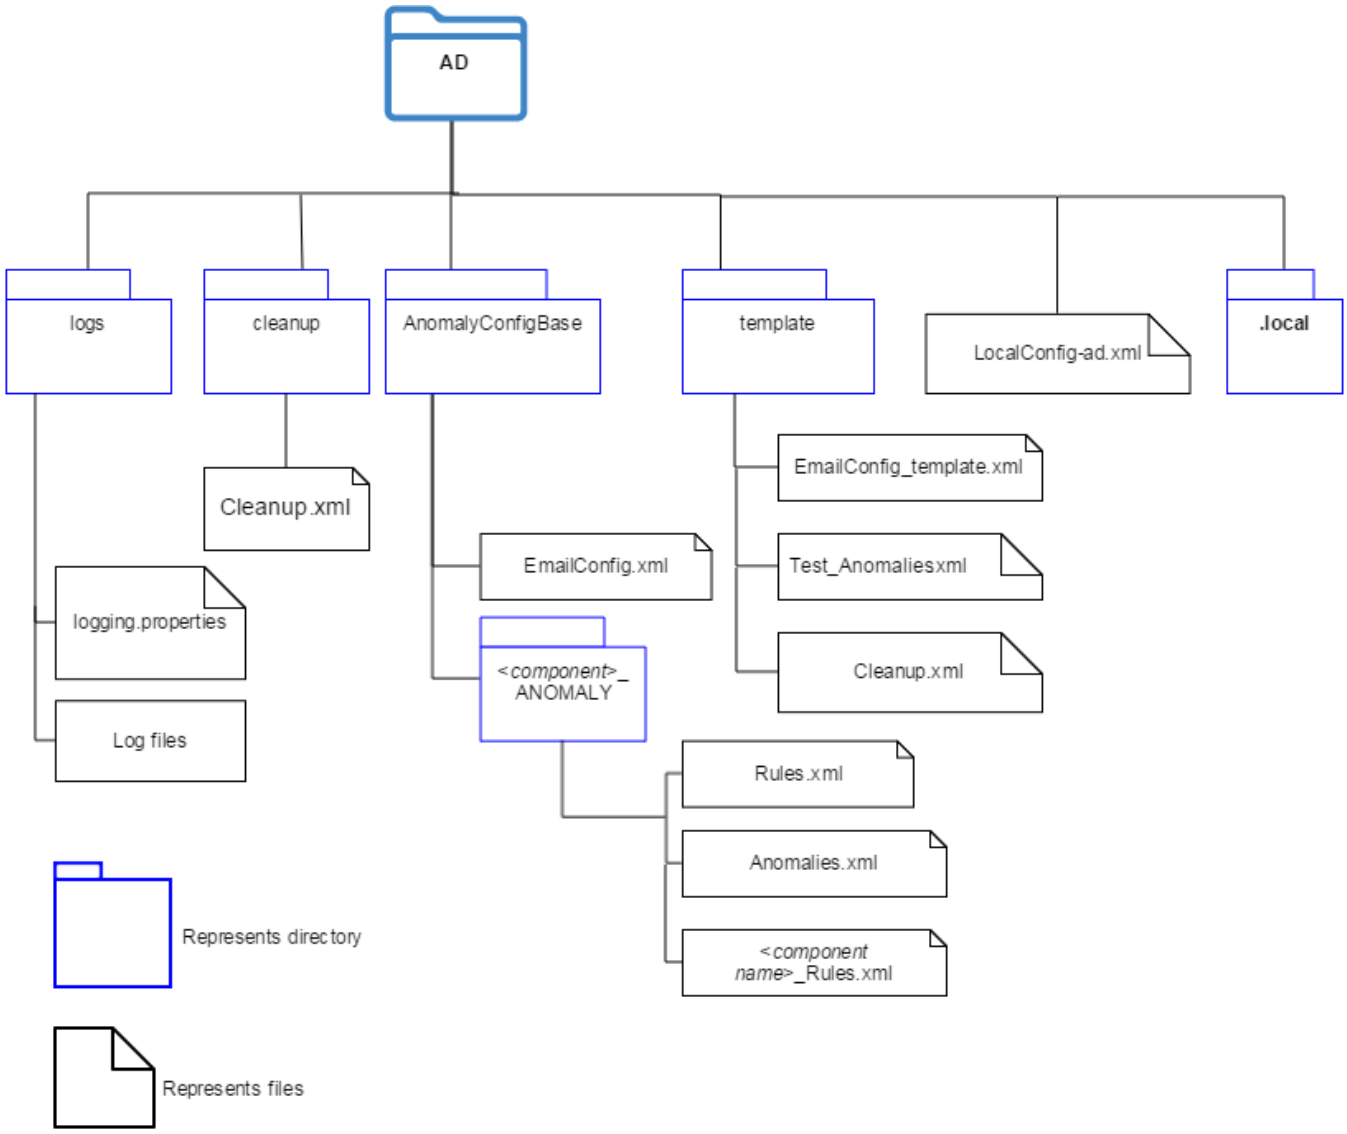
Device Pack Migration

1. **What are the options in migratePMtoCAMM and when do we use them?**
   The options to execute migratePMtoCAMM are a, d, and t. Use these options under the following scenarios:
   d: To migrate the device pack before upgrading the Data Collector. However, do not start the device pack till the Data Collector is upgraded to release 2.3.4. Also, always use option “d” to migrate the CANECeNodeB, CACRBT, or CACRBTUSER device pack.
   t: To test the device pack that is generated in a DX NetOps Mediation Manager setup, in another DX NetOps Mediation Manager setup. You can also use this option to test the device pack that is generated in the lab environment before upgrading Performance Management in the production environment.
   a: To migrate the device pack and start the device pack immediately after migration. However, before you use this option confirm that the Data Collector is upgraded to release 2.3.4.
2. **Will there be any data loss after migration?**
   No. If you are using DX NetOps Mediation Manager 2.2.6 and above in Performance Management 2.3.4, the migration script will handle the historical files and start processing after the point where the EMS Profile stopped.
3. **Why are there gaps in reports after executing the migration script?**
   After the migration, there should not be gaps in the report. However, if there is no data from the EMS server at any time, gaps appear in the reports.

Notification Feature

1. **Where are the configuration files of the Notification feature available?**
   The Notification feature is available starting DX NetOps release 2.5. If you install afresh or upgrade to the latest version, the configuration files for the Notification feature are added to the following location: <*CAMM_Install_folder*>/CA/CAMM/AD
2. **What is the folder structure for the configuration files of the Notification feature?**
   All configuration files for the Notification feature are in the AD folder, which is in the <*CAMM_Install_folder*> location. The following diagram provides the list of other files and subfolders:

Figure 94: Anomaly Detector Folders and Files



3. **What are the contents of the configuration files and their uses?**

   AnomalyConfigBase

   Contains the following folders that has the anomaly files for each component and the xml file to generate emails:

   – • MC_ANOMALY
   - LC_ANOMALY
   - Engine_ANOMALY
   - Presenter_ANOMALY
   - EmailConfig.xml

   <*component*>_ANOMALY

   <*component*> refers to MC, LC, Engine, or Presenter. By default, this folder contains two xml files: Rules.xml and Anomalies.xml. When you select an anomaly for a component in UI, <*component name*>_Rules.xml is created and it contains the anomalies with rules specified in the UI. According to the rules specified in UI, notification is sent. The <*component name*> refers to the component name in the UI.

EmailConfig.xml Contains server properties details and email addresses that are specified in the Server Properties area in UI. This file is generated based on the EmailConfig_Template.xml file when you specify the parameters in Server Properties. Anomaly notification is sent to the email addresses added to this file.

logs
Contains log files that the Notification feature generates.

template
Contains template xml files to trigger test email, perform cleanup, and store the server properties and email addresses.

LocalConfig-ad.xml Starts the Notification feature. This file also contains information about the default port number. Currently, the feature uses the port 29570. Therefore, ensure that the port is available for this feature. If the port 29570 is occupied and you want to allot different port for the Notification feature, stop the feature, change the port number in the LocalConfig-ad.xml file, start the feature, and change the port number in all other locations where DX NetOpscomponents are installed.

cleanupContains xml file to perform the cleanup of the log files. You can change the log file cleanup by changing the appropriate parameters.

.local
Contains the jmxPort number and this folder is created when the feature is started. This port remotely monitors Java resources (CPU, Memory, Heap, and Number of Classes) of this feature.

4. **When I upgrade DX NetOps, will the email server properties and anomaly settings be lost?**
   No.
5. **What happens to the selected anomalies when an Engine is moved from one LocalController to another LocalController?**
   ENGINE_<*devicepack*>_Rules.xml is deleted and created again. In this process, the previously selected parameters are lost.
6. **How can I know the anomalies for which I will receive email notifications?**Use one of the following methods to know the selected anomalies:
   - Through UI: In the My Settings, Notification area, expand the DX NetOps MM Components node and click a component. For the selected anomalies in the <*component*> Anomalies area, you receive notifications.
   - Through scripts: Execute the cammStatus -ad script from the <*CAMM Install*>/CA/CAMM/tools folder.
   - Through <*component name*>_Rules.xml: See the rules which have selected=”true”.
7. Can I change the anomalies name in **the <*component name*> Anomalies area** in UI?Yes. Follow these steps:
   1. Open the <*component name*>_Rules.xml file in the <*component*>_ANOMALY folder.
   2. Change the text in the name field.
      Example: In MC-Primary_Rules.xml, change "MC stopped" in the name field according to your choice.
   3. Save the file and exit.
8. **What are the parameters in the <*component name*>_Rules.xml file and which parameters can be changed?**
   The details of the parameters in the <*component name*>_Rules.xml are as follows:

   asserted
   Indicates whether the anomaly is detected or not. Do not change this parameter.

   frequencyIndicates the time interval according to which the rule is executed in the background. If anomaly is detected during the execution, email notification is sent.
   Units: Seconds

   id
   Specifies the component identifier. Do not change this parameter.

   nameSpecifies the anomaly name. This name appears in the Anomalies section in UI.

   selectedIndicates whether the component is selected through UI for anomaly detection.
9. **How can I change input parameters of a rule that is used to detect an anomaly?**
   Open the <*component name*>_Rules.xml file in the <*component_name*>_ANOMALY folder. In this file, except the asserted and id fields, you can update the other input parameters.

Example: In PRESENTER_CAPM_Rules.xml, the DX NetOps MM DC Queue size growing anomaly, you can modify the setThresholdInPercentage and setMaxTrend input parameters.

10. How do I stop **DX NetOps** to detect anomaly?
    In the Notification area, expand the DX NetOps MM Components node, click a component, clear the check box of the anomaly, and click Save.
11. **How to customize the test email message?**
    Open the Test_Anomalies.xml file in the <*CAMM_Install_Folder*>/AD/Template folder and change the subject or title.
12. **How can I customize the troubleshooting and causes messages according to my environment?**
    Open the Anomalies.xml file in the AD/AnomalyConfigBase/<*component*>_ANOMALY location and change the text.
13. **How to start and stop the notification feature?**
    Execute the following script to start the feature:
    ```
    startall -c ad
    ```
    Execute the following script to stop the feature:
    ```
    stopall -c ad
    ```
14. Can anomaly be detected even when the **DX NetOps components are** not running?
    Yes, unless the stopall script was executed to stop all services of DX NetOps.
15. **Is there any specific system requirements for the Notification feature to function?**
    No.
16. **Can I use this feature to monitor anomalies in CA Performance Management?**
    No.
17. **Can I use this feature if the primary MultiController is down?**
    No. Do not change the settings through UI when the primary MultiController is down.
18. **What happens to the selected anomalies if an Engine is removed from my environment?**
    All the anomalies that are selected for the Engine are deleted.
19. **Where is the log file for the Notification feature?**
    In the <*CAMM_Intall_Folder*>/AD/logs location.
20. **How do I change the log levels for this feature?**
    Open logging.properties from the <*CAMM_Intall_Folder*>/AD/logs location and change INFO to FINE/FINEST
21. **How to edit the default port number?**
    Follow these steps:
    a. Stop the feature by executing the stopall -c ad script.
    b. Open LocalConfig-ad.xml from the <*CAMM_Intall_Folder*>/AD location.
    c. Change the port number in the LocalConfig-ad.xml file.
    d. Start the feature.
    e. Change the port number in all other locations where DX NetOps components are installed.
22. **How can I monitor the system resources used by this feature?**Follow these steps:

1. a. Install JDK 1.7 or above in a system where DX NetOps is running.
   b. Double-click jconsole.exe in <*JDK_HOME*>\bin to open JConsole.
   c. Select Remote Process in the JConsole New Connection dialog.
   d. Copy the JMX connection URL from the log file. Example: service:jmx:rmi:///jndi/rmi://127.0.0.1:10979/timJmxRmi
   e. Replace the “127.0.0.1” IP address with the actual IP address where the Notification process is running.
   f. Replace "10979" with the value in the jmxPort.xml file in the <*CAMM_Install_Folder*>/CAMM/AD/.local location.
   g. Type the login credentials and click Connect.
      JConsole displays the utilization details of “Memory”, “CPU”, “Threads” & “Classes”.

Device Pack Information

The device pack information [DPInfo] files contain the supported metric, specific instructions, and known issues. Click here to download the HTML format of the DPInfo files.

Click here to download the Excel workbook that contains the list of device packs and the supported CA eHealth and CA Performance Management versions.

Greenbook

This section provides problem determination and troubleshooting guidelines for the DX NetOps Mediation Manager product. CA also recommends that you interview the customer using the Troubleshooting Methodology for CA Support Partners. The Troubleshooting Methodology for CA Support Partners provides a script for obtaining basic information to assist you with problem determination for all CA products and solutions.

If you have completed the problem determination interview and used the resource information provided in this guide and the problem or issue reported by the customer is not resolved, please contact CA Support for assistance. You can open a case or contact our Customer Care representatives.

Common Troubleshooting and Actions

Common Issue

The most common issue is data missing or data discrepancy in the report. This may include an individual graph on a report not containing data through to all reports containing no data. Use the following steps to diagnosing these and other types of issues:

- Confirm the status of DX NetOps MM components:
- Log in to the Web Manager. Ensure the status of each Component and Sub Component is active (represented by a green tick). If any component is down, attempt to start them using ‘startall’ command ($CAMM_HOME/tools/startall).
- If any Sub Component is down, attempt to start it through the GUI by clicking on ‘Start’.
- If any Component or Sub Component continues to fail, increase the logging level as explained in “Using the Log files” section, reproduce the problem and collect the following log files:
  - $CAMM_HOME/MC/repository/*
  - $CAMM_HOME/<(sub)component>/log/*<current_date>.log

Other Issues

Engine common problems are related to:

- Lose of connectivity to the EMS
- The input data format is changed on the EMS

For connectivity to EMS lost:

- Check Log files in $CAMM_HOME/COMPONENTS/ENGINE_<device_pack>/logs directory, specifically the STD-ERROR-<timestamp>.log files.
- Check the file $CAMM_HOME/COMPONENTS/ENGINE_<devicePack>/.local/EngineStatistics.xml. It indicates the performance, success or failure of every part of the Poll.
- Check the file $CAMM_HOME/COMPONENTS/ENGINE_<devicePack>/repository/work/InventoryDeviceList.xml

For change of input EMS data format:

- In addition to the above log files, EngineStatistics.xml and InventoryDeviceList.xml files, also check the Engine output is making it to the Delivery Service by stopping the Presenter and checking the Queue directory.

Presenter common problems are related to:
Data not arriving from the Delivery Service
The common problem when Data are not seen in the Presenter is when the processed data is not delivered by the Delivery Service. The troubleshooting steps in this case are the following:

- Check the log files in the log directory specific to the device pack presenter specifically focusing on the STDERR log files, e.g. $CAMM_HOME/COMPONENTS/PRESENTER_<device_pack>/logs/*
- Check if the Engine output is making it to the Delivery Service by stopping the Presenter and checking the $CAMM_HOME/Queue directory.

Stop the Presenter and check if the processed data from the Engine is reaching the Delivery Service.
The processed file should be present under the $CAMM_HOME/Queue directory.

- Check to see if CSV, XML or DDI files are present in the $CAMM_HOME/output directory
- If data are expected to be presented in the SNMP format, try querying the SNMP MIB using snmpwalk.

Troubleshooting Greenbook

Contents

Basic Troubleshooting

- Connect to the DX NetOps MM Web Manager (see Using the DX NetOps MM Web Manager) to gather information about the DX NetOps MM Cluster and collect the following info:
  - Are all the components running?
  - Is it a Single Server install? If not, how many LC's are there?
  - Which Device Pack is the customer having problems with?
- Review the logs of the device pack Engine to see if the issue is in the Engine and check if restarting Engine solves the problem.
- Review the logs of the device pack Presenter to see if the issue is in the Presenter and check if restarting Presenter solves the problem.
- If the "DX NetOps MM for DX NetOps MM" Device Pack is installed on the server, DX NetOps MM Engine polls itself to indicating the current Run state of each component giving you an overall performance of the entire DX NetOps MM environment.
- By default CAMM is installed under $CAMM_HOME\COMPONENTS\ENGINE_CAMM and $CAMM_HOME \COMPONENTS\PRESENTER_CAMM directory.

How to Stop and Start DX NetOps MM Components and Sub Components

Visit the following pages to learn about the scripts to start, stop, and check the status of the components:

- DX NetOps Mediation Manager
- DX NetOps Mediation Manager for Performance Management

Using the DX NetOps MM Web Manager

CAMM Web Manager reflects the high level operational status and health of DX NetOps MM components such as MultiController, LocalController and Sub Components such as Device Pack's Engine and Presenter. However, it does not indicate if Sub Components are actually collecting data. The utilization of resources on the server by each Component is also indicated. If one or more of the components are not running, they can be restarted from the web interface.

Log into DX NetOps MM Web Manager from the URL http://server:port (8880 is default port). The default username is 'admin' and the password is 'camm'.

Using the Log Files

The CAMM directory structure is created in a logical manner. Every Component (MultiController, LocalController, Generic Executor, Delivery Service) and Sub Component (Engine & Presenter) has a log directory.

The logs are automatically archived as per settings specified in the LocalConfig-ge.xml: $CAMM_HOME/GE_<user>/LocalConfig-ge.xml

Logs for DX NetOps MM main Components are located in the following directories:

- MultiController**:** $CAMM_HOME/MC/logs/CAMM-Multi-Controller-<timestamp>.log
- LocalController**:** $CAMM_HOME/LC/logs/CAMM-Local-Controller-<timestamp>.log
- GenericController**:** $CAMM_HOME/GE_<username>/logs/*.log
- **Device Pack:** $CAMM_HOME/COMPONENTS/<device-pack-name>/logs/*.*
- **Web:** $CAMM_HOME/WEBCAMM/logs/*.log

The “STD-ERROR-<timestamp>.log” file located in the same directories contains the error messages. This is often the most important file to look at when troubleshooting an issue.

Logs for DX NetOps MM Sub Components (Engine & Presenter):
The Sub Components of each device pack installed on the server has its own sub directory under the COMPONENTS directory. The Device Pack names are included in the name of the directory. Each Sub Component has a logs directory under the specific device pack ENGINE or PRESENTER sub directories. Log files for each component would indicate if there is a problem with the Device Pack. For example, if it failed to collect/parse data from the EMS.

- **Device pack Engine:** $CAMM_HOME/COMPONENTS/ENGINE_<DEVICE_PACK>/logs directory
  Example: /opt/CA/CAMM/COMPONENTS/ENGINE_CAMM/logs/CAMM-Application-<YYYY-MM-DD>.log
- **Device Pack Presenter:** $CAMM_HOME/COMPONENTS/PRESENTER_<DEVICE_PACK>/logs directory.
  Example: /opt/CA/CAMM/COMPONENTS/PRESENTER_CAMM/logs/CAMM-Application-<YYYY-MM-DD>.log

The “STD-ERROR-<timestamp>.log” file located in the same directories contains the error messages. This is often the most important file to look at when troubleshooting an issue.

Increasing log verbosity

All the above mentioned Components and Sub Components log files by default contain informational level messages (INFO). The granularity of logging can be increased temporarily for troubleshooting purposes by modifying the corresponding “logging.properties” file located in the $CAMM_HOME/<sub-component>/logs directory of each Component and Sub-Component.

Follow these steps:

1. Edit the “logging.properties” file in the same logs directory; replace the two instances of INFO with FINEST and save the file.
   For example, change it from the default:

```
 com.torokina.common.logging.apache.FileHandler.directory=E\:\\CA\\CAMM/DS/logs
handlers=com.torokina.common.logging.apache.FileHandler
 com.torokina.common.logging.apache.FileHandler.level=INFO
.level=INFO
com.torokina.common.logging.apache.FileHandler.prefix=CAMM-Delivery-System-
```

   To this:

```
 com.torokina.common.logging.apache.FileHandler.directory=E\:\\CA\\CAMM/DS/logs
handlers=com.torokina.common.logging.apache.FileHandler
com.torokina.common.logging.apache.FileHandler.level=FINEST
.level=FINEST
```

```
com.torokina.common.logging.apache.FileHandler.prefix=CAMM-Delivery-System-
```

2. Enable the new logging level by either restarting the component or sub-component (stopall/startall or cammCtrl) or by running the following command from within the relevant log directory to enable without restart: $CAMM_HOME/tools/cammCtrl a 127.0.0.1 p <port> -l ./logging.properties

   WARNING

   Increasing the log level will result in significantly more detail being logged and consequently more disk space usage. Make sure to monitor the disk space and revert back to default INFO settings as soon as reproduction of the problem has been completed.

Documentation Legal Notice

Flow Monitoring

Network Flow Analysis gives you an enterprise-wide view into the composition of traffic on every link and helps you detect threatening traffic patterns in the making.

It provides network traffic analysis with real-time visibility into the traffic throughout your enterprise. Network groups can quickly identify the source of performance problems, validate the impact of planned and unplanned changes within the network, and avoid unnecessary WAN costs. In addition, management can make accurate decisions regarding cost reduction, capacity planning, troubleshooting, and network traffic analysis across the enterprise. You can access as much as one year of flow data for your entire network.

This section contains everything you need for flow monitoring from getting started to troubleshooting information.

Release Notes

This section contains information on the following topics:

New Features and Enhancements

The current DX NetOps release contains the following new features and enhancements:

10.0.5 New Features and Enhancements

OData API Enhancements

In NFA 10.0.5, OData API is enhanced with many new features.

The enhancements are included in the following existing APIs:

- Routers APIs
- Interfaces APIs
- Interface aggregations APIs
- Custom virtual interfaces APIs
- Application mapping APIs

The following are the new APIs that are exposed through NFA OData APIs:

- Port priority rules APIs
- Reserved seating APIs
- AS Names APIs

InSpeed/OutSpeed for Viptela Devices

You can now view the interface bandwidth up/down stream for the Viptela devices in the Physical & Virtual page under Administration. Currently NFA uses the 'ifTable' to capture a single bandwidth value and the same speed is shown as both IN and OUT for an interface. With this feature, the interface bandwidth up/down stream values that are present in the Viptela MIB are displayed as IN and OUT speed for the Viptela devices. See the following field mappings for the InSpeed and OutSpeed in the 'VIPTELA-OPER-VPN.mib'.

interfaceBandwidthDownstream - InSpeed

interfaceBandwidthUpstream - OutSpeed

The value in the interfaceSpeedMbps field is displayed as InSpeed and OutSpeed when the interfaceBandwidthDownstream and interfaceBandwidthUpstream does not have any data.

10.0.4 New Features and Enhancements

SNMP Router Refresh

From NFA 10.0.4, you can refresh the SNMP Router through the OData API. For detailed documentation, refer SNMP Router Refresh page.

10.0.3 New Features and Enhancements

Manage Address-Hostname

The NFA maintains only the latest resolved hostname against the IP address previously. From NFA 10.0.3, you can maintain the historical data of the IP address and hostname association.

NOTE

More Information:

Manage Address-Hostname

IP Address and Hostname Historical Data

IP Address and Hostname API

NFA ODataAPI QueryBuilder

The ODataAPI is a flexible tool that lets users easily extract data from the DX NetOps database. The ODataAPI enables integration between DX NetOps data and external applications. The ODataAPI is a public API that uses the QueryBuilder GUI. The QueryBuilder is a guided URL builder that lets you create custom Query URLs to extract and explore performance data. The URLs return customized data in the specified format. You can view the data in a browser or process the data in a custom web application.

More Information: NFA OData QueryBuilder

Platform Support

- Red Hat Enterprise Linux 7.5, or 7.6 on a 64-bit processor

10.0.2 New Features and Enhancements

The current DX NetOps the release includes the following new and updated features.

Support for AdoptOpenJDK Java

CA Technologies, a Broadcom Company, is moving towards adopting more open source technologies in its products. As a part of this strategy, various products have started using open-source implementations of Java. To align with this corporate direction, DX NetOps has adopted AdoptOpenJDK (1.8.0.212), replacing Oracle JDK.

Edit a Report Without Opening the Report

From this release, you can edit a custom report without opening the report. You can use the **Edit** link against a specific report and change the report criteria. You can find the edit options in the following reports:

- Custom Reports
- Flow Forensics Reports
- Analysis Reports
- Site to Site reports

Generate Flow Forensic Report for Routers Common to Multiple Harvesters

With this enhancement, you can get flow forensic report from either specific harvester or from all harvester when you select the following ROUTER filter types.

- Router Address
- Router Address and Interface In
- Router Address and Interface Out
- Router Address and Interface In or Out

When you generate a report based on one of these filters, NFA prompts you to enter the router IP. Enter the router IP address. DX NetOps displays a drop-down with a list of associated harvesters. Based on your selection, the NFA displays a report from All Harvesters (Default) or from the selected harvester.

NOTE

- Harvesters Drop-down is displayed only if the specified IP is available on any of the harvesters.
- Harvesters Drop-down is displayed even if the router belongs to only one harvester.

More Information: Create or View a Flow Forensics Report

NAT Segment Group Reports

From the DX NetOps 10.0 Service Pack 2, you can view NAT Segment Group reports. Network address translation (NAT) method maps one IP address into another by changing the network address information in the IP header of packets.

More Information: NAT Segment Group

Support for Additional NetFlow Fields in Options Template

The current release supports sampling rates specified by SAMPLING_INTERVAL (34) and SAMPLING_ALGORITHM (35) fields in the Options template.

More Information: Set Up the Routers

10.0.1 New Features and Enhancements

The DX NetOps the release includes the following new and updated features

Configure MySQL User Password

You can now manage the MySQL user password using the NFA MySQL User Password Change Utility.

More Information: Configure MySQL User Password

Application Mapping API

Using the application mapping, you can discover and map all your entities and their inter-dependencies. CA Network Flow Analysis supports the ToS, host, and subnet applications.

More Information: Application Mapping

Delete Available Interfaces

You can delete an interface from the available interfaces.

More Information: Available Interface

Support for Microsoft Excel as OData Client

This release supports OData as a Data source for Microsoft Excel client only for entity collections.

Enabling Router Name Prefix in Interface Selection Tab

The interface selection tab in Custom and Analysis reports now shows an Interface name with Router Name/IP as a prefix. Now users can identify the correct interface to include/exclude in the report, when multiple interfaces have same name.

10.0.0 New Features and Enhancements

The DX NetOps the release includes the following new and updated features

Support for AWS VPC Flow Logs

When you enable the Amazon Web Services virtual private cloud flow, you can view the following network traffic flow reports:

- Source and destination IPv4 address
- Source and destination ports
- Protocols used
- Bytes and packets transferred

More Information: AWS VPC for CA Network Flow Analysis

Support for DX NetOps OData API

This release supports APIs that enable you to extract data from the DX NetOps or perform Administrative Operations. The DX NetOps APIs use the OData v4.0 industry standard. OData enables integration between DX NetOps and other external applications.
You can perform the following actions using the DX NetOps OData API:

- Generate data in smaller sets and view the result in multiple pages.
- Use custom query to override the system default values for any specific query.
- Use built-in filtering options to filter the required data. For example, you can retrieve a list of routers that are rebooted in last 24 hours.
- Extract data for the entities and navigate to the associated entities. For example, you can retrieve data for protocol_traffic within a time duration.

You can perform various Administrative Operations on the DX NetOps entities. For more information, see Network Flow Analysis OData API.

Microsoft .NET Framework Update

Dependency on Microsoft .NET Framework 3.5.1 for using DX NetOps is removed.

More Information: Compatibility Matrix.

Handling of Router Refresh Scenario - Fresh Installation

When there is a change in SysObjectID of a router sending NetFlow to DX NetOps, DX NetOps treats the change as a router refresh. Router Refresh detection can happen in one of the following scenarios:

- Changing the configuration on the router with SysObjectID change.
- Adding or deleting the router interface with SysObjectID change.
- Using the same IP when replacing an existing router with a new router with SysObjectID change.

In the previous version of DX NetOps whenever a Router Refresh is detected in DX NetOps, the following changes are made to the interfaces/ routers:

- CA NFA prefixes the existing interfaces of that router with string OLD -
- CA NFA creates a set of interfaces and starts showing data on them.

Eventually, you see a router with multiple interfaces with duplicate ifIndex values.

When this information is synced up to CA PM, the interfaces were getting consolidated in CA PM due to duplicate ifIndex values. Hence it was not possible to view either historical or live data on those interfaces.

From the current release, the following changes are made in Router Refresh.

When a router Refresh is detected, the following changes are made to the interfaces/ routers:

- CA NFA prefixes the existing interfaces of that router with string OLD - and suffix with timestamp to identify multiple routers Refresh.
- CA NFA sets the LifeCycleState of Router to RETIRED in database.
- CA NFA creates a router with the same IP in CA NFA Console with LifeCycleState ACTIVE.
- The new interface is attached to the New router.
- If there is another router refresh detection on the same router, the ACTIVE router is marked as RETIRED and a new ACTIVE router is created.

Eventually, you can see more than one router with the same IP, whenever a device refresh occurs.

Handling of Router Refresh Scenario - After Upgrade

When you upgrade to the current release from any supported version of CA NFA, the following changes occur.

When a router Refresh is detected before upgrade, [Interfaces with duplicate ifIndex attached to one router], the following changes are made to the interfaces/ routers:

- CA NFA adds a router entry with LifeCycleState as RETIRED in the reporter DB for each such router
- All the inactive interfaces [Interfaces with OLD - prefix] of each router point to the Retired routers

NOTE

- If more than one router refresh happened on a router before upgrade, you can see only one Retired router with all the Inactive Interfaces.
- When you upgrade from CA NFA 9.3.6 and CA NFA 9.3.8 to the current release, you may not view the prefix OLD for refreshed devices as the prefix is not done in the base releases.

Compatibility Matrix

DX NetOps is compatible with the following products/ application:

NOTE
For more information about supported DX NetOps releases, see the DX NetOps Interoperability.

Product	Version	NFA 10.0.5	NFA 10.0.4	NFA 10.0.3	NFA 10.0.2	NFA 10.0.1
DX NetOps Performance Management		See: DX NetOps Interoperability				
DX NetOps Virtual Network Assurance		See: DX NetOps Interoperability				
Microsoft .NET Framework	4.6.2	**yes**	**yes**	**yes**	**yes**	**yes**
Microsoft Internet Explorer	11	**yes**	**yes**	**yes**	**yes**	**yes**
Unified Infrastructure Management (UIM)	20.1.0	**yes**	**yes**	**x**	**x**	**x**
	9.2.0	**yes**	**yes**	**yes**	**x**	**x**
	9.1.0	**yes**	**yes**	**yes**	**yes**	**x**
	9.0.2	**yes**	**yes**	**yes**	**yes**	**yes**
	9.0.1	**yes**	**yes**	**yes**	**yes**	**yes**
	8.5.1	**yes**	**yes**	**yes**	**yes**	**yes**
nfa_inventory probe (for UIM)	v1.41	**yes**	**yes**	**yes**	**yes**	**yes**
DX Operational Intelligence	1.3 (OI Connector 1.3)	**yes**	**yes**	**yes**	**x**	**x**
	1.3 (OI Connector 1.2.1)	**yes**	**yes**	**yes**	**yes**	**yes**

NOTE
OI connector 1.2.1 does not support CA NFA 10.0.1, if you change the default password for the MySQL user using the MySQL User Password utility.

Product Accessibility Features

CA Technologies is committed to ensuring that all customers, regardless of ability, can successfully use its products and supporting documentation to accomplish vital business tasks.

Product Names and Abbreviations

This documentation references the following products and abbreviations:

- Access Control List (ACL)
- CA Anomaly Detector (CA AD)
- CA Application Delivery Analysis (CA ADA)
- CA NetQoS Performance Center (CA NPC)
- CA Performance Center (CA PC)
- CA Performance Management (CA PM)
- CA Unified Communications Monitor (CA UC Monitor)
- CA Unified Infrastructure Management (CA UIM)
- CA Unified Infrastructure Management Portal (UMP)
- Quality of Service (QoS)
- Simple Network Management Protocol (SNMP)
- Simple Network Management Protocol Data Monitoring Probe (SNMPcollector)
- Type of Service (ToS)
- Unified Data Management (UDM)
- Unified Service Manager (USM)
- Virtual Machine (VM)

Third-Party Software License Agreements

This section contains third-party software license agreements for applications that are added/included as part of the current release of DX NetOps

Key Terms and Concepts

Contents

1-minute (high-resolution) data

1-minute (high-resolution) data is detailed information that is collected from each Harvester and is provided to the NFA console for display in views and reports. The data includes top protocols for each interface; traffic for the top hosts and conversations; top conversations for the top protocols; and top protocols, hosts, and conversations for the top ToS values. The 1-minute data is stored on the Harvester server in the `archive` database.

15-minute (historical) data

15-minute (historical) data is longer-range information that is collected for each interface. The information includes the protocols, hosts, and conversations for each interface. Summary data is also collected for the ToS, the top protocols for the top ToS values, and the top hosts and conversations for the top ToS values. The data is stored in the database.
`archive15`

Administrator

An A*dministrator,* in the context of this document, is a person who is responsible for administering the product in the NFA console. An Administrator also manages elements in the Performance Center Console that are related to DX NetOps, such as SNMP profiles, groups, users, and roles.

application mapping

Application mapping is a rule-based technique for combining the traffic for an application to facilitate reporting for the application. Application mapping rules are based on factors that can include the traffic origin (host, subnet and mask, and/or port), ToS, and protocol.

Autonomous System

Autonomous System (AS) refers to a connected group of Internet Protocol (IP) routing prefixes. The IP routing prefixes have a single, clearly defined routing policy and are controlled by one or more network operators. Meaningful AS data is available in reports only when routers and interfaces are configured to export it.

baseline

A *baseline* is a record of typical behavior, which is computed from past behavior. Baselines help you compare changes over time and predict future data or performance. Comparing current values to baseline projections is useful for determining whether current values are typical. The baseline in a trend plot is computed by using data from the six weeks before the selected date range, excluding the data point already in the trend plot.

conversation

A *conversation* is a session of subnet-to-subnet or user-to-user (host-to-host) traffic. TheDX NetOps the console displays conversation information, so you can find out whether a particular conversation is causing a traffic spike on an interface, for example. You can create and run reports to identify the top volume-based conversations.

custom virtual interface

A *custom virtual interface* (CVI) is an abstract representation of a network interface, which corresponds to one or more subnets of actual physical interfaces. CVIs can give you visibility into network traffic for a carrier cloud. Set up CVIs for data center traffic that is transferred to subnets through an MPLS carrier cloud when the flow is enabled on the routers in the data center.

dashboards

Dashboards are dynamic report-building pages in the Performance Center Console. Dashboards are accessible from the **Dashboards** tab (CA PC) or **Reports** tab (NPC). Each dashboard is a collection of views that present data from registered data sources on a single web page. The layout, views, time interval, and group context of each dashboard can be customized.

data sources

Data sources are the products that provide data for display in the Performance Center Console. Data sources also provide some configuration data that is stored in the Performance Center. DX NetOps is designed to be a data source for Performance Center.

drilldown report

A *drilldown report* is a more detailed report that you display by clicking a link in a report. You can open a drilldown report by clicking an interface name in an Enterprise Overview page report, for example. Properly credentialed users also can drill down from Performance Center views to detailed reports in the NFA console.

drill down

To *drill down* is to navigate from one data view to another, more detailed data view or context page. The new page displays data from the same time frame, for the same managed item or set of items. You can drill down to details in DX NetOps from views in Performance Center.

filter

A *filter* in a report is a set of selection criteria that are used to focus a report on the desired data.

firewall

A *firewall* server acts as a gateway between a local area network (LAN) and a large network that is not secure--such as the Internet. A firewall server typically runs a software package that inspects inbound and outbound packets, and decides whether to allow the packets to pass.

flow

A *flow* is a set of IP packets that pass a network observation point during a certain time interval. In DX NetOps, flow may consist of NetFlow v5, v7, or v9 or one of the following flow types that conforms to the standards for NetFlow v5, v7, or v9: sFlow version 5; or IPFIX, J-Flow, cFlow, or Huawei NetStream flow.

For data from non-sampled flows to appear in reports of 15-minute (historical) data, these minimum fields are required:

- One of the following: 1 - IN_BYTES, 85 - IN_PERMANENT_BYTES, 231 - FW_INITIATOR_OCTETS, or 232 - FW_RESPONDER_OCTETS
- All of the following: 4 - PROTOCOL, 7 - L4_SRC_PORT, 8 - IPV4_SRC_ADDR, 10 - INPUT_SNMP, 11 - L4_DST_PORT, 12 - IPV4_DST_ADDR, and 14 - OUTPUT_SNMP

group

A *group* is a collection of managed items that are organized in a tree structure. A global administrator can use Performance Center to create custom groups of the managed items that an operator can see. These managed items can be applications, servers, networks, routers, and interfaces, for example.

Harvester

A *Harvester* is a component in a distributed deployment of DX NetOps, which collects raw flows from the routers. In a two-tier architecture deployment, the Harvester processes and stores the 1-minute and 15-minute data.

host

A *host* is a specific computer engaged in an exchange across the network. In some cases, a host represents a managed services provider whose IT staff manages and monitor the networks and systems of multiple customers. In DX NetOps, hosts are identified by name or IP address. You can track host activity to find out whether a specific server or end-user system is responsible for significant traffic on an interface, for example. You can create and run reports about the traffic that is generated or is received by specified hosts.

IIS

IIS is the Web server that is part of the Microsoft Windows Server application. IIS consists of several services, including Simple Mail Transfer Protocol (SMTP). In versions of IIS before 5.0, IIS is an abbreviation for Internet Information Server. In version 5.0 and later, IIS is an abbreviation for Internet Information Services.

interface

An *interface* is a point of connection, such as a Serial, Frame Relay, Fast Ethernet, ATM, or PVC interface. DX NetOps reports on any logical interface that is enabled on a supported router that has flow enabled. The NFA console displays the interfaces that are monitored in your environment.

IP domains

IP domains are logical collections of data from different devices and networks. Domains let your enterprise conduct separate monitoring of IP addresses with associated interfaces or monitor applications that belong to separate customer networks. A global administrator can monitor IP domains from a single Console, but operators view data only for the domains that they have permission to view. Administrators create custom IP domains in the Performance Center Console. Administrators can use the NFA console to assign Harvesters, routers, interfaces, CVIs, and some other elements to IP domains.

LDAP

LDAP, or Lightweight Directory Access Protocol, is a software protocol for locating organizations, individuals, and other resources, such as files and devices in a network. LDAP is based on a client/server model. The LDAP client makes a Transmission Control Protocol (TCP) connection to an LDAP server, and then sends requests and receives responses over this connection.

NetFlow

NetFlow is a transaction between two hosts, which uses a unique pair of port numbers and IP addresses and which includes certain network traffic information. A Cisco router can be configured to export flow information by sending UDP packets that contain flow statistics to one or more collectors such as the Harvesters. DX NetOps supports NetFlow versions 5, 7, and 9 and sFlow version 5. DX NetOps also supports IPFIX, J-Flow, cFlow, and Huawei NetStream that complies with the standards for NetFlow v5, v7, or v9.

NFA console

The *NFA console* is a component in a distributed deployment of DX NetOps, which provides a web-based user interface for reports and for some administrative functions. The NFA console creates reports from Enterprise Overview data, which is stored locally and from the 1-minute resolution data and 15-minute resolution data that it retrieves from other components.

Performance Center

Performance Center is a term this documentation uses to refer to CA Performance Center and CA NetQoS Performance Center collectively. DX NetOps is designed to be used with one of these programs. Page names or functions that are specific to a Performance Center version may be identified by the full program name or acronym. *CA PC* is used as an acronym for CA Performance Center and *NPC* is used for CA NetQoS Performance Center.

permission groups

Permission groups define the scope of the managed items that each user or operator can monitor. Administrators can create and assign custom groups of items to match each user's area of responsibility, such as applications, servers, networks, routers, and interfaces. Administrators assign permission groups in Performance Center to give users access to default or custom groups.

product privilege

A *product privilege* is a type of permission that is associated with a user account in Performance Center. The product privileges grant access to features in the Performance Center Console, the NFA console, and any other data sources. The administrators who manage user accounts assign product privileges in the Performance Center Console.

protocol

A *protocol* is a standard for regulating communication between computers. Common protocols include: HTTP, SNMP, FTP, and VoIP. The information that is displayed may include the top protocols in and out for a particular interface. This information can help identify which application is causing network traffic. You can also create and run reports to determine which protocols and applications are used by different groups in your organization.

QoS (Quality of Service)

QoS (Quality of Service) is a defined level of performance--quality of transmission and service availability--in a data transmission system.

report

A *report* is a display of collected data, which you view in the NFA console from the **Enterprise Overview**, **Interfaces**, **Custom Reporting**, **Flow Forensics**, **Analysis**, and **Site to Site** pages. You can print or save reports in PDF format. You can also export reports as comma-separated value (CSV) files. An Administrator can set up some reports to be sent by email at scheduled intervals.

reporting information base (RIB)

The *reporting information base (RIB)* is a system of web services and XML files that describe and provide the data for views and dashboards in the CA Performance Center Console. This data originates from data sources, such as DX NetOps. The RIB capability provides an operating environment for cross-product, federated, and third-party reporting. RIB uses a single data access web service with SQL-like capabilities.

reporting period

A *reporting period* is a user-specified time range for data to be included in a DX NetOps report. The time options vary with each report type, but the report period could consist of hours, days, weeks, or months.

Reserved Seating

Reserved Seating is a rule-based technique for ensuring that reports include the traffic that interests you, even if the traffic volume or rate is low. The rules create 'reserved seats' in reports for data that matches the target ports and protocols.

role

A *role* controls access to product features in the NFA console and the Performance Center Console. In a well-planned deployment, roles let users access the features they need to perform their duties. Roles also restrict access to features that operators and administrators do not need. The administrator who manages user accounts assigns roles in the Performance Center Console.

Single Sign-On

Single Sign-On is the authentication scheme that provides a one-time login to authenticate users in the suite of related products. Once users are authenticated, they can navigate among the products without signing in again.

SMTP

SMTP (Simple Mail Transfer Protocol) is the Transfer Control Protocol/Internet Protocol (TCP/IP) protocol that is used for sending and receiving e-mail in data networks.

SNMP

SNMP (Simple Network Management Protocol) is a network management protocol that is used almost exclusively in data networks. SNMP is a method for monitoring and controlling network devices, as well as managing configurations, statistics collection, performance, and security.

SNMP profiles

SNMP profiles are definitions that contain the information for using SNMP securely to query device MIBs (Management Information Bases). Each connection to a device is made by using an SNMP profile. Administrators create SNMP profiles as needed in the Performance Center Console. In a multi-tenant CA Performance Center environment, SNMP profiles are tenant-specific. In this type of environment, each Harvester uses one of the SNMP profiles that are set up for its parent tenant.

Summary views

Summary views provide an overview of high-level information, such as averages from groups of managed items. Summary views often provide drilldown paths to more detailed, related pages.

synchronization

Synchronization, or global synchronization, is a Performance Center process that exchanges configuration and other data with DX NetOps. For example, if an administrator creates user accounts or SNMP profiles, the associated data is pushed down to the NFA console through synchronization. Synchronization occurs every 5 minutes automatically. Administrators also can perform a full or partial synchronization on demand.

threshold

A *threshold* is a user-definable limit. Meeting or exceeding a threshold may trigger an alarm. Thresholds are also used in some views to determine the status colors for items. For example, the Interface Utilization view on the **Enterprise Overview** page uses user-definable utilization thresholds for the status colors of the top interfaces.

trap

A *trap* is a message that indicates a threshold has been reached or that another user-defined condition has occurred. An SNMP agent sends traps to the NFA console or to a network management system (NMS). The Watchdog agent defines a number of traps for system and application management.

trend line

A *trend line* is a projection of the future performance of an element that is based on data from past performance. DX NetOps constructs the trend line as the best straight line through the data points of the baseline period.

two-tier architecture

Two-tier architecture refers to a type of DX NetOps deployment. The components work together to collect, process, and store flow data; display the data in reports; and generate traps, events, and scheduled reports.

A two-tier architecture deployment consists of the NFA console and one or more Harvesters (Windows or Linux). These components may be located on separate servers or on a stand-alone server.

view

Views, or *data views*, present report data, usually as a bar graph, pie chart, table, trend chart, or stacked trend chart. A view is created on the fly when you display data in the NFA console or the Performance Center Console. For example, the **Enterprise Overview** page in the NFA console consists of a collection of views. In some cases, you can export the view data to a file in `CSV` format or create a PDF report from it.

Web user interface

The DX NetOps the web user interface appears as the NFA console, which lets an operator access DX NetOps views and reports from a web browser. Administrators for DX NetOps use this interface to perform a number of administrative functions.

Known Issues

This section describes the known issues and workaround, if any:

Known Issue in release 10.0.5

Filter and OrderBy system queries do not work for custom properties in NFA OData API

Symptom: Filter and OrderBy system queries do not work for custom properties in NFA OData API.

Solution: No known solution as of now.

There are no other known issues in the current release. Password Reset issue and DBPasswordUtils is not working in windows 2012/2016 harvester issue can be found while upgrading, this occurs when the password has been changed and upgrading to 10.0.5.

Known Issue in release 10.0.4

DBPasswordUtils is not working in windows 2012/2016 harvester

Symptom: The utility gets hanged and the passwords cannot be changed.

Solution: Replace the ReporterAnalyzer.ini file from console and copy to the harvester machine and rerun the DBPasswordUtils.

There are no other known issues in the current release. Password Reset issue can be found while upgrading, this occurs when the password has been changed and upgrading to 10.0.4.

Known Issue in release 10.0.3

There are no new known issues in the current release. Password Reset issue can be found while upgrading from 10.0.2 version. This occurs when the password has been changed and upgrading to 10.0.3.

Known Issue in release 10.0.2

Password reset to default password on upgrade from 10.0.1 to 10.0.2 on SB.

Symptom:

NFA Services are down.

Solution:

Re-run the password utility after the upgrade.

> **NOTE**
> This known issue in Network Flow Analysis 10.0.2 is applicable to the releases 10.0.2 and later. This issue occurs when upgrading from 10.0.x to 10.0.2 and later versions.

Reaper service does not start on Linux

Symptom:
Reaper service is down.

Solution:
Navigate to `<NFA_HOME>/DBUsers/` directory and run the `dos2unix ReporterAnalyzer.ini` command. Start the Reaper service.

Known Issue in release 10.0.1 and Previous Release

Application Failed While Creating Response from the Data

Symptom:

Expand queries gives an error for olingo v4.1.0 when XML is the output format.

Solution:

No known solution as of now.

Pump Service Fails to Start after Upgrade

Symptom:

The pump service fails to start after upgrade.

Solution:

Verify the connection errors in the pump log. Ensure all the services are up and running and restart the pump service.

If you notice any exception that is related to “Invalid file format”, delete the content in `$INSTALL_DIR/REPORTER/datafiles/input/Staging` and start the pump service.

Report Service Does not Start after Upgrade

Symptom:

The Report service fails to start after upgrade.

Solution:

If you notice any MySqlException exception in the Report Service log, restart the Report service.

Delay in Display of AWS VPC Flow Data

Symptom:

The AWS VPC flow data does not show up immediately in the CA NFA console.

Solution:

There is a delay of ten minutes to display the AWS VPC Flow data received from CA VNA.

Known Issue in release 9.5.0

The known issues that were identified in DX NetOps 9.5.0 are applicable to the current release too. For more information, see the Known Issues 9.5.0 page.

Fixed Issues

Issues Fixed in DX NetOps 10.0.5

Defect ID	Support Case	Symptom	Resolution Text
DE453462	20296423	For the Linux machines, when a disk is mounted it is sent as a fixed disk and NFA stores it in the DiskUtilization table. While the disk is unmounted NFA does not record the event and the existing record is not deleted from table showing an alert.	While getting the disk utilization details from the SNMP calls, the existing fixed details for that particular harvester are deleted. And the new disk utilization details are inserted.
DE468870	32057726	When drilling down to NFA from CAPC (as a power user), the Flow Forensics, and the Site to Site tabs are hidden. The issue frequently occurs when you navigate between the tabs in NFA.	With this fix, admin users can view the Flow Forensics, and the Site to Site tabs when drilling down to NFA from CAPC.
DE472164	32108663	For MySQL users, if the password contains "D"(capital D) and while encrypting the password it is converted to special character ":". When NFA OData API forms the connection url to connect database, issues occur due to the special characters in the url. In few OData API calls urls are formed dynamically and in few cases urls are formed using props and settings.	Code changes are made to query the calls using OData Api even the password in the ReporterAnalyzer .ini file contains ":".

DE474732	32168437	When using the OData API to create a CVI, some subnets are not created properly in the database. This issue occurs when subnet octets range is more than 127, example: 128.128.128.0/24.	Modified the OData API query to properly insert the subnet ranges.
DE475864	20081275	The Top Interfaces charts in EOV page show high Rates and Utilization for interfaces.	Code changes are made to show the correct Rates and Utilization for interfaces for the Top Interfaces charts in EOV page.
DE474918	32143693	Viptela devices interface up/ down stream speeds are not accurate.	Code changes are made to display the correct up/down stream values of the interface bandwidth for the Viptela devices.
DE472115	32170411	FLT files are creating unwanted interfaces.	Removed the FLT file interface creation code in the NFAConsole to avoid the duplication of the interfaces.
DE460119	31879645, 31825621	As part of merge interfaces, after the console/harvester services are restarted, the merge activity gets aborted intermediately.	Code changes are made to verify the merge activity when the harvester/console services are restarted. Also implemented the retry mechanism when the merge activity goes wrong after the restart.
DE480460	32265965	RouterName and RouterID are missing in Interfaces API after upgrading from 10.0.2.	RouterName and RouterID are now available in the Interfaces API.
DE446065	20292015	While processing few custom virtual subnet rules which has IPv6 source/destination getting an exception "java.lang.IllegalArgumentException: Length of IP Address and Subnet Mask do not match!"	NFA does not support custom virtual interfaces rules for IPv6 flows whose source/destination is IPv6. Added checks to validate any such flows to discard while processing.

Issues Fixed in DX NetOps 10.0.4

Defect ID	Support Case	Symptom	Resolution Text
DE427109, DE401883	1260915	AD errors in log after upgrading to 10.0.1	Code changes are done to handle the custom storage engine’s bad templates with invalid data length.
DE449372	20325365	When a device is deleted from NFA's 'Enable Interfaces' page, does not get deleted from the CAPC, the NFA is attached to.	A device when deleted from 'Enable Interfaces' page in NFA UI gets deleted (along with its interfaces) from the CAPC, the NFA is attached to.

DE431573	20064968, 20019669	After adding a router to a harvester sometimes, we get the exception 'Expected flow sequence cannot be null' is seen in harvester wrapper log file.	Worked on the root cause of the issue and now the exception 'Expected flow sequence cannot be null' will not be seen in harvester wrapper log file.
DE424445	20023828	While loading 15-min resolution data NQMysql service crashes, if the database file is invalid under ReaperArchive15 directory.	Code changes are made to resolve Netqos NQMysql service crash so that the data for 15-min resolution gets loaded successfully.
DE454079	31830273	Odata api has ifindex type as Singed Int 32 while as per standards ifindex of interfaces can be of unsigned int 32.	Modified the way odata handles ifindex of routers.
DE441128	20101447, 20283369	FLT files are processing too slow.	Added index to few columns of the reporter.routers table and optimized few queries which are involved in processing of .flt files.
DE439463	20107064, 31829166	Odata api while deleting interface/s and router/s runs delete queries in reporter and harvester tables and also sends agentids instead of interaceids while deleting interfaces from reporter.interfaces table.	Modified delete interface odata api and router delete odata api so that wrong interfaces will not get deleted from reporter.interfaces table during these operations.

Issues Fixed in DX NetOps 10.0.3

Defect ID	Support Case	Symptom	Resolution Text
DE433457	20064513	IIS causes web page to not work: logo is not displaying on custom report pdf on console after I enable X-Content-Type-Options" value="nosniff".	Enable X-Content-Type-Options" value="nosniff" and change the image format jpg to gif. The report now displays the logo with nosniff.
DE428904	20050972	Deleting a router from Enable Interfaces page, deletes router from all the harvesters.	Code changes are made to deletes router only from the respective harvester.
DE427756	20037583	Egress Multicast data is not shown on the input interface, even if the input interface is non-zero.	Egress Multicast data is now shown on the input interface as well when the input interface is non-zero.
DE413121, DE424390	01336769, 20022801	Some devices do not get refreshed automatically.	Devices get priority properly to get refreshed periodically.
DE435729	20077629	Merge Interface rest API gives "start time and end time not available" response while merging two interfaces.	Code changes are done to return an appropriate response while merging two interfaces.

DE436715	20090739	Values are changed for SNMP profiles during full sync in CA PM, if the privacy protocol is AES256_3DES.	Code changes are made to show the correct value after full sync with CA PM when the privacy protocol is for AES256_3DES.
DE433120	20105234	On Linux, reaper service is down after harvester installation. The reaper reads incorrect DB password from ini file due to windows line encodings.	As part of the fix, the dos2unix command is applied to the DBUsers\ReporterAnalyzer.ini file.

Issues Fixed in DX NetOps 10.0.2

Defect ID	Support Case	Symptom	Resolution Text
DE405363	01259410	SNMP information like interface speed is not shown in 'Enable Interfaces' page for Huawei devices.	The 'Enable Interfaces' page for Huawei devices now displays the SNMP information.
DE415974	01352611	• Harvester service stops processing incoming flows if mask value from netflow is greater than 128. • Harvester service stops processing incoming flows if any srcIpv6/ dstIpv6 host address from netflow is received as ::ffff:xx.xx.xx.xx(ipv4 mapped ipv6 address).	Harvester service runs successfully and processes all the incoming flows.
DE343953	00957440, 00931541, 00960805, 00960786	Query service crashes when multiple reports are running in parallel.	Reports now run in parallel without crashing query service.

Issues Fixed in DX NetOps 10.0.1

DE386567	01195069	CA NFA no longer detects the proper sampling rate for the router.	CA NFA detects and honors the proper sampling rate for the routers.
DE391191	01070997	Data gaps are seen in the flow statistics page.	Data gaps are not seen now.
DE394250	01245443	CA NFA 9.5.0 shows less data for some routers, compared to the data for the same routers in CA NFA 9.3.8.	CA NFA shows correct data for all the routers.

Getting Started

DX NetOps gives you an enterprise-wide view into the composition of traffic on every link and helps you detect threatening traffic patterns in the making.

It provides network traffic analysis with real-time visibility into the traffic throughout your enterprise. Network groups can quickly identify the source of performance problems, validate the impact of planned and unplanned changes within the network, and avoid unnecessary WAN costs. In addition, management can make accurate decisions regarding cost reduction, capacity planning, troubleshooting, and network traffic analysis across the enterprise. You can access as much as one year of flow data for your entire network.

DX NetOps may be integrated as a data source for CA Performance Center (CA PC) or CA NetQoS Performance Center (CA NPC). The Performance Center Console displays report data from DX NetOps and any other programs that are integrated as data sources.

Welcome to the TechDocs Platform

The TECH DOCS PORTAL is the sole source for DX NetOps documentation.

Is there a recommended web browser?

Use Chrome or Firefox for the best experience. Internet Explorer 8 or higher is also supported.

What is the home page?

The home page is a front-page to quickly get you to the information you want:

- Search for information
- Browse a table of contents
- Click navigation tiles to key sections
- Switch between versions or languages
- Export the whole information set to PDF
- View live announcements

How do I find content?

The search box on top of the table of contents in the left tree pane searches this product only. You can use wildcards, such as "?" for single characters and "*" for undefined multiple characters, and matched phrase or excluded term searches.

Search	Here
Left explorer tree (like a Table of Contents)	
"Search for" field Returns five topics that best match the search term.	Advanced Click the magnifying glass icon to list all topics within this product that include the search term.	Partial word searches	For partial word searching, use: • **CTRL-F** (contents within an article) • Your favorite search engine (limit search to "broadcom.com" for best results)

How do I create printable or offline output?

From the upper right corner of a page, click **PDF** to download printable documents of the pages you are viewing. To download the sections or entire documentation as PDF, navigate to the starting page of the section or documentation home page and download the PDF.

How do I switch to another version or language?

Click **Versions** to select the documentation for a different version.

Click **Languages** to select the documentation in a supported language.

How do I switch to another product?

Click the TECHDOCS link in the upper left corner to return to the root TECH DOCS PORTAL page. From there, you can select any product documentation set from the product drop-down list.

How do I add ask a question or post my own advice on a page?

We want to hear your comments. Click in the **Write a comment** section at the bottom of any page to enter your thoughts, technical question, or opinion. Like a forum, all viewers can see what you post as a comment, and CA Technologies content authors are notified so that they can quickly respond. If you are logged in with your CA credentials, your log in name is posted with your comment. If you are not logged in, enter the displayed characters to post anonymously.

How do I give general feedback?

Use the additional features at the bottom of the page to rate the usefulness of the page or to make suggestions to help us improve it. You can also rate and comment on the overall wiki space.

Introduction to CA Network Flow Analysis

DX NetOps provides network traffic analysis with real-time visibility into the traffic throughout your enterprise. You can access as much as one year of flow data for your entire network.

DX NetOps gives you an enterprise-wide view into the composition of traffic on every link and helps you detect threatening traffic patterns in the making. Network groups can quickly identify the source of performance problems, validate the impact of planned and unplanned changes within the network, and avoid unnecessary WAN costs. In addition, management can make accurate decisions regarding cost reduction, capacity planning, troubleshooting, and network traffic analysis across the enterprise.

DX NetOps can be integrated as a data source for either CA Performance Center or CA NetQoS Performance Center, whichever program your enterprise uses. The Performance Center Console displays report data from DX NetOps and any other programs that are integrated as data sources.

This documentation describes administration tasks that you perform in the DX NetOps console. Other administration tasks, such as the management of users, roles, permissions, SNMP profiles, and some types of groups, might be performed in the Performance Center Console.

Install Performance Center and register DX NetOps as a data source so you can use all the features. You can access Performance Center from the DX NetOps console as soon as you register the product.

> **NOTE**
> The term *Performance Center* refers to CA Performance Center and CA NetQoS Performance Center collectively. Program-specific page names or functions could be identified by the full program name or acronym, which is *CA PC* for CA Performance Center and *CA NPC* for CA NetQoS Performance Center.

Capabilities of CA Network Flow Analysis

DX NetOps capabilities help you analyze network traffic and make informed decisions about resolving issues. The capabilities described in the following list can give you valuable data for capacity planning, troubleshooting, and traffic analysis.

- Identify network traffic that exceeds a specified threshold so you can manage your network proactively.
- Identify bandwidth requirements for applications and users so you can evaluate network capacity precisely.
- Immediately identify the interfaces, hosts, and applications that generate the most traffic in your enterprise. This information is essential for short-term and long-term troubleshooting.
- View the impact of application rollouts on WAN links and measure application traffic growth using protocol-level trend analyses, application baseline trend comparisons, and percent-growth tables. These analyses help you make more informed infrastructure investments.
- Pinpoint the exact cause of a network problem by examining 100 percent of all NetFlow and IPFIX traffic from the last four hours.
- Review automatic alerts and detailed reports so you discover network problems quickly.
- Design and run reports that are based on criteria that you select.
- View real-time NetFlow and IPFIX monitoring reports and alarms for every interface on the network for past 30 days with 1-minute granularity.
- Establish baselines for protocol and flow data so you can compare current data with past performance.
- Analyze trends in applications, hosts, and conversations per class of service. This information helps you optimization your network infrastructure for application performance.
- Drill into raw flows per interface to assist with troubleshooting.
- Review trend settings for historical data and for future projections to perform more effective capacity planning.

Introduction to Performance Center

DX NetOps can be integrated as a data source for either CA Performance Center or CA NetQoS Performance Center, but it is not required. The Performance Center Console displays report data from DX NetOps and any other programs that are integrated as data sources.

When your administrator adds DX NetOps as a data source for Performance Center, several changes occur:

- The NFA console banner contains a link to the Performance Center Console (either *CA PC* or *CA NPC*).
- If your user account enables it, you can see DX NetOps views in customizable dashboards and context pages in the Performance Center Console.
- Properly credentialed users also can drill in to details in the NFA console from views in Performance Center.

Notes:

- The term *Performance Center* refers to CA Performance Center and CA NetQoS Performance Center collectively. Program-specific page names or functions might be identified by the full program name or acronym, which is *CA PC* for CA Performance Center and *CA NPC* for CA NetQoS Performance Center.
- To learn more about Performance Center views and customization options, see the wiki for your Performance Center.

The CA Network Flow Analysis User Interface

The primary DX NetOps user interface is the NFA Console, a web interface that you use to view the collected data, and perform administrative tasks.

DX NetOps analyzes, formats, and displays collected data in the following page views:

- **Enterprise Overview Page**

Summarizes information about the interfaces that exceed or are close to exceeding a utilization threshold that product administrators establish. The **Enterprise Overview** page also shows the top interfaces, protocols, and hosts for your enterprise. The timeframe for this report is the most recent 24 hours available to the NFA console.

- **Interfaces Page**

Lists available routers and their component interfaces. Click an interface to drill down to more detailed information about the interface. You can select a timeframe and a report type.

- **Custom Reporting Page**

Displays the current list of defined Custom Reports and provides options for running, creating, editing, and managing the reports. You can use a wizard to create Custom Reports. Several report types are available, including interface, protocol, ToS, host, and conversation. You can combine the types to produce the results you want. You can save and run these reports on demand or on a schedule.

- **Flow Forensics Page**

Displays the current list of defined Flow Forensics reports and provides options for running, creating, editing, and managing the reports. You can open the **Report Settings** dialog to create a Flow Forensics report. You can add filters and can specify the data collection timeframe. For example, you can analyze protocols, hosts, or conversations on your network. You can export the data on the screen to a file in comma-separated value (CSV) format. You can save and run these reports on demand or on a schedule.

- **Analysis Page**

Displays the current list of defined Analysis reports and provides options for running, creating, editing, and managing the reports. You can use a wizard to create an Analysis report. An Analysis report lets you establish a threshold for comparing collected data, identifying potential bottlenecks, anomalies, and viruses. For example, you could use an Analysis report to see which interfaces exceeded 70 percent utilization over a certain timeframe. You can save and run these reports on demand or on a schedule.

- **Site to Site Page**

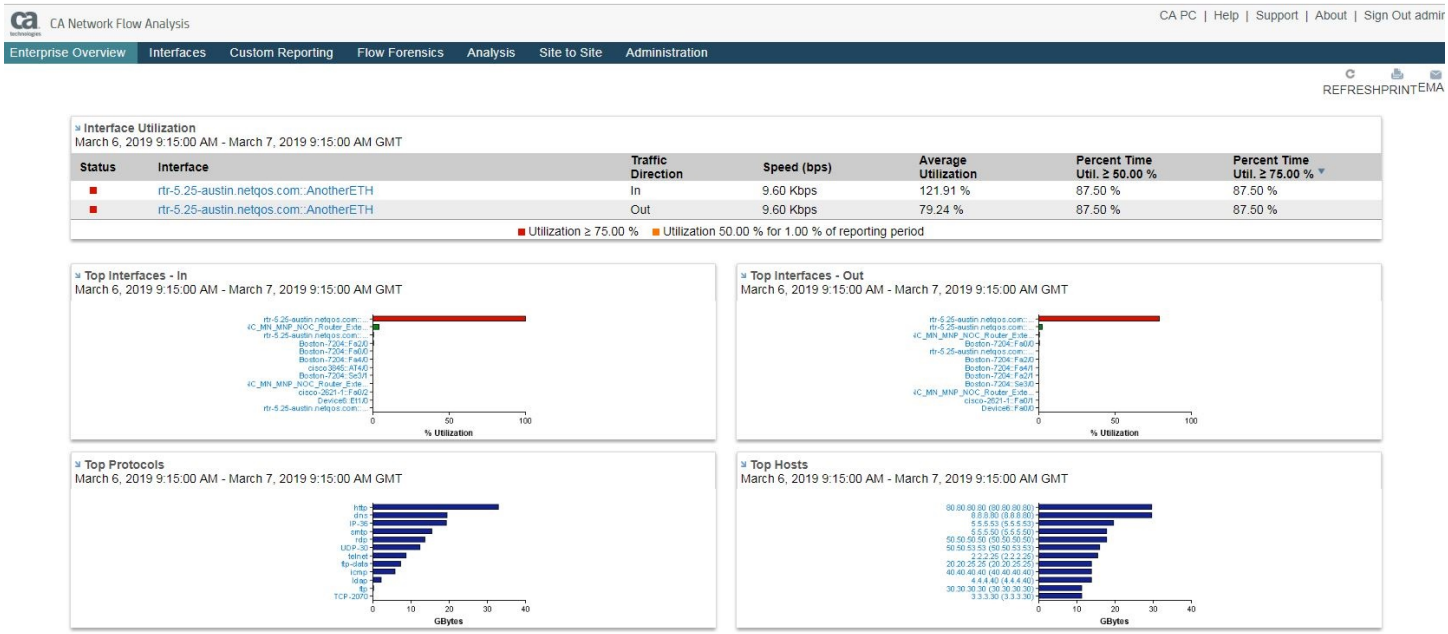
Displays the current list of defined Site to Site reports and provides options for running, creating, editing, and managing the reports. Site to Site reports enable you to view volumes of data between two or more sites. Sites can be defined as a collection of subnets that can also be discontiguous. You can save and run these reports on demand or on a schedule.

- **AdmInistration Page**

Provides access to administrative tasks for Administrators of DX NetOps.

Enterprise Overview Page

The **Enterprise Overview** page shows a set of built-in views of real-time network performance data, to help identify high-level patterns, anomalies, trends, and issues with network traffic. To display the **Enterprise Overview** page, click **Enterprise Overview** in the NFA console menu.



Depending on your access settings, the **Enterprise Overview** page may contain data for some or all of the following views:

- **Interface Utilization**: A table of data about the interfaces with the highest utilization levels
- **Top Interfaces - In**: Utilization and volume information for the interfaces that have high volumes of inbound traffic
- **Top Interfaces - Out**: Utilization and volume information for the interfaces that have high volumes of outbound traffic
- **Top Protocols**: Total volume of traffic associated with the most heavily used protocols
- **Top Hosts**: Traffic volumes of the most active hosts (inbound, outbound, and total traffic)

The **Enterprise Overview** displays data for the most recent 24-hour period that is available. The reporting timeframe is noted under the title of each view.

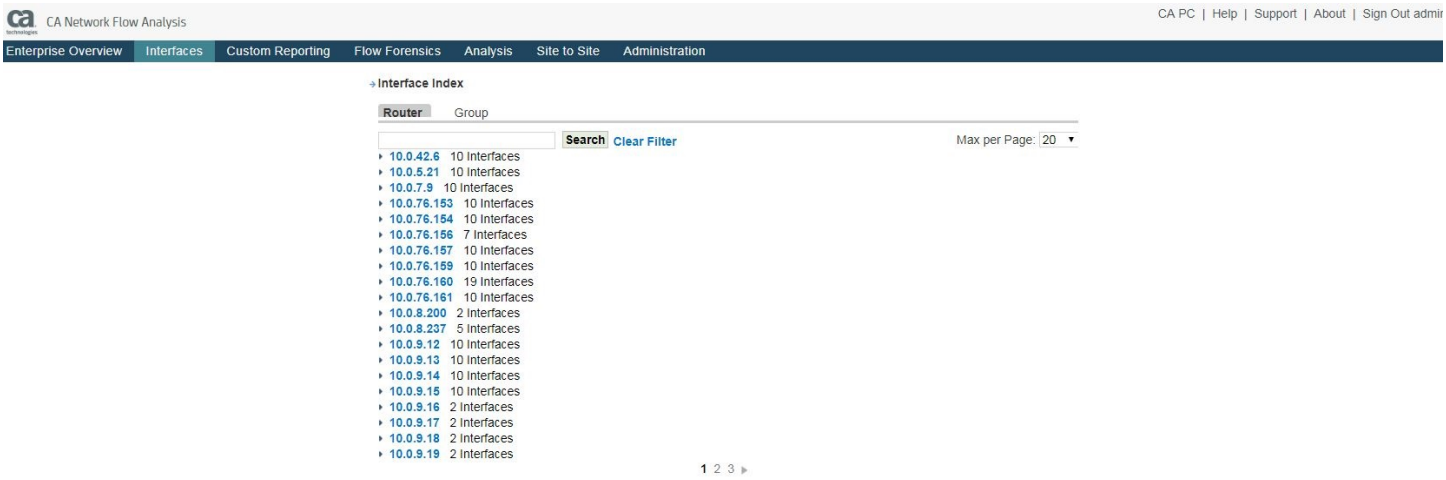
Available Actions for the Enterprise Overview Page

You can perform the following actions on the **Enterprise Overview** page, provided that you have the required access:

- Display data about each interface, protocol, or host in bar graphs by opening Tooltips.
- Open additional reports about each interface, protocol, or host by clicking the bars or the blue drilldown links.
- In the **Interface Utilization** view, customize the status thresholds.
- Export the data for each view to a .CSV file.
- Update the data by using the **Refresh** icon.
- Print the **Enterprise Overview** page to a PDF file (Administrator or Power User accounts only).
- Email PDF files of the current views or schedule PDFs to be sent out to one or more recipients on a schedule (Administrator or Power User accounts only).

Interfaces Page

You can use **Interfaces** page reports to review traffic for specific interfaces, to identify the cause of network problems or to anticipate upcoming problems. You can get an overview of network traffic from the **Enterprise Overview** reports, then get more detail from the **Interfaces** page reports.

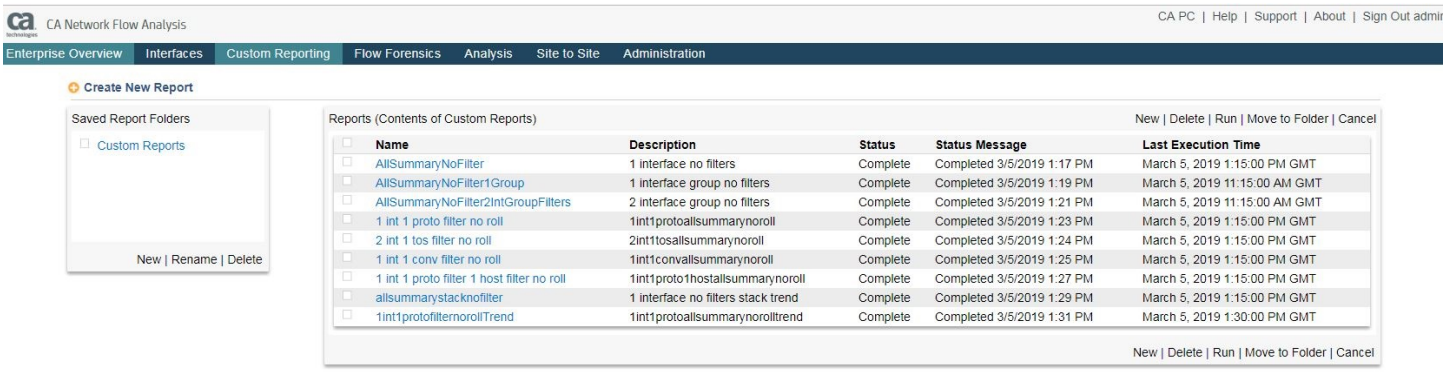


Custom Reporting Page

Custom Reports can answer specific technical and business questions in your environment, such as the following questions:

- Which applications are used most heavily in the regional offices?
- What is the total volume of traffic for global operations?
- Does the new data center have the capacity to handle additional servers?

To get started, select **Custom Reporting** from the NFA console menu.



The **Create New Report** page opens, which lists the existing reports. If you have the required permissions, the page contains functions for creating, managing, and running Custom Reports. You can generate updated versions of reports, add new report definitions, and change report settings.

The **Create New Report** page includes the following functions:

Saved Report Folders:

- *New:* Create a report folder.
- *Rename:* Change the name of a report folder.

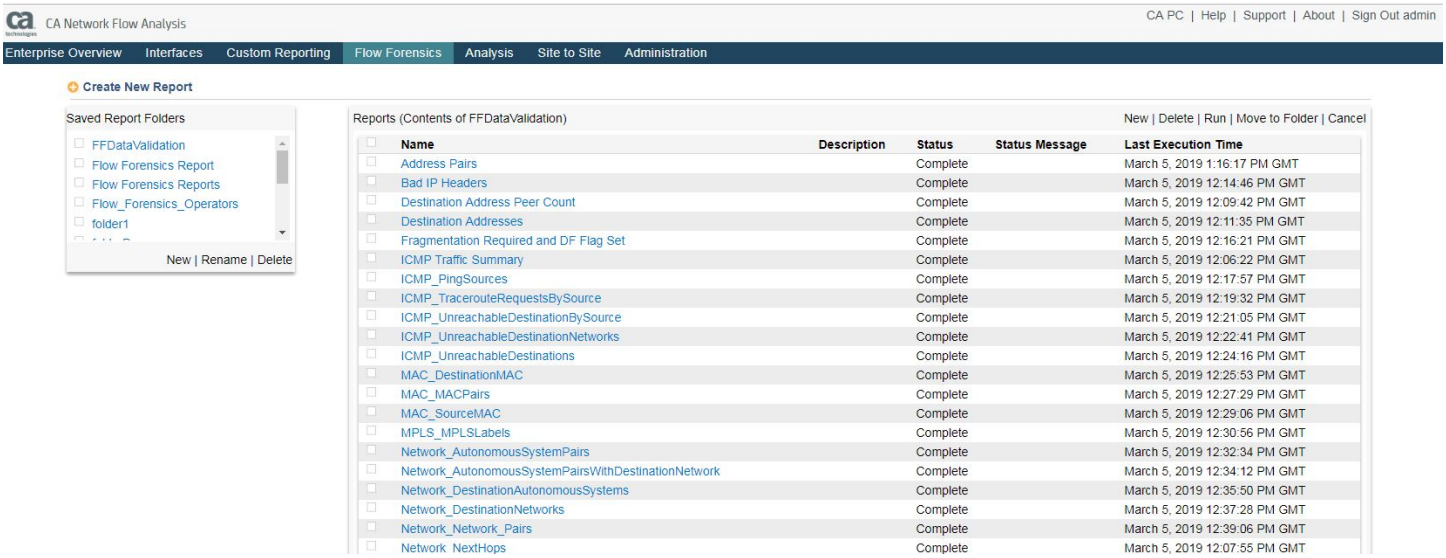
Reports:

- *New:* Create a Custom Report definition.
- *Run:* Regenerate the data for one or more Custom Reports.
- *Move to Folder:* Change the parent folder for one or more report definitions.
- *Cancel:* Stop one or more reports from running.

Flow Forensics Page

You can use Flow Forensics reports to leverage the detailed data that Flow Forensics provides, such as reporting data from multiple interfaces in real time.

To open the Flow Forensics page, click **Flow Forensics** in the NFA console menu.



When you click the **Flow Forensics** tab, the **Saved Report Folders** pane is displayed on the left and the existing reports are displayed on the right.

You can perform the following tasks in the **Saved Report Folders** pane: create folders, rename folders, and delete custom folders. You cannot delete the default **Flow Forensics Reports** folder, which is built in to DX NetOps. Create additional folders to provide more extended organization for your Flow Forensics reports.

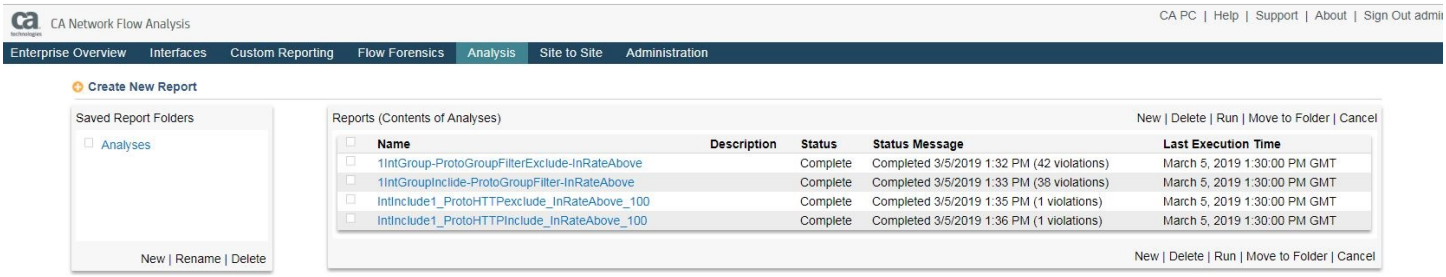
The right pane displays the Flow Forensics report definitions in the currently selected folder. Use the links at the top and bottom of the pane to delete or run selected reports, as well as to create or move reports.

Analysis Page

You can troubleshoot problems as they occur by using Analysis reports to identify issues before users in your environment are adversely affected.

An Analysis report is designed to compare collected network data to a threshold so you can identify potential bottlenecks, anomalies, and viruses. Analysis reports help you identify potential problems before they become serious issues. You can schedule these reports to run regularly, which means you can continually analyze your network traffic for potential issues.

To open the Analysis page, click **Analysis** in the NFA console menu.



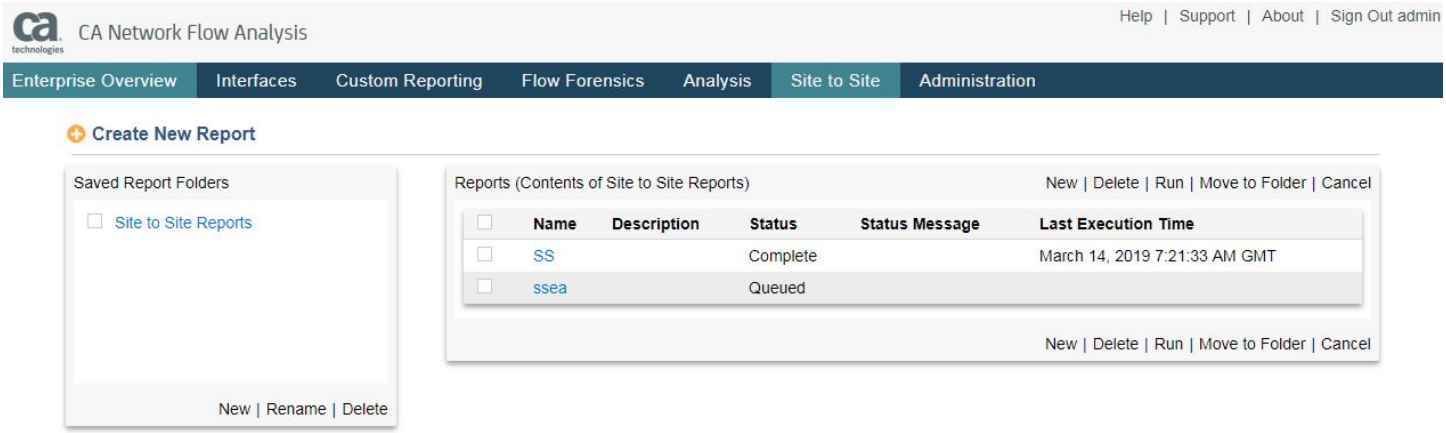
Site to Site Page

Site to Site reports enable you to view volumes of data between two or more sites. A site may be defined as a collection of subnets that can also be discontiguous.

Use Site to Site reports to compare the following between pairs of sites:

- Bytes in
- Rate in
- Bytes out
- Rate out

To get started, select **Site to Site** from the NFA console menu.



Introduction to Flow Cloner

You can use the Flow Cloner tool to forward flow data from a flow-enabled Harvester to another collection device, such as a Harvester in a different deployment. For example, the Flow Cloner could send flows to an Intrusion Detection System (IDS). By using the Flow Cloner, you can send the same data to two collection devices without burdening your routers with sending the data twice.

The Flow Cloner listens for packets in promiscuous mode, then forwards them to the IP addresses that you designate. In this mode, the Flow Cloner passes the packets along to any other process that is listening for them. A Harvester that is co-installed with a running Flow Cloner sees all the packets that are destined for it.

Installing

This section is for systems administrators who are installing DX NetOps. When installation is complete, you will have set up the following:

- NFA Console
- NFA Harvester
- (Optional) Flow Cloner

NOTE

More information:
(Optional) CA Anomaly Detector

System Recommendations and Requirements

Installation Process Overview

In a *stand-alone* deployment, a single server hosts the NFA console and the Harvester.

In a *distributed* deployment, DX NetOps components are distributed among multiple servers.

Workflow for Installing a Stand-Alone Deployment

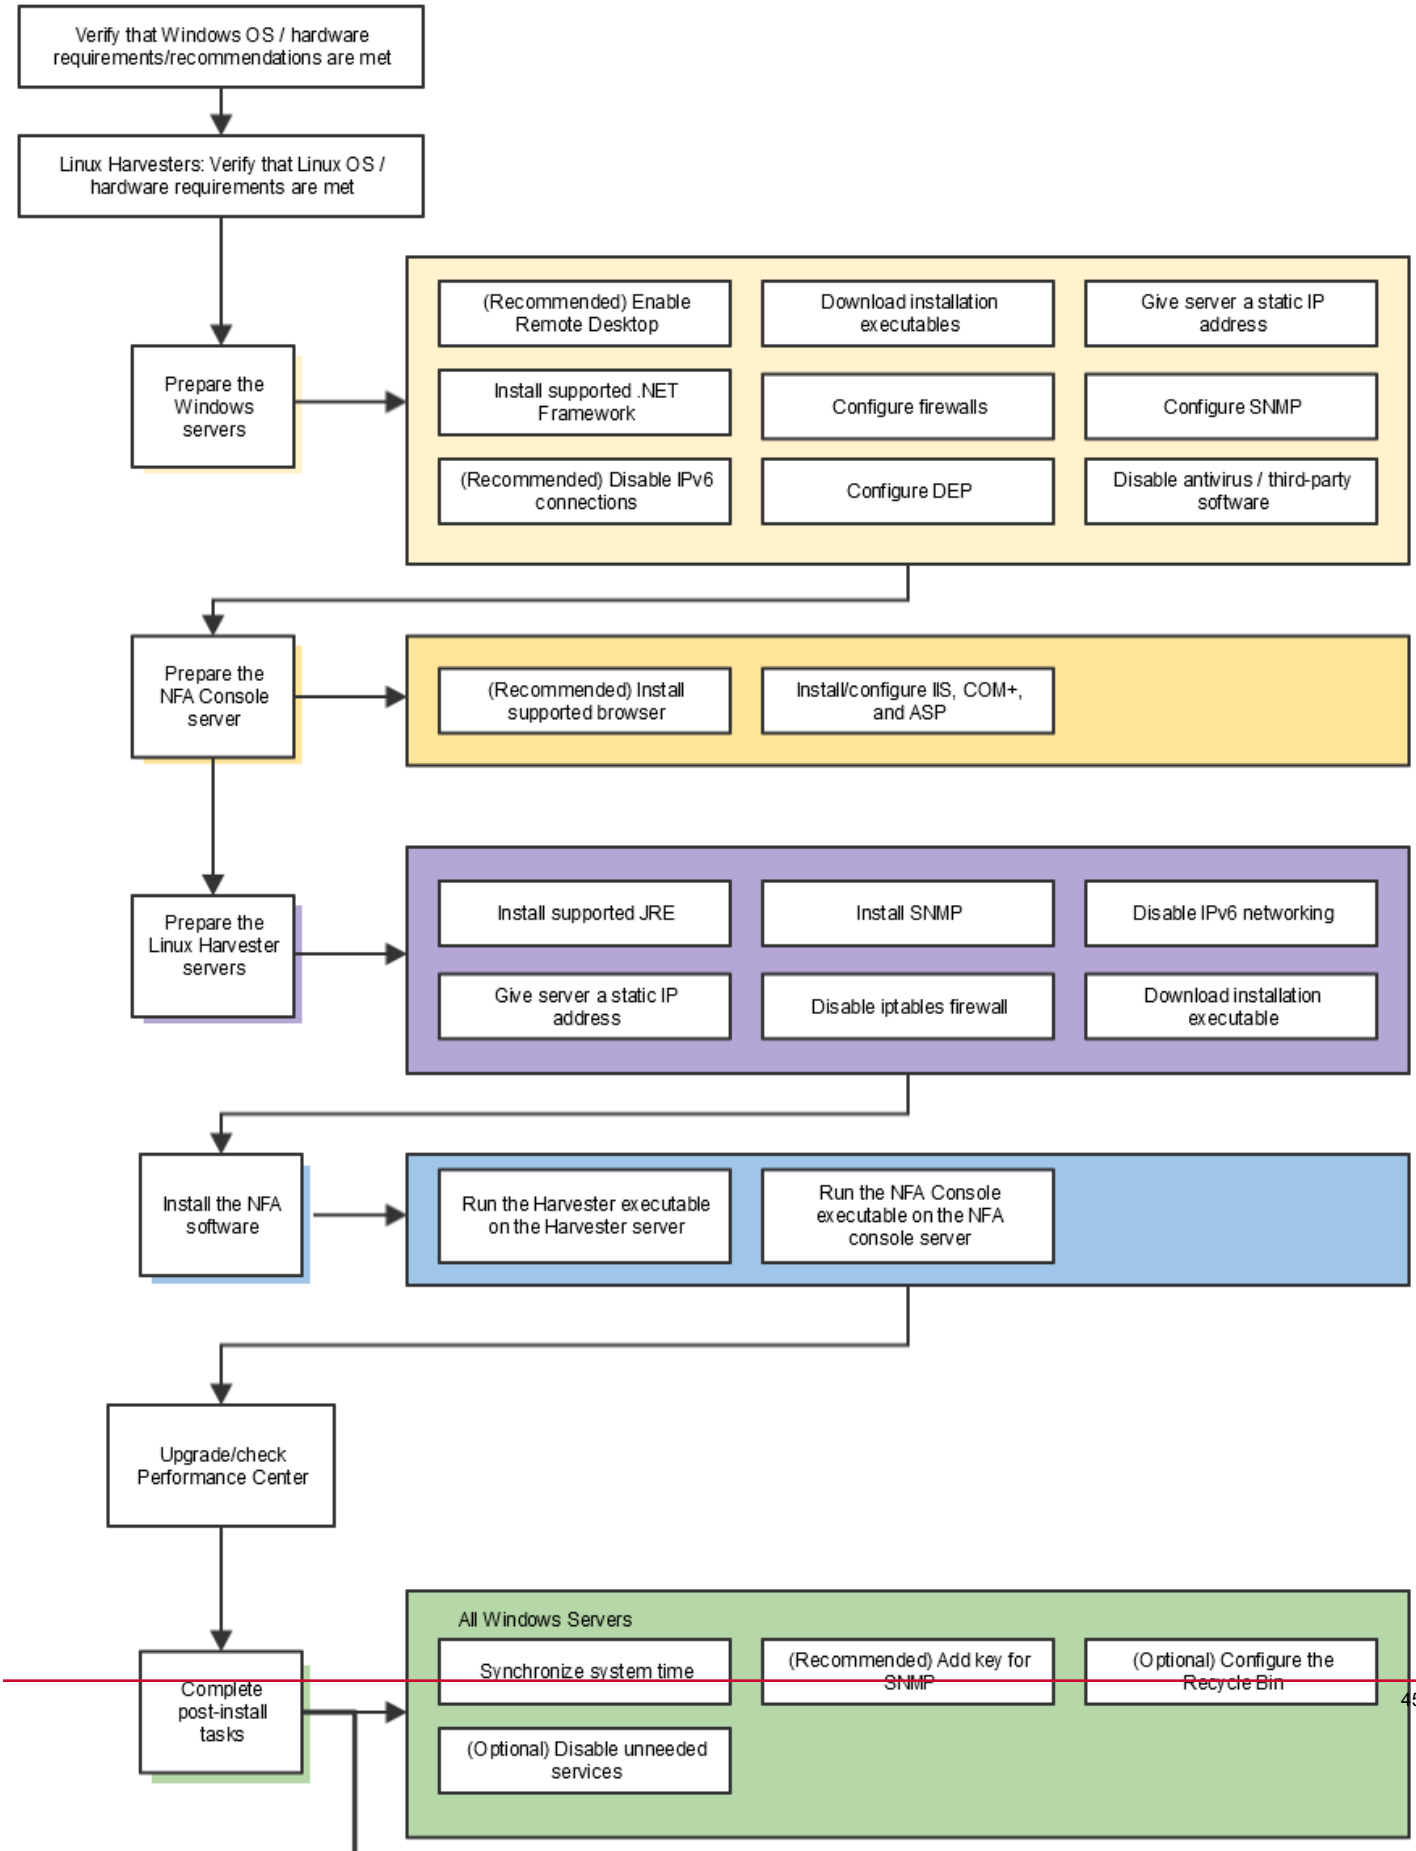
Use the following diagram as a general checklist for installing a stand-alone deployment of DX NetOps.

Figure 95: NFA stand-alone

Workflow for Installing a Distributed Deployment

Use the following diagram as a general checklist for installing a distributed deployment of DX NetOps.

Figure 96: NFA Distrib



Download the Installation Files

Copy the current version of the installation/upgrade files to the installation server so you are certain to have access to the files.

1. Get the files for installing or upgrading the components:
   a. Log in to support portal.
   b. Navigate to the **Download Management**.
   c. Click **Network Flow Analysis**.
   d. Select **CA Network Flow Analysis MULTI-PLATFORM**, x.x.x from Release drop-down list.
   e. Click DOWNLOAD NOW.
   The ISO file is downloaded.

   NOTE
   An ISO file is an archive file that contains the contents of an optical disk. Each one of the available ISO files contains the files for installing or upgrading the component named in the file link.
2. Perform one of the following tasks:
   – Burn the ISO files to a CD-ROM or DVD.
   – Extract the contents of the ISO files by using an ISO image software application. Many free ISO image applications are available.
3. Extract the appropriate files to the installation servers:

Stand-alone servers:

- – • CA Network Flow Analysis
    - `NFHarvesterSetupx.x.x.exe`
    - `RAConsoleSetupx.x.x.exe`
  - CA Anomaly Detector
    - `ADSetupx.x.x.exe`

Distributed deployments:

1. – • Windows Harvester servers in distributed deployments:
    - `NFHarvesterSetupx.x.x.exe`
  - Linux Harvester servers in distributed deployments:
    - `NFHarvesterSetupx.x.x.bin`
  - CA Anomaly Detector
    - `ADSetupx.x.x.exe`
  - NFA console servers in distributed deployments:
    - `RAConsoleSetupx.x.x.exe`

You can install or upgrade the software locally or remotely.

System Recommendations and Requirements

This section describes the hardware and operating system recommendations and requirements for the DX NetOps component servers. Configure and secure the operating system as described here.

We tested the product with the following hardware configuration. Your requirements might vary depending on the characteristics and volume of interfaces, applications, and operators in your network.

NOTE

- The recommended specifications described here apply to both physical and virtual deployments. The specifications represent an optimal configuration. You can run DX NetOps successfully on configurations that do not meet these specifications, although your performance might vary.
- Performance is improved by running the software and the operating system on separate drives. However, it is possible to install and run the software and operating system on the same drive.
- For the following per harvester recommendations, the Autonomous System (AS) is set to 50 and Type of Service (TOS) is set to 50 for the flow data (Flows per minute, Interfaces, Routers). For high variability of AS and TOS numbers Flows per minute has to be reduced.

Large Scale Environments

An example of a large scale environment:

- 100 million or greater flows (NetFlow v9**)
- 70,000 interfaces sending flows
- 1,000 or greater routers sending flows
- 24 harvesters

**This is based on v9 NetFlows, which included the following data:

(`srcaddr` , `srcport` , `dstaddr` , `dstport` , `port` , `input` , `output` , `dpkts` , `doctets` , `duration` , `tos` , `TCP_FLAGS` , `SRC_MASK` , `DST_MAST` , `IN_SRC_MAC` , `OUT_SRC_MAC` , `IN_DST_MAC` , `OUT_DST_MAC` , `icmp_type` , `SRC_VLAN` , `DST_VLAN` , `mpls_label_1` , `mpls_label_1` , `mpls_top_label_type` , `mpls_top_label_ip_addr` , `mpls_label_10` , `nexthop` , `src_as` , `dst_as`)

Architecture - 2 Tier

High-level Recommendations for Harvesters

- Windows 2016
- Windows 2012R2
- SSD storage - especially for Harvesters with greater than 4 million flows / 5000 interfaces / 50 routers
- 8 CPUs (2 quad-core CPUs) - 2.8 GHz
- Reserved resources (CPU and memory) in VM environment
- Max Disk Read / Write latency kept to < 10 ms
- Do not install DX NetOps on the operating system drive (for example, on `Windows` , not on `C:`)

Per Harvester recommendations, based on Flow Rate, Interfaces, Routers

Flows per minute	Interfaces	Routers	Memory	Disk Read IOPS needed	Disk Write IOPS needed	Disk Space needed***
9000000	500	5	16 GB	approx. 300	approx. 200	1.5 TB
8000000	1000	10	16 GB	approx. 300	approx. 200	1.5 TB
7000000	2000	20	16 GB	approx. 300	approx. 200	1.5 TB
4000000	5000	50	12 GB	approx. 100	approx. 200	1.0 TB
3000000	5000	100	12 GB	approx. 50	approx. 150	750 GB
2000000	5000	100	12 GB	approx. 50	approx. 150	750 GB

NOTE

Linux supports 9000000 flows per minute for IPv4 and 8000000 flows per minute for IPv6.

***This includes default values to limit data retention

- Raw NFA file storage - 24 hours
- 1-minute data - 30 days
- 15-minute data - 365 days

High-level Recommendations for Console

- Windows 2016
- Windows 2012R2
- 4 CPUs - 2.8 GHz
- 8 GB memory
- Reserved resources (CPU and memory) in VM environment
- Do not install DX NetOps on the operating system drive (for example, on `Windows` , not on `C:`)

Medium Scale Environments

An example of a medium scale environment:

- 16 million flows (NetFlow v9**)
- 20,000 interfaces sending flows
- 200 routers sending flows
- 4 harvesters

**This is based on v9 NetFlows, which included the following data:

(`srcaddr` , `srcport` , `dstaddr` , `dstport` , `port` , `input` , `output` , `dpkts` , `doctets` , `duration` , `tos` , `TCP_FLAGS` , `SRC_MASK` , `DST_MAST` , `IN_SRC_MAC` , `OUT_SRC_MAC` , `IN_DST_MAC` , `OUT_DST_MAC` , `icmp_type` , `SRC_VLAN` , `DST_VLAN` , `mpls_label_1` , `mpls_label_1` , `mpls_top_label_type` , `mpls_top_label_ip_addr` , `mpls_label_10` , `nexthop` , `src_as` , `dst_as`)

Architecture - 2 Tier

High-level Recommendations for Harvesters

- Windows 2016
- Windows 2012R2
- 8 CPUs (2 quad core CPUs) - 2.8 GHz
- Reserved resources (CPU and memory) in VM environment
- Max Disk Read / Write latency kept to < 10 ms
- Do not install DX NetOps on the operating system drive (for example, on `Windows` , not on `C:`)

Per Harvester recommendations, based on Flow Rate, Interfaces, Routers

Flows per minute	Interfaces	Routers	Memory	Disk Read IOPS needed	Disk Write IOPS needed	Disk Space needed***
4000000	5000	50	12 GB	approx. 100	approx. 200	1.0 TB
3000000	5000	100	12GB	approx. 50	approx. 150	750 GB
2000000	5000	100	12 GB	approx. 50	approx. 150	750 GB

***This includes default values to limit data retention

- Raw NFA file storage - 24 hours
- 1-minute data - 30 days
- 15-minute data - 365 days

High-level Recommendations for Console

- Windows 2016
- Windows 2012R2
- 4 CPUs - 2.8 GHz
- 8 GB memory
- Reserved resources (CPU and memory) in VM environment
- Do not install DX NetOps on the operating system drive (for example, on `Windows` , not on `C:`)

Small Scale Single Box Environments

An example of a small scale environment:

- 2 million flows (NetFlow v9)
- 5,000 interfaces sending flows
- 100 routers sending flows

Architecture - Stand-Alone (Single Box)

High-level Recommendations for Stand-Alone (Single Box)

- Windows 2016
- Windows 2012R2
- 4 CPUs - 2.8 GHz
- 16 GB memory
- Reserved resources (CPU and memory) in VM environment
- Max Disk Read / Write latency kept to < 10 ms
- Do not install DX NetOps on the operating system drive (for example, on `Windows` , not on `C:`)

Single Box recommendations, based on Flow Rate, Interfaces, Routers (includes the Console)

Flows per minute	Interfaces	Routers	Memory	Disk Read IOPS needed	Disk Write IOPS needed	Disk Space needed***
2000000	5000	100	16 GB	approx. 50	approx. 150	1 TB

***This includes default values to limit data retention

- Raw NFA file storage - 24 hours
- 1-minute data - 30 days
- 15-minute data - 365 days

NOTE
More information:

View Flow Statistics

Windows Servers

Verify that your hardware meets the specifications that are noted here.

Setting or Component	Description
Operating System	Microsoft Windows Server 2012 R2 Standard Edition on a 64-bit processor Microsoft Windows Server 2016 Standard Edition on a 64-bit processor
Operating System updates	Latest Service Pack and all important updates installed. Install only important Windows updates and service packs. Do not install an unsupported Web browser.
Disk space	C: drive with 40 GB of available space for the operating system We recommend installing DX NetOps on a separate drive that is dedicated to DX NetOps. Verify that the drive contains the following disk space available: • 41 GB for the installation or upgrade files • NFA console or stand-alone server: 200 GB or more available for data • Harvester server: 1 TB of available space for data
CPU	• NFA console or stand-alone server: One 2.8-GHz quad core processor • Harvester server: Two 2.8-GHz quad core processors (8 CPUs)
Memory	• NFA console: 12-GB RAM • Stand-alone server: 16 GB RAM • Harvester server: 12 GB or 16 GB RAM based on flow rate (link)
Hard drives	• NFA console or stand-alone server: Three 146-GB hard drives in RAID5 configuration • Harvester Server: Six 300-GB hard drives in RAID5 configuration For highest performance, use SSD drives. You can step down to 15,000 RPM or 10,000 RPM drives, if you can tolerate less performance. We do not recommend going lower than 10,000 RPM.
Ports	1-Gb Ethernet port Run the following command on harvester, if the harvester is having multiple NIC's. Before running, ensure you have the correct IP address of the Harvester that matches in the Administration -> Harvester page of NFA `Mysql -P3308 -D harvester -t -e "update parameter_descriptions set defaultValue='x.x.x.x' where parameter='harvesterIPAddress';"` Restart the CA NFA Harvester service. If you enter the wrong IP address in the above command it results in devices being created on Harvester IP addresses that you did not want. Make sure you have the correct Harvester IP address before running the commands.
Screen resolution	Minimum display resolution of 1024x768 (XGA)

Web browser	Microsoft Internet Explorer version 11 Mozilla Firefox (latest version) Google Chrome (latest version) • NFA console or stand-alone server: Browser optional • Clients that log in to the NFA console: Browser required • Some other browsers or browser versions might work for logging in from a client, but they have not been tested. **Notes:** The following browser versions have known issues: • Microsoft Internet Explorer version 9 - The **Log In** dialog and screen might have display artifacts: • The **Log In** button text might be white, although the button is functional. The **Log In** button is located in the bottom right corner of the dialog and has a blue box around it. If you position your cursor inside the box, the cursor changes to Hand mode. The login function is active whenever the cursor is in the Hand mode. The following browser versions have known issues: • The screen behind the **Log In** dialog might not be rendered in a uniform blue color. • Microsoft Internet Explorer v10 - If you save reports as PDF files, or set up scheduled reports to send PDF files, the PDFs are not searchable. The PDFs are rendered as pictures, which do not include searchable text. • Working in the CA Performance Center Console: Use Internet Explorer with Compatibility View turned off. You can work in the NFA console with Compatibility View turned on or off. Changing the Compatibility View option for the current session: • If Internet Explorer Developer Tools installed, press **F12** on your keyboard. Select the option that does not contain the phrase "Compatibility View".
Features, settings, and additional software	• .NET Framework 4.5, which is enabled by default in the Windows Server 2012 operating system. • .NET Framework 4.6.2, which is enabled by default in the Windows Server 2016 operating system. • **For NFA 10.0.0 and 10.0.1 release:** Java Runtime Engine (JRE) 1.8.0_192, which is installed automatically during the installation or upgrade of the DX NetOps software. • **For NFA 10.0.2 release:** AdoptOpenJDK JRE 1.8.0_212 • **For NFA 10.0.3 and 10.0.4 releases:** AdoptOpenJDK JRE 1.8.0_232

NOTE
More information:

- For more specific recommendations on large, medium, and small-scale environments, see System Recommendations and Requirements.

Prepare the Windows Servers

Before you begin the installation, verify that the following conditions are met. Failure to meet these requirements and recommendations can result in data loss, increased downtime, software conflicts, or installation failure.

Follow these steps:

1. Log in to a Windows server as a user who is a member of the Administrators group.

2. Download the DX NetOps Prerequisite Tool.
   The tool ensures that all the prerequisites are enabled or disabled on Windows Server 2016 server.

   NOTE

   For **Windows Server 2012 R2 server**, ensure that you install .Net 4.6 before executing this prerequisite tool.
3. Extract the contents of the zip file.
4. Run the check script. No changes are made to the system currently. The script is only a check.
5. When the check script finishes, check the output for information and instructions. If the check script determines that changes are necessary, it generates a fix script to make those changes.
6. Run the fix script, if necessary.
7. Launch the fix script in a **Command Prompt** window, so that the output is visible for review.
8. When finished, check the output for instructions on rebooting and re-running the check script.
9. When there no further changes are necessary; Install the Software.

(Optional) Verify the Prerequisites Manually

If anything fails to work while using the tool, or if it is preferable to take care of the prerequisites manually, see the following pages:

Additional Requirements

- If you use Performance Center, verify that a supported version is installed in your deployment. Install a supported version of Performance Center on a separate server after you install DX NetOps
- When you apply Windows updates, restart all servers to ensure that the updates are applied.
- For a Harvester running on a Windows VM with greater than 4 million flows/minute, make the following environment changes:
  – Navigate to **Device Manager, Network adapters, vmxnet3 Ethernet Adapter, Properties, Advanced** tab.
  – Configure the following properties on the VMXNET 3 interface.

Property	Value
Receive Side Scaling	Enabled
Small Rx Buffers	8192
Rx Ring 1 Size	4096

Verify the following requirements on each Windows server:

Stand-Alone Server	**Distributed NFA Console Server**	**Distributed Harvester Server**
If possible, meet Windows hardware recommendations.		
Meet Windows operating system requirements.		
Configure Regional settings.		
Assign a static IP address to each server. Set the Harvester server IP address to match the flow export destination that is assigned to each router.		
Install the supported version of .NET Framework 3.5 SP1 *.		
Install .NET Framework 4.6.2 *.		
(Recommended) Enable Remote Desktop Connection to allow remote access.		
(Recommended) Install a supported browser **.		
Configure the firewall.		

Install IIS, COM+, and ASP **.
Configure SNMP **.
(Recommended) Disable IPv6 connections.
Configure DEP **.
Disable the following third-party software: Antivirus, server monitoring, and maintenance software until the installation is complete. If you enable antivirus scans later, exclude the DX NetOps installation path and its subdirectories.

* If this requirement is not met, the installation program either does not open or does not complete successfully.
** If the server fails to pass the check for this requirement, a warning message opens.

Configure Data Execution Prevention (DEP)

Data Execution Prevention (DEP) helps to prevent code executing from data pages. To configure the appropriate DEP policy level:

Follow these steps:

1. Log in as a user who has administrator privileges for DX NetOps.
2. Open the **Control Panel** and click the **System** link.
3. Click the **Advanced system settings** link.
4. Click the **Advanced** tab in the **System Properties** dialog.
5. In the **Performance** area, click **Settings**.
6. Click the **Data Execution Prevention** tab in the **Performance Options** dialog.
7. Select **Turn on DEP for essential Windows programs and services only**.
8. Save your settings and exit:
   a. Click **Apply** in the **Performance Options** dialog.
      A message opens and informs you that you must restart your system to implement the new settings. Click **OK**.
   b. Click **OK** in the **Performance Options** dialog.
   c. Click **OK** in the **System Properties** dialog.
9. (Optional) Restart your system before you install or upgrade the software.
   If you proceed without restarting the system, the prerequisite test displays a warning about the DEP configuration.

Install .NET Framework

In both fresh installation or during upgrade, the current version of DX NetOps requires .NET Framework 4.6.2 on all Windows servers. As an administrator or member of administrator group install the .NET Framework on all of the Windows servers.

Follow these steps:

1. Download the .NET Framework update.
   – Web installer:
     https://www.microsoft.com/en-us/download/details.aspx?id=53345
   – Offline installer:
     https://www.microsoft.com/en-us/download/details.aspx?id=53344
2. Run the installer.
3. Follow the instruction on the installer wizard and complete the installation.

Install IIS, ASP, COM+, and SNMP

Install the following required components on a stand-alone server or NFA console server:

- IIS
- ASP
- IIS 6 Management Compatibility
- COM+ Network Access
- SNMP

> **NOTE**
> Before proceeding with the installation, ensure that vcredist_x86.exe is installed on the server. Please install vcredist_x86.exe from here, if it is not installed.

For Windows 2012 Server, follow these steps:

1. Log in as a user who has administrator privileges for CA Network Flow Analysis.
2. Open **Server Manager**.
3. In the **Dashboard**, select **Add roles and features**.
   If the **Before you begin** page displays, click **Next**.
4. In the **Select installation type** page, select **Role-based or feature-based installation**.
   Click **Next**.
5. In the **Select destination server** page, select **Select a server from the server pool**. Select the appropriate server from the **Server Pool** list, then click **Next**.
6. In the **Select server roles** page, select **Application Server**. Click **Next**.
7. In the **Select features** page:
   a. Expand **.NET Framework 4.5 Features**.
      a. Select **.NET Framework 4.5**, if not already checked.
      b. Select **ASP.NET 4.5**, if not already checked.
      c. Expand **WCF Services**, and select **HTTP Activation**.
   b. Select **SNMP Service**.
      a. Select **SNMP WMI Provider**.
         Click **Add Features** when prompted.
   c. Expand **User Interfaces and Infrastructure**.
      a. Select **Desktop Experience**.
         Click **Add Features** when prompted.
   d. Click **Next**.
8. In the **Application Server** page, click **Next**.
9. In the **Select role services** page:
   a. Select **COM+ Network Access**.
   b. Select **Web Server (IIS) Support**.
      Click **Add Features** when prompted.
   c. Click **Next**.
10. In the **Web Server Role (IIS)** page, click **Next**.
11. In the **Select role services** page:
    a. Expand the **Application Development** section.
       a. Select **ASP**.
    b. Expand the **Management Tools** section.
       a. Select **IIS 6 Management Compatibility**.
    c. Click **Next**.

12. The **Confirm installation selections** page summarizes your actions and displays related messages.
    If you are prompted to specify an alternate source path, click **Specify an alternate source path**.
    a. Specify the path to the SxS Sources on the Windows Install CD, then click **OK**.
13. Install the role services and options you selected:
    a. Click **Install**.
    The **Results** page opens when the installation or upgrade is complete.
    b. (Optional) Click **Print, e-mail, or save the installation/upgrade report**, review the information, then close the page.
    c. Click **Restart Server**.

For Windows 2016 Server, follow these steps:

1. Log in as a user who has administrator privileges for DX NetOps.
2. Open **Server Manager**.
3. In the **Dashboard**, select **Add roles and features**.
   If the **Before you begin** page displays, click **Next**.
4. In the **Select installation type** page, select **Role-based or feature-based installation**.
   Click **Next**.
5. In the **Select destination server** page, select **Select a server from the server pool**. Select the appropriate server from the **Server Pool** list, then click **Next**.
6. In the **Select server roles** page, select **Web Server (IIS)**, and click **Next**.
7. In the **Select features** page:
   a. Expand **.NET Framework 4.6 Features**.
      a. Select **.NET Framework 4.6,** if not already checked.
      b. Select **ASP.NET 4.6**, if not already checked.
      c. Expand **WCF Services**, and select **HTTP Activation**.
   b. Expand **SNMP Service**.
      a. Select **SNMP WMI Provider**.
      Click **Add Features** when prompted.
   c. Click **Next**.
8. In the **Web Server Role (IIS)** page, click **Next**.
9. In the **Select role services** page:
   a. Expand the **Application Development** section.
      a. Select **ASP**.
   b. Expand the **Management Tools** section.
      a. Select **IIS 6 Management Compatibility**.
   c. Click **Next**.
10. The **Confirm installation selections** page summarizes your actions and displays related messages.
    If you are prompted to specify an alternate source path, click **Specify an alternate source path**.
    a. Specify the path to the SxS Sources on the Windows Install CD, then click **OK**.
11. Install the role services and options you selected:
    a. Click **Install**.
    The **Results** page opens when the installation or upgrade is complete.
    b. (Optional) Click **Print, e-mail, or save the installation/upgrade report**, review the information, then close the page.
    c. Click **Restart Server**.

Configure SNMP on Windows Servers

The Simple Network Management Protocol (SNMP) service is required by the Watchdog services. To configure the SNMP service on the Windows servers in your deployment:

Follow these steps:

1. Log in as a user who has administrator privileges for DX NetOps.
2. To display the list of community names for the SNMP service:
   a. Select **Start**, **Administrative Tools**, **Services**.
   The **Services** window opens.
   b. Right-click the **SNMP Service** and select **Properties**.
   The **SNMP Service Properties** dialog opens.
   c. Select the **Security** tab.
3. Verify that the appropriate community name is in the **Accepted community names** list. The default community name is "public".
4. If the appropriate community name is not listed, add it:
   a. Click **Add**.
   The **SNMP Service Configuration** dialog opens.
   b. Set the following options:
      - Community rights: Select **Read Only**.
      - Community Name: Enter **public** or a custom community name. Use the same community name throughout the DX NetOps deployment:
        `snmpd.conf` file on each Linux server
        SNMP service on each Windows server
        Watchdog Settings page of the NFA console
   c. Click **Add**.
   The **SNMP Service Configuration** dialog closes. The **SNMP Service Properties** dialog displays the new name in the **Accepted community names** list.
5. Save your changes and exit:
   a. Click **Apply**, **OK** in the **SNMP Service Properties** dialog.
   Your changes are saved and the dialog closes.
   b. Select **File**, **Exit** in the **Services** window.
   The **Services** window closes.

Disable IPv6 Connections on Windows Servers

This release does not support connections to IPv6-formatted addresses. If connection to IPv6-formatted addresses is enabled, data collection fails.

The instructions are based on the assumption that each server has a single network interface card, which is the recommended configuration.

Follow these steps:

1. Log in as a user who has administrator privileges for DX NetOps.
2. Open the **Network Connections** window:
   a. Select **Start**, **Control Panel**.
   b. Click **Network and Internet**.
   c. Click **Network and Sharing Center**.
   d. Click **Change adapter settings**.
   The **Network Connections** window opens and shows the currently configured connections.

3. Right-click the connection.
4. Select **Properties** from the menu.
   The **Properties** dialog opens.
5. Clear the **Internet Protocol Version 6 (TCP/IPv6)** check box, if it is selected.
6. Click **OK**.
   The dialog closes and your changes are saved.
7. Select **Organize**, **Close** in the **Network Connections** window.
   The window closes.

Firewall Configuration

For DX NetOps to work properly in a firewall-protected environment, certain ports must be open. The following topics summarize the ports that must be open to allow communication among the DX NetOps components. To perform these tasks, log in as a user who is a member of the Administrators group.

Ports to Open for a Stand-Alone System

Open the following ports for a stand-alone system to allow DX NetOps communications to function properly.

From	To	Port [Function]
NFA console	Outbound	TCP 25 [SMTP email reports] UDP 53 [DNS]
Harvester	Routers (SNMP interface, read-only)	UDP 161 [SNMP polling]
Harvester	Trap destination	UDP 162 [traps]
Router	Harvester	UDP 9995 [flow]
Administrators and operators	NFA console	TCP/HTTP 80 [UI access and SNMP web services] TCP/HTTP 8381 [Single Sign-On]
CA PC / CA NPC Console	NFA console	TCP/HTTP 80 [device and interface synchronization with CA PC / CA NPC] TCP 8681 [data import for DX NetOps views in CA PC / CA NPC, CA UIM] TCP 8981 [NFA data read via OData API]
Administrators	Each server	TCP 3389 [Remote Desktop, if Remote Desktop is used] TCP 5800, 5801, 5900, 5901 [VNC, if VNC is used]

Ports to Open for a Two-Tier Distributed Deployment

NFA console and Harvesters on separate servers

From	To	Port [Function]
NFA console	Outbound	TCP 25 [SMTP email reports] UDP 53 [DNS]

NFA console	Harvester	TCP 3307 [CA MySQL] TCP 3308 [MySQL] TCP 8066 [SOAP web service calls] TCP 8067 [Flow Statistics web service calls] TCP 8080 [File web server port for collecting Harvester files] UDP 161 [Watchdog service]
Harvester	NFA console	TCP 8067 [Flow Statistics web service calls]
Harvester	Routers (SNMP interface, read-only)	UDP 161 [SNMP polling]
Harvester	Trap destination	UDP 162 [traps]
Router	Harvester	UDP 9995 [flow]
Administrators and operators	NFA console	TCP/HTTP 80 [UI access and SNMP web services] TCP/HTTP 8381 [Single Sign-On]
CA PC / CA NPC Console	NFA console	TCP/HTTP 80 [device and interface synchronization with CA PC / CA NPC] TCP 8681 [data import for DX NetOps views in CA PC / CA NPC] TCP 8981 [NFA data read via OData API]
Administrators	Each server	TCP 3389 [Remote Desktop, if Remote Desktop is used] TCP 5800, 5801, 5900, 5901 [VNC, if VNC is used]

Web Browser Support

For client systems that are used to log into the NFA console: We recommend Microsoft Internet Explorer version 11 or the latest version of Mozilla Firefox. Other browsers or browser versions may work with the NFA console, but have not been tested.

NFA console server: Install Microsoft Internet Explorer version 11 or Mozilla Firefox (latest version).

To set up DX NetOps and work with data in the CA Performance Center console, use Internet Explorer with Compatibility View turned off. You can use Internet Explorer in the NFA console with Compatibility View turned on or off.

If Internet Explorer Developer Tools are installed, you can use **F12** to access Compatibility View options for the current browser session.

Follow these steps:

1. Press **F12**.
   A new pane opens in the lower half of the window.
2. Click the **Browser Mode** item on the main menu.
3. Select the Internet Explorer option that does not contain the phrase "Compatibility View."

Configure Regional Settings

Having incorrect regional settings on the server can cause various errors in the web interface. DX NetOps requires that the regional settings be set to US Regional settings with the proper **sShortDate** and **sLongDate** settings in the registry.

Follow these steps:

1. Enter the **Windows** regional settings menu through the **Control Panel**.
2. Select **English (United States)** as the **Format**.
   Click **OK**.
3. In the **Registry Editor**, use **Edit, Find** to search for the following registry keys and update them to the following values:
   - **sLongDate**: `dddd, MMMM dd, yyyy`
   - **sShortDate**: `M/d/yyyy`
   - **sLanguage**: `ENU`
   - **Locale**: `00000409`
   - **LocaleName**: `en-US`
   - **sCountry**: `United States`
   - **sDecimal**: `.`
4. Use the **F3** key to continue searching the registry for more instances of these keys.
5. Repeat until the **Registry Editor** states it has finished searching the registry.
   The regional settings change in the **Control Panel** might not update every registry entry, which can affect the database if all entries are not updated manually.
6. After all changes are made, restart the server to apply the registry changes.

Linux Servers

For a distributed deployment, DX NetOps supports running the Harvester on dedicated Linux servers. If you install the Harvester software on a Linux system, verify that your hardware meets the recommendations and requirements that are noted here.

Setting or Component	Description
Operating System	Red Hat Enterprise Linux 6.8 or 7.3, 7.4 on a 64-bit processor **(for all NFA releases)**, and Red Hat Enterprise Linux 7.5, or 7.6 on a 64-bit processor **(for NFA 10.0.3 and 10.0.4)**
Language	English, Chinese (Simplified), French (France), or Japanese language The appropriate language packs are required for localized deployments.
Disk Space	Root partition that contains 40 GB of available space Partition for DX NetOps that contains the following amounts of available space: • 41 GB for the installation or upgrade files • 4 GB for swap • 1 TB for data
CPU	Two 2.26-GHz quad-core processors
Memory	Minimum 12 GB RAM
Hard drives	Six 300-GB, 10,000-RPM SAS hard drives in RAID5 configuration If you do not have enough available space in the `/tmp` directory (at least 4 GB) and you cannot configure it, relocate the directory. Export the `IATEMPDIR` environment variable (for the Install Anywhere temporary directory) to set a new location, and select a directory with sufficient available space.
Ports	1-Gb Ethernet port
Screen resolution	Minimum display resolution of 1024x768 (XGA)

Features, settings, and additional software	AdoptOpenJDK JRE 1.8.0.232, for Network Flow Analysis 10.0.3 and 10.0.4 releases. AdoptOpenJDK JRE 1.8.0.212, for CA Network Flow Analysis 10.0.2 release. Java Runtime Engine (JRE) 1.8.0_192, which is installed automatically during the installation or upgrade of the DX NetOps software till NFA 10.0.1 and previous releases.

Prepare the Linux Servers

Before you begin the installation, verify that the following conditions are met. Failure to comply with these requirements can result in data loss, increased downtime, software conflicts, or a failed installation.

- Before you begin **NFA 10.0.3 GUI installation on RHEL 7.6**, run the `yum install redhat-lsb*` command.
- Before you begin the tasks, log in to a Linux server with root privileges.
- System Requirements: Verify that the installation servers meet the requirements and recommendations.
- Run the **yum install -y fontconfig** command, to install the CA Network Flow Analysis using the User Interface mode.
- Before running the installer, install the libaio package if it is not part of the already installed OS.
- Verify that each of the Harvester Linux servers is ready for the installation by:
  - Assigning a static IP address to each server. Set the Harvester server IP address to match the flow-export destination for each router.
  - Disabling the following third-party software: Antivirus, server monitoring, and maintenance software. If you enable antivirus scans later, exclude the DX NetOps installation path and its subdirectories.

    NOTE

    - If SNMP is not running, the installation program displays a warning. You can bypass the warning and install SNMP later.
    - Polling fails if DNS resolution is not configured.
- For a Linux Harvester running on a VM with greater than 4 million flows/minute, make the following environment changes:
  a. Set the following kernel parameter in the `/etc/sysctl.conf` file, to match the socket buffer size of 32 MB.
     ```
     net.core.rmem_max=33554432
     ```
  b. If ethtool is not available on the server, install the ethtool using the following command:
     ```
     yum install ethtool
     ```
  c. Set the interface rx buffer to the max 4096.
     ```
     ethtool -G <interface> rx 4096
     ```
     Where *<interface>* is the interface receiving the netflow, for example eth0.

     NOTE

     Localization Notes:

     - To support non-Latin characters such as Japanese and Simplified Chinese, any command-line clients that you use for installation must be configured for UTF-8 encoding. If UTF-8 encoding is not enabled, these characters may not display properly.
     - The appropriate language packs are required for localized deployments.
     - Regional Settings must use a period (.) to indicate a decimal value. If your deployment is localized to French, change the decimal symbol to a period in the **Region and Language: Customize Format** dialog.

Disable IPv6 Networking on Linux Servers

Disable IPv6 networking on each Linux server that has a Harvester installed.

NOTE
Complete this task before you add the Harvester in the NFA console. If IPv6 is enabled when you add a Harvester in the NFA console, the Harvester automatically binds with an IPv6-format address. This prevents DX NetOps from receiving the Harvester data.

Verify IPv6 Status

Verify if IPv6 is enabled or not. In case IPv6 is enabled, disable the IPv6, else continue to Disable the iptables Firewall.

Follow these steps:

1. Log in with root privileges.
2. Execute the following command:
```
$ ip a | grep inet6
```
3. In case you find the following as the result, then IPv6 is enabled:
```
inet6 ::1/128 scope host
inet6 fe80::e922:bcdf:e150:labb/64 scope link
```
4. If IPv6 is disabled, you should see no output if you run this command.

Disable IPv6

Perform the following steps to disable IPv6.

Follow these steps:

1. Log in with root privileges.
2. Open the /etc/sysctl.conf file with the following command:
```
$ sudo vim /etc/sysctl.conf
```
   a. Add the following lines to it:
```
net.ipv6.conf.all.disable_ipv6 = 1
net.ipv6.conf.default.disable_ipv6 = 1
```
   b. Now save the file and reboot your computer with the following command:
```
$ sudo reboot
```
   c. Verify that IPv6 is disabled by running the following command:
```
$ ip a | grep inet6
```

Disable the iptables Firewall

We recommend that you disable the iptables firewall and stop the iptables service on each Linux server that has a Harvester installed. Disabling iptables ensures that all the required ports are open and that the iptables firewall does not impact performance adversely.

NOTE
If your enterprise requires the use of iptables, make sure that you open all of the applicable firewall ports in the firewall configuration list. Also, make sure that you have full localhost-to-localhost access. This step is required because DX NetOps uses RMI (Remote Method Invocation) access.

Complete the following steps to disable all levels of iptables and allow communication among DX NetOps components.

Disable iptables in RHEL 6

Follow these steps:

1. Log in as root or with a sudo user account.
2. Run the following commands in a command prompt window:

```
service iptables stop

chkconfig iptables off

chkconfig  --list |grep iptables
```

3. Review the output of the last command to make sure that all of the iptables levels are off, as shown in the following example:

```
iptables 0:off 1:off 2:off 3:off 4:off 5:off 6:off
```

Disable iptables in RHEL 7

Follow these steps:

1. Log in as root or with a sudo user account.
2. Check the status of iptables, using the following command:

```
systemctl status firewalld
```

3. If the iptables are in enable status, stop the iptables using the following command. If they are disabled, ignore the further steps.

```
systemctl stop firewalld
```

4. Disable the iptables using the following command:

```
systemctl disable firewalld
```

> **NOTE**
>
> **More information:**
>
> Firewall configuration list

DNS Name Resolution

DX NetOps requires DNS name resolution. If host names do not resolve to their corresponding IP addresses, SNMP polling fails.

To determine whether an IP address resolves to a host name on a Linux server, enter the `hostname -i` command in a command prompt window, as shown in the following example:

```
[root@NFAHARV]# hostname -i
```

If the command fails to return the corresponding IP address, you can edit the `/etc/hosts` configuration file on the Harvester server manually. Add a line for the local server, which associates the host name and IP address.

Follow these steps:

1. Log in to the Harvester server as root or with a sudo user account.
2. Open the `/etc/hosts` file in a text editor.
3. Add a line that associates the IP address with the local host name, as shown in the following example:

```
[root@NFAHARV]# more /etc/hosts;

# Do not remove the following line, or various programs

# that require network functionality will fail.

127.0.0.1 localhost localhost.localdomain localhost

::1 localhost6.localdomain6 localhost6

10.0.0.10 NFAHARV

where:

 10.0.0.10 = IP address of the Harvester server

 NFAHARV = Host name of the Harvester server
```

4. Save and close the `/etc/hosts` file.
5. Restart the DX NetOps services on the Harvester server, including the following services:
   – NFA CollpollWS (nfa_collpollws): CA NFA Collection and Poller Webservices
   – NFA Proxies (nfa_proxies): CA NFA DNS/SNMP Proxies
   – NFA Poller (nfa_poller): CA NFA Poller

   Your change takes effect immediately.

Install SNMP on Linux Servers

Install the Net-SNMP. Net-SNMP is required to support Watchdog functionality.

Install net-snmp

Follow these steps:

1. Install net-snmp RPM using the following command.

```
yum install -y net-snmp net-snmp-utils
```

2. Follow the prompt to complete the `net-snmp` installation.

Configure SNMP on RHEL 6

Follow these steps:

1. Open the /etc/snmp/snmpd.conf file using a text editor.
2. Find the following line:

```
com2sec notConfigUser default public
```

3. Ensure the following lines exist, else add them:

```
view all included .1

access notConfigGroup "" any noauth exact all none none

smuxpeer .1.3.6.1.4.1.674.10892.1

trapsink <IP_address> <desired_community_string>
```

4. Open the /etc/sysconfig/iptables.config file using a text editor.
5. Add the following lines to open the SNMP ports

```
-A INPUT -p udp -m udp --dport 161 -j ACCEPT

-A INPUT -p udp -m udp --dport 162 -j ACCEPT
```

6. Restart the snmpd service, using the `service snmpd restart` command.
7. Restart iptables service, using the `service iptables restart` command.

Configure SNMP on RHEL 7

Follow these steps:

1. Set up a minimal configuration:

```
cd /etc/snmp

cp -p snmpd.conf snmpd.conf.dist

echo "rocommunity public">snmpd.conf

echo "syslocation here" >>snmpd.conf

echo "syscontact root@localhost" >>snmpd.conf
```

2. Activate at boot and start the SNMP service:

```
systemctl enable snmpd && systemctl start snmpd
```

3. Execute a simple test:

```
snmpwalk -v 1 -c public -O e 127.0.0.1
SNMPv2-MIB::sysDescr.0 = STRING: Linux rhel7.example.com 3.10.0-54.0.1.el7.x86_64 #1
 SMP Tue Nov 26 16:51:22 EST 2013 x86_64
SNMPv2-MIB::sysObjectID.0 = OID: NET-SNMP-MIB::netSnmpAgentOIDs.10
```

NOTE

More information:

- The `snmpd.conf` file contains information on adding viewing rights for HostResources-MIB and UCD-SNMP-MIB, or check online for information on setting up read permissions.

Install the Software

Before you begin the DX NetOps installation:

- Verify that the servers meet the requirements and recommendations.
- Stop other programs from running during the installation.
- Ensure that no one else is logged in to the server during the installation.

Install the components:

After installation is complete, perform Post-Installation or Upgrade Tasks.

Install the Components on a Stand-Alone Server

Complete the steps in this topic to install all of the components on a single Windows server or virtual machine.

Install the Harvester

This section describes the procedure to install the harvester.

Follow these steps:

1. Verify that the installation server is prepared.
2. Log in as a user who has administrator privileges for DX NetOps.
3. Start the Harvester phase of the installation: Double-click the `NFHarvesterSetupx.x.x.exe` file.
4. Verify that the appropriate language is selected, then click **OK**.
   The **Welcome** screen opens.
5. Click **Next**.
   The **CA NFA Harvester License Agreement** screen opens.
6. Review and Click **Next** to accept the license agreement:
   Prerequisite tests run to look for problems on the server. If a problem is found, an error message opens. A critical problem causes the program to exit. A **Prerequisite Check Warning** message or other warning message opens for non-critical problems, which gives you the option to make corrections now or after the installation or upgrade is complete.
7. Review the test results in the **Prerequisite Check Warning** message, if it opens:
   a. Correct problems now or wait until the program finishes.
   b. Click **OK** to close the message.

8. Verify or specify the installation directory and Click **Next**:
   a. (Optional) Click **Choose** in the **Choose Install Folder** screen to change the installation location.
   Default Location: `C:\CA\NFA`.

      NOTE

      We recommend that you install DX NetOps components on a dedicated drive and not the operating system drive. The CA NFA console is installed to the same directory that you choose for the Harvester.

   The **Pre-Installation Summary** screen opens.
9. Review the pre-installation information and click **Install**.
   The **Installing Harvester** screen opens. When the installation is complete, the **Install Complete** screen opens and reports any errors that occurred.
10. (Optional) If errors occurred during the installation, see the following log for details:
   install_path`\Harvester_Install_`*<timestamp>*`.log` (where *<timestamp>* is the time the log was created)
11. Click **Done** in the **Install Complete** screen.
   The Harvester installation program closes.

Install the CA NFA console

This section describes the procedure to install the CA NFA Console.

Follow these steps:

1. Start the NFA console installation software: Double-click the `RAConsoleSetupx.x.x.exe` file in Windows Explorer.
   The language selection screen opens.
2. Verify that the appropriate language is selected, then click **OK**.
   The **Welcome** screen opens.
3. Click **Next** in the Welcome screen.
   The **NFA Console License Agreement** screen opens.
4. Review and Click **Next** to accept the license agreements:
   The **Third-Party License Agreement** screen opens.
5. Read the third-party license agreement and Click **Next**.
   Prerequisite tests run. If an error message opens that requires attention, see Troubleshooting.
6. Review the test results in the **Pre-requisite Check Warning** message, if it opens:
   a. Fix any noncritical problems now or wait until the program finishes.
   b. Click **OK** to close the message.
      The **Singlebox Confirmation** message opens and asks you to confirm that you want a stand-alone deployment.
7. Review the information and click **OK**.
   The **Pre-Installation Summary** screen opens.
8. Review the pre-installation information and click **Install**.
   The **Installing NFA** screen opens. When the NFA console installation is complete, the **Install Complete** screen opens.
   a. Select **Yes, restart my system**.
   b. Click **Done**.
      Installation is complete.

Next: Complete the following:

- Initial configuration
- Post-installation tasks

Install a Distributed Deployment

The topics in this section describe how to install the software on each component server. The recommended installation order is Harvesters first, then the NFA console.

To install a two-tier distributed deployment:

- Install the Harvester on a Windows Serveror
  Install the Harvester on a Linux Server
- Install the NFA Console

Install the Harvester on a Windows Server

Distributed deployments have separate servers for the NFA console and the Harvester. Complete the steps in this topic to install the Harvester on a dedicated Windows server or virtual machine.

In a distributed deployment, each Harvester is on a separate server. To install a Harvester on a dedicated Windows server or virtual machine, complete the following. These steps apply to a two-tier distributed deployment.

Follow these steps:

1. Verify that the server is prepared.
2. Log in as a user who has administrator privileges for DX NetOps.
3. Start the installation: Double-click the `NFHarvesterSetupx.x.x.exe` file in Windows Explorer on the Harvester server.
   The language selection screen opens.
4. Verify that the appropriate language is selected, then click **OK**.
   The **Welcome** screen opens.
5. Click **Next** in the **Welcome** screen.
   The **License Agreement** screen opens.
6. Review and accept the license agreement:
   a. Read the license agreement and scroll down.
   b. If you want to continue under the terms of the license agreement, click the option to accept it.
   c. Click **Next**.
      Prerequisite tests are run to identify problems on the server. If a problem is found, an error message opens.
7. If the **Prerequisite Check Warning** message opens, review the test results:
   a. Correct problems now or wait until the program finishes.
   b. Click **OK** to close the message.
      Once the server passes the required checks and you close any noncritical messages, the **Choose Install Folder** screen opens and displays the default root installation path.
8. Verify or specify the installation directory:
   a. (Optional) Click **Choose** in the **Choose Install Folder** screen to change the installation location.
      The default location is `C:\CA\NFA` . We recommend that you install DX NetOps components on a drive that is dedicated to DX NetOps, not the operating system drive. The NFA console and the Harvester are installed to the same directory.
   b. Click **Next** when the installation path setting is correct.
      The **Pre-Installation Summary** screen opens.
9. Review the pre-installation information, then click **Install**.
   The **Installing Harvester** screen opens. When the installation is complete, the **Install Complete** screen opens and reports any errors that occurred.
10. (Optional) If errors occurred during the installation, see the following log for details:

install_path\Harvester_Install_<*timestamp*>.log (where <*timestamp*> is the time the log was created)

11. Click **Done** in the **Install Complete** screen.
    The Harvester installation program closes.

Next:

- To install an additional Harvester on another Windows server, repeat these steps.
- Install the NFA Console.

Install the Harvester on a Linux Server

A two-tier distributed deployment of DX NetOps may include one or more Linux Harvester servers. To install the Harvester software on a dedicated Linux server or virtual machine, complete the steps in this topic.

Follow these steps:

1. Verify that the server is prepared.
2. Log in to the Harvester server as `root` .
   You can install the software locally or remotely; for example, by using `ssh` when you are logged in with root privileges.

   NOTE
   If you do not have root access, use an account with sudo privileges.
3. Open a command prompt window.
4. Run the following command to change the`ulimit` for the open files limit:

   ```
   ulimit -n ulimit_number
   ```

   Example:

   ```
   ulimit -n 65536
   ```

5. Prepare the installation/upgrade file for execution:
   a. Log in to the Harvester server as `root` .
      You can install or upgrade the software locally or remotely; for example, by using `ssh` when you are logged in with root privileges. If you do not have root access, use an account with sudo privileges.
   b. Execute the `chmod` command on the file in a terminal window:

      ```
      chmod u+x NFHarvesterSetupx.x.x.bin
      ```

   c. (Optional) Execute the list command to verify that the file is executable:

      ```
      ls -al
      ```

      The file permission settings are displayed.
6. Run the installation or upgrade software:

   ```
   ./NFHarvesterSetupx.x.x.bin
   ```

7. If the Linux server or virtual machine has GUI installed then follow the steps mentioned in Install Harvester through GUI.

8. If the Linux server or virtual machine is not GUI enabled, follow the steps mentioned in Install Harvester through Console.

Install Harvester through Console

1. Click Enter and accept the license agreement.
2. Select the installation folder or click enter to continue with the default installation location.
3. Review the Pre-Installation Summary.
4. Click Enter.

The Harvester installation is completed through Console.

Install Harvester through GUI

1. Verify that the appropriate language is selected, then click **OK**.
   The **Welcome** screen opens.
2. Click **Next** in the **Welcome** screen.
   The **License Agreement** screen opens.
3. Review and accept the license agreement:
   a. Read the license agreement and scroll down.
   b. If you want to continue under the terms of the license agreement, click the option to accept it.
   c. Click **Next**.
      Prerequisite tests are run to identify problems on the server. If a problem is found, an error message opens.
4. If the **Prerequisite Check Warning** message opens, review the test results:
   a. Correct problems now or wait until the program finishes.
   b. Click **OK** to close the message.
      Once the server passes the required checks and you close any noncritical messages, the **Choose Install Folder** screen opens and displays the default root installation path.
5. Verify or specify the installation directory:
   a. (Optional) Click **Choose** in the **Choose Install Folder** screen to change the installation location.
      We recommend that you install DX NetOps components on a partition that is dedicated to DX NetOps. The NFA console is installed to the same directory that you choose for the Harvester.
   b. Click **Next** when the installation path setting is correct.
      The **Pre-Installation Summary** screen opens.
6. Review the pre-installation information, then click **Install**.
   The **Installing Harvester** screen opens, which shows the progress. When the installation is complete, the **Install Complete** screen opens and reports any errors that occurred.
7. (Optional) If errors occurred during the installation, see the following log for details:
   install_path`/Harvester_Install_<`*timestamp*`>.log` (where <*timestamp*> is the time the log was created)
8. Click **Done** in the **Install Complete** screen.
   The Harvester installation program closes.

Next:

- To install an additional Harvester on another Linux server, repeat these steps.
- Install the NFA console.

Install the NFA Console

Distributed deployments use separate servers for the NFA console and Harvesters. Complete the steps in this topic to install the NFA console on a dedicated Windows server or virtual machine.

Follow these steps:

1. Verify that the installation server meets the following requirements:
   – The server is prepared.
   – The software is installed on the Harvester servers.
2. Log in to the NFA console server as a user who has administrator privileges for the system and for DX NetOps.
3. Start the installation: Double-click the `RAConsoleSetupx.x.x.exe` file in Windows Explorer on the NFA console server.
   The language selection screen opens.
4. Verify that the appropriate language is selected, then click **OK**.
   The **Welcome** screen opens.
5. Click **Next**.
   The **License Agreement** screen opens.
6. Review and accept the license agreements:
   a. Read the NFA console license agreement and scroll down.
   b. If you want to continue, click the option to accept the license agreement.
   c. Click **Next**. The **Third-Party License Agreement** screen opens.
   d. Read the third-party license agreement and scroll down.
   e. If you want to continue, click the option to accept the third-party license agreement.
7. Click **Next**. Prerequisite tests run.
   If the server fails any noncritical tests, the **Prerequisite Check Warning** message opens.
8. If the **Prerequisite Check Warning** message opens, review the test results:
   a. Correct problems now or wait until the program finishes.
   b. Click **OK** to close the message.
9. Click **Next**.
   The **Choose Install Folder** screen opens.
10. (Optional) Click **Choose** to change the program installation location when prompted or enter a new path manually.
11. Click **Next**. The **Pre-Installation Summary** screen opens.
12. Review the pre-installation information, then click **Next**.
    The **Installing NFA** screen opens and installation starts. Once installation starts, you cannot cancel it.
    When the program finishes, the **Install Complete** screen opens and reports any errors.
13. (Optional) If errors occurred, see the installation log:
    install_path`\NFA_Install_<`*timestamp*`>.log`
14. Exit from the installation program:
    a. Select one of the restart options:
       - **Yes, restart my system**: Restart the system when you click **Done**.
       - **No, I will restart my system myself**: Defer the restart to be performed manually.
    b. Click **Done**.
       The installation program closes. If you selected the option to restart now, the system restarts and the installation is finalized.

Next: Complete the following:

- Initial configuration
- Post-installation tasks

Install Performance Center

Your deployment can include either CA Performance Center or CA NetQoS Performance Center, but it is not required. After you install DX NetOps, you would register it as a data source in the Performance Center Console. You use the Performance Center Console to perform certain administrative tasks. You also use it to view DX NetOps data next to data

from other data sources. Until you register the product as a data source, some of the function links on the **Administration** page are disabled.

Verify that you have one of the following programs installed:

- Compatibility Matrix , installed on a Linux server that does not have a Harvester installed, or
- CA NetQoS Performance Center 6.2, installed on a server that is running Windows Server 2008 R2 Standard edition

You cannot co-locate CA Performance Center or CA NetQoS Performance Center with the current release of any DX NetOps component or CA Anomaly Detector.
If you uninstall DX NetOps from a server that has any related software installed, the related software is disabled.

See the documentation for your Performance Center type for information on installation.

NOTE

More information:

- CA Performance Management

Install Flow Cloner

Once you have the Flow Cloner installed and configured, the flows going to the Harvester are forwarded whenever the CA NFA Flow Cloner service is running. The service starts by default whenever the server is rebooted. You can change this setting to run the service on demand. The configuration file must identify at least one destination IP address or the service will not start.

Install the Flow Cloner on the Harvester server in a distributed deployment or on the single server in a stand-alone deployment.

NOTE
The Flow Cloner has not affected Harvester performance significantly during testing. If you use the Flow Cloner on a high-flow Harvester server, we recommend monitoring performance.

Prerequisites

Before you install the Flow Cloner, verify that your installation server meets the following prerequisites:

- The server is configured and installed or upgraded.
- The server already has software installed and configured to act as one of the following components:
  - Windows Harvester server in a DX NetOps distributed deployment
  - Single server in a stand-alone deployment.
- The server has at least 12.8 MB of disk space available on the target drive for the Flow Cloner.
- You exited from all other programs.
- No other user is logged in to the server.

Installing Flow Cloner

Follow these steps:

1. Log in to the Windows-based Harvester installation server as a user with administrator privileges.
   The installation server must have the DX NetOps Harvester software installed.
2. Locate the installation program file: *install_path*\setup\FlowClonerSetupx.x.x.exe .
3. Start the installation program: For example, double-click the FlowClonerSetupx.x.x.exe file in Windows Explorer.
4. Click **Next** in the **Welcome** screen that opens.
   The **Pre-Installation Summary** screen opens and shows the installation path and disk space requirements. The Flow Cloner will be installed in the same root installation directory that is used for the Harvester or stand-alone software.

5. Click **Install**.
   The **Install Complete** screen opens when the installation is complete.
6. Click **Done**.
   The installation program closes. An installation log file named `FlowCloner_Install_<timestamp>.log` is created in the root installation directory.

Configuring Flow Cloner Options

To configure the Flow Cloner, modify its default initialization (`.ini`) file. The `.ini` file contains a header line followed by a line for each destination host (each host that will receive the cloned packets). You must specify at least one destination host. If you do not specify values for the header fields, the default values are used.

Follow these steps:

1. Log in to the Flow Cloner installation server as a user who has administrator privileges.
2. Open the following file in a text editor: *install_path*`\Netflow\FlowCloner\flowclonedef.ini`
   The `.ini` file has a header line followed by a line for each host that will receive packets.
3. Customize the header line:
   The header content must be contained in the first non-commented and non-blank single line in the file.
   – To use the default value for the input NIC, replace the entire header line with the following token:

     ```
     /use defaults
     ```

     You can follow the `/use defaults` token with a comment, as shown in the following example:

     ```
     /
     use defaults ; use first available NIC and port 9995 to listen and send flows on the first
     ```

     The program uses the first available NIC. The hosts listen for the original flows and cloned flows on port UDP 9995. The `/use defaults` token takes effect only if the header does not contain any other tokens.
   – (Optional) To specify the listening port, enter the `/port= token` , followed by the port number. The Harvester that receives the original flows listens on UDP 9995 unless you use the `/port` token to specify a different port.
     Default: UDP 9995
   – (Optional) To specify the destination port, enter the `/dest port= token` , followed by the port number. The hosts that receive the cloned flows listen on UDP 9995 unless you use the /dest port token to specify a different port. All of the hosts listen for the cloned flows on the same port.
     Default: UDP 9995
   – (Optional) To specify the Input NIC, enter the `/listen ip= token` , followed by the IP address for the NIC on which the Flow Cloner listens for packets.
     Default: First functional IP address of the host
4. Specify one or more hosts that will receive the cloned packets:
   Enter each host on a separate line, which consists of the `dest ip= token` and IP address of the destination host. You can put the destination host lines in any order.
   Example:

   ```
   /dest ip=10.0.0.100 ; send cloned packets to 10.0.0.100
   ```

   If the IP address is missing, the line is ignored.
5. Save and close the `FlowCloneDef.ini` file.
6. Start the CA NFA Flow Cloner service on the Harvester server.

The Flow Cloner is enabled and attempts to forward packets to each valid destination that you specified. Flow cloning continues until you stop the CA NFA Flow Cloner service manually.
The CA NFA Flow Cloner service is configured to start automatically on reboot and start sending cloned flow data. To operate the Flow Cloner only on demand, change this configuration in the **Services** window. The service can run only if the configuration file identifies at least one destination IP address.

NOTE

More information:

Flow Cloner Configuration Files

Initial Configuration

After the DX NetOps software is installed, some configuration is needed. The articles that follow provide information to help you with the initial configuration.

Generate or Configure Certificates for Use by CA Network Flow Analysis

DX NetOps (CA NFA) can be configured to use X.509 certificates to enable various levels of secure transport across the product. The NFA Console software includes the `openssl` command-line utility that can be used to:

- Generate certificate signing requests
- Sign certificates (either self-signing or acting as a Certificate Authority (*CA*))
- Manage certificate storage

Regardless of what types of security you are configuring, you can use the `openssl` tool to fulfill your certificate management needs.

We recommend obtaining certificates for use with DX NetOps from your trusted Certificate Authority. If you choose not to use certificates signed by a trusted Certificate Authority, follow these instructions to generate your own certificates for use with CA NFA.

The general procedure involves:

1. Creating a certificate on the NFA Console server that acts as a Certificate Authority certificate.
2. Using that certificate to sign certificates that are generated for the NFA Console and for each Harvester in your deployment.

Follow these steps:

On the Console:

WARNING

- The `openssl req -new` command asks you to enter information to incorporate into the certificate request. The **Common Name** must be unique in each request.
- The number you use as the argument for `-set_serial` in the `openssl x509` commands (generating a certificate signed by the console acting as a *CA*) must be unique in each request.

1. Create a directory named *install_path*`\certs` for storing certificates and certificate stores.
   Execute the commands in the following steps from this directory.
2. Set the `OPENSSL_CONF` environment variable for the `openssl` configuration file.
   ```
   set OPENSSL_CONF=install_path\Tools\openssl\bin\openssl.cfg
   ```

3. Use `openssl` to generate a self-signed certificate. This certificate acts as the certificate authority (*CA*) certificate for the console and for all harvesters. The `openssl` command can be found on the NFA Console, in the *`install_path`*`\tools\openssl\bin` directory.
   a. Generate the private key:
      ```
      openssl genrsa -des3 -out nfa-ca-key.pem 2048
      ```
   b. Generate a Certificate Signing Request:
      ```
      openssl req -new -key nfa-ca-key.pem -out nfa-ca.csr
      ```
   c. Remove passphrase from the private key:
      ```
      copy nfa-ca-key.pem nfa-ca-key.pem.orig
      openssl rsa -in nfa-ca-key.pem.orig -out nfa-ca-key.pem
      ```
   d. Generate the self-signed certificate:
      ```
      openssl x509 -req -days 1825 -in nfa-ca.csr -signkey nfa-ca-key.pem -out nfa-ca-cert.pem
      ```
4. Use `openssl` to generate a new certificate for the console, signed by the *CA* certificate you just generated.
   a. Generate the private key:
      ```
      openssl genrsa -des3 -out nfa-console-key.pem 2048
      ```
   b. Generate a Certificate Signing Request:
      ```
      openssl req -new -key nfa-console-key.pem -out nfa-console.csr
      ```
   c. Remove passphrase from the private key:
      ```
      copy nfa-console-key.pem nfa-console-key.pem.orig
      openssl rsa -in nfa-console-key.pem.orig -out nfa-console-key.pem
      ```
   d. Generate a certificate signed by the console acting as a *CA*:
      ```
      openssl x509 -req -days 1825 -in nfa-console.csr -CA nfa-ca-cert.pem -CAkey nfa-ca-key.pem -set_serial
       <unique_num> -out nfa-console-cert.pem
      ```
5. Use `openssl` to generate a PKCS12 keystore that contains both the *CA* certificate and the console certificate that is signed by the *CA* certificate.
   a. Generate keystore with console private key and console certificate:
      ```
      openssl pkcs12 -export -in nfa-console-cert.pem -inkey nfa-console-key.pem -out nfa-console-
      keystore.pfx
      ```
   b. Generate truststore with console certificate and *CA* certificate:
      ```
      openssl pkcs12 -export -in nfa-console-cert.pem -inkey nfa-console-key.pem -certfile nfa-ca-cert.pem -
      out nfa-console-truststore.pfx
      ```
6. Use `openssl` to generate a new certificate signed by the *CA* for each Harvester.
   a. Generate private key:
      ```
      openssl genrsa -des3 -out nfa-harvester-key.pem 2048
      ```
   b. Generate a Certificate Signing Request:
      ```
      openssl req -new -key nfa-harvester-key.pem -out nfa-harvester.csr
      ```
   c. Remove passphrase from private key:
      ```
      copy nfa-harvester-key.pem nfa-harvester-key.pem.orig
      openssl rsa -in nfa-harvester-key.pem.orig -out nfa-harvester-key.pem
      ```
   d. Generate a certificate signed by the console acting as a CA:
      ```
      openssl x509 -req -days 1825 -in nfa-harvester.csr -CA nfa-ca-cert.pem -CAkey nfa-ca-key.pem -
      set_serial <unique_num> -out nfa-harvester-cert.pem
      ```
7. Use `openssl` to generate a pkcs12 keystore and truststore that contains both the *CA* certificate and the harvester certificate that is signed by the *CA* certificate for each Harvester.
   a. Generate the keystore with harvester private key and harvester certificate:
      ```
      openssl pkcs12 -export -in nfa-harvester-cert.pem -inkey nfa-harvester-key.pem -out nfa-harvester-
      keystore.pfx
      ```
   b. Generate the truststore with harvester certificate and *CA* certificate:

```
openssl pkcs12 -export -in nfa-harvester-cert.pem -inkey nfa-harvester-key.pem -certfile nfa-ca-cert.pem -out nfa-harvester-truststore.pfx
```

8. Verify that the certificates created are without errors.

```
openssl verify -CAfile nfa-ca-cert.pem nfa-console-cert.pem nfa-harvester-cert.pem
```

On each Harvester:

1. Create a directory named *install_path*\certs for storing certificates and certificate stores.
2. Copy the *CA* certificate file and the Harvester certificate files and stores (keystore and truststore) to the certs directory created in step 1.

NOTE
If you are using certificates signed by an actual Certificate Authority, you can use these steps to generate the required *.pfx files in the *install_path*\certs directory. Place copies of your certificate and private key files in pem format in the *install_path*\certs directory. The *.pfx and *.pem files are required for securing DX NetOps.

Enable HTTPS for CA Network Flow Analysis

DX NetOps (CA NFA) can be configured for secure communication through the web interface.

NOTE

Some of the following settings might be available during an upgrade.

Prerequisites

Create the required certificate files using the procedure in

Generate or Configure Certificates for Use by CA Network Flow Analysis

Enable HTTPS on the Console

Follow these steps:

1. Install the *CA* certificate (generated as a prerequisite) as a trusted Certificate Authority (*CA*) for your server.
   a. Double-click the nfa-console-truststore.pfx .

b. Run the import wizard to import the certificate as trusted by the local machine.

NOTE
More information:

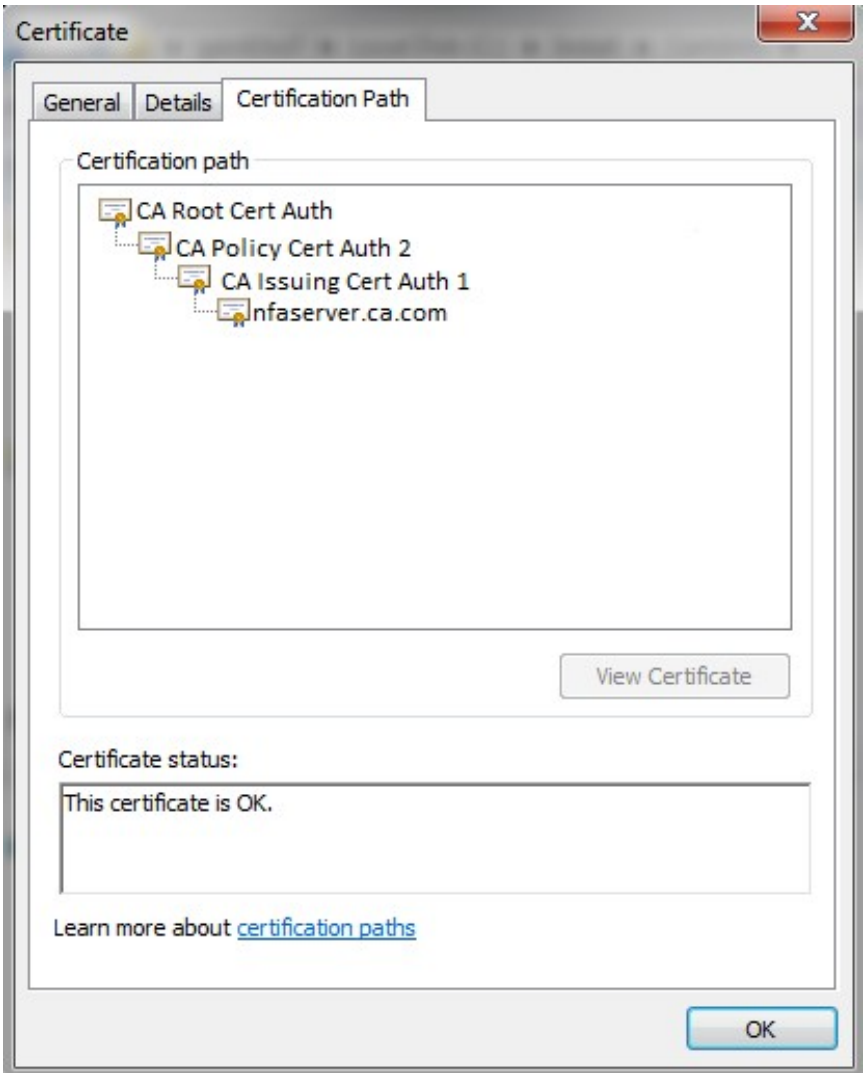
See "To import a certificate" in How to Use the Certificates Console

2. Install the Console SSL certificate.
   a. Install a signed certificate in IIS Manager Server Certificates.
      a. In the **Internet Information Service (IIS) Manager**, go to the **Features** view.
      b. Open **Server Certificates**.
      c. Under **Actions**, click **Import** to import the `nfa-console-keystore.pfx` file.

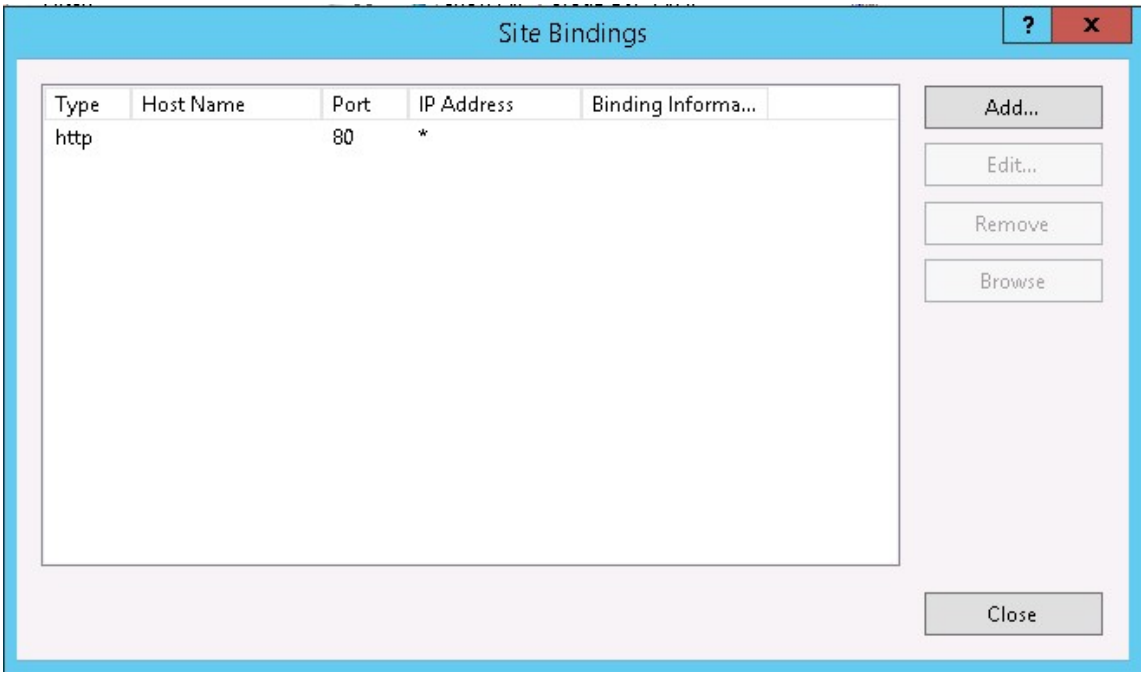
NOTE
More information:

Install an Internet Server Certificate

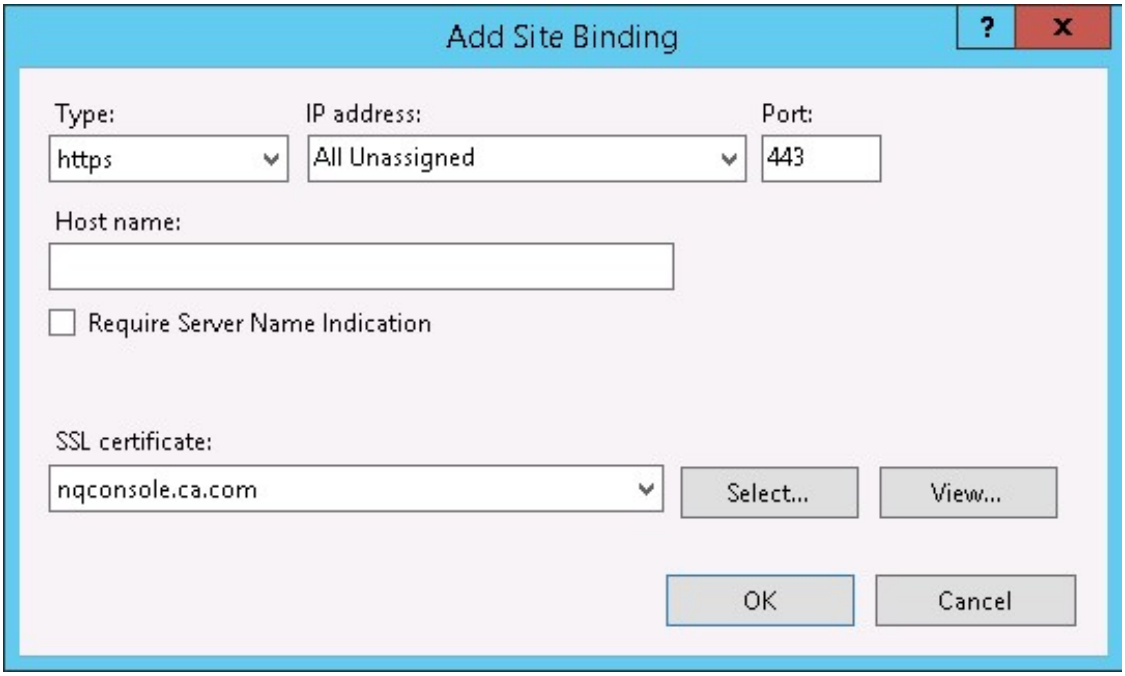
   b. To confirm that the certificate is properly installed, open the certificate and select the **Certification Path** tab. Select each certificate displayed in the Certification path and check that the **Certificate status** field shows “This certificate is OK”. Contact the certificate provider if **Certificate status** field displays errors.



3. Configure the HTTPS port IIS Application. By default, IIS does not have a binding for HTTPS.
   a. In the **Internet Information Services (IIS) Manager**, navigate to the **Default Website**.
   b. Under **Actions**, click **Bindings**.
   c. In the **Site Bindings** dialog, click **Add**.



d. Select the signed certificate from the **SSL certificate** list.



WARNING
Do not disable http-port 80 binding. DX NetOps will not work properly if http is disabled.

4. Edit the product configuration XML file.
   install_path\Portal\SSO\webapps\sso\configuration\ReporterAnalyzer.xml
   a. In the `SignInPageProductDefaultUrl` section, change `Scheme` from http to https.
   b. Enter 443 for the `Port` (blank by default).
   Example:

```
<?xml version="1.0" encoding="utf-8" ?>
```

```
<Configuration>
      <SingleSignOnEnabled>True</SingleSignOnEnabled>
      <SingleSignOnProductCode>ra</SingleSignOnProductCode>
      <SignInPageProductTitle><![CDATA[NetQoS<sup><font class="Superscript">®</font></sup>
       ReporterAnalyzer<sup><font class="Superscript">™</font></sup>]] ></SignInPageProductTitle>
      <SignInPageProductDescription>Network Traffic Analysis</SignInPageProductDescription>
      <SignInPageProductDefaultUrl>
        <Scheme>https</Scheme>
        <Port>443</Port>
        <PathAndQuery>/ra/default.aspx</PathAndQuery>
      </SignInPageProductDefaultUrl>
      <SingleSignOnWebServiceUrl>
        <Scheme>http</Scheme>
        <Port></Port>
        <PathAndQuery>/ReporterDataSource/SingleSignOnWS.asmx</PathAndQuery>
      </SingleSignOnWebServiceUrl>
</Configuration>
```

5. Configure Single Sign-On SSL scheme and port.
   Run *install_path*\Portal\sso\bin\SsoConfig.exe

```

Enter q to quit SsoConfig
```

6. Backup and edit the SSO `start.ini` file.
   Edit *install_path*`\Portal\SSO\start.ini`.
   a. Uncomment the `--module=ssl` line so that it is active:
      `--module=ssl`
   b. Modify the `--module=http` line to be https:
      `--module=https`
7. Configure the SSO `jetty-https.xml`, `jetty-ssl.xml`, and `jetty-ssl-context.xml` files.
   a. Copy the `jetty-https.xml` template from
      install_path`\Portal\Jetty\etc\jetty-https.xml`
      to
      install_path`\Portal\SSO\etc\jetty-https.xml`
   b. Copy the `jetty-ssl.xml` template from
      install_path`\Portal\Jetty\etc\jetty-ssl.xml` to

      install_path`\Portal\SSO\etc\jetty-ssl.xml`
   c. Copy the `jetty-ssl-context.xml` template from
      install_path`\Portal\Jetty\etc\jetty-ssl-context.xml` to

install_path\Portal\SSO\etc\jetty-ssl-context.xml

d. Edit *install_path*\Portal\SSO\etc\jetty-ssl.xml .
In the addConnector section, set the port to 8382.

```
<Set name="port">8382</Set>
```

e. Edit *install_path*\Portal\SSO\etc\jetty-ssl-context.xml .
Edit the sslContextFactory section to contain the following lines.

```
<Set name="KeyStorePath">install_path/certs/nfa-console-keystore.pfx</Set>

<Set name="KeyStorePassword">yourkeypassword</Set>

<Set name="KeyStoreType">pkcs12</Set>

<Set name="KeyStoreProvider"><Property name="jetty.sslContext.keyStoreProvider"/
></Set>

<Set name="KeyManagerPassword">yourkeypassword</Set>

<Set name="TrustStorePath">install_path/certs/nfa-console-truststore.pfx</Set>

<Set name="TrustStorePassword">yourkeypassword</Set>

<Set name="TrustStoreType">pkcs12</Set>
```

NOTE

Use the keystore/truststore password created in Generate or Configure Certificates for Use by CA Network Flow Analysis for both the KeyStorePassword and TrustStorePassword .

8. Reboot the NFA Console to apply the changes.
9. Confirm that you can access the NFA Console using https.

Enable TLS for MYSQL Connections

NOTE

This section is applicable only to secure MYSQL communication.

Transport Layer Security (TLS) is a cryptographic protocol that provides communications security over a network.

MySQL performs encryption on a per-connection basis. With MySQL 5.7.22, TLS 1.2 is supported both for the database and for connections into the database.

Prerequisites

Before enabling TLS, create the required certificate files.

- Generate or Configure Certificates for Use by CA Network Flow Analysis

Enable TLS on a Standalone System

Follow these steps:

1. Edit *install_path*\MySql\my.ini and uncomment these lines:
   ```
   require_secure_transport=true
   tls_version=TLSv1,TLSv1.1,TLSv1.2
   ssl-ca=install_path/certs/nfa-ca-cert.pem
   ssl-cert=install_path/certs/nfa-console-cert.pem
   ssl-key=install_path/certs/nfa-console-key.pem
   ```
   Edit all occurrences of these lines. Use appropriate names for the *.pem files, and restrict the versions of TLS by removing those you do not wish to allow.
2. Change the ReporterAnalyzerWebSite Application Pool settings.
   a. Open **Internet Information Services (IIS) Manager**, select **Sites**, **Default Web Site**.
   b. Click **Basic Settings** in the Actions pane.
   The Edit Site window appears.
   c. Click **Test Settings** to verify the site connection.
   After the connection is successful, exit the Site Connection.

      NOTE

      If the connection is unsuccessful, follow the below steps **(step d - step h)**.
   d. Click **Connect as...** on the **Edit Site** window.
   The Connect As window appears.
   e. Select the **Specific user**, and click **Set** to enter the username and password.
   f. Click **OK** and exit the site connection.
   g. Click **Restart for Default Web Site**.
   h. Click **Ok**.
3. Edit *install_path*\Netflow\bin\netqosmy.ini and uncomment these lines:
   ```
   require_secure_transport=true
   tls_version=TLSv1,TLSv1.1,TLSv1.2
   ssl-ca=install_path/certs/nfa-ca-cert.pem
   ssl-cert=install_path/certs/nfa-console-cert.pem
   ssl-key=install_path/certs/nfa-console-key.pem
   ```
4. Edit all occurrences of these lines. Use appropriate names for the *.pem files, and restrict the versions of TLS by removing those you do not wish to allow.
5. Edit *install_path*\DBUsers\ReporterAnalyzer.ini :
   a. Everywhere requireSSL is set to false, set it to true.
   b. Make sure the keystore property points to the keystore created in:
   Generate or Configure Certificates for Use by CA Network Flow Analysis
   Use the same pkcs12 store for all, for example:
   install_path/certs/nfa-console-keystore.pfx
   c. Make sure the truststore property points to the truststore created in:

Generate or Configure Certificates for Use by CA Network Flow Analysis
Use the same pkcs12 store for all, for example:
install_path/certs/nfa-console-truststore.pfx

d. Set thekeystore/truststorepassword properties to the password used to generate them.
e. Set `SslCa` to the *install_path*/certs/ `nfa-ca-cert.pem` file.
f. Set `SslCert` to the *install_path*/certs/nfa-console-cert.pem file.
g. Set `SslKey` to the *install_path*/certs/nfa-console-key.pem file.

6. Restart the following services in this order.
   - CA MySql
   - NetQoS NQMySql
   - CA NFA Harvester
   - CA NFA Collection and Poller Webservices
   - CA NFA Data Retention
   - CA NFA DNS/SNMP Proxies
   - CA NFA File Server
   - CA NFA Poller
   - CA NFA Reaper

Enable TLS on a Distributed System

Follow these steps:

On the Console

1. Edit *install_path*\MySql\my.ini and uncomment these lines:

```
require_secure_transport=true
tls_version=TLSv1,TLSv1.1,TLSv1.2
ssl-ca=install_path/certs/nfa-ca-cert.pem
ssl-cert=install_path/certs/nfa-console-cert.pem
ssl-key=install_path/certs/nfa-console-key.pem
```

   Edit all occurrences of these lines. Use appropriate names for the `*.pem` files, and restrict the versions of TLS by removing those you do not wish to allow.
2. CChange the ReporterAnalyzerWebSite Application Pool settings.
   a. Open **Internet Information Services (IIS) Manager**, select **Sites**, **Default Web Site**.
   b. Click **Basic Settings** in the Actions pane.
   The Edit Site window appears.
   c. Click **Test Settings** to verify the site connection.
   After the connection is successful, exit the Site Connection.

      NOTE

      If the connection is unsuccessful, follow the below steps **(step d - step h)**.

   d. Click **Connect as...** on the **Edit Site** window.
   The Connect As window appears.
   e. Select the **Specific user**, and click **Set** to enter the username and password.
   f. Click **OK** and exit the site connection.
   g. Click **Restart for Default Web Site**.
   h. Click **Ok**.
3. Reboot the server to restart all services.

On the Harvester

1. Edit *install_path*\MySql\my.ini (or my.cnf on Linux) and uncomment these lines:

   ```
   require_secure_transport=true

   tls_version=TLSv1,TLSv1.1,TLSv1.2

   ssl-ca=install_path/certs/nfa-ca-cert.pem

   ssl-cert=install_path/certs/nfa-harvester-cert.pem

   ssl-key=install_path/certs/nfa-harvester-key.pem
   ```

   Edit all occurrences of these lines. Use appropriate names for the *.pem files, and restrict the versions of TLS by removing those you do not wish to allow.
2. Edit *install_path*\Netflow\bin\netqosmy.ini (or Netflow/my.cnf on Linux) and uncomment these lines:

   ```
   require_secure_transport=true
   tls_version=TLSv1,TLSv1.1,TLSv1.2
   ssl-ca=install_path/certs/nfa-ca-cert.pem
   ssl-cert=install_path/certs/nfa-harvester-cert.pem
   ssl-key=install_path/certs/nfa-harvester-key.pem
   ```

   Edit all occurrences of these lines. Use appropriate names for the *.pem files, and restrict the versions of TLS by removing those you do not wish to allow.
3. Edit *install_path*\DBUsers\ReporterAnalyzer.ini :
   a. Everywhere requireSSL is set to false, set it to true.
   b. Make sure the keystore property points to the keystore created in:
   Generate or Configure Certificates for Use by CA Network Flow Analysis
   Use the same pkcs12 store for all, for example:
   install_path/certs/nfa-harvester-keystore.pfx
   c. Make sure the truststore property points to the truststore created in:
   Generate or Configure Certificates for Use by CA Network Flow Analysis
   Use the same pkcs12 store for all, for example:
   install_path/certs/nfa-harvester-truststore.pfx
   d. Set the keystore/truststore password properties to the password used to generate them.
   e. Set SslCa to the *install_path*/certs/ nfa-ca-cert.pem file.
   f. Set SslCert to the *install_path*/certs/nfa-harvester-cert.pem file.
   g. Set SslKey to the *install_path*/certs/nfa-harvester-key.pem file.
4. Restart the following services in this order.
   – CA MySql
   – NetQoS NQMySql
   – CA NFA Harvester
   – CA NFA Collection and Poller Webservices
   – CA NFA Data Retention
   – CA NFA DNS/SNMP Proxies
   – CA NFA File Server
   – CA NFA Poller
   – CA NFA Reaper

Enable TLS 1.2 for HTTPS Connection

Transport Layer Security (TLS) is a cryptographic protocol that provides communications security over a network.

Prerequisites

Create the required certificate files before enabling TLS.

- Generate or Configure Certificates for Use by CA Network Flow Analysis

Follow these steps:

> **NOTE**
>
> Ensure that you follow these steps properly or you might lose the RDP connection.

1. Run gpedit.msc from the NFA installed system.
2. Navigate to Computer Configuration, Administrative Templates, Windows Components, Remote Desktop Services, Remote Desktop Session Host, Security.
3. Double click **Require use of specific security layer for remote (RDP) connections.**
4. Click **Enabled**.
5. From the Security Layer drop-down list, select **Negotiate.**
6. Click **OK**.
7. Back up the registry and create the following registry for TLS 1.0 and TLS 1.1:
   a. Key: HKLM SYSTEM\CurrentControlSet\Control\SecurityProviders\SCHANNEL\Protocols\TLS 1.0\Server
      Value: Enabled
      Value type: REG_DWORD
      Value Data: 0
   b. Key: HKLM SYSTEM\CurrentControlSet\Control\SecurityProviders\SCHANNEL\Protocols\TLS 1.1\Server
      Value: Enabled
      Value type: REG_DWORD
      Value Data: 0
8. Navigate to the *install_path\Portal\SSO\etc*.
9. Edit the *jetty-ssl-context.xml* file and add the following lines after tag *<Set name="ExcludeCipherSuites">.*

```
<Set>

.

.

<Array type="String">
 <Item>SSL_RSA_WITH_DES_CBC_SHA</Item>
 <Item>SSL_DHE_RSA_WITH_DES_CBC_SHA</Item>
 <Item>SSL_DHE_DSS_WITH_DES_CBC_SHA</Item>
 <Item>SSL_RSA_EXPORT_WITH_RC4_40_MD5</Item>
 <Item>SSL_RSA_EXPORT_WITH_DES40_CBC_SHA</Item>
 <Item>SSL_DHE_RSA_EXPORT_WITH_DES40_CBC_SHA</Item>
 <Item>SSL_DHE_DSS_EXPORT_WITH_DES40_CBC_SHA</Item>
 <Item>SSL_RSA_WITH_RC4_128_MD5</Item>
 <Item>TLS_RSA_WITH_RC4_128_MD5</Item>
 <Item>TLS_RSA_WITH_RC4_128_SHA</Item>
```

```
 <Item>SSL_RSA_WITH_RC4_128_SHA</Item>
 <Item>TLS_ECDHE_RSA_WITH_RC4_128_SHA</Item>
 <Item>SSL_ECDHE_RSA_WITH_RC4_128_SHA</Item>
 <Item>SSL_DHE_RSA_WITH_3DES_EDE_CBC_SHA</Item>
 <Item>TLS_DHE_RSA_WITH_AES_128_CBC_SHA</Item>
 <Item>TLS_DHE_RSA_WITH_3DES_EDE_CBC_SHA</Item>
 <Item>TLS_DHE_RSA_WITH_AES_128_CBC_SHA256</Item>
 <Item>TLS_DHE_RSA_WITH_AES_128_GCM_SHA256</Item>
</Array>
</Set>
<!--<Get name="sslContextFactory">-->
    <Set name="excludeProtocols">
     <Array type="java.lang.String">
     <Item>SSL</Item>
     <Item>SSLv2</Item>
     <Item>SSLv2Hello</Item>
     <Item>SSLv3</Item>
     <Item>TLSv1</Item>
     <Item>TLSv1.1</Item>
     </Array>
    </Set>
```

NOTE

The following steps 10 and 11 are required only for CA PC integration using HTTPS or TLS.

10. Edit *install_path*/RIB/start.ini .
    a. Comment the following lines to disable HTTP communication.

    ```
    --module=http
    jetty.port=8681
    ```

    b. Uncomment the following lines and edit as necessary (the `keystore.password` and `keymanager.password` should be the same value) to enable https communication.

    ```
    --module=https
    jetty.keystore=install_path/certs/nfa-console-keystore.pfx
    jetty.keystore.password=somepassword
    jetty.keymanager.password=somepassword
    jetty.truststore=install_path/certs/nfa-console-truststore.pfx
    jetty.truststore.password=somepassword
    https.port=8681
    ```

11. Edit *install_path*/RIB/etc/jetty-ssl.xml , and perform the following:
    a. To restrict to only certain transport layer protocols, uncomment and edit the following before the closing configures tag (this restricts to only TLS 1.2):

    ```
    <Call name="addExcludeProtocols">

        <Arg>

         <Array type="java.lang.String">
    ```

```
        <Item>SSL</Item>

        <Item>SSLv2</Item>

        <Item>SSLv2Hello</Item>

        <Item>SSLv3</Item>

        <Item>TLSv1</Item>

        <Item>TLSv1.1</Item>

      </Array>

     </Arg>

  </Call>
```

b. To exclude the ciphers, add the following lines after <*Set name="ExcludeCipherSuites"*> tag:

```
<Set>

  <Array type="String">

     <Item>SSL_RSA_WITH_DES_CBC_SHA</Item>

     <Item>SSL_DHE_RSA_WITH_DES_CBC_SHA</Item>

     <Item>SSL_DHE_DSS_WITH_DES_CBC_SHA</Item>

     <Item>SSL_RSA_EXPORT_WITH_RC4_40_MD5</Item>

     <Item>SSL_RSA_EXPORT_WITH_DES40_CBC_SHA</Item>

     <Item>SSL_DHE_RSA_EXPORT_WITH_DES40_CBC_SHA</Item>

     <Item>SSL_DHE_DSS_EXPORT_WITH_DES40_CBC_SHA</Item>

  <Item>SSL_RSA_WITH_RC4_128_MD5</Item>

  <Item>TLS_RSA_WITH_RC4_128_MD5</Item>

  <Item>TLS_RSA_WITH_RC4_128_SHA</Item>

  <Item>SSL_RSA_WITH_RC4_128_SHA</Item>
  <Item>TLS_ECDHE_RSA_WITH_RC4_128_SHA</Item>

  <Item>SSL_ECDHE_RSA_WITH_RC4_128_SHA</Item>
```

```
<Item>SSL_DHE_RSA_WITH_3DES_EDE_CBC_SHA</Item>

<Item>TLS_DHE_RSA_WITH_AES_128_CBC_SHA</Item>

<Item>TLS_DHE_RSA_WITH_3DES_EDE_CBC_SHA</Item>

<Item>TLS_DHE_RSA_WITH_AES_128_CBC_SHA256</Item>

<Item>TLS_DHE_RSA_WITH_AES_128_GCM_SHA256</Item>

  </Array>

</Set>
```

12. Confirm that ports 8382 and 8681 are open if firewalls are enabled.
13. Restart the following services in this order.
    - CA MySQL
    - NetQoS NQMySql
    - CA NFA Harvester
    - CA NFA Collection and Poller Webservices
    - CA NFA Data Retention
    - CA NFA DNS/SNMP Proxies
    - CA NFA File Server
    - CA NFA Poller
    - CA NFA Reaper

Security Settings for Protection Against BEAST and Weak Diffie-Hellman Moduli

This section describes how to protect the system from the following security attacks are identified:

- Information potentially disclosed due to weak Diffie-Hellman moduli
- Eavesdropping possible due to support of RC4 cipher

To protect the system from these security attacks, add the following to the registry:

```
[HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\SecurityProviders\SCHANNEL\Ciphers
\RC4 128/128]

"Enabled"=dword:00000000

[HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\SecurityProviders\SCHANNEL\Ciphers
\RC4 40/128]

"Enabled"=dword:00000000

[HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\SecurityProviders\SCHANNEL\Ciphers
\RC4 56/128]

"Enabled"=dword:00000000
```

```
[HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\SecurityProviders\SCHANNEL
\KeyExchangeAlgorithms\Diffie-Hellman]

"ServerMinKeyBitLength"=dword:0x00000800
```

AWS VPC for CA Network Flow Analysis

The current release of DX NetOps lets you view the following Amazon Web Services virtual private cloud network traffic flow reports:

- Source and destination IPv4 address
- Source and destination ports
- Protocols used
- Bytes and packets transferred

NOTE

Configure only one Harvester per VNA plug-in to collect the data from CA VNA. In the hybrid network, ensure that the IP address is unique and different from the IP address used in the cloud.

Prerequisites

Ensure that the CA Virtual Network Assurance and AWS plug-in is installed. Also, ensure that you can connect to the CA VNA server from your CA NFA instance. You can enable AWS VPC for CA Network Flow Analysis only on Windows.

Configure AWS VNA plug-in

Set up the connection from your CA NFA to the CA VNA, to enable communication between the two servers. The CA NFA uses the connection to fetch the network traffic flow reports. Perform the following steps on the CA NFA Harvester.

Follow these steps:

1. Open the `vnadatacollector.properties` file that is located at the `C:\CA\NFA\Netflow\bin` directory.
2. Add the values for the following properties:
   VNAIPAddress
   specifies the IP address of the VNA server
   VNAPort
   Specifies the port of the VNA server
3. Save and close the file.
4. Start the `CA NFA VnaDataCollector` service.

   NOTE
   By default, the `CA NFA VnaDataCollector` service is in Stopped state.

Configure Single Sign-On

Unsecured

The Single Sign-On tool authenticates you at start-up so you can log in once and can use several related products without logging in again. If you log in to CA Performance Center, for example, you can jump to information in DX NetOps without logging in again.

Single Sign-On is installed automatically when you install DX NetOps.

Notes:

- The Single Sign-On tool uses Lightweight Directory Access Protocol (LDAP) if LDAP is set up. The Single Sign-On tool does not use LDAP by default.
- For more information about configuring the Single Sign-On tool for LDAP authentication and other options, see Single Sign-On in the CA Performance Management documentation.

Secured

If you need to enable secure communication between CA Performance Center (CA PC) and DX NetOps (CA NFA) in your environment, complete the following tasks (in order):

1. Generate or Configure Certificates for Use by CA Network Flow Analysis
2. Enable TLS 1.2 for HTTPS Connection
3. Enable HTTPS for CA Network Flow Analysis

After completing these tasks, complete the steps in Set Up HTTPS for CA Single Sign-On . Prior to configuring CA NFA as a data source in CA PC, you will need to establish a trust relationship between CA PC and the NFA Console. This can be accomplished either by importing the “official” Certificate Authority certificate in use in your environment into the CA PC trust store, or by importing the CA NFA Certificate Authority certificate generated in item 1 (above) into the CA PC trust store.

Follow these steps:

1. Copy the certificate (`nfa-ca-cert.pem` in this example) to the CA PC server.
2. Run the `keytool` command to import the certificate.
   ```
   <CAPC_install_dir>/jre/bin/keytool -import -alias <some_alias> -trustcacerts -file nfa-ca-cert.pem -
   keystore <CAPC_install_dir>/jre/lib/security/cacerts
   ```
3. Run the `keytool` command to verify/print the newly imported certificate(s).
   ```
   <CAPC_install_dir>/jre/bin/keytool -list -keystore <CAPC_install_dir>/jre/lib/security/cacerts | grep -i
    <some_alias>
   ```
4. Configure DX NetOps as a data source in CA PC, making sure to choose https as the protocol.
   See the CA PC documentation for details.

Configure the Product to Work with Performance Center

Some essential administration tasks may be performed in either Performance Center or the NFA console.

Configuring Using Performance Center

To configure DX NetOps properly in Performance Center (either CA Performance Center or CA NetQoS Performance Center), perform the following tasks:

- Register the product as a data source for Performance Center.
- Set up the following elements in the Performance Center console:

  - SNMP profiles
  - (*Optional*) IP domains
  - User accounts, permissions, and roles
  - (*Recommended*) Groups
- Configure flow collection
  - Add Harvesters.
  - Enable the routers and interfaces to export flows.
- (*Optional*) Configure traps.
- (*Optional*) Verify that DX NetOps is receiving data.

Once you register the product and complete the administration tasks, operators can see meaningful reports in the NFA console and in the Performance Center console.

Register CA Network Flow Analysis

Register the product in the Performance Center Console, on the **Manage Data Sources** page (CA PC) or the **Data Source List** page (NPC).

> **NOTE**
> For information about the number of data sources that you can use, see the *Release Notes* for your Performance Center version.

Follow these steps:

1. Verify that no one else is running a session of DX NetOps. If multiple users write to the database simultaneously, problems can result.
2. Log in to the Performance Center Console as a user who has the Administrator role.
3. Click **Admin**, **Data Sources**.
   The current list of registered data sources are shown on the **Manage Data Sources** page (CA PC) or the **Data Source List** page (NPC).
4. Click **Add** (CA PC) or **New** (NPC).
   The **Add Data Source** dialog opens.
5. Select the type of data source you want to add from the **Source Type** list.

   > **NOTE**
   > All CA products that can be registered as data sources are shown in the **Source Type** list. The list is not filtered to hide products that are installed already.
6. Enter the **Host Name** of the data source.
   The hostname is the IP address or DNS hostname of the server that hosts the database for the data source. For a distributed deployment of the product, enter the hostname of the NFA console or stand-alone server.
7. Enter the port to use for contacting DX NetOps.
   For more information about the port setting, see Single Sign-On in the CA Performance Management documentation.
8. Select the protocol to use for contacting the data source. Select **https** if your network uses SSL for communications. Verify that you have configured the system correctly before you select the **https** option.

   > **NOTE**
   > For more information about using SSL for communication between the product and Performance Center, see Single Sign-On in the CA Performance Management documentation.
9. (Optional) Enter a **Display Name** for the DX NetOps data source.
   If you do not enter a name, a default name is created by combining the data source type and hostname. For example, you can use a default name like `NetworkFlowAnalysis@xxx.x.x.xx` or you can use a name like `NetworkFlowAnalysis_NewYork`.
10. Confirm whether the web console address is the same as the **Host Name**. If it is not, take the following steps:

- Clear the **Same as Data Source** check box.
- Provide the web console hostname, port, and protocol.

11. Click **Save**.
    The updated list shows the data sources that are registered.

Test Data Source Connections

In most cases, the status indicates that data source registration has completed successfully. If the status indicates an error, use the test feature on the **Manage Data Sources** page (CA PC) or **Data Source List** page (NPC).

The **Test** button initiates a test to confirm that a new data source is registered and connected correctly. The test checks for version compatibility and verifies that the data source is not registered with a different instance of the software.

If the test fails, verify that the DNS hostname or IP address of the data source server is correct.

Verify SNMP Profiles

DX NetOps sends secure SNMP information to Performance Center at registration. Subsequently, this information is transformed into SNMP profiles. *SNMP profiles* are definitions that contain the information necessary to enable secure queries of device MIBs using SNMP. Profile information is updated at each synchronization (every five minutes).

SNMP populates bandwidth, interface type, and router/interface description information.

During initial product setup, verify that the available SNMP profiles are adequate to monitor your environment. The available SNMP profiles are listed on the **Manage SNMP Profiles** page (CA PC) or **SNMP Profile List** page (NPC).

View the SNMP Profiles List

You can view a list of SNMP profiles that have already been defined. The list includes high-level information about the contents of each profile.

Tenant-Specific Profiles in CA Performance Center:

- If no tenant definitions have been created, the definitions in the **SNMP Profile List** are shared among all registered data sources. The global administrator sees a list of SNMP profiles that are not explicitly associated with a tenant.
- Tenant administrators only see the items that are associated with their tenant.

Follow these steps:

1. Log in as a user with the Administrator role.
2. Display the list of SNMP profiles:
   - CA PC: Select **Admin, System Settings: SNMP Profiles**.
   - NPC: Select **Admin, NetQoS Settings: SNMP Profiles**.

   The page displays the current list of SNMP profiles.
   The following information is listed for each profile:
   - **Order**
     Determines the order in which the secure information contained in an SNMP profile is used to try to query a selected device. If the query fails, the next profile is used, in priority order.
   - **Profile Name**
     Defines a name for the SNMP profile. Profile names must be unique, cannot be duplicated across SNMP versions, and are not case-sensitive.
   - **Port** (CA PC Only)
     Identifies the port that is used to make SNMP connections to devices.

Default: UDP 161.

- **SNMP Version**
  Specifies the version of SNMP that the profile uses. Because SNMPv1 and SNMPv2C are similar from a security standpoint, they share a single option. SNMPv3 is a separate option.
- **Authentication Protocol**
  (SNMPv3 Only) Specifies the authentication protocol to use when contacting devices associated with this profile. The following algorithms for authenticating SNMPv3 packets are supported:
  - **None** (do not attempt authentication)
  - **MD5** (Message Digest 5)
  - **SHA** (Secure Hash Algorithm)
- **Privacy Protocol**
  Identifies the encryption protocol that is used to contact associated devices, if any. Always **None** if no authorization protocol is in use.
- **Use by Default**
  Indicates whether the information in this profile is used when not explicitly assigned to a device. If disabled, this profile is excluded from discovery in data sources that support the exclusion of profiles.

To perform any action on this page, select a profile, then click a button.

Add SNMP Profiles

Administrators can create SNMP profiles in the Performance Center Console. You can create SNMPv1/v2C or SNMPv3 profiles.

Follow these steps:

1. Log in to the Performance Center Console as a user with the Administrator role.
2. Display the list of SNMP profiles:
   - CA PC: Select **Admin, System Settings: SNMP Profiles**.
   - NPC: Select **Admin, NetQoS Settings: SNMP Profiles**.

   The page displays the current list of SNMP profiles.
3. Click **New**.
   The **Add SNMP Profile** dialog opens.
4. Complete the fields and change default settings as needed. Some fields apply only to SNMPv3 or SNMPv1/v2C.
   - **Profile Name**
     Defines a name for the SNMP profile. Profile names must be unique, cannot be duplicated across SNMP versions, and are not case-sensitive.
   - **SNMP Version**
     Specifies the version of SNMP that the profile uses. Because SNMPv1 and SNMPv2C are similar from a security standpoint, they share a single option. SNMPv3 is a separate option.
   - **Port**
     (Optional for SNMPv1/v2C) Identifies the port that is used to make SNMP connections to devices associated with this profile.
     Default: UDP 161.
   - **User Name**
     (SNMPv3 Only) Identifies the user for the profile, whose secret keys were used potentially to authenticate and encrypt the SNMPv3 packets. The **User Name** is a character string.
   - **Context Name**
     (SNMPv3 Only) Specifies a collection of management information that is accessible by an SNMP entity. The **Context Name** is necessary for providing end-to-end identification and for retrieving data from an SNMPv3 agent. The **Context Name** is an octet string.
   - **Community Name**

(SNMPv1/v2C Only) Defines a secure string that lets the data source query the MIB of the associated device. The community that you supply must provide read-only access to the device MIB.

NOTE
In the default SNMP profile, the community is 'public'.

- **Verify Community Name**Confirms the secure community string (name).
- **Authentication Protocol**
  (SNMPv3 Only) Specifies the authentication protocol to use when contacting devices associated with this profile. The following algorithms for authenticating SNMPv3 packets are supported:
  - **None** (do not attempt authentication)
  - **MD5** (Message Digest 5)
  - **SHA** (Secure Hash Algorithm)
- **Authentication Password**
  (SNMPv3 Only) Specifies the password for authentication using SNMPv3 and the selected authentication protocol.

  NOTE
  For SNMP profiles that are used with DX NetOps, make sure you specify a password that is at least eight characters long. If the password does not meet this requirement, the SNMP profile will be invalid and no SNMP data will be returned when the SNMP profile is used for polling. In this case the corresponding interfaces and devices in views, reports, and dashboards are missing device names, interface names, interface speeds, and interface utilization data.
- **Verify Authentication Password**
  Confirms the authentication password.
- **Privacy Protocol**
  (Optional) Specifies the encryption protocol to use for data flows sent to any devices or servers associated with this profile. Select one of the following protocols to create a valid SNMP profile for DX NetOps polling:
  - **None** (do not encrypt communications)
  - **DES**
  - **AES (128-bit encryption)**
  - **Triple DES**

  NOTE
  If **AES 192** and **AES 256** options are listed, do not select either of those options: They are not supported for DX NetOps. If the SNMP profile you create is not valid, no SNMP data is returned for devices and interfaces that use it. In this case the corresponding interfaces and devices in views, reports, and dashboards are missing device names, interface names, interface speeds, and interface utilization data.

  The privacy protocol option is not enabled until authentication is enabled for this profile.
- **Privacy Password**
  Defines the password that is used when exchanging encryption keys. See the Note in **Authentication Password** for a possible length requirement.
- **Verify Privacy Password**
  Defines the password used when exchanging encryption keys.
- **Use by default for new devices** (CA PC)
  Enable this profile for auto-discovery (NPC)
  Specifies whether the profile is used by default to contact any new devices that are discovered from monitored traffic. If it fails, the next profile in priority order is used. Disable this parameter to exclude a profile from discovery.

5. Click **Save**.
6. You return to the list of SNMP profiles. The new profile appears in the list.
   Performance Center performs a global synchronization to send the profile information to DX NetOps.

Verify IP Domains

The IP domains feature helps to address potential IP address conflicts. Domain identifiers indicate that two managed items that otherwise appear as duplicate IP addresses are actually two *different* managed items.

IP domains also let a global administrator in Performance Center control which managed items are visible to and accessible by a particular administrator or user.

Information about custom IP domains is sent down to the data sources during synchronization. Domains are available for use during configuration. You can use the NFA console Administration functions to add interfaces, custom virtual interfaces (CVIs), routers, and Harvesters to the custom domains that you create.

During initial setup, verify that the existing IP domains are adequate to monitor your environment. To see the domains, complete one of the following actions in the Performance Center Console:

- (CA PC) Select **Admin, IP Domains**, and review the domains on the **Manage IP Domains** page.
- (NPC) Select **Admin, Groups**, and expand the **All Groups** tree on the **Manage Groups** page.

View the IP Domains List

IP domains are required for monitoring multiple environments with overlapping IP addresses. Set up all the domains that you need before you begin to export flow data.

Follow these steps:

1. Log in to the Performance Center Console as a user with the required administrative role rights.
2. Display the current domains by completing one of the following actions:
   - (CA PC) Select **Admin, Custom Settings**: **IP Domains**.
     The **Manage IP Domains** page opens and displays the current domains.
   - (NPC) Select **Admin, NetQoS Settings**: **Groups**, and expand the **All Groups** tree on the **Manage Groups** page. The current domains are shown under **All Domains**. To display the parameters for a domain in CA NetQoS Performance Center, select the domain and click the **Properties** tab.

If you have not created any custom IP domains, only the **Default Domain** appears in the list. This predefined domain has a 'null' setting for all parameters.

Any custom domains that you have created include values for the following parameters:

- **Name**
  Identifies the domain.
- **Description**
  (Optional) Describes this domain namespace, such as naming the enterprise that owns it.
- **Primary DNS Address**
  Is the IP address of the primary name server for this domain.
- **Primary DNS Port**
  Is the port number that the primary name server uses.
- **Secondary DNS Address**
  Is the IP address of the secondary name server for this domain. Can be the same as the primary address.
- **Secondary DNS Port**
  Is the port number that the secondary name server uses.

Add Custom IP Domains

Administrators can set the domain assignment for Harvesters, routers, interfaces, and custom virtual interfaces (CVIs). We recommend that you set up any custom tenants and domains you need before you add the Harvesters.

Having the appropriate IP domains set up helps to achieve the following goals:

- Assign the correct tenant-domain when you add Harvesters so that their routers and interfaces inherit the correct associations. The routers have the appropriate SNMP profiles available to poll their interfaces.
- Make specific content accessible only to the operators who need to monitor it.
- Enable Administrators to create domain-specific ToS labels, protocol groups, and Autonomous System (AS) names in DX NetOps.
- Avoid IP address conflicts.
  For example, suppose a router with a single IP address has interfaces that belong to different enterprises. The domain identifiers clarify that the interfaces are different managed items, even though they have the same IP address.

The **Default Domain** is created automatically. The **Default Domain** includes any items that are not assigned to a custom domain.

Follow these steps:

1. Log in to the Performance Center Console as a user with the required administrative role rights.
2. Display the current domains by completing one of the following actions:
   – (*CA PC*) Select **Custom Settings: IP Domains**.
     The **Manage IP Domains** page opens and displays the current domains.
   – (*CA NPC*) Select **Admin, NetQoS Settings: Groups**, then expand the **All Groups** tree on the **Manage Groups** page.
     The current domains are shown under **All Domains**.

   If you have not created any custom IP domains, only the **Default Domain** appears in the list.
3. Create a new domain:
   – (*CA PC*) Click **New**.
     The **IP Domains Administration** dialog opens.
   – (*CA NPC*) Right-click **All Domains** and select **Add New Domain**.
     The **Add Domain** dialog opens.
4. Supply information for the following parameters:
   – **Domain Name**
     Identifies the domain.
   – **Description**
     (Optional) Describes this domain namespace, such as naming the enterprise that owns it.
   – **Device Name Alias**
     (*CA PC only*) Indicates the alias to use for a managed device. A device alias is a user-configured name that is applied to the associated managed item in CA Performance Center. Click Browse to navigate to and import a CSV file of aliases. The CSV file contains a comma-separated list of IP address-to-device alias mappings.
     Aliases that are associated with the primary IP address of a device take precedence over aliases that are associated with any secondary IP addresses. Look for the primary IP address in the Address column of the Inventory Devices list. We recommend always using the primary IP address of the device in the CSV file.
     For example:

     ```
     172.24.36.107,Austin Router
     ```

     Browse to select the file and click **Open**.
     If you include aliases for devices you are managing already, it can take up to 5 minutes to begin synchronizing these aliases with CA Performance Center.

     NOTE
     To remove an alias, import a CSV file that includes the IP address for the device and a blank alias column. To change an alias, modify the alias entry in the CSV file and reimport the file.
   – **Interface Description Override**

(*CA PC only*) Indicates the alternate description to use for an interface. Interface descriptions appear in CA Performance Center already, but you can provide an alternate description. Click **Browse** to navigate to and import a CSV or TXT file of alternate descriptions. The file contains a comma-separated list of values that include the device IP address, interface name, interface description, and alternate interface description (alias) mappings.
For example:

```
172.24.36.107,ethernet_7,vmxnet3 Ethernet Adapter,Connection to Dallas
```

NOTE
Use the primary IP address of the associated device in the CSV or TXT file. Secondary IP addresses are not supported. Look for the primary IP address in the **Address** column of the **Inventory Devices** list.

Browse to select the file and click **Open**.
If you include alternate descriptions for interfaces you are managing already, it can take up to 5 minutes to begin synchronizing these descriptions with CA Performance Center.

NOTE
You can use the same alternate interface descriptions for more than one interface.To remove an alternate description, import a CSV or TXT file that includes the IP address for the device, the interface name, the interface description, and a blank alias column. When you remove an alternate description, the original interface description reappears in CA Performance Center views.

WARNING
If you use a spreadsheet program to remove all of the alternate descriptions from a `CSV` file, include a column heading for the interface description override column in the imported file. If you do not include this column heading, the original interface descriptions will not reappear in CA Performance Center views.

To change a description, modify the alias entry in the `CSV` or `TXT` file and re-import the file.

- **DNS Settings check box**
  (*CA PC only*) If selected, displays the Primary DNS/Port and Secondary DNS/Port options.
- **Primary DNS Address**
  Is the IP address of the primary name server for this domain.
- **Primary DNS Port**
  Is the port number that the primary name server uses.
- **Secondary DNS Address**
  Is the IP address of the secondary name server for this domain. Can be the same as the primary address.
- **Secondary DNS Port**
  Is the port number that the secondary name server uses.
- **Enable DNS Proxy Address**
  (*CA NPC only*) Indicates whether the proxy address is enabled for this IP domain.
- **DNS Proxy Address**
  (*CA NPC only*) Is the IP address of the DNS proxy server.
  This setting is required only if your network is located behind a DNS proxy server.

5. Click **Save**.The new IP domain appears on the page.
6. Repeat the steps as required to add more IP domains.

Configure Flow Collection

The next step is to configure the routers in DX NetOps and verify that they are sending data to the Harvesters.

DX NetOps can begin to collect flows after you complete the following tasks:

- Recommended: Add the domains that you need.

  NOTE
  More information:

  Add Custom IP Domains
- Add the Harvesters.
- Configure the routers and interfaces to export flow data.

Add One or More Harvesters

Add one or more Harvesters to enable data to be processed and displayed.

We recommend registering DX NetOps and setting up the domains before you add any Harvesters.

Follow these steps:

1. Open the NFA console, logged in with Administrator rights. For example, enter the following address in a browser:
   `http://<ipaddress>/ra/`
   User name: `admin`
   Password: `admin`
2. Open the **Harvester** page:
   a. Select **Administration** from the NFA console menu.
      The **Administration** page opens.
   b. Select **System, Harvester** from the menu on the left side of the page.
      The **Harvester** page opens and displays the current list of Harvesters.
3. Click **Add**.
   The **Add Harvester** dialog opens.
4. Enter the following information:
   – **IP Address**
     Address of the Harvester server.
   – **Description**
     Identifying text about the Harvester, which appears in the Harvester page table.
   – **Domain**
     Parent tenant and domain combination for the Harvester and for any routers and interfaces that begin to supply data to the Harvester.
     Changing this setting affects the tenant-domain association for new routers that begin exporting flow data and any new interfaces that begin generating flow.
     In a multi-tenant environment, the Harvester tenant affects which SNMP profiles are available for routers to poll interfaces.
     The domain affects which operators and reports have access to the data from routers and interfaces.
     This option is visible only in an environment that contains multiple domains.
5. Click **Save**.
   The new Harvester is added and appears in the Harvester list, provided that the IP address passes the connection test. If the test connection to the web service fails, an error message opens.
   The usual process is to add one or more Harvesters, then configure the router interfaces to export flow to the Harvesters. If you configure the routers to export flow to the Harvesters first, the NFA console immediately begins to collect data from the new Harvester. In this case, the domain for the routers is set at the time you add the parent Harvester.

   NOTE
   Make sure the Harvesters you add have not been deleted from the **Harvester** page previously. To add a Harvester instance successfully in DX NetOps after deleting it, the Harvester installation server must be re-imaged and the Harvester software must be re-installed.

Verify the Harvester Domain

Verify that each Harvester is associated with the appropriate domain before you set up routers to export flow data. If you have not already done so, set up any needed custom tenants and domains before you proceed.

> **NOTE**
> The tenant feature is applicable only to deployments that include CA Performance Center. If your deployment uses CA NetQoS Performance Center, the tenant setting is **Default Tenant**.

Follow these steps:

1. Open the **Harvester** page:
   a. Select **Administration** from the NFA console menu.
      The **Administration** page opens.
   b. Select **System, Harvester** from the menu on the left side of the page.
      The **Harvester** page opens and displays the current list of Harvesters.
2. Click **Edit** on the row for the Harvester that you want to edit.
   The **Edit Harvester** dialog opens.
3. (*Optional*) Change the **Domain** setting (tenant-domain combination) as needed.
   Default: Default Tenant \ Default Domain.
   You can also change the **IP Address** and **Description**.
   If no custom IP domains have been created, the **Harvester** table includes only the **IP Address** and **Description** columns.
4. Click **Save** when your changes are complete.
   Your changes are saved immediately.

Set Up the Routers

Enable NetFlow on each DX NetOps router by completing the following steps. You can configure routers to export any of the following flow protocols:

- NetFlow v5, v7, v9, and Random Sampled NetFlow
- sFlow version 5
- IPFIX, J-Flow, cFlow, and NetStream flow that complies with the standards for NetFlow v5, v7, or v9

Notes:

- Configure flow from each source to be exported to a single Harvester. If flow from one source is exported to multiple Harvesters, a number of problems result. If this occurs, contact CA Support for help.
- NetFlow provides a broad view of your network packet streams by creating flow records for all packets. The data from these flow records represents all packets. Sampled NetFlow/IPFIX and sFlow take samples from your packet streams, producing fewer flow records and lessening the impact to a collector. The lower your sampling rate, the less precise the data is likely to be.
- Cisco documentation notes that "Sampled NetFlow does not allow random sampling and thus can make statistics inaccurate when traffic arrives in fixed patterns." Therefore, if you choose NetFlow v9 Sampling, you must use Random Sampled NetFlow. Refer to the Cisco documentation for your hardware and IOS version for more details.

The CA Network Flow Analysis 10.0.2 supports SAMPLING_INTERVAL (34) and SAMPLING_ALGORITHM (35) additional NetFlow fields in Options Template for sampling rates. For the SAMPLING_ALGORITHM (35), only random sampling algorithm (0x02) is supported. A netflow from a SourceId must have one of the following set of fields:

- FLOW_SAMPLER_ID(48), FLOW_SAMPLER_MODE (49), FLOW_SAMPLER_RANDOM_INTERVAL (50) fields or
- SAMPLING_INTERVAL (34) and SAMPLING_ALGORITHM (35)

For data from non-sampled flows to appear in reports of 15-minute (historical) data, these minimum fields are required:

- One of the following:

  - 1 - IN_BYTES
  - 85 - IN_PERMANENT_BYTES
  - 231 - FW_INITIATOR_OCTETS
  - 232 - FW_RESPONDER_OCTETS
- 4 - PROTOCOL
- 7 - L4_SRC_PORT
- 8 - IPV4_SRC_ADDR/ 27 - IPV6_SRC_ADDR
- 10 - INPUT_SNMP
- 11 - L4_DST_PORT
- 12 - IPV4_DST_ADDR/ 28 - IPV6_DST_ADDR
- 14 - OUTPUT_SNMP

Follow these steps:

1. Back up the current router configuration.
2. Configure NetFlow export for each interface individually:
   a. Set the flow export version.
   b. Set the flow source IP address. Cisco recommends that you configure a loopback source interface. The IP addresses of non-loopbacked interfaces can change.
   c. Set the flow destination IP address and set the destination port to 9995. If you are using a custom value for the harvester listening port, use that value as the destination port. The port values must match or the Harvester does not receive flow data.
   d. Set the flow expiration timeout to 1 minute.
3. Enable flow for each interface.
   - NetFlow v5 or v5-compatible flow:
     - Monitoring multiple interfaces on a router: Use either all ingress or all egress. Use the same option for all of the interfaces. Ingress and egress values may vary slightly due to routers dropping packets and changing ToS values as traffic travels between interfaces.
     - Monitoring a single known interface on a router: Use ingress and egress. This option results in fewer total flows from the router to the Harvester and puts less load on the network and the Harvester.
   - NetFlow v9 or v9-compatible flow:
     The Harvester identifies and deduplicates multiple flows on a single router, so you can use ingress and egress on multiple interfaces. You may find it most efficient to use this option for two or three interfaces. You have the option to enable ingress and egress across all interfaces, but this configuration may put an unnecessary burden on the Harvester.
4. Configure SNMP index persistence on each router that supports this feature.

NOTE
More information:

- NetFlow Version 9 Flow-Record Format

Configure ifTypes

The interfaces from which DX NetOps (CA NFA) will process flow data are configurable based on ifType. There are interface types that typically will not export flow data, and DX NetOps ignores these ifTypes:

- 1
- 18
- 37
- 100
- 101
- 102
- 103
- 104
- 134

However, you may have a different router configuration, and need to modify the ifTypes on this list.

Follow these steps:

1. Locate the `poller.properties` file.

   install_path\Netflow\bin\poller.properties

   Open the file in a text editor.
2. The ifTypes that CA NFA will ignore are included on the following line:

   ```
   ifTypesToIgnore=1,18,37,100,101,102,103,104,134
   ```

   Edit this list to add or remove ifTypes as necessary. The list must contain integer values, separated by commas, and containing no spaces.
3. Save the edited file.
4. Restart the poller service (CA NFA Poller).

NOTE
More information:

- IANAifType-MIB Definitions

Verify That Data Is Received

To verify that data is received, complete the following tasks:

Verify That the Interfaces Are Enabled

Once you configure DX NetOps to receive flow data, verify that the expected interfaces are monitored.

Follow these steps:

1. Open the NFA console, logged in with Administrator rights.
2. Open the **Available Interfaces** page:
   a. Select **Administration** from the NFA console menu.
      The **Administration** page opens.
   b. Select **Interfaces, Enable Interfaces** from the menu on the left side of the page.
      The **Available Interfaces** page opens.
3. Expand the router details to display the interface list: Click the arrow to the left of the router name.
4. Review the list to review whether the interfaces are enabled.
5. Change the interface status: Select the check box next to one or more interfaces, then click **Enable** or **Disable**.
   The selected interfaces are immediately enabled or disabled.
6. Repeat these steps for each router.

Verify That the Interfaces Are Visible in the NFA Console

Make sure that the configured interfaces are visible in the NFA console.

1. Verify that interfaces are visible on the **Enterprise Overview** page:
   a. Log in to the NFA console.
   b. Click **Enterprise Overview** in the main menu.
   c. Make sure the report views show interfaces.
2. Verify that interfaces are visible in the **Interface Index**:
   a. Click **Interfaces** in the NFA console menu.
      The **Interface Index** opens.
   b. Make sure that the **Interface Index** includes the interfaces that you expect to see.
      You can locate interfaces by expanding router details to view interfaces. Alternatively, you can use the **Search** box to find routers or interfaces by entering all or part of a name or description.
3. If interfaces are not visible, perform the following preliminary troubleshooting tasks:
   – Verify that the DX NetOps services are running on the NFA console server.
   – Review the logs. View the logs in the NFA console or open the logs from:

     install_path\reporter\Logs

Change the Domain of Interfaces and CVIs

Interfaces and CVIs inherit their initial tenant-domain setting from the parent router and Harvester when the Harvester is added and the program begins to collect data from the router and interfaces. If the Harvester is not associated with a custom domain, the routers and interfaces are assigned to the Default Domain as their data begins to be collected.

You can edit the settings for interfaces and CVIs at any time. The domain setting does not have to match the parent router or Harvester. Changing the domain can affect which operators and reports have access to the interfaces' data.

> **NOTE**
> The tenant feature is applicable only to deployments that include CA Performance Center. If your deployment uses CA NetQoS Performance Center, the tenant setting is **Default Tenant**.

Follow these steps:

1. Open the **Active Interfaces** page:
   a. Select **Administration** from the NFA console menu.
      The **Administration** page opens.
   b. Select **Interfaces, Physical & Virtual** from the menu on the left side of the page.
      The **Active Interfaces** page opens.
2. Locate and select the check box next to one or more interfaces that you want to associate with a tenant-domain.
   – To search for parent routers, interfaces, or CVIs, enter all or part of a router IP address, a router or interface name, or an interface description in the **Search** field, and then click **Search**. Expand the router details.
   – To navigate to an interface or CVI manually, go to the page that contains the parent router and click the arrow next to the router name. The router details expand to show the interfaces and CVIs.
3. Click **Edit**.
   The editing dialog opens. The **Domain** selection list is included in the dialog only if multiple domains exist.
4. Select a tenant-domain option from the **Domain** list.
5. Click **Save**.
   The dialog closes. The changes are shown on the **Active Interfaces** page.

> **NOTE**
> You can also change the tenant-domain setting for Harvesters and routers.

Configure Traps

Trap configuration is complete when you have finished the following tasks:

- Create the traps that you need.
- Enable traps to be displayed as events in the Performance Center Console:
  a. Open the **Application Settings** page in the NFA console.
  b. Set the **Trap Destination** value to match the IP address of one of the following servers:
     - (*CA PC*) NFA console or stand-alone server that is registered as a data source
     - (*CA NPC*) Event Manager server
- (*Optional*) Enable Watchdog trap notifications to be sent to your trap receiver:
  Open the **Watchdog Settings** page in the NFA console. Configure values for the **Trap Destination**, **Email Address**, and other Watchdog settings.
- (*Optional*) Verify that the events are displayed on the Performance Center Console, on the **Events** page (CA PC) or the **Event List** page (CA NPC). If the events are not shown as expected, verify that the following conditions are met:
  – The logs show that events have been generated and have been forwarded to the Event Manager.
  – The Event Manager host name is resolvable by the DNS server for DX NetOps.
  – The **Trap Destination** value on the **Application Settings** page in the NFA console matches the IP address of one of the following servers:
    - (*CA PC*) NFA console or stand-alone server that is registered as a data source
    - (*CA NPC*) Event Manager server
  – (*CA NPC Only*): The Event Manager is installed.

Set Up User Accounts

One predefined user account, admin, is included with the installation of DX NetOps. The admin account has full administrative privileges.

The administrator must create a user account for each person who will use the product--administrators and operators. Custom user accounts enhance security and take advantage of the narrowly defined role rights that determine access to product features and data.

Custom user accounts are best deployed in a well-planned system that includes custom groups. Custom groups are assigned as permissions to let product operators view only the data, menus, and dashboards that they need to perform their daily tasks.

View a List of User Accounts

You can see a high-level overview of user account settings in the Performance Center Console. Until you create custom user accounts only the two factory user accounts are available.

Follow these steps:

1. Log in to the Performance Center Console as a user with the required administrative role rights.
2. Click **Admin, User Settings**: **Users**.
   The current list of user accounts is displayed on the **Manage Users** page (CA PC) or the **User List** page (NPC).
   The table includes the following information about each user account:
   – **Name**
     Is a login name for the user account.
   – **Role**
     Is the role assigned to the user account.
   – **CAPC Privilege / NPC Privilege**

Identifies the level of access to registered data sources, such as DX NetOps.

- **Permission**
  Lists the permission groups that are assigned to this account. You can view permission groups as nested locations in the **Groups** tree.
  Default: '/All Groups'.
- **Status**
  Indicates whether the user account is enabled or disabled.

  NOTE
  Additional status values may be listed in the Console for CA NetQoS Performance Center: Built-in (configured automatically) and Online (currently logged in).

To perform any action on this page, click one of the buttons along the bottom.

Add User Accounts

Add a user account for each person who will operate the products. For security purposes, operators should not share user accounts.

NOTE
This topic describes the steps to perform this task in CA Performance Center. If you register DX NetOps as a data source for CA NetQoS Performance Center, the steps are slightly different.

Follow these steps:

1. Log in to the Performance Center Console as a user with the required administrative role rights.
2. Confirm that the required roles and groups exist.
3. Select **Admin, User Settings**: **Users**.
   The current list of user accounts is displayed.
4. Click **New**.
   The **Create New User** wizard (CA PC) or **Add User** page (CA NPC) opens.
5. Enter information for the following account parameters:
   - **Name**
     Is a login name for the user account. Limited to 50 characters.
   - **Description**
     (Optional) Describes the user account to help you identify it.
   - **Email Address**
     (Optional) Associates an email address with the user account.
   - **Preferred Language** *(CA PC only)*
     Specifies the language spoken by the operator associated with the user account.
   - **Authentication Type**
     Identifies the authentication method that applies to this user account. The method must match Single Sign-On configuration. Select one of the following:
     - **Performance Center** *(CA PC) or* **Product** (NPC): The default authentication scheme deployed by Performance Center.
     - **External**: A third-party authentication scheme, such as LDAP or SAML.
   - **Password**
     Defines a password for the user account. The password is limited to 32 characters.
   - **Time Zone**
     Corresponds to the time zone in which the user will view data.
     Default: UTC (Coordinated Universal Time).
   - **Role**
     Is the role assigned to the user account.
   - **Account Status** *(CA PC only)*

Determines whether the account is activated for use (Enabled).

- **User Options** *(CA NPC only)*
  Determines whether the account is activated for use (Enabled) and whether the user is allowed to share views with other products (Allow user to generate view URLs).

6. Assign access permissions to the user.
7. Add permission groups to the user account.
8. Click **Save**.
   The new user appears in the list of user accounts.

Role Rights

The rights that are assigned to each role determine user access to dashboards and menus. For example, role rights control the types of views that users can see and control whether users can export data, customize settings, and set up schedules for sending email reports.

Administrators can grant additional rights to users by editing their role. The **Edit Role** dialog lists role rights that are assigned to roles. The **Manage Users** or **User List** page shows the role that is assigned to each user.

> **NOTE**
> Do not remove the administrative role rights from your primary administrator account. Administrative access to the console is required.

Add Role Rights for Users

If the predefined user roles do not fit your requirements, you can add custom user roles. Ideally, you create the roles that each unique product operator needs to be able to perform his or her job responsibilities.

Custom roles work best within a system of custom groups. Custom groups let you precisely grant access to dashboards and product features while restricting access to sensitive data. The same groups that you create to organize data can serve as “permission groups” when you set up user account permissions.

A new role has no rights until you add them.

Follow these steps:

1. Log in to the Performance Center Console as a user with the required administrative role rights.
2. Navigate to the **Manage Roles** or **Roles List** page.
   The page displays the current list of roles.
3. Click **New**.
   The **Add Role** dialog opens.
4. Supply the required information and make selections in the fields provided:
   - **Name**
     (Optional) Identifies the role. Limited to 45 characters.
   - **Description**
     (Optional) Describes the role. For example, identifies the job-related duties that the associated user performs.
   - **Role Status**
     Select **Enabled** to make the role active. Required to give users with this role the access granted by role rights.
5. Specify the menus that will be visible to users with the new role:
   a. Select **Menu Set** (CA PC) or select a menu or product from the list at the bottom of the dialog (NPC).
   b. Click **Edit**.
      The **Edit Menu Set** dialog opens. Menus in the **Available Menus** list can be added to the role.
   c. Click an item on the left that you want to add to the role, then click the right arrow.
      Use **Shift + Click** or **Ctrl + Click** to select multiple items.
      Each selected item moves to the **Selected Menus** list.

d. (Optional) Use the Up and Down arrows to move items around in the list. The order of menus in the list determines their order on the **Dashboards** tab.
e. Click **OK**.
You return to the **Add Role** page.

6. Set the Performance Center rights for the role:
   a. Select **Performance Center** (CA PC) or **NetQoS Performance Center** (NPC).
   b. Click **Edit**.
   A dialog opens, which you use to select Performance Center access rights.
   c. Click an item on the left that you want to add to the role, then click the right arrow.
   The access right moves to the **Selected Rights** list.
   d. (Optional) Use the Up and Down arrows to move items around in the list. The order of role rights determines their priority in cases where rights overlap.
   e. Click **OK**.
   You return to the **Add Role** page.
7. Set the DX NetOps rights for the role:
   a. Select the name of the registered DX NetOps instance.
   b. Click **Edit**.
   A dialog opens, which you use to select access rights for DX NetOps in the same way you selected access rights for Performance Center.
   c. When the access rights are set up correctly, click **OK**.
   The new role is created and appears in the **Role List**.
8. Repeat the previous step to set the rights for any additional data source that you want to include.
9. Click **Save** on the **Add Role** page.
   You return to the **Manage Roles** page (CA PC) or **Roles List** page (NPC).

> **NOTE**
> When you finish creating a role, assign it to a user account as a separate step. Roles are inoperative until they are assigned to user accounts. Only users with the 'Administer Users' and 'Administer Roles' role rights can assign roles to user accounts.

Assign Permission Groups to User Accounts

Individual operators require data access permissions to monitor data in the products. Access permissions are based on groups. You can assign access permissions according to your plan for custom groups. Your goal as the administrator is to make sure that all operators see only the data they require to do their job.

For example, suppose you create custom groups and assign them as permissions to IT staff. When staff members log in to Performance Center, they can view data from the systems that are assigned to them.

Follow these steps:

1. Log in to the Performance Center Console as a user with administrative privileges.
2. Click **Admin, User Settings: Users**.
   The **Manage Users** page (CA PC) or **User List** page (CA NPC) opens.
3. Select a user account that you want to change, and click **Edit**.
   The **Edit User** wizard or dialog opens.
4. Display the permission groups:
   – (CA PC) Click the **Access Permissions** button.
   – (CA NPC) Locate the **Permission Groups** pane in the middle of the page.
   The group settings are displayed.
5. Add permission groups to the user account

- Expand the groups in the **Available Groups** tree on the left so that subgroups are shown.
- Select a group or subgroup.
- Click the right arrow or **Add** button to add the group.
- Repeat as necessary.

The selected permission groups appear in the **Selected Groups** pane.

6. Select the default group for the user; the data that appears by default in the dashboards for the user:
   - (CA PC) Right-click the target group and select **Make Default**.
   - (CA NPC) Select the target group and click **Make Default**.
7. Click **Save**.
   The changes are saved to the user account, and you return to the **Manage Users** page.
   When the user logs in, data from the default group appears in dashboards by default.

Assign Product Privileges

Each registered data source has its own product privilege setting, which grants unique privileges within that product interface. Administrators give users product privileges for each data source. For example, the product privilege determines whether a user can log in to DX NetOps or drill down from a Performance Center view to details in the NFA console. Privileges are specific to the data source instance.

The default administrator account, admin, is locked to prevent changes to product privileges. This account must have Administrator privileges for all registered data sources. If you select a group of accounts that includes the admin account, you cannot edit the product privileges for any of the selected accounts.

DX NetOps Product Privileges

A user must have product privileges for the DX NetOps data source to log in to the NFA console. Product privileges also determine whether a user can access the **Administration** page, and can perform certain functions:

- **Administrator**
  Gives access to the **Administration** page in the NFA console and to all functions. Functions include creating and managing user accounts, roles, groups, SNMP profiles, and scheduling for reports.
- **Power User**
  Gives user-level access and any additional abilities that the Role setting grants. For DX NetOps, the Power User privilege is equivalent to the Administrator privilege.
- **User**
  Gives access to **Top Interfaces** reports and **Interface Utilization** reports on the **Enterprise Overview** page.
  A User with the appropriate Permission Group settings also has access to the following reports:
  - **Top Hosts** and **Top Protocols** reports on the **Enterprise Overview** page, if the user also has access to All Groups
  - **Interfaces** page reports for the interfaces that are accessible to the user
  - Existing reports on the **Custom Reporting**, **Flow Forensics**, **Analysis**, and **Site to Site** pages
  - Menus that an administrator has assigned to the User role

  The Role and Permission Group settings determine whether the User also can run existing reports, create reports, and manage reports. To create reports, a User must have access to All Groups.
- **None**
  Has no access to a data source. The user who has this product privilege cannot log in to the NFA console or drill down from a Performance Center view to the NFA console. By default, all users have this product privilege setting for all data sources.

  NOTE
  The same user account can have different privileges for different data sources.

Set Up Groups

We recommend that you create custom groups to help manage items in the Performance Center Console. Custom groups are required to let operators see performance data from the routers they manage.

Properly configured, groups can prevent operators from viewing particular types of data for security reasons. The administrator can selectively grant users access to data in their area of responsibility, such as a physical location or subnet.

Create Custom Groups

Before you start creating groups, plan a strategy and a structure. Consider the types of access permissions that operators require to perform their monitoring duties. If necessary, you can discuss your organizational and monitoring goals with a CA technical representative.

Create groups under the **All Groups** node in the **Groups** tree, or within an existing custom or site group. You cannot add groups to system groups, which appear "locked" in the **Groups** tree.

You can add a maximum of 2000 child groups to a parent group.

Follow these steps:

1. Log in to the Performance Center Console as a user with the required administrative role rights.
2. Navigate to the **Manage Groups** page.
   The page displays current groups in a tree structure.
3. Expand nodes in the **Groups** tree to find a location for the new group.
4. Right-click the node, and select **Add Group** (CA PC) or **Add New Group** (NPC).
   The **Add Group** window opens with the **New** tab selected by default.
5. Supply values for the following parameters:
   - **Group Name**
     Specifies a name for the group. Do not use the following special characters in group names: /&\,%.
   - **Description**
     (Optional) Helps you identify the group.
6. Confirm the setting for the following parameter:
   - **Include the children of managed items**
     Adds the children of managed items automatically when the items are added to this group. If this option is disabled and you add a router, the router interfaces are not included. As a result, the data from those interfaces is not visible in drilldown views.
     Default: **Selected** (CA PC) or **Not Selected** (NPC).

     NOTE
     Clear this option for a custom group that contains routers or the group will not be usable in in the NFA console.
7. Select **Custom** or **Site** from the **Group Type** list.
   If you selected **Site** as the type, specify values for the additional parameters that appear, including **Location**.
8. Click **Save**.
   The new group appears in the **Groups** tree.
   The group contains no items until you add them. You have two options for adding items to a custom group:
   - Manually populate the group by adding items in the **Manage Groups** interface.
   - Create rules to manage group membership.

Results of Unregistering

On rare occasions, you might need to unregister DX NetOps. For example, you would unregister a DX NetOps instance before registering it with a different Performance Center instance.

If you unregister DX NetOps, the following rules apply:

- Users: Users who are not associated with DX NetOps are deleted. Existing User IDs remain unchanged. You cannot add new users or edit user account settings while unregistered.
- Roles: Roles are not deleted. Users continue to have their previous roles. Existing Role IDs remain unchanged. You cannot change the roles or permissions for existing users while unregistered.
- Groups:
  - Groups that do not exist in DX NetOps are deleted. You cannot add or change groups while unregistered.
  - Nested groups that are associated with an interface are displayed as interface groups in the NFA console.
  - Groups that are not associated with an interface are displayed as permissions.
- Single Sign-On and LDAP: Single Sign-On and LDAP values remain unchanged.

NOTE

More information:

- P repare to Change the Performance Center Version

Enable Multi-Tenancy

To create separate monitoring environments that you administer from a single user interface, add custom tenants. A tenant represents a customer environment that a managed service provider (MSP) administers. Each tenant environment is independent, and can contain multiple users and roles that are not shared among tenants.

Prerequisites

- Install DX NetOps 9.5.0.
- Install CA Performance Center supported version. For supported version, see Compatibility Matrix.
- Add DX NetOps (CA NFA) to CA Performance Center (CA PC) as a data source.

Creating a Tenant in CA PC

Create a Tenant

Follow these steps:

1. Log in to CA PC as the administrator.
2. In the **Administration** menu, click **Tenants**.

   NOTE
   More information:

   Manage Tenants
3. On the **Manage Tenants** page, click **New**.
4. Give the tenant a **Name** that reflects the tenant usage (in the following examples, *tenant7*). Tabbing through the fields (up to the password fields) creates the default *tenant7_admin* and *tenant7_user*. Enter the credentials for the *tenant7* administrator and *tenant7* user.
5. Click **Save**.
6. On the **Manage Tenants** page, select the tenant you just created (*tenant7*) and click **Administer**.

This takes you to **Manage Users** for that tenant, indicated in the box in the upper-right corner of the screen that says "Administering Tenant: *tenant7*".

7. On the **Manage Users** page, select *tenant7_admin* and click **Edit**.
   a. In **1 Account Details**, verify that the **Role** is Administrator and change the password if desired. Click **Next**.
   b. In **2 Access Permissions**, click **Next**.
   c. In **3 Administer Group**, click **Next**.
   d. In **4 Product Privileges**, set the **Network Flow Analysis@...** privilege as **User**. Click **Save**.
8. On the **Manage Users** page, select *tenant7_user* and click **Edit**.
   a. In **1 Account Details**, verify that the **Role** is IT Operator and change the password if desired. Click **Next**.
   b. In **2 Access Permissions**, click **Next**.
   c. In **3 Administer Group**, click **Next**.
   d. In **4 Product Privileges**, set the **Network Flow Analysis@** privilege as **User**. Click **Save**.

Define Roles for the Tenant

Follow these steps:

1. Select **Administration, Roles**.
2. On the **Manage Roles** page, select **IT Operator** and click **Edit**.
   a. In the **Edit Role** page, select **Performance Center** and click **Edit**.
      a. Under **Available Rights**, select **Drill into Data Sources** and click the arrow to move it to **Selected Rights**.
      Note: Scroll to the bottom of the **Selected Rights** to see that it was added.
      b. Click **OK**.
   b. In the **Edit Role** page, select **Network Flow Analysis@...** and click **Edit**.
      a. Edit as necessary so that all rights except **Manage Reports** are under **Selected Rights**.
      b. Click **OK**.
   c. Click **Save**.
3. On the **Manage Roles** page, select **Administrator** and click **Edit**.
   a. In the **Edit Role** page, select **Performance Center** and click **Edit**.
      a. If **Selected Rights** does not include **Drill into Data Sources**, move it from **Available Rights**.
      b. Click **OK**.
   b. In the **Edit Role** page, select **Network Flow Analysis@...** and click **Edit**.
      a. Edit as necessary so that all rights are listed under **Selected Rights**.
      b. Click **OK**.
   c. Click **Save**.

Define the Domain For This Tenant

1. Select **Administration, IP Domains**.
2. In the **Manage IP Domains** page, click **New**.
3. Enter the necessary information for the domain for this tenant.
   It is helpful to create a domain name that references the name of the tenant; for example, *Tenant7-IPDomain*.
4. Click **Save**.

Sync CA PC with DX NetOps

1. Select **Administration, Data Sources**.
2. Select **Network Flow Analysis@...** and click **Resync**.
3. In the **Resync Data Source** dialog, click **Resync**.

Create Report Folders in DX NetOps

1. Log in as the tenant admin user (*tenant7_admin*).
2. Click the **Custom Reporting** tab.
3. Click **New** to create a new folder for tenant reports.
   It is helpful to create a name that references the name of the tenant; for example, *tenant7_CustomReportingFolder*.
4. Click **OK**.
5. Click the **Analysis** tab.
6. Click **New** to create a new folder for tenant reports.
   It is helpful to create a name that references the name of the tenant; for example, *tenant7_AnalysisReportFolder*.
7. Click **OK**.
8. Resync with CA PC.

Add Tenant Groups in CA PC

1. As the non-tenant admin user, select **Administration, Groups**.
2. Expand the nodes in the **Groups, Defined Tenants** tree to find the tenant of interest (*tenant7*).
3. Under the tenant, expand **Inventory** to find **Service Provider Defined Groups**.
4. Right-click and select **Add Group**.
5. Select the **Existing** tab.
6. Expand **Inventory**, **Data Sources**, **Network Flow Analysis@...**
   a. Under **Custom Report Groups**, select the tenant report folder (***tenant7_CustomReportingFolder*** **Folder**).
   b. Click **Select**.
   c. Under **Analysis Groups**, select the tenant report folder (***tenant7_AnalysisReportFolder*** **Folder**).
   d. Click **Select**.
7. Resync with DX NetOps.

Add Routers and Interfaces to the Tenant

1. As the non-tenant admin user in DX NetOps, select **Interfaces, Physical & Virtual** from the menu on the left side of the **Administration** page.
2. On the **Active Interfaces** page, select the checkbox next to the router and click **Edit**.
   a. Under **Domain**, select the domain created for this tenant (*tenant7 \ Tenant7-IPDomain*).
   b. Click **Save**.
3. Uncheck the router, if it is still checked.
4. Expand the router to show the list of interfaces.
5. Select the desired interfaces, or select the checkbox in the heading row to select all interfaces.
6. Click **Edit**.
   a. Under **Domain**, select the domain created for this tenant (*tenant7 \ Tenant7-IPDomain*).
   b. Click **Save**.
7. Confirm that the interfaces show the correct domain in the **Domain** column.

Configure the Product Using CA Network Flow Analysis

To configure the product without Performance Center, you would perform the following tasks:

- Set up the following elements in the NFA console:

  - SNMP profiles
  - User accounts, permissions, and roles
  - (*Recommended*) Groups
- Configure flow collection
  - Add Harvesters.
  - Enable the routers and interfaces to export flows.
- (*Optional*) Configure traps.
- (*Optional*) Verify that DX NetOps is receiving data.

NOTE

You cannot configure IP Domains in DX NetOps.

Additional Administrative Tasks

You may want to complete a number of additional administrative tasks, depending on your environment and on the number of users. You should complete some tasks as soon as DX NetOps is running. Consider the following tasks:

- **Verify that required settings are complete**
  Make sure that you have completed all the installation tasks. Certain settings are required to enable functionality, such as emailing reports and triggering SNMP traps.
- **Adjust settings to improve performance**
  Certain report settings can affect performance, such as the frequency of DNS host name resolution.
- **Check interface speeds**
  If interfaces are at or above 100 percent utilization in the NFA console (for example, as seen on the **Enterprise Overview** page), consider adjusting the interface speeds.
- **Control router display**
  You can exclude domains from the display to control which routers are displayed in the NFA console.
  Note: This action is applicable only in a deployment that includes multiple domains.
- **Disable monitoring of router-generated traffic**
  If you do not want reports to show broadcast traffic for each router, change the **Pump Broadcast/Multicast** application setting to **False**.
- **Monitor product components**
  The Watchdog services help you monitor components. Make sure that the appropriate settings are configured to notify you of component issues as soon as possible. Specify thresholds, an email address for receiving messages, and other settings.
- **Adjust security settings**
  To export reports to *comma-separated value* (CSV) files successfully, the security settings in your environment may make it necessary to add the IP address of the NFA console to your list of trusted sites.

Post-Installation or Upgrade Tasks

Complete the following post-installation tasks:

- Install Performance Center in your deployment.
- Configure SNMP on Linux Harvester servers.
- Exclude the following directories from real-time scans:
  - `C:\Windows\Temp`
  - *`install_path`* and all subdirectories

Real-time scans of these directories can corrupt the database.
- Do not implement drive space compression. Drive space compression can cause database losses and can degrade system performance.
- We recommend that you install Adobe Flash Player on systems with desktops that access the NFA console and install Adobe Reader on systems with desktops that access the PDF documentation.
- (*Optional*) Configure CA Anomaly Detector.

The tasks described here assume that the steps for pre-installation and installation or upgrade are complete.

Stand-Alone Server	Distributed NFA Console Server	Distributed Harvester Server (Windows)
Synchronize system time		
(*Recommended*) Update the list of trusted internet sites *		
(*Recommended*) Modify router ACLs **		(Recommended) Modify router ACLs **
(*Recommended*) Disable UAC		
(*Recommended*) Configure Web content expiration		
(*Recommended*) Create a TrapConfiguration key		
(*Optional*) Configure the Recycle Bin		
(*Optional*) Disable unneeded Windows services.		

* Complete this task for the systems that access the NFA console and the stand-alone server or NFA console server.
** In a distributed deployment, verify that the router access control lists (ACLs) are configured to enable the Harvesters to perform SNMP polling.

NOTE

More information:

- Get Adobe Flash Player
- Get Adobe Reader

Configure SNMP on Linux Servers

To configure a Linux server for a Harvester, complete the following tasks:

- Set up the SNMP configuration file.
- Configure SNMP to start automatically on boot.
- Start the snmpd service.

Follow these steps:

1. Log in as root and open a shell prompt.
2. (Highly Recommended) Use the following steps to set up the SNMP configuration file. This configuration file is needed for Watchdog SNMP polling.

   NOTE
   If you have a custom (non-default) snmp configuration file at
   `/etc/snmp/snmp.conf`
   , you might want to skip this step and update your existing configuration file instead. In this case, consult with an administrator to update the required settings to match the settings in the example configuration file. For example, make sure the
   `rocommunity`
   value is set as shown in the example configuration file.

If you use a custom community name as the `rocommunity` value, use the same community name throughout the DX NetOps deployment:
- The `snmpd.conf` file on each Linux Harvester server
- SNMP service on each Windows server
- The **Watchdog Settings** page of the NFA console

a. (Recommended) Back up the configuration file in `/etc` , for example by entering the following command:

```
cp /etc/snmp/snmpd.conf /etc/snmp/snmpd.conf.bak
```

b. Change to the `Netflow` directory:

```
cd install_path/Netflow
```

Where *install_path* is the target directory for installing the Harvester: `/opt/CA/NFA/` or a custom location

c. Copy the `snmpd.conf` file in the `Netflow` directory to the `/etc/snmp` directory, overwriting the existing file:

```
cp -i snmpd.conf /etc/snmp
```

d. Confirm the overwrite operation when prompted.

e. Verify that the configuration file is in place:

```
ls -l /etc/snmp/snmpd.conf
```

f. Verify that the configuration file has the correct permissions:

```
chmod 600 snmpd.conf
```

3. Configure SNMP to start automatically on every boot by entering the following command:

```
chkconfig snmpd on
```

4. Start the SNMP service in either of the following ways:
   - Enter the command:

```
service snmpd start
```

   - Navigate to **Services** in the user interface, select **snmpd**, **Start**, then click **Save**.
     The SNMP service starts with the community name that is defined in the `snmpd` file.

Synchronize System Time

Synchronize the system time among all servers that have DX NetOps components installed, unless the system time is synchronized automatically. We also recommend that you synchronize the system time for any Linux servers in your deployment, including the server that hosts CA Performance Center.

This topic describes an approach for synchronizing system time on Windows Server 2012 servers.

Follow these steps:

1. Log in as a user who has administrator privileges for DX NetOps.

2. Right-click the date or time on the right edge of the taskbar.
   The **Clock and Calendar** dialog opens.
3. Click **Change date and time settings**.
   The **Date and Time** dialog opens.
4. Select the **Internet Time** tab.
5. Click **Change settings**.
   The **Internet Time Settings** dialog opens.
6. Select the **Synchronize with an Internet time server** check box.
7. Select the server with which you want to synchronize. The default selection is `time.windows.com`.
8. Click **Update Now**.
   The system time is synchronized with the selected server.
9. Click **OK** in the **Internet Time Settings** dialog.
10. Click **OK** in the **Date and Time** dialog.

> **NOTE**
> If you have collection devices in different time zones, set each device to its local time zone. Times are converted to Greenwich Mean Time (GMT).

Update the List of Trusted Internet Sites

We recommend that you add the NFA console server to the list of trusted internet sites, unless your browser security settings allow unrestricted access to internet sites.

Note: The steps in this task are written for Internet Explorer 11.

Follow these steps:

1. Log in as a user who has administrator privileges for DX NetOps.
2. Launch Internet Explorer.
3. Click **Tools**, **Internet Options**.
   The **Internet Options** window opens.
4. Select the **Security** tab.
5. Click the **Trusted Sites** icon.
6. Click **Sites**.
   The **Trusted Sites** dialog opens.
7. Enter **http://<*NFAServerName-or-IP*>** in the **Add this Web site to the zone** field.
8. Click **Add**.
   Your change is saved and the site is added to the **Websites** list.
9. Exit:
   a. Click **Close**.
   b. Click **OK** in the **Internet Options** window.
      The **Internet Options** window closes.

Modify the Access Control Lists

We recommend that you configure the router access control lists (ACLs) to ensure that Harvesters (stand-alone, distributed, Windows and Linux) can perform SNMP polling.

> **NOTE**
> If you configure flow to be exported from loopback interfaces, verify that DX NetOps can access the IP addresses of those interfaces.

Disable User Account Control (UAC)

We recommend that you disable User Account Control (UAC) on any Windows stand-alone server or NFA console server. UAC is not fully supported for the current version of DX NetOps. Enabling UAC on the stand-alone server or NFA console server can result in unexpected behavior.

Follow these steps:

1. Log in as a user who has administrator privileges for DX NetOps.
2. Click **Start**, **Control Panel**, **User Accounts**.
   The **User Accounts** window opens.
3. Click **Change User Account Control settings**.
   The **User Account Control Settings** dialog opens.
4. Move the slider bar to the bottom **Never notify** level, if it is not already at this level.
   UAC is set to be disabled for all local accounts on the server.
5. Click **OK**.
   You return to the **User Accounts** tasks page.
6. Close the window.

Configure Web Content Expiration

We recommend that you configure IIS on a stand-alone or NFA console to ensure that fresh web content is displayed. With the **Expire Web Content Immediately** setting enabled, the browser displays an updated page from the server rather than cached content.

Follow these steps:

1. Log in as a user who has administrator privileges for DX NetOps.
2. Select **Start**, **Administrative Tools, Internet Information Services (IIS) Manager**.
   The **Internet Information Services Manager** window opens.
3. Display the options for expiring web content:
   a. Click the server name in the **Connections** pane.
      The server features are displayed.
   b. Double-click the **HTTP Response Headers** icon in the **HTTP Features** group.
      The window displays the current HTTP Response Headers.
   c. Click **Set Common Headers** in the **Actions** pane.
      The **Set Common Headers** dialog opens.
4. Select the following options:
   – **Expire Web content** check box
   – **Immediately**
5. Exit:
   a. Click **OK** to save your changes and close the dialog.
   b. Close the **Internet Information Services Manager** window.

Create a TrapConfiguration Key

Create an empty TrapConfiguration key in the Windows Registry on the Harvester to prevent the SNMP service from logging false positive events.

Follow these steps:

1. Log in as a user who has administrator privileges for DX NetOps.
2. Open a command prompt window.

3. Run the following command:

```
reg add HKLM\SYSTEM\CurrentControlSet\Services\SNMP\Parameters\TrapConfiguration
```

If the command executes successfully, the return value is: "The operation completed successfully."
The TrapConfiguration registry key is created in the following location:
`HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\SNMP\Parameters`

Configure the Recycle Bin

We recommend that you configure the Recycle Bin to remove deleted files from the server immediately. The default behavior is for the system to save copies of deleted files in the Recycle Bin.

This should be done on any computer where DX NetOps is installed.

Follow these steps:

1. Log in as a user who has administrator privileges for DX NetOps.
2. Right-click the **Recycle Bin** icon on the desktop.
3. Select **Properties** from the menu.
   The **Recycle Bin Properties** dialog opens.
4. On the **General** tab, select the drive where DX NetOps is installed.
5. Select **Don't move files to the Recycle Bin. Remove files immediately when deleted**.
6. Click **Apply**.
7. Repeat these steps for each additional drive that you want to configure.
8. Click **OK**.

Disable Unneeded Windows Services

You have the option to disable services on the Windows servers in your deployment that are not needed by the product. This step is designed to help secure your servers. This step is not required. If the following services are needed for another reason, do not disable them.

Follow these steps:

1. Log in as a user who has administrator privileges for DX NetOps.
2. Open the **Services** window: Select **Start**, **Administrative Tools**, **Services**.
   The **Services** window opens.
3. Right-click the following services and select **Manual** or **Disabled**.
   Do not select **Stop** or the services will restart whenever the server is rebooted.

Windows Server Services That You Can Disable:

Application Layer Gateway Service	Application Management	Certificate Propagation
Distributed Link Tracking Client	Distributed Transaction Coordinator	DNS Client
Function Discovery Resource Publication	Human Interface Device Access	IP Helper
Link-Layer Topology Discovery Manager	Microsoft Iscsi Initiator Service	Multimedia Class Scheduler
Netlogon	Network List Service	Network Location Awareness
Portable Device Enumerator Service	Print Spooler	Remote Access Auto Connection Manager
Remote Access Connection Manager	Remote Registry	Resultant Set of Policy Provider
Secondary Logon	Smart Card	Smart Card Removal Policy

Special Administration Console Helper	SSDP Discovery	Tablet PC Input Service
Telephony	Volume Shadow Copy	Windows Audio
Windows Audio Endpoint Builder	Windows CardSpace	Windows Color System
WinHTTP Web Proxy Auto-Discovery Service	WMI Performance Adapter	

Configure MySQL User Password

From the CA NFA 10.0.1 release, you can manage the MySQL user password using the NFA MySQL User Password Change Utility. You must change the MySQL user password in CA NFA Harvester and in the CA NFA console. Ensure that the password for a user is same in both CA NFA Harvester and CA NFA Console.

Follow these steps:

1. In the CA NFA Harvester server and CA NFA Console, navigate to `<CA_NFA_HOME>\Tools` directory.
2. Stop the CA NFA services using the following commands:

   Windows:

   ```
   Harvester: harvester_services.bat stop
   Console: console_services.bat stop
   ```

   Linux:

   ```
   Harvester: harvester-services.sh stop
   ```

3. Open the `DBPasswordUtils.exe` file.
   A command prompt opens to let you change the password.
4. At the prompt, select the user for which you intend to change the password.

   ```
   Select the DB User to change the Password

   1. netqos

   2. harvest

   3. archive

   4. Exit

   Enter your choice (No.):
   ```

   The utility displays the conditions to set the password.
5. At the prompt, enter the required password:

   ```
   Enter the Password for <selected_user_name> DB User :
   ```

   The utility sets the desired password for the selected user.
6. (Optional) Repeat the steps to set password for more users.
7. At the prompt, select option to exit the command prompt.

8. Restart the CA NFA services using the following commands:

   Windows:

   ```
   Harvester: harvester_services.bat start
   Console: console_services.bat start
   ```

   Linux:

   ```
   Harvester: harvester-services.sh start
   ```

9. Restart the IIS server using the `iisreset` command.
   You have changed the MySQL password for the selected users.

   NOTE

   More Information: For more information about troubleshooting any connection issues with CA Anomaly Detector, see CA NFA and CA Anomaly Detector Connection Issue.

Uninstalling the Software

DX NetOps 9.3.0 and later includes an option to uninstall the product, which you can use to remove DX NetOps after an installation or upgrade.

Notes:

- The Uninstaller has no Undo option: Once you uninstall the software, you cannot restore the deleted files automatically.
- You should be able to install and uninstall the DX NetOps software once or twice without incident. If you have ongoing problems, contact CA Support instead of installing and uninstalling the software repeatedly.

  WARNING
  Do not use the Uninstall option if you have upgraded from CA NetQoS ReporterAnalyzer 9.0.1.

Prerequisites

Before you begin uninstalling the DX NetOps software from a server, verify that the component is working properly.

Verify that the appropriate databases are present, as listed in the following table.

Database	Location
reporter	*install_path*\MySql\data\reporter on the stand-alone or NFA console server
harvester	*install_path*\MySql\data\harvester on the stand-alone or Harvester servers
archive15	*install_path*\Netflow\datafiles\ReaperArchive15 on the stand-alone or Harvester servers
data_retention	*install_path*\MySql\data\data_retention on the stand-alone or Harvester servers
archive	*install_path*\Netflow\datafiles\ReaperArchive on the stand-alone or Harvester servers
nsas	*install_path*\MySql\datafiles\HarvesterArchive on the stand-alone or Harvester servers

Verify that the DX NetOps services and MySQL are running, as listed in the following table:

Service	Stand-Alone	Harvester	Console
CA NFA Collection and Poller Webservices (nfa_collpollws on Linux)	Yes	Yes	N/A
CA NFA Data Retention (nfa_dataretention on Linux)	Yes	Yes	N/A
CA NFA DNS/SNMP Proxies (nfa_proxies on Linux)	Yes	Yes	Yes
CA NFA File Server (nfa_filewebservice on Linux)	Yes	Yes	Yes
CA NFA Harvester (nfa_harvester on Linux)	Yes	Yes	N/A
CA NFA Poller (nfa_poller on Linux)	Yes	Yes	N/A
CA NFA Pump	N/A	Yes	Yes
CA NFA Reaper (nfa_reaper on Linux)	N/A	Yes	N/A
CA NFA RibSource	Yes	N/A	Yes
CA MySql (mysql on Linux)	Yes	Yes	Yes
NetQoS NQMySql (nfa_mysqlCSE on Linux)	Yes	Yes	Yes
NetQoSVnaDataCollector	N/A	Yes	N/A
NetQoS Reporter Manager	Yes	N/A	Yes
NetQoS Reporter/Analyzer General Services	Yes	N/A	Yes
NetQoS Reporter/Analyzer Pump	Yes	N/A	Yes
NetQoS Reporter/Analyzer Query Services	Yes	N/A	Yes
NetQoS Reporter/Analyzer Report	Yes	N/A	Yes
NetQoS Reporter/Analyzer Watchdog	Yes	N/A	Yes

Uninstall DX NetOps

This procedure describes how to uninstall the DX NetOps software by using the Uninstaller. You also can uninstall the software from the Windows **Add or Remove Programs** window, where it is listed under the publisher CA Technologies, Inc.

NOTE
These steps assume that you are uninstalling DX NetOps from a standalone or distributed deployment server that has no other related software installed.

Follow these steps:

1. Log in as a user who has administrator privileges for DX NetOps.
2. Back up your data and configuration files.
3. Exit from all applications - no exceptions.
4. Start the Uninstaller: In *install_path*\Uninstall
   – Stand-alone system: Double-click `Uninstall NFA Console` to uninstall the NFA console first, then double-click `Uninstall NFA Harvester` to uninstall the Harvester.
   If you attempt to uninstall the Harvester software first, an error message displays.
   – Distributed deployment: Double-click `Uninstall NFA Console` (NFA console server), then `Uninstall NFA Harvester` (Harvester server).
   The **Uninstall** window opens.

   NOTE
   Leave the file system undisturbed while uninstallation is in progress. Do not attempt to view the progress in Windows Explorer, for example.
5. Click **Uninstall**.
   The Uninstaller removes all of the program and data files, including the following DX NetOps and MySQL elements:
   – Data
   – Services
   – Registry entries
   – Shortcuts, links, and aliases created by the installer (user-created shortcuts or links cannot be removed by the uninstaller)
   – Most files
   – Some directories
   When the process is complete, the screen displays a list of the directories and files that were not deleted.
   Once the program finishes, the **Uninstall Complete** screen opens.
6. Click **Done** to close the **Uninstall Complete** screen.
7. Wait a few minutes to allow the helper process to finish the final cleanup.
   Some files are not deleted until this phase is finished. Once the final cleanup is finished, the Uninstaller itself is deleted.
8. Reboot the computer to complete the uninstall process.
9. Check the following to verify the uninstall:
   a. Verify that the Registry keys in the following location are deleted:
      `HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\NetQoS`
   b. Verify that the DX NetOps services are removed.
   c. Verify that the DX NetOps programs (such as NFA or Harvester and MySQL) are no longer visible from the Control Panel. If they are, select each program individually and click **Uninstall**.

Notes:

- The uninstallation log is at the root level of the original installation path. For example, the Harvester uninstallation log is at:

  install_path\Harvester_Uninstall_<timestamp>.txt
- You may want to manually delete any DX NetOps directories and files that are still present.
- If you make an unsuccessful attempt to reinstall the software, contact CA Support.

Upgrading

This section is for systems administrators who are upgrading DX NetOps. When complete, you will have updated the following:

- NFA Console (Windows Server 2016, Standard Edition on a 64-bit processor)
- NFA Harvester (Windows Server 2016, Standard Edition on a 64-bit processor, or Linux server)
- (Optional) Flow Cloner (Windows Server 2016, Standard Edition on a 64-bit processor)

NOTE
More information:

(Optional) CA Anomaly Detector

Upgrade CA Network Flow Analysis

You can upgrade from the following version to the current version of DX NetOps:

- DX NetOps 9.3.3, 9.3.6, 9.3.8, 9.5.0, 10.0.0
- Compatibility Matrix
- (Optional) CA Anomaly Detector 9.3.3, 9.3.6, 9.5.0, 10.0.0

When you upgrade the software, you continue to use the same architecture:

- Stand-alone to stand-alone
- Distributed 2-tier to distributed 2-tier
- You cannot upgrade to current version of DX NetOps with a distributed 3-tier architecture.
  You can convert from a 3-tier architecture to a 2-tier architecture on DX NetOps 9.3.3, then upgrade to the current version of CA NFA.

DX NetOps 9.3.3 is the earliest software version that you can upgrade directly to the current version of CA NFA. If you have an earlier version, upgrade to 9.3.3 or 9.3.6 before you proceed.

NOTE

Before upgrading, Administrators should review all users that have the Manage Reports right, to determine what level of access they require after upgrade. Prior to DX NetOps 9.3.1, users with the Manage Reports right had visibility to all interfaces and reports in the system. Starting with DX NetOps 9.3.1, users with the Manage Reports right only have access to those reports, interfaces, and report folders where the Administrator has explicitly granted access.

Administrators can use the automatically generated groups that correspond to each report folder to control access to reports in that folder. Administrators should be aware that when they grant access to a specific report to a user with the Manage Reports right, that user will have access to all reports in the folder where that report resides.

Notes:

- Upgrade DX NetOps before any upgrade you make to Performance Center.
- Do not install or upgrade any DX NetOps component on a server that has Performance Center installed. You can co-locate the NFA console or stand-alone deployment with CA Anomaly Detector, but not with any other related software.
- If you plan to switch between CA NetQoS Performance Center (NPC) and CA Performance Center (CA PC), unregister before you upgrade DX NetOps. Unregister before a switch from CA NPC to CA PC or a switch from CA PC to CA NPC.
- Windows NT LAN Manager (NTLM) is not supported by the Single Sign-On tool.
- If you are using HTTPS, you need to perform the configuration steps found in the I nstallin g section.

NOTE

More information:

Upgrade from CA NFA 9.0.161

If you are on NFA 9.0.161, we recommend upgrading from 9.0.161 to 9.1.4, to 9.2.1 and then to 9.3.3 follow the steps below:

1. Before starting any upgrade, regardless of what version you are running, you MUST make backups of all of your Databases on the RA Console, Harvester, and DSA following the steps on pages 50-51 of the 9.1.3 upgrade Guide.
2. Prepare your servers by installing Java 1.6u41 on all RA servers, and then run the consoletool-exe.jar on on the RA Console server.
3. Upgrade from 9.0.161 to 9.1.4 following the NFA 9.1.3 Upgrade Guide.

   NOTE

   The CA NFA 9.1.4 was a minor release so there was 9.1.4 Upgrade Guide published.
4. Once the upgrade to NFA 9.1.4 completes, there is a period of time where your historical data will be migrated to the new database format. You need to wait for this historical data migration to complete on each of your DSA's before proceeding with the upgrade to 9.2.1To verify that your Historical Data migration completed, run the following command on your DSA's:

   ```
   mysql -P3308 -D nqrptr -t -e "select from_unixtime(value) from settings where
    name='migrationCompletedTime';"
   ```

   If this query returns a current time stamp, it means the historical migration completed and you can upgrade to NFA 9.2.1.
5. After you verify step 4 and verify that you can see historical data, cleanup any left over tables on the DSA by following the steps in this KB on how to Cleanup old NQRPTR files to prevent future upgrade problems.
6. Backup your 9.1.4 databases, follow the steps on pages 52-53 of the 9.1.3 Upgrade Guide.
7. Then you can upgrade from 9.1.4 to 9.2.1 following the NFA 9.2.1 Upgrade Guide.
8. If you have NPC installed on the same server as NFA, you will need to migrate NPC to a new server before upgrading to NFA 9.3.3 using this document:Tech Tip: NFA 9.3 Upgrade Tip - How to Migrate Netqos Performance Center(NPC) to a New Server
9. Once this completes backup All databases as documented in the NFA 9.3.3 Guide.
10. Upgrading to NFA 9.3.3 will require an upgrade of MySql to version 5.6. This may add additional time to your upgrade since all of your databases will be backed up while the upgrade runs. This will also require additional free space during the upgrade to ensure there is enough room to backup your databases as noted in this document: Tech Tip: NFA New Mysql version 5.6 pre-upgrade considerations
11. Then upgrade to NFA 9.3.3 following the 9.3.3 Upgrade Guide.

Converting From a Three-Tier to a Two-Tier Architecture

This release does not support a three-tier architecture. Before upgrading to 9.5.0, convert a DX NetOps 9.3.3 three-tier deployment to a two-tier deployment.

Prerequisites

DSA

On each DSA:

1. Download the DX NetOps three-tier to two-tier conversion tool and extract the contents of the zip file.
   250
   Copy the `3TConverter.ps1` script to a directory on the DSA.
2. Determine the Windows PowerShell version.
   a. Open the **Windows PowerShell** command window.
   b. Enter the following command to set the execution policy:
      ```
      Set-ExecutionPolicy RemoteSigned
      ```
      Enter **Y** at the prompt to change the execution policy.
   c. Enter the following command to determine the version:
      ```
      $PSVersionTable.PSVersion
      ```
      Windows Server 2008 R2 systems typically have PowerShell 2.0, while Windows Server 2012 R2 systems have PowerShell 3.0 or 4.0.
   d. Close the **Windows PowerShell** command window.
3. Download and install MySQL Connector/Net, `mysql-connector-net-<version>.msi` .
   PowerShell 2.0:
   https://dev.mysql.com/get/Downloads/Connector-Net/mysql-connector-net-6.7.9.msi
   PowerShell 3.0 or 4.0:
   https://dev.mysql.com/get/Downloads/Connector-Net/mysql-connector-net-6.9.9.msi
4. If there are Harvesters running on Linux in the three-tier architecture, download and install the most recent version of PuTTY 64-bit (version 0.69 at the time of writing). It is easiest to use the MSI Windows Installer version.
   http://www.chiark.greenend.org.uk/~sgtatham/putty/latest.html Select to add PuTTY to the PATH, if necessary.

Windows Harvesters

On each Windows Harvester:

1. Share the *install_path*`\Netflow\datafiles\ReaperArchive15` directory with "Administrators" or users with Administrative rights.
   a. Navigate to `install_path\Netflow\datafiles` .
   b. Right-click the `ReaperArchive15` directory and select **Properties**.
   c. Select the **Sharing** tab and click **Share**.
   d. Select **Administrators** from the list and click **Share**.
2. Verify that there is enough disk space to copy the `ReaperArchive15` files from the DSA systems to the Harvester. The amount of required disk space could be as much as is currently configured on a single DSA.

Linux Harvesters

On each Linux Harvester:

1. Verify that all Linux Harvester hosts have the same user and password with read/write access. The conversion script uses a single user/password combinations to access all Linux Harvesters.
2. If the Harvester is not installed in the default installation directory (`/opt/CA/NFA`), create a symbolic link from `/opt/CA/NFA` to the installation directory.
   For example, if the Harvester is installed in `/home/NetQoS` :
   ```
   ln -s /home/NetQoS /opt/CA/NFA
   ```
3. Verify that there is enough disk space to copy the `ReaperArchive15` files from the DSA systems to the Harvester. The amount of required disk space could be as much as is currently configured on a single DSA.

Convert the DSAs

1. Stop all NFA services on the Console, each DSA, and each Harvester. *DO NOT* stop the MySQL service.
   Console:
   – CA NFA File Server
   – CA NFA RibSource
   – CA Performance Center SSO
   – NetQoS Reporter Manager Service
   – NetQoS Reporter/Analyzer General Services
   – NetQoS Reporter/Analyzer Pump Service
   – NetQoS Reporter/Analyzer Query Services
   – NetQoS Reporter/Analyzer Watchdog
   – NetQoS ReporterAnalyzer Report Service
   Harvester:
   – CA NFA Collection and Poller Webservices
   – CA NFA Data Retention
   – CA NFA DNS/SNMP Proxies
   – CA NFA File Server
   – CA NFA Harvester
   – CA NFA Poller
   – CA NFA Reaper
   DSA:
   – CA NFA Data Retention
   – CA NFA DSA Loader
   – CA NFA Pump
2. On each DSA, open a **Windows PowerShell** command window and browse to the directory containing the `3TConverter.ps1` script.
   Execute the script with the following arguments:
   ```
   ./3TConverter.ps1 -nfaconsole <nfa_console_ip> -installDir <install_path> [-linuxInstallDir
   <linux_install_path>] [-numDays <number_of_days_to_copy>]
   ```
   The optional `-numDays` parameter specifies the most recent number of days of 15-minute data to copy to the Harvesters. If this parameter is not set, all data is copied. We recommend setting the parameter to a low number so that the system can be brought back up in less time. After the system is back up, you can execute the script again to copy the remainder of the historical data while the system is receiving new flow data.
   a. If there are Linux Harvesters in the configuration, you are prompted for a user and password.
   b. Enter **y** to accept the **rsa** key when prompted.
   For example:
   ```
   .\3TConverter.ps1 -nfaconsole 10.2.0.15 -installDir C:\CA\NFA -linuxInstallDir /opt/CA/NFA -numDays 1
   ```
   Wait for the script to finish executing.
3. Restart all NFA services.
4. If the script was previously run with a `-numDays` parameter, execute the script again (on each DSA) without the `-numDays` parameter to convert the remaining 15-minute data.
5. After all 15-minute data are copied, stop sharing the *install_path*`\Netflow\datafiles\ReaperArchive15` directory on each Windows Harvester.
   Note: On Windows Server 2008 R2 systems, sharing leaves a lock on the `ReaperArchive15` directory. To remove the lock:
   a. Right-click `ReaperArchive15` and select **Properties**.
   b. Select the **Security** tab, then click **Advanced**.
   c. Select the **Administrators** group, then click **Change Permissions**.

d. Select **Include inheritable permissions from this object's parent**, then click **Apply**.
e. Exit from the **Properties** dialog.

Troubleshooting Conversion Issues

3TConverter.ps1 is Not Recognized

Error:

```
The term '.\3TConverter.ps1' is not recognized as the name of a cmdlet, function, script file, or operable
 program…
```

Solution:

`cd` to the directory that contains the `3TConverter.ps1` script and rerun the script.

All Directories Have Been Previously Copied

The `3TConverter.ps1` script creates and updates a file with the list of all DSA `ReaperArchive15` directories that have been successfully copied. This file is located in each DSA's installation directory, named `copiedArchive15Folders.txt` . If all files have already been copied, this message displays and the script exits.

If for some reason you need to recopy the files, delete the `copiedArchive15Folders.txt` file and delete the directories on the Harvester that need to be recopied, then rerun the script.

Execution of Scripts is Disabled

Error:

```
File 3Tconverter.ps1 cannot be loaded because the execution of scripts is disabled on
this system. Please see "get-help about_signing" for more details.
```

Solution:

1. Enter the **Windows PowerShell** command:
   `Set-ExecutionPolicy RemoteSigned`
2. Enter **Y** when prompted.

Specified Install Directory Does Not Exist

Solution:

Locate the NFA installation directory for the DSA and provide the full path to the directory in the `-installDir` argument. By default, the DSA is installed in `C:\CA\NFA` .

Unable to Query for Routers

Error:

```
Unable to query for routers: … Exception: Cannot find type [MySql.Data.MySqlClient.MySqlConnection]: verify
 that the assembly containing this type is loaded.
```

Solution:

Download and install MySQL Connector/Net.

Unable to Query for Routers

Error:

```
Unable to query for routers: … Exception: Exception calling "Open" with "0" argument(s): Unable to connect to
 any of the specified MySQL hosts.
```

Solution:

- Verify that the IP address specified for the `-nfaconsole` argument matches the IP address of the NFA Console for this configuration.
- Verify that the "CA MySql" service is running on the NFA Console.

Unable to Access Linux Harvester

Error:

```
Unable to access Linux Harvester: … Exception: The term 'pscp.exe' is not recognized as the name of a cmdlet,
 function, script file, or operable program…
```

or

```
Unable to access Linux Harvester: … Exception: The term 'plink.exe' is not recognized as the name of a cmdlet,
 function, script file, or operable program…
```

Solution:

- Download and install PuTTY.
- Ensure that PuTTY is added to the PATH.
- Close and reopen Windows PowerShell to refresh the environment.

Access Denied or Unable to Access Linux Harvester

Solution:

Verify that the provided user and password are correct and have read/write access on all Linux Harvester systems.

Unable to Copy Files to Windows Harvester

Solution:

Verify that that all Windows Harvesters have their `ReaperArchive15` directories shared with "Administrators".

Unable to Make ReaperArchive15/ Directory

Solution:

Verify that the provided Linux installation directory is correct and the same for all Linux Harvesters. Otherwise, verify that all necessary symbolic links have been created.

No Flow Data, Historical or New, on Windows Harvesters

Solution:

1. Verify that all NFA services are up on the Harvester and the Console.
2. Open a Remote Desktop session on the Windows Harvester.
3. Open the **File Explorer** and look for a "lock" icon on the `ReaperArchive15` directory. To remove the lock:
   a. Open the folder **Properties**.
   b. Select the **Security** tab, then click **Advanced**.

c. Select the **Administrators** group, then click **Change Permissions**.
d. Select **Include inheritable permissions from this object's parent** and click **Apply**.
e. Click **Ok** several times to exit from the **Properties** dialog.

4. Verify the `reporter` and `harvester` database settings.
   reporter Database Settings
   harvester Database Settings

No Flow Data, Historical or New, on Linux Harvesters

Solution:

1. Verify that all NFA services are running on the Harvester and the Console.
2. Verify that the owner and group of the `ReaperArchive15` directory and subdirectories are set to "nfa". If not, run the command:
   `chown -R nfa:nfa <linuxInstallDir>/Netflow/datafiles/ReaperArchive15/*`
3. Verify the `reporter` and `harvester` database settings.
   reporter Database Settings
   harvester Database Settings

reporter Database Settings (Console)

Table	Parameter	Value

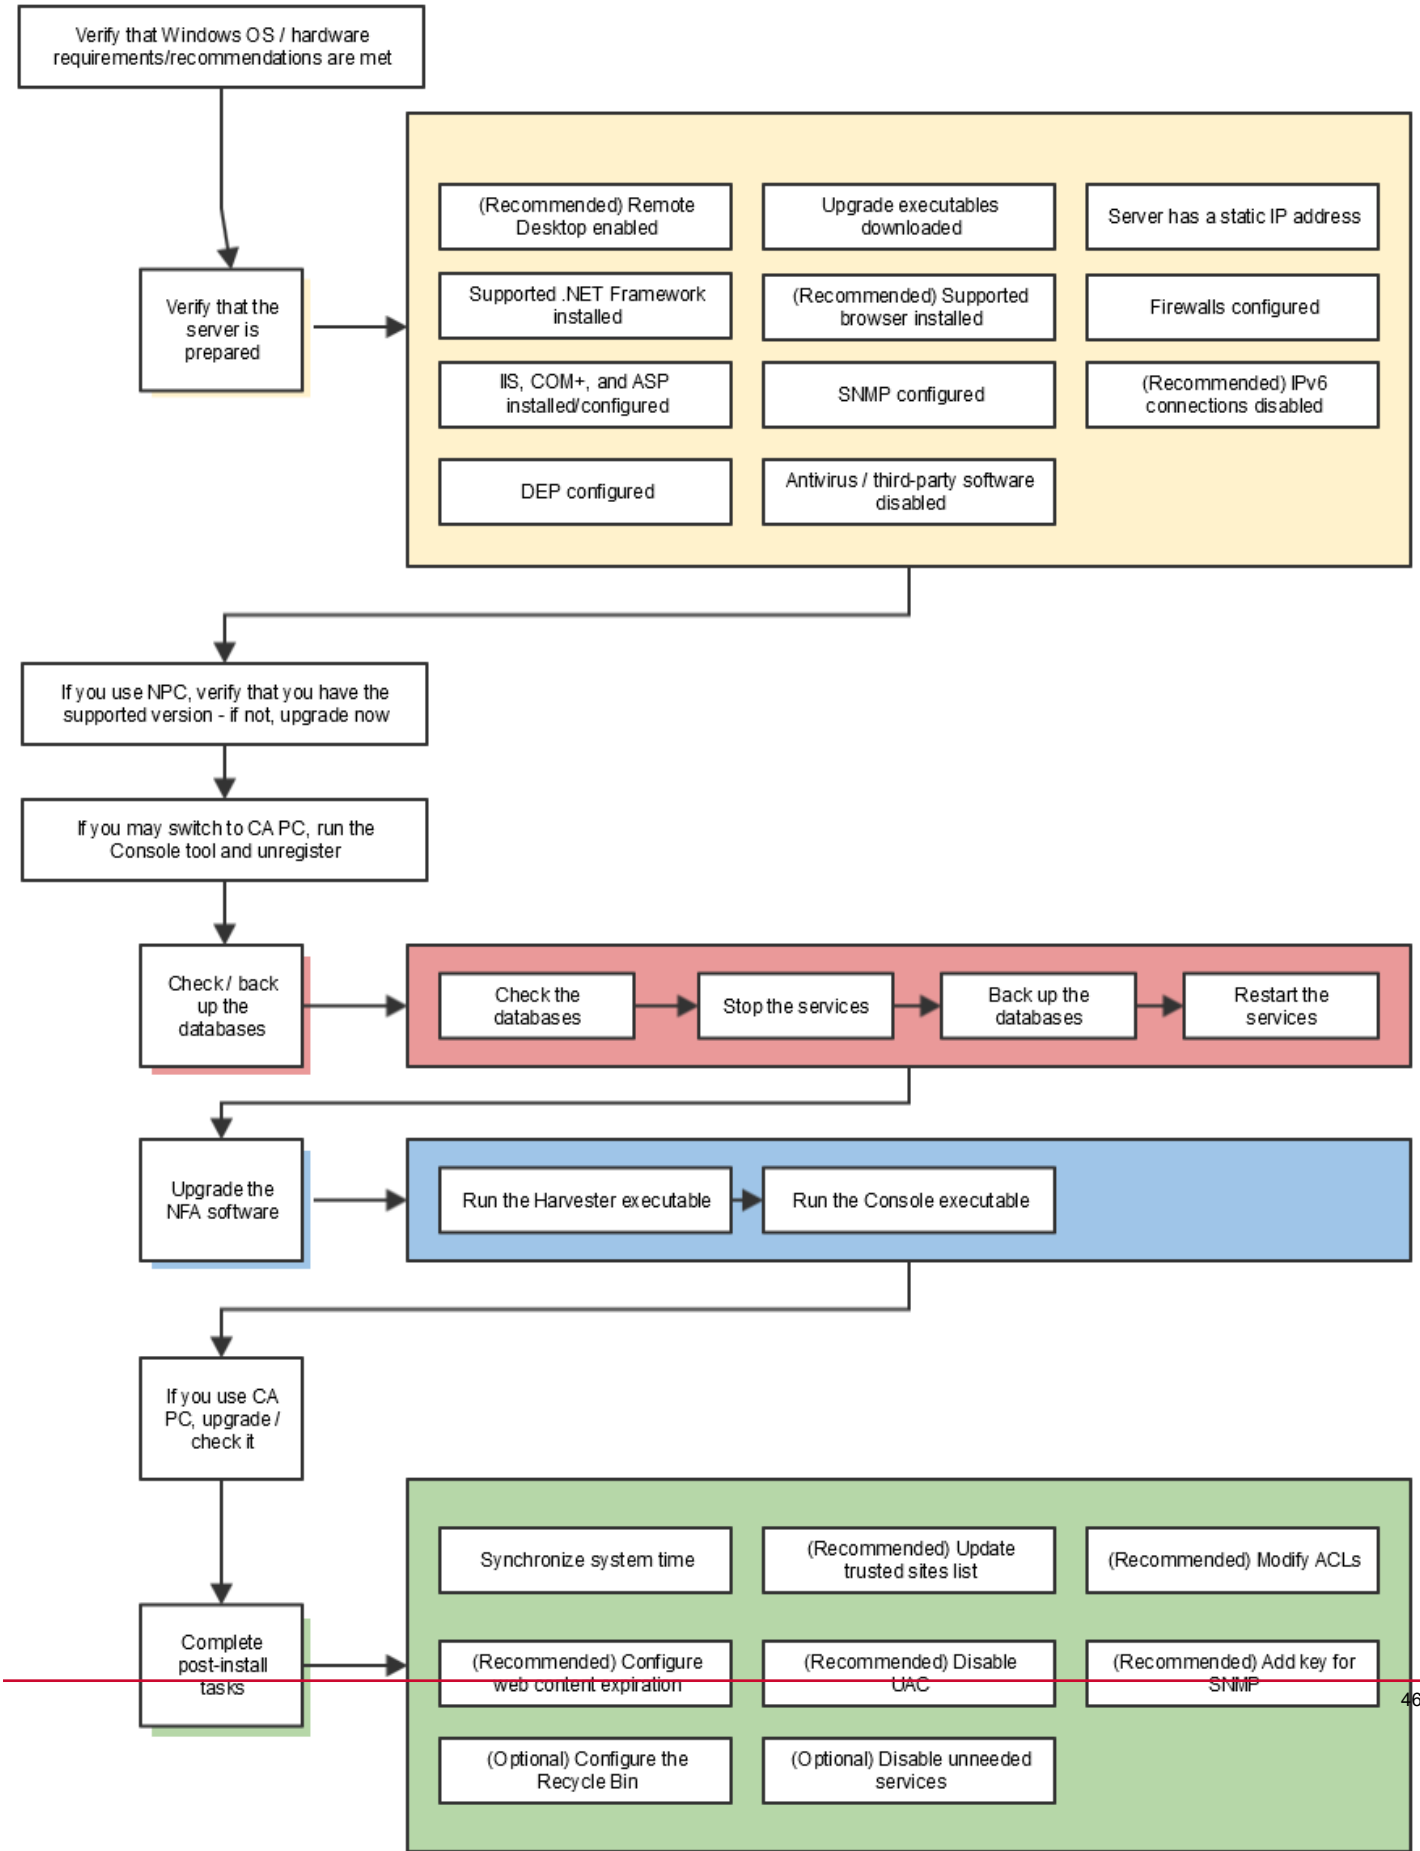
Workflow for Upgrading a Stand-Alone Deployment

Use the following diagram as a general checklist for upgrading a stand-alone deployment.

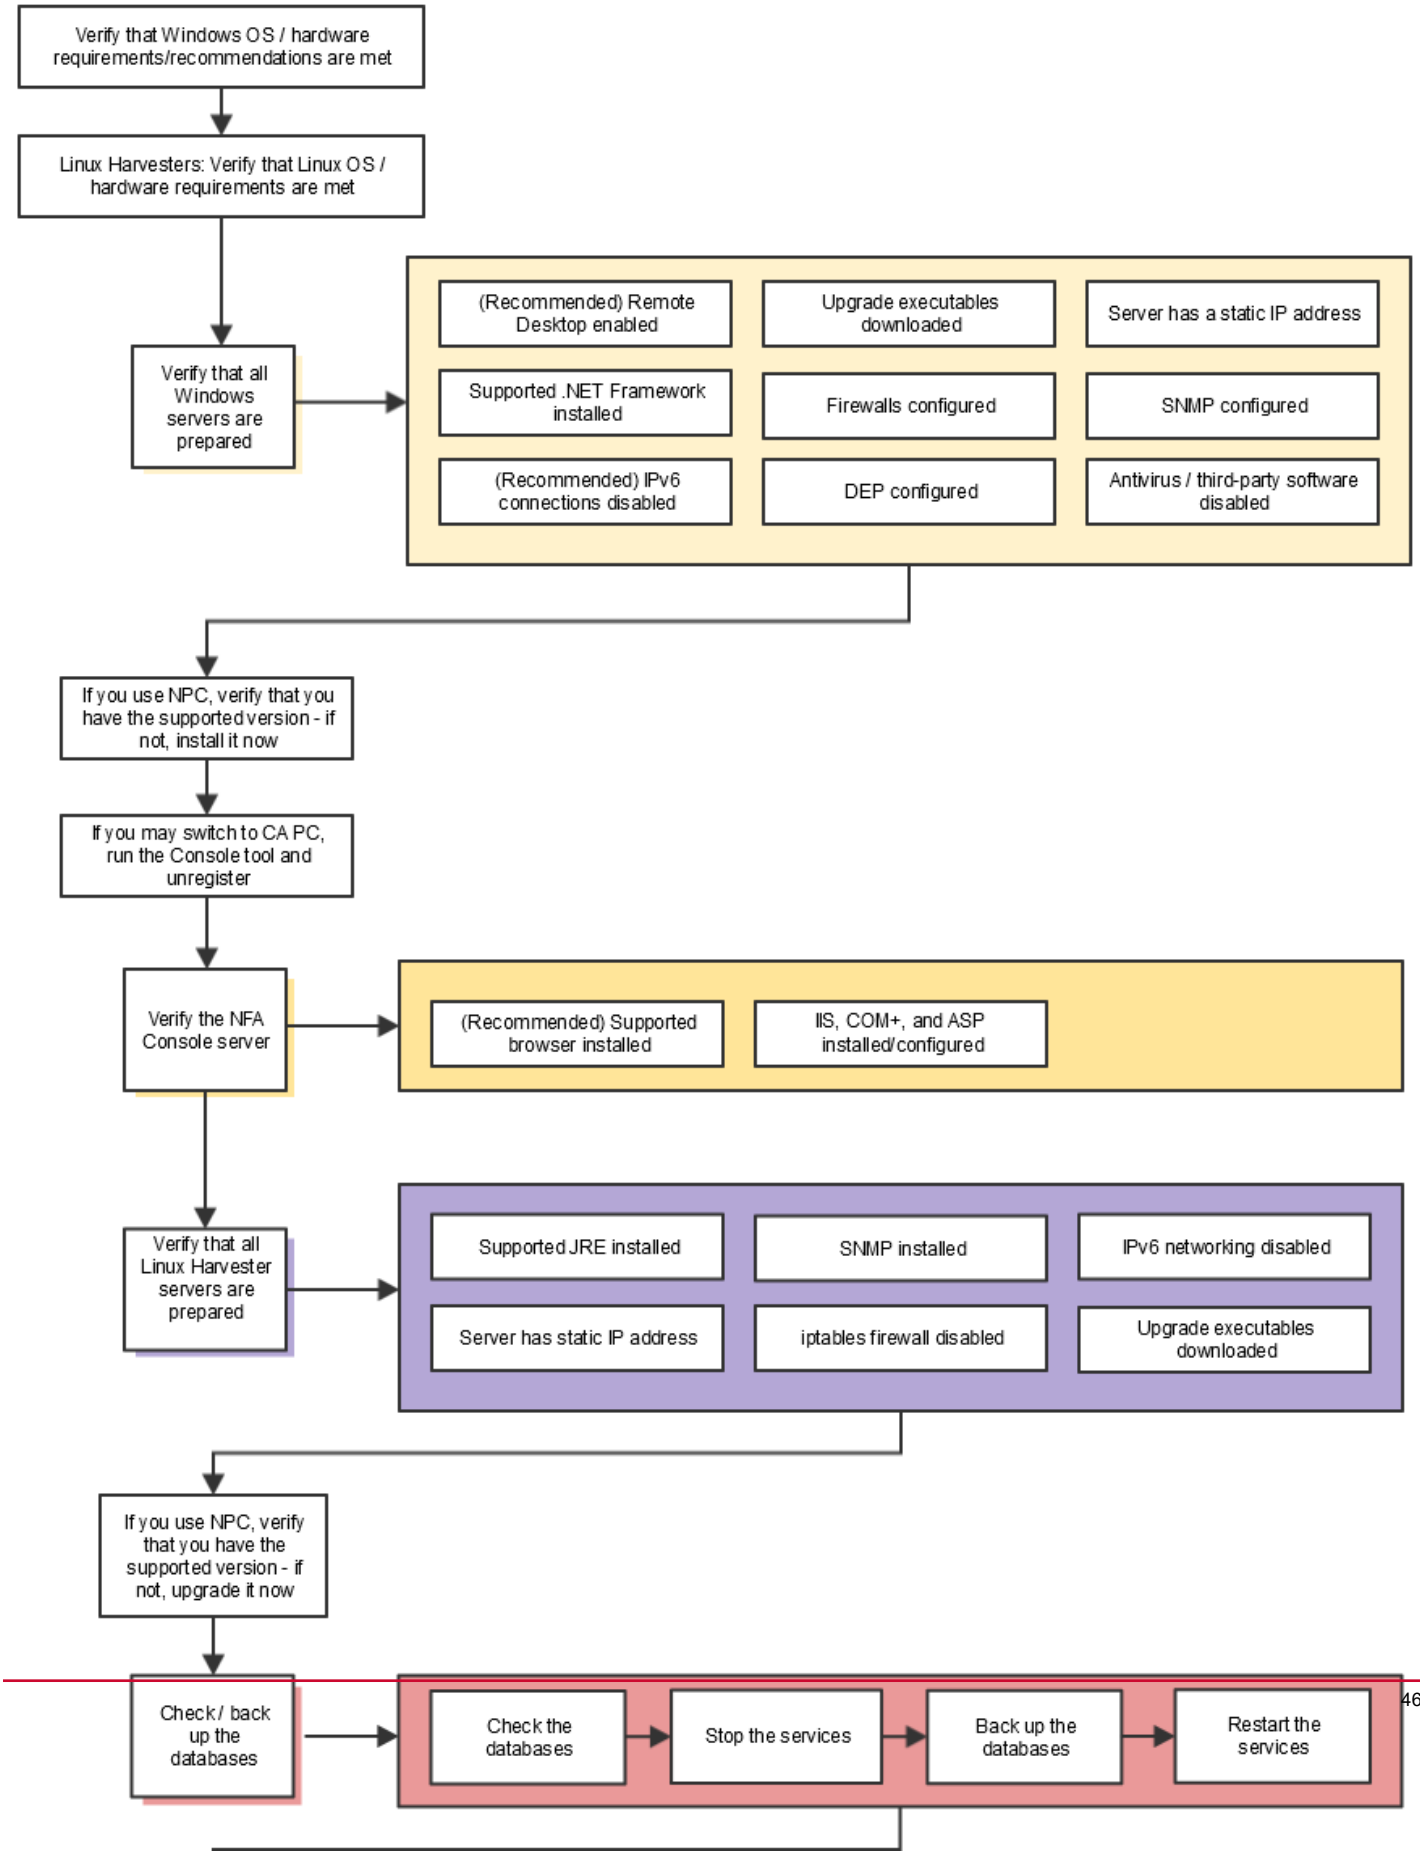
Figure 97: Upgrade stand-alone NFA_9.3.7



Workflow for Upgrading a Distributed Deployment

Use the following diagram as a general checklist for upgrading a distributed deployment.

Figure 98: Upgrade distributed NFA_9.3.7



Download the Upgrade Files

Copy the installation/upgrade files to the installation server so you are certain to have access to the files.

1. Get the files for installing or upgrading the components:
   a. Log in to support.ca.com.
   b. Navigate to the **Download Center**. For example, select **Download Center** from the **Support** menu in the left pane.
   c. Select the following navigation options:
      - **Select a Product**: Select "DX NetOps - MULTI-PLATFORM" to display the links for the NFA console, Harvester (Windows), Harvester (Linux), and CA Anomaly Detector installation and upgrade ISO files.
      - **Select a Release**: Select ***<version>***
   d. Download the ISO files from the **Product Components** list that is displayed.

      TIP
      An ISO file is an archive file that contains the contents of an optical disk. Each one of the available ISO files contains the files for installing or upgrading the component named in the file link.
2. Perform one of the following tasks:
   – Burn the ISO files to a CD-ROM or DVD.
   – Extract the contents of the ISO files by using an ISO image software application. Many free ISO image applications are available.
3. Extract the appropriate files to the installation servers:
   – Stand-alone servers:
      - `NFHarvesterSetup<version>.exe`
      - `RAConsoleSetup<version>.exe`
   – Windows Harvester servers in distributed deployments:
      - `NFHarvesterSetup<version>.exe`
   – Linux Harvester servers in distributed deployments:
      - `NFHarvesterSetup<version>.bin`
   – NFA console servers in distributed deployments:
      - `RAConsoleSetup<version>.exe`

You can install or upgrade the software locally or remotely.

Verify that the Windows Servers Are Prepared

Before you begin the upgrade, verify that the following conditions are met. Failure to comply with these requirements can result in data loss, increased down time, software conflicts, or a failed upgrade.

NOTE
More information:

- The system requirements are updated for DX NetOps 9.5.0. See System Recommendations and Requirements.
- You must have backups of your installation. See Backing Up and Restoring Data.

Verify that the following conditions are met:

- Installation servers have fully operational installations of DX NetOps software that is supported for upgrade.
- Your deployment includes a supported version of Performance Center, if you are using Performance Center.
- You have the required backups of your installation.
- The Windows servers meet the requirements in the following table.

Stand-Alone Server	Distributed NFA Console Server	Distributed Harvester Server
Windows operating system requirements are met		
(Recommended) Windows hardware recommendations are met		
(Recommended) Remote Desktop connection is enabled to allow remote access		
Upgrade executables are downloaded to the servers		
Static IP address is assigned to each server. Set the Harvester server IP address to match the flow export destination that is assigned to each router.		
Supported version of .NET Framework 3.5 is installed *		
Supported version of .NET Framework 4.6.2 is installed *		
(Recommended) Supported browser is installed **		
Firewalls are configured		
IIS, COM+, and ASP are installed **		
SNMP is configured **		
IPv6 addresses are disabled		
DEP is configured		
The following third-party software is disabled until the upgrade is complete: Antivirus, server monitoring, and maintenance software. If you enable antivirus scans later, exclude the DX NetOps installation path and its subdirectories.		
Databases are checked		
Services are stopped, databases and required files/directories are backed up, and services are restarted		

* The upgrade program does not open or does not complete successfully unless this requirement is met.
** If the server fails to pass this check, a warning message opens.

General Notes:

- Stop other programs from running during the installation or upgrade.
- When you apply Windows updates, restart all servers to ensure that the updates are applied.
- Ensure that no one else is logged in to the server during the installation or upgrade.

Upgrade Microsoft Windows Server 2008 to Microsoft Windows Server 2012 R2

This section describes the steps to migrate CA NFA with data to Microsoft Windows Server 2012 R2:

- Microsoft Windows Server 2012 R2 Standard Edition, when upgrading from a previous supported version of DX NetOps (CA NFA) which is installed on Microsoft Windows Server 2008 R2 Standard Edition.
- Microsoft Windows Server 2012 R2 Standard Edition, when performing a new installation of DX NetOps.

WARNING

- **Do not perform an in-place upgrade of the Windows operating system**. To upgrade a Microsoft Windows Server 2008 system which is hosting an existing version of DX NetOps, you must provision a new server with Windows Server 2012 R2 Standard Edition.
- Plan to migrate the existing IP addresses of the DX NetOps monitoring device to the new server.

In the following instructions,

- (WS2008) means to perform the task on the existing Windows Server 2008 CA NFA system.
- (WS2012) means to perform the task on the new Windows Server 2012 CA NFA system.

Two-Tier Deployment

Follow these steps:

1. Install Windows Server 2012 R2 Standard Edition on new servers.
2. (WS2012) Do a clean install of current version of the CA NFA on the new servers.
3. For each Windows Harvester:
   a. (WS2008) Stop the following services:
      - CA NFA Collection and Poller Webservices
      - CA NFA Data Retention
      - CA NFA DNS/SNMP Proxies
      - CA NFA File Server
      - CA NFA Harvester
      - CA NFA Poller
      - CA NFA Reaper
      - CA NFA Flow Cloner (if Flow Cloner is installed)
   b. (WS2008) Create the directory *install_path*\MySql_Backups .
   c. (WS2008) Execute the following commands from a Command Prompt window:

```
cd install_path\MySql\bin
mysqldump --routines --events -u root -P 3308 harvester
> install_path\MySql_Backups\harvester_backup.sql
mysqldump --routines --events -u root -P 3308 poller > install_path\MySql_Backups
\poller_backup.sql
mysqldump --routines --events -u root -P 3308 data_retention
> install_path\MySql_Backups\data_retention_backup.sql
```

   d. (WS2008 and WS2012) Copy the *install_path*\MySql_Backups directory to the Windows Server 2012 system.
   e. (WS2008 and WS2012) Copy the *install_path*\Netflow\datafiles directory to the Windows Server 2012 system.
   f. (WS2008) Shutdown the Windows Server 2008 system.
   g. (WS2012) Stop the following services:
      - CA NFA Collection and Poller Webservices
      - CA NFA Data Retention
      - CA NFA DNS/SNMP Proxies
      - CA NFA File Server
      - CA NFA Harvester
      - CA NFA Poller
      - CA NFA Reaper
   h. (WS2012) Execute the following commands from a Command Prompt window:

```
cd install_path\MySql\bin
mysql -P 3308 -u root -e "drop database harvester"
mysql -P 3308 -u root -e "create database harvester"
mysql -P 3308 -u root harvester < install_path\MySql_Backups\harvester_backup.sql
mysql -P 3308 -u root -e "drop database poller"
```

```
mysql -P 3308 -u root -e "create database poller"
mysql -P 3308 -u root poller < install_path\MySql_Backups\poller_backup.sql
mysql -P 3308 -u root -e "drop database data_retention"
mysql -P 3308 -u root -e "create database data_retention"
mysql -P 3308 -u root data_retention < install_path\MySql_Backups
\data_retention_backup.sql
```

i. (WS2012) Restart the NFA Services that you stopped in step g.
j. (WS2012) Reconfigure the Windows Server 2012 system to use the Windows Server 2008 IP address.

4. For the Windows Console:
   a. (WS2008) Stop the following services:
      - CA NFA RibSource
      - CA Performance Center SSO
      - NetQoS Reporter Manager Service
      - NetQoS Reporter/Analyzer General Services
      - NetQoS Reporter/Analyzer Pump Service
      - NetQoS Reporter/Analyzer Query Services
      - NetQoS Reporter/Analyzer Watchdog
      - NetQoS ReporterAnalyzer Report Service
   b. (WS2008) Create the directory *install_path*\MySql_Backups .
   c. (WS2008) Execute the following commands from a Command Prompt window:

```
cd install_path\MySql\bin
mysqldump --routines --events --skip-lock-tables -u root -P 3308 reporter
> install_path\MySql_Backups\reporter_backup.sql
```

   d. (WS2008 and WS2012) Copy the *install_path*\MySql_Backups directory to the Windows Server 2012 system.
   e. (WS2008) Shutdown the Windows Server 2008 system.
   f. (WS2012) Stop the following services:
      - CA NFA RibSource
      - CA Performance Center SSO
      - NetQoS Reporter Manager Service
      - NetQoS Reporter/Analyzer General Services
      - NetQoS Reporter/Analyzer Pump Service
      - NetQoS Reporter/Analyzer Query Services
      - NetQoS Reporter/Analyzer Watchdog
      - NetQoS ReporterAnalyzer Report Service
   g. (WS2012) Execute the following commands from a Command Prompt window:

```
cd install_path\MySql\bin
mysql -P 3308 -u root -e "drop database reporter"
mysql -P 3308 -u root -e "create database reporter"
mysql -P 3308 -u root reporter < install_path\MySql_Backups\reporter_backup.sql
```

   h. (WS2012) Restart the NFA services that you stopped in step f.
   i. (WS2012) Reconfigure the Windows Server 2012 system to use the Windows Server 2008 IP Address.
5. For the Anomaly Detector:
   a. (WS2008) Stop the following Anomaly Detector Services:

- CA NFA Host Resolver Service
- CA NFA Hunter Tracker Service
- CA NFA Ribsource

b. (WS2008) Create the directory *install_path*\MySql_Backups .
c. (WS2008) Execute the following commands from a Command Prompt window:

```
cd install_path\MySql\bin
mysqldump --routines --events -u root -P 3308 nsas > install_path\MySql_Backups
\nsas_backup.sql
```

d. (WS2008 and WS2012) Copy the *install_path*\MySql_Backups directory to the Windows Server 2012 system.
e. (WS2008) Shutdown the Windows Server 2008 system.
f. (WS2012) Stop the following Anomaly Detector Services:
   - CA NFA Host Resolver Service
   - CA NFA Hunter Tracker Service
   - CA NFA Ribsource
g. (WS2012) Execute the following commands from a Command Prompt window:

```
cd install_path\MySql\bin
mysql -P 3308 -u root -e "drop database nsas"
mysql -P 3308 -u root -e "create database nsas"
mysql -P 3308 -u root nsas < install_path\MySql_Backups\nsas_backup.sql
```

h. (WS2012) Restart the Anomaly Detector services that you stopped in step f.
i. (WS2012) Reconfigure the Windows Server 2012 system to use the Windows Server 2008 IP Address

6. (WS2012) Upgrade each CA NFA system to the current version.

Standalone Deployment

Follow these steps:

1. Install Windows Server 2012 R2 Standard Edition on a new server.
2. (WS2012) Do a clean install of current version of CA NFA on the new server.
3. (WS2008) Stop the following services:

- CA NFA Collection and Poller Webservices
- CA NFA Data Retention
- CA NFA DNS/SNMP Proxies
- CA NFA File Server
- CA NFA Harvester
- CA NFA Poller
- CA NFA Reaper
- CA NFA RibSource
- CA Performance Center SSO
- NetQoS Reporter Manager Service
- NetQoS Reporter/Analyzer General Services
- NetQoS Reporter/Analyzer Pump Service
- NetQoS Reporter/Analyzer Query Services
- NetQoS Reporter/Analyzer Watchdog
- NetQoS ReporterAnalyzer Report Service
- CA NFA Host Resolver Service (if Anomaly Detector is installed)
- CA NFA Hunter Tracker Service (if Anomaly Detector is installed)
- CA NFA Flow Cloner (if Flow Cloner is installed)

4. (WS2008) Create the directory *install_path*\MySql_Backups .
5. (WS2008) Execute the following commands from a Command Prompt window:

```
cd install_path\MySql\bin
mysqldump --routines --events -u root -P 3308 harvester > install_path\MySql_Backups
\harvester_backup.sql
mysqldump --routines --events -u root -P 3308 poller > install_path\MySql_Backups
\poller_backup.sql
mysqldump --routines --events -u root -P 3308 data_retention
> install_path\MySql_Backups\data_retention_backup.sql
mysqldump --routines --events --skip-lock-tables -u root -P 3308 reporter
> install_path\MySql_Backups\reporter_backup.sql
```

   If Anomaly Detector is installed:

```
mysqldump --routines --events -u root -P 3308 nsas > install_path\MySql_Backups\nsas_backup.sql
```

6. (WS2008 and WS2012) Copy the *install_path*\MySql_Backups directory to the Windows Server 2012 system.
7. (WS2008 and WS2012) Copy the *install_path*\Netflow\datafiles directory to the Windows Server 2012 system.
8. (WS2008) Shutdown the Windows Server 2008 system.
9. (WS2012) Stop the following services:

- CA NFA Collection and Poller Webservices
- CA NFA Data Retention
- CA NFA DNS/SNMP Proxies
- CA NFA File Server
- CA NFA Harvester
- CA NFA Poller
- CA NFA Reaper
- CA NFA RibSource
- CA Performance Center SSO
- NetQoS Reporter Manager Service
- NetQoS Reporter/Analyzer General Services
- NetQoS Reporter/Analyzer Pump Service
- NetQoS Reporter/Analyzer Query Services
- NetQoS Reporter/Analyzer Watchdog
- NetQoS ReporterAnalyzer Report Service
- CA NFA Host Resolver Service (if Anomaly Detector is installed)
- CA NFA Hunter Tracker Service (if Anomaly Detector is installed)

10. (WS2012) Execute the following commands from a Command Prompt window:

```
cd install_path\MySql\bin
mysql -P 3308 -u root -e "drop database harvester"
mysql -P 3308 -u root -e "create database harvester"
mysql -P 3308 -u root harvester < install_path\MySql_Backups\harvester_backup.sql
mysql -P 3308 -u root -e "drop database poller"
mysql -P 3308 -u root -e "create database poller"
mysql -P 3308 -u root poller < install_path\MySql_Backups\poller_backup.sql
mysql -P 3308 -u root -e "drop database data_retention"
mysql -P 3308 -u root -e "create database data_retention"
mysql -P 3308 -u root data_retention < install_path\MySql_Backups
\data_retention_backup.sql
mysql -P 3308 -u root -e "drop database reporter"
mysql -P 3308 -u root -e "create database reporter"
mysql -P 3308 -u root reporter < install_path\MySql_Backups\reporter_backup.sql
```

If Anomaly Detector is installed:

```
mysql -P 3308 -u root -e "drop database nsas"
mysql -P 3308 -u root -e "create database nsas"
mysql -P 3308 -u root nsas < install_path\MySql_Backups\nsas_backup.sql
```

11. (WS2012) Restart the NFA Services that you stopped in step 9.
12. (WS2012) Reconfigure the Windows Server 2012 system to use the Windows Server 2008 IP address.
13. (WS2012) Upgrade each CA NFA component to the current version.

Upgrade Microsoft Windows Server from 2012 R2 to Microsoft Windows Server 2016

This section describes the steps to migrate CA NFA with data to the Microsoft Windows Server 2016:

- Microsoft Windows Server 2016 Standard Edition, when upgrading from a previous supported version of DX NetOps (CA NFA) which is installed on Microsoft Windows Server 2012 R2 Standard Edition.
- Microsoft Windows Server 2016 Standard Edition, when performing a new installation of DX NetOps.

  WARNING

  - **Do not perform an in-place upgrade of the Windows operating system**. To upgrade a Windows Server 2012 system which is hosting an existing version of DX NetOps, you must provision a new server with Windows Server 2016 Standard Edition.
  - Plan to migrate the existing IP addresses of the DX NetOps monitoring device to the new server.

In the following instructions,

- (WS2012) means to perform the task on the existing Windows Server 2012 R2 CA NFA system.
- (WS2016) means to perform the task on the new Windows Server 2016 CA NFA system.

Two-Tier Deployment

Follow these steps:

1. Install Windows Server 2016 Standard Edition on new servers.
2. (WS2016) Do a clean install of current version of the DX NetOps on the new servers.
3. For each Windows Harvester:
   a. (WS2012) Stop the following services:
      - CA NFA Collection and Poller Webservices
      - CA NFA Data Retention
      - CA NFA DNS/SNMP Proxies
      - CA NFA File Server
      - CA NFA Harvester
      - CA NFA Poller
      - CA NFA Reaper
      - CA NFA Flow Cloner (if Flow Cloner is installed)

   b. (WS2012) Create the directory *install_path*\MySql_Backups .
   c. (WS2012) Execute the following commands from a Command Prompt window:

```
cd install_path\MySql\bin
mysqldump --routines --events -u root -P 3308 harvester
 > install_path\MySql_Backups\harvester_backup.sql
mysqldump --routines --events -u root -P 3308 data_retention
 > install_path\MySql_Backups\data_retention_backup.sql
mysqldump --routines --events -u root mysql proc > proc.sql
```

   d. (WS2012 and WS2016) Copy the *install_path*\MySql_Backups directory to the Windows Server 2016 system.
   e. (WS2012 and WS2016) Copy the *install_path*\Netflow\datafiles directory to the Windows Server 2016 system.
   f. (WS2012) Shutdown the Windows Server 2012 system.
   g. (WS2016) Stop the following services:

- CA NFA Collection and Poller Webservices
- CA NFA Data Retention
- CA NFA DNS/SNMP Proxies
- CA NFA File Server
- CA NFA Harvester
- CA NFA Poller
- CA NFA Reaper

h. (WS2016) Execute the following commands from a Command Prompt window:

```
cd install_path\MySql\bin
mysql -P 3308 -u root -e "drop database harvester"
mysql -P 3308 -u root -e "create database harvester"
mysql -P 3308 -u root harvester < install_path\MySql_Backups\harvester_backup.sql
mysql -P 3308 -u root -e "drop database data_retention"
mysql -P 3308 -u root -e "create database data_retention"
mysql -P 3308 -u root data_retention < install_path\MySql_Backups
\data_retention_backup.sql
```

i. (WS2016) Restart the NFA Services that you stopped in step g.

j. (WS2016) Reconfigure the Windows Server 2016 system to use the Windows Server 2012 IP address.

4. For the Windows Console:

a. (WS2012) Stop the following services:

- CA NFA RibSource
- CA Performance Center SSO
- NetQoS Reporter Manager Service
- NetQoS Reporter/Analyzer General Services
- NetQoS Reporter/Analyzer Pump Service
- NetQoS Reporter/Analyzer Query Services
- >NetQoS Reporter/Analyzer Watchdog
- NetQoS ReporterAnalyzer Report Service

b. (WS2012) Create the directory `install_path\MySql_Backups`.

c. (WS2012) Execute the following commands from a Command Prompt window:

```
cd install_path\MySql\bin
mysqldump --routines --events --skip-lock-tables -u root -P 3308 reporter
 > install_path\MySql_Backups\reporter_backup.sql
mysqldump --routines --events -u root mysql proc > proc.sql
```

d. (WS2012 and WS2016) Copy the `install_path\MySql_Backups` directory to the Windows Server 2016 system.

e. (WS2012) Shutdown the Windows Server 2012 system.

f. (WS2016) Stop the following services:

- CA NFA RibSource
- CA Performance Center SSO
- NetQoS Reporter Manager Service
- NetQoS Reporter/Analyzer General Services
- NetQoS Reporter/Analyzer Pump Service
- NetQoS Reporter/Analyzer Query Services
- NetQoS Reporter/Analyzer Watchdog
- NetQoS ReporterAnalyzer Report Service

g. (WS2016) Execute the following commands from a Command Prompt window:

```
cd install_path\MySql\bin
mysql -P 3308 -u root -e "drop database reporter"
mysql -P 3308 -u root -e "create database reporter"
mysql -P 3308 -u root reporter < install_path\MySql_Backups\reporter_backup.sql
mysql -u root mysql < proc.sql
```

h. (WS2016) Restart the NFA services that you stopped in step f.
i. (WS2016) Reconfigure the Windows Server 2016 system to use the Windows Server 2012 IP Address.

5. For the Anomaly Detector:
   a. (WS2012) Stop the following Anomaly Detector Services:
      - CA NFA Host Resolver Service
      - CA NFA Hunter Tracker Service
      - CA NFA Ribsource
   b. (WS2012) Create the directory *install_path*\MySql_Backups .
   c. (WS2012) Execute the following commands from a Command Prompt window:

```
cd install_path\MySql\bin
mysqldump --routines --events -u root -P 3308 nsas > install_path\MySql_Backups
\nsas_backup.sql
```

   d. (WS2012 and WS2016) Copy the *install_path*\MySql_Backups directory to the Windows Server 2016 system.
   e. (WS2012) Shutdown the Windows Server 2012 system.
   f. (WS2016) Stop the following Anomaly Detector Services:
      - CA NFA Host Resolver Service
      - CA NFA Hunter Tracker Service
      - CA NFA Ribsource
   g. (WS2016) Execute the following commands from a Command Prompt window:

```
cd install_path\MySql\bin
mysql -P 3308 -u root -e "drop database nsas"
mysql -P 3308 -u root -e "create database nsas"
mysql -P 3308 -u root nsas < install_path\MySql_Backups\nsas_backup.sql
```

   h. (WS2016) Restart the Anomaly Detector services that you stopped in step f.
   i. (WS2016) Reconfigure the Windows Server 2016 system to use the Windows Server 2012 IP Address
6. (WS2016) Upgrade each CA NFA system to current version.

Standalone Deployment

Follow these steps:

1. Install Windows Server 2016 Standard Edition on a new server.
2. (WS2016) Do a clean install of the current version of the DX NetOps on the new server.
3. (WS2012) Stop the following services:

- CA NFA Collection and Poller Webservices
- CA NFA Data Retention
- CA NFA DNS/SNMP Proxies
- CA NFA File Server
- CA NFA Harvester
- CA NFA Poller
- CA NFA Reaper
- CA NFA RibSource
- CA Performance Center SSO
- NetQoS Reporter Manager Service
- NetQoS Reporter/Analyzer General Services
- NetQoS Reporter/Analyzer Pump Service
- NetQoS Reporter/Analyzer Query Services
- NetQoS Reporter/Analyzer Watchdog
- NetQoS ReporterAnalyzer Report Service
- CA NFA Host Resolver Service (if Anomaly Detector is installed)
- CA NFA Hunter Tracker Service (if Anomaly Detector is installed)
- CA NFA Flow Cloner (if Flow Cloner is installed)

4. (WS2012) Create the directory *install_path*\MySql_Backups .
5. (WS2012) Execute the following commands from a Command Prompt window:

```
cd install_path\MySql\bin
mysqldump --routines --events -u root -P 3308 harvester > install_path\MySql_Backups
\harvester_backup.sql
mysqldump --routines --events -u root -P 3308 data_retention
 > install_path\MySql_Backups\data_retention_backup.sql
mysqldump --routines --events --skip-lock-tables -u root -P 3308 reporter
 > install_path\MySql_Backups\reporter_backup.sql
mysqldump --routines --events -u root mysql proc > proc.sql
```

   If Anomaly Detector is installed:

```
mysqldump --routines --events -u root -P 3308 nsas > install_path\MySql_Backups\nsas_backup.sql
```

6. (WS2012 and WS2016) Copy the *install_path*\MySql_Backups directory to the Windows Server 2016 system.
7. (WS2012 and WS2016) Copy the *install_path*\Netflow\datafiles directory to the Windows Server 2016 system.
8. (WS2012) Shutdown the Windows Server 2012 system.
9. (WS2016) Stop the following services:

- CA NFA Collection and Poller Webservices
- CA NFA Data Retention
- CA NFA DNS/SNMP Proxies
- CA NFA File Server
- CA NFA Harvester
- CA NFA Poller
- CA NFA Reaper
- CA NFA RibSource
- CA Performance Center SSO
- NetQoS Reporter Manager Service
- NetQoS Reporter/Analyzer General Services
- NetQoS Reporter/Analyzer Pump Service
- NetQoS Reporter/Analyzer Query Services
- NetQoS Reporter/Analyzer Watchdog
- NetQoS ReporterAnalyzer Report Service
- CA NFA Host Resolver Service (if Anomaly Detector is installed)
- CA NFA Hunter Tracker Service (if Anomaly Detector is installed)

10. (WS2016) Execute the following commands from a Command Prompt window:

```
cd install_path\MySql\bin
mysql -P 3308 -u root -e "drop database harvester"
mysql -P 3308 -u root -e "create database harvester"
mysql -P 3308 -u root harvester < install_path\MySql_Backups\harvester_backup.sql
mysql -P 3308 -u root -e "drop database data_retention"
mysql -P 3308 -u root -e "create database data_retention"
mysql -P 3308 -u root data_retention < install_path\MySql_Backups
\data_retention_backup.sql
mysql -P 3308 -u root -e "drop database reporter"
mysql -P 3308 -u root -e "create database reporter"
mysql -P 3308 -u root reporter < install_path\MySql_Backups\reporter_backup.sql
mysql -u root mysql < proc.sql
```

If Anomaly Detector is installed:

```
mysql -P 3308 -u root -e "drop database nsas"
mysql -P 3308 -u root -e "create database nsas"
mysql -P 3308 -u root nsas < install_path\MySql_Backups\nsas_backup.sql
```

11. (WS2016) Restart the NFA Services that you stopped in step 9.
12. (WS2016) Reconfigure the Windows Server 2016 system to use the Windows Server 2012 IP address.
13. (WS2016) Upgrade each CA NFA component to current release.

Verify that the Linux Servers Are Prepared

Before you begin the upgrade, verify that the following conditions are met. Failure to comply with these requirements can result in data loss, increased down time, software conflicts, or a failed upgrade.

- System Requirements: Verify that the upgrade servers meet the Linux requirements and recommendations.

NOTE
Harvester Linux servers must be upgraded to RHEL 6.8, 7.3, or 7.4 before the upgrade.

- Software Requirements: Verify that the upgrade servers have fully operational DX NetOps software that is supported for upgrade.
- Verify that each of the Harvester Linux servers is ready for the upgrade by:
  - Assigning a static IP address to each server. Set the Harvester server IP address to match the flow export destination that is assigned to each router.
  - Configuring SNMP
    If SNMP is not running, the upgrade program displays a warning. You can bypass the warning and configure SNMP after the upgrade, however.
  - Disabling the iptables firewall
  - Disabling IPv6 networking
  - Configuring DNS resolution. Polling fails if DNS resolution is not configured.
  - Stopping services
  - Backing up the databases
- To support non-Latin characters such as Japanese and Simplified Chinese, any command line clients that you use for installation must be configured for UTF-8 encoding. If UTF-8 encoding is not enabled, these characters may not display properly.
- The appropriate language packs are required for localized deployments.
- Regional Settings must use a period (.) to indicate a decimal value. If your deployment is localized to French, change the decimal symbol to a period in the **Region and Language**: **Customize Format** dialog.

NOTE
More information:

System Recommendations and Requirements

Check and Back Up the Databases

These steps should be followed to check and back up your databases before upgrading to DX NetOps 9.5.0:

Check the MySQL Databases

Checking the database tables corrects some problems and helps to avoid failures and recovery assistance with CA Support. Run the `mysqlcheck` command before the upgrade to verify that the database tables are set up properly.

You can run the `mysqlcheck` command to check the following databases:

- reporter: Located on each stand-alone or NFA console server (which typically contains some large tables)
- harvester: Located on each stand-alone or Harvester server
- data_retention: Located on each stand-alone or Harvester server
- nsas: Located on the CA Anomaly Detector server, which can be the stand-alone, NFA console, or separate server

Checking large database tables can be time-consuming. If you run the check on an entire database, each table in the database is locked in read-only state sequentially. The table that is being checked is unavailable for write operations.

You can run `mysqlcheck` without stopping MySQL. The MySQL daemon process (`mysqld`) can continue to run on Linux servers and the MySQL service can continue to run on Windows servers.

Follow these steps:

1. Log in to one of the DX NetOps servers as a user with administrator privileges. On a Linux Harvester server, log in as `root` .

2. Check the following databases:
   - Stand-alone server: harvester, reporter, and data_retention databases
   - Harvester server (distributed deployment): harvester, and data_retention databases
   - NFA console server (distributed deployment): reporter database
   - CA Anomaly Detector server: nsas database (if CA Anomaly Detector is installed on the stand-alone server or the NFA console server)
3. Enter one of the following `mysqlcheck` commands at a command or shell prompt:
   - To check the tables in all of the applicable databases on the server:

     ```
     mysqlcheck --all-databases
     ```

   - To check all of the tables in a single database:

     ```
     mysqlcheck --databases db_name
     ```

     where *db_name* = Name of the database that you want to check**Example**:

     ```
     mysqlcheck --databases reporter
     ```

   You do not need to specify the path to the database. The `mysqlcheck` command will find any or all databases that use the default port (port 3308). The custom storage engine does not support the use of the `mysqlcheck` command for its archive and archive15 databases. The command fails to run even if you specify the correct port (port 3307) for the connection to these databases.
   The command checks each table, attempts to repair any problems, then analyzes and optimizes the table. The return text lists the database tables that were checked and reports the status for each table.
   If the table passed the check, **OK** follows the table name. If a warning is returned and is followed by **OK**, the problem was resolved. If unresolved errors occur, contact CA Support.

Stop the Services

Before you back up the databases and upgrade the DX NetOps software, stop services to prevent new data from being sent to the NFA console until the upgrade is complete. Failure to stop the services does not cause the upgrade to fail, but some collected data is not processed.

Stop Services on Windows Servers

To prepare for backing up the databases, stop the services on all of the Windows servers in your DX NetOps deployment.

Follow these steps:

1. Log in as a user who has administrator privileges for DX NetOps.
2. Open the **Services** window: Click **Start, Control Panel, Administrative Tools, Services**.
3. Stop the Harvester service (NetQoS Harvester service or CA NFA Harvester) on each Harvester server.
4. Wait 15 minutes for data file processing to complete.
5. Stop the remaining DX NetOps services on each Windows server:

Service	Stand-Alone	Harvester	Console	Anomaly Detector
CA NFA Collection and Poller Webservices	Yes	Yes	N/A	N/A

CA NFA Data Retention	Yes	Yes	N/A	N/A
CA NFA DNS/SNMP Proxies	Yes	Yes	N/A	N/A
CA NFA File Server	Yes	Yes	N/A	N/A
CA NFA Harvester	Yes	Yes	N/A	N/A
CA NFA Host Resolver Service *	N/A	N/A	N/A	Yes *
CA NFA Hunter Tracker Service *	N/A	N/A	N/A	Yes *
CA NFA Poller	Yes	Yes	N/A	N/A
CA NFA Pump	N/A	Yes	Yes	N/A
CA NFA Reaper	Yes	Yes	N/A	N/A
CA NFA RibSource	Yes	N/A	Yes	N/A
NetQoS MySql	Yes	Yes	Yes	N/A
NetQoS NQMySql	Yes	Yes	N/A	N/A
NetQoS Reporter Manager Service	Yes	N/A	Yes	N/A
NetQoS Reporter/ Analyzer General Services	Yes	N/A	Yes	N/A
NetQoS Reporter/ Analyzer Pump Service	Yes	N/A	Yes	N/A
NetQoS Reporter/ Analyzer Query Services	Yes	N/A	Yes	N/A
NetQoS Reporter/ Analyzer Watchdog	Yes	N/A	Yes	N/A
NetQoS ReporterAnalyzer Report Service	Yes	N/A	Yes	N/A

* If CA Anomaly Detector is installed on the stand-alone DX NetOps server or NFA console server, stop these CA Anomaly Detector services.

The services and data collection stop. The data files are processed within 15 minutes.

6. Check the following directory on the NFA console server:
   install_path\Netflow\datafiles\HarvesterWork
   When the `HarvesterWork` folder is empty, you can back up the database.
   The services are restarted automatically during the upgrade process.

Stop Services on Linux Servers

To prepare for the database backups, stop the services on any Linux Harvester servers that are in your product deployment.

Follow these steps:

1. Log in as root or with a sudo user account.

2. Stop the nfa_harvester (CA NFA Harvester) service on each Linux Harvester server.
3. Wait 15 minutes for data file processing to complete.
4. Stop the following services on each Linux Harvester server:
   – mysql (NetQoS MySQL)
   – nfa_collpollws (CA NFA Collection and Poller Webservices)
   – nfa_dataretention (CA NFA Data Retention)
   – nfa_filewebservice (CA NFA File Server)
   – nfa_mysqlCSE (NetQoS NQMySql Custom Storage Engine)
   – nfa_poller (CA NFA Poller)
   – nfa_proxies (CA NFA DNS/SNMP Proxies)
   – nfa_reaper (CA NFA Reaper)

   After you stop the services, the Time BIN (`.tbn`) files are collected and processed within 15 minutes.
5. Check the following directory on the NFA console server: *`install_path`*`\Netflow\datafiles\HarvesterWork`
   When the `HarvesterWork` folder is empty, you can back up the database.
   The services are restarted automatically during the upgrade process.

Back Up the Databases and Restart the Services

Before you upgrade, back up the databases and files that are listed in the following table.

Important:

- Run backups concurrently. If you restore data from backups that have different timestamps, problems can result. Ensure that your backed-up data files are timestamped with the same hour.
- Store backups to a remote location to guard against the possibility of a hardware or operating system failure on the main server. For example, back up the databases to an administrative share or mapped network drive.

Database	Stand-Alone	Harvester (Distributed)	NFA Console (Distributed)	Anomaly Detector
reporter: Enterprise Overview data; NFA console configuration data	Important	N/A	Important	N/A
harvester: Harvester configuration data	Important	Important	N/A	N/A
nsas: Anomaly Detector configuration data	N/A	N/A	N/A	Important
archive15: Historical (15-minute) data	Recommended	Recommended	N/A	N/A
Customized Files: Configuration or other files that have been customized	Important	Important	Important	N/A
Customized data_retention: Settings to regulate data retention	Important if customized	Important if customized	N/A	N/A
HarvesterArchive: Flow Forensics data	Optional, rarely backed up	Optional, rarely backed up	N/A	N/A
archive: Realtime (1-minute) data	Optional, rarely backed up	Optional, rarely backed up	N/A	N/A

The following list describes the databases and their locations.

- reporter: Back up the previous 24 hours of Enterprise Overview data, NFA console configuration settings, and synchronization information.
- harvester: Back up the Harvester configuration data.
- nsas: If CA Anomaly Detector is installed on the same server as the NFA console or the stand-alone server, back up the configuration data for running CA Anomaly Detector. If CA Anomaly Detector is located on its own server, you can perform this backup when you upgrade CA Anomaly Detector.
  Path: *install_path*\MySql\data\nsas
- archive15: Back up the historical (15-minute) data that is stored for the reporting routers and interfaces. This backup is optional, but many administrators do back up the 15-minute data.
  Path: *install_path*\Netflow\datafiles\ReaperArchive15 directory
- Customized configuration files: Back up any customized configuration files--files that you customized or that were customized by CA Support. In addition, back up any customizations that you made to the website or reports.
  The DX NetOps configuration files typically have a `.config`, `conf.`, or `.ini` extension and are located in the product installation path. Other customizations may include `.css` files and report logos.
- archive: Back up the realtime (1-minute) data.
  Path: *install_path*\Netflow\datafiles\ReaperArchive directory
- Customized data_retention: If you customized any data retention settings, back up the data retention configuration data. It is unusual to customize data retention settings except with the assistance of CA Support. Changes to data retention settings can cause problems from rising demands on drive space.

Follow these steps:

1. Log in as a user who has administrator privileges for DX NetOps.
2. Connect to the server:
   a. Open a Remote Desktop session.
   b. Initiate a Terminal Services or VNC session to the installation server.
3. Back up each target directory or database, as described in:
   Backing Up and Restoring Data
4. Restart the services.

Upgrade a Stand-Alone Server

A *stand-alone deployment* consists of a single server that hosts both the Harvester and the NFA console. Complete the steps in this topic to upgrade the Harvester and NFA console on a single Windows server or virtual machine.

> **NOTE**
> The program checks for server problems at various points during the installation or upgrade. If a problem is found, an error message opens. A critical problem causes the program to exit. A warning message opens for non-critical problems, which you can correct at any time. The prerequisite checks look for general indicators that problems exist, but they do not warn you about all problems. You are responsible for preparing the server properly and for completing all required post-installation steps.

Follow these steps to complete the Harvester phase:

1. Verify that the server is upgrade-ready.
2. Log in to the server as a user who is a member of the Administrators group.
3. Stop the pump service on the NFA console server:
   a. Click **Start, Programs, Administrative Tools, Services**.
   b. Right-click the NetQoS Reporter/Analyzer Pump service.
   c. Select **Stop** in the right-click menu. The service stops.
4. Log in to the Harvester server as a user who is a member of the Administrators group.

5. Start the Harvester phase of the upgrade: Double-click the `NFHarvesterSetupx.x.x.exe` file. The language selection screen opens.
6. Verify that the appropriate language is selected, then click **OK**.
   The **Welcome** screen opens.
7. Click **Next**.
   The **CA NFA Harvester License Agreement** screen opens.
8. Review and accept the license agreement:
   a. Read the license agreement and scroll down.
   b. If you want to continue, click the option to accept the license agreement.
   c. Click **Next**.
      Prerequisite tests look for problems and may cause an error message to open.
9. If the **Prerequisite Check Warning** message opens, review it, correct or note any non-critical problems, then click **OK**.
   The **Upgrading Existing Installation** message opens and the **Choose Install Folder** screen opens. This screen displays the original root installation path as the default setting.
10. Verify that the specified installation directory is correct, then click **Next**.

    WARNING

    If you do not use the original installation path, the upgraded software will not run properly

    If the program does not find certain expected directories in the installation path, an error message opens and the upgrade stops. This problem does not occur when the previous software installation is fully functional.
    The **Pre-Installation Summary** screen opens.
11. Review the pre-installation information, then click **Install**.
    The **Installing Harvester** screen opens. When the Harvester upgrade is complete, the **Install Complete** screen opens and reports any errors that occurred.
12. (Optional) If errors occurred during the upgrade, see the following logs for details:
    – General installation log: *`install_path`*`\Harvester_Install_<`*`timestamp`*`>.log` (where <*timestamp*> is the time that the log was created)
    – Upgrade migration log: *`install_path`*`\migrator.log`
13. Click **Done** in the **Install Complete** screen.
    The Harvester upgrade program closes.

Follow these steps to complete the NFA console phase:

1. Start the NFA console upgrade software: Double-click the `RAConsoleSetupx.x.x.exe` file in Windows Explorer.
   The program starts and the language selection screen opens.
2. Verify that the appropriate language is selected, then click **OK**.
   The **Welcome** screen opens.
3. Click **Next**.
   The **NFA Console License Agreement** screen opens.
4. Review and accept the license agreements:
   a. Read the NFA console license agreement and scroll down.
   b. If you want to continue, click the option to accept the license agreement.
   c. Click **Next**.
      The **Third-Party License Agreement** screen opens.
   d. Read the third-party license agreement and scroll down.
   e. If you want to continue, click the option to accept the third-party license agreement.
   f. Click **Next**.
5. If the **Prerequisite Check Warning** message opens, review it, correct or note any non-critical problems, then click **OK**.

The **Singlebox Confirmation** message opens and asks you to confirm that you want a stand-alone deployment.

6. Review the information and click **OK**.
   The **Pre-Installation Summary** screen opens.
7. Review the pre-installation information, then click **Install**.
   The **Installing NFA** screen opens. When the NFA console upgrade is complete, the **Install Complete** screen opens.
8. Exit from the upgrade program:
   a. Select one of the restart options:
      - **Yes, restart my system**: Restart the system when you click **Done**.
      - **No, I will restart my system myself**: Defer the restart to be performed manually.
   b. Click **Done**.
      The upgrade program closes. If you selected the option to restart now, the system restarts and the upgrade is finalized.
9. (Optional) Check the revision history to verify that the software is upgraded to the correct version:
   a. Open a Command Prompt window.
   b. Start MySQL by entering the following command:
      ```
      mysql
      ```
   c. Display the revision history by entering the following commands:
      ```
      select * from harvester.revision_history;
      select * from reporter.revision_history;
      ```
10. If you did not choose to automatically restart the system, reboot now.
11. If you are using Performance Center, do a full synchronization.

Upgrade a Distributed Deployment

In a distributed deployment, DX NetOps components are distributed among multiple servers. The articles in this section describe how to upgrade each component server.

To upgrade a two-tier distributed deployment, complete the following procedures:

- Upgrade the Harvester on a Windows Server, or
  Upgrade the Harvester on a Linux Server
- Upgrade the Console

You cannot upgrade a three-tier distributed deployment. However, you can convert a three-tier DX NetOps 9.3.3 deployment to a two-tier architecture, then upgrade to current version.

The steps in these articles are written for the recommended upgrade order: Harvester upgrades, then the NFA console upgrade.

NOTE
The program checks for server problems at various points during the installation or upgrade. If a problem is found, an error message opens. A critical problem causes the program to exit. A warning message opens for non-critical problems, which you can correct at any time. The prerequisite checks look for general indicators that problems exist: They do not warn you about all problems. You are responsible for preparing the server properly and for completing all required post-installation steps.

NOTE

More information:

- Converting From a Three-Tier to a Two-Tier Architecture

Upgrade the Harvester on a Windows Server

In a distributed deployment, each Harvester is installed on a separate server. To upgrade a Harvester on a dedicated Windows server or virtual machine, complete the steps in this topic. These steps apply to a two-tier distributed deployment. You cannot upgrade a three-tier distributed deployment to DX NetOps 9.5.0 and later versions.

Follow these steps:

1. Verify that the server is upgrade-ready.
2. Log in to the NFA console server as a user who is a member of the Administrators group.
3. Stop the pump service on the NFA console server:
   a. Click **Start**, **Programs**, **Administrative Tools**, **Services**.
   b. Right-click the NetQoS Reporter/Analyzer Pump service and select **Stop**. The service stops.
4. Log in to the Harvester server as a user who is a member of the Administrators group.
5. Start the upgrade: Double-click the `NFHarvesterSetupx.x.x.exe` file in Windows Explorer on the Harvester server.
   The language screen opens.
6. Verify that the appropriate language is selected, then click **OK**.
   The **Prior Installation Detected** message opens.
7. Review the message and click **OK**.
   The **Welcome** screen opens.
8. Click **Next**.
   The **License Agreement** screen opens.
9. Review and accept the license agreement:
   a. Read the license agreement and scroll down.
   b. If you want to continue, click the option to accept the license agreement.
   c. Click **Next**.
      Prerequisite tests look for problems and may cause an error message to open.
10. If the **Prerequisite Check Warning** message opens, review it, correct or note any non-critical problems, then click **OK**.
    The **Choose Install Folder** screen opens and displays the original root installation path as the default setting.
11. Verify that the specified installation directory is correct, then click **Next**.

    NOTE
    If you do not use the original installation path, the upgraded software will not run properly.

    If the program does not find certain expected directories in the installation path, an error message opens and the upgrade stops. This problem does not occur when the previous software installation is fully functional.
    The **Pre-Installation Summary** screen opens.
12. Review the pre-installation information, then click **Install**.
    The **Installing Harvester** screen opens. When the upgrade is complete, the **Install Complete** screen opens and reports any errors that occurred.
13. (Optional) If errors occurred, see the following logs for details:
    – General installation log: *install_path*`\Harvester_Install_<`*timestamp*`>.log`
    – Upgrade migration log: *install_path*`\migrator.log`
14. Exit from the upgrade program:
    a. Select one of the restart options:
       - **Yes, restart my system**: Restart the system as soon as you click **Done**.
       - **No, I will restart my system myself**: Defer the restart to be performed manually.
    b. Click **Done**.
       The upgrade program closes. If you selected the option to restart now, the system restarts and the upgrade is finalized.

15. (Optional) Verify that the following conditions are met:
    - Harvester services are running.
    - Harvester is receiving data.
    - The revision history shows that the component is upgraded to the correct version. To display the revision history, complete the following:
      a. Start MySQL by entering the following command in a Command Prompt window:
         ```
         mysql
         ```
      b. Display the revision history by entering the following command:
         ```
         select * from harvester.revision_history;
         ```

Next:

- To upgrade another Harvester, repeat these steps on the additional Harvester server.
- To continue upgrading a two-tier deployment, upgrade the Console server.

Upgrade the Harvester on a Linux Server

A two-tier distributed deployment may include one or more Linux Harvester servers. To upgrade the Harvester software on a dedicated Linux server or virtual machine, complete the steps in this topic.

Follow these steps:

1. Verify that the server is upgrade-ready.
   See Linux Servers page for compatible RHEL versions.
2. Log in to the NFA console server as a user who is a member of the Administrators group.
3. Stop the pump service on the NFA console server:
   a. Click **Start**, **Programs**, **Administrative Tools**, **Services**.
   b. Right-click the NetQoS Reporter/Analyzer Pump service and select **Stop**. The service stops.
4. Log in to the Harvester server as `root` user.
   You can install the software locally or remotely; for example, by using `ssh` when you are logged in with root privileges. If you do not have root access, use an account with sudo privileges.
5. Open a command prompt window.
6. Run the following command to change the `ulimit` for the open files limit:
   ```
   ulimit -n ulimit_number
   ```
   Example:
   ```
   ulimit -n 65536
   ```
7. Prepare the installation/upgrade file for execution:
   a. Log in to the Harvester server as `root` .
      You can install or upgrade the software locally or remotely; for example, by using `ssh` when you are logged in with root privileges. If you do not have root access, use an account with sudo privileges.
   b. Execute the `chmod` command on the file in a terminal window:
      ```
      chmod u+x NFHarvesterSetupx.x.x.bin
      ```
      example: chmod u+x NFHarvesterSetup9.5.0.bin
   c. (Optional) Execute the list command to verify that the file is executable:
      ```
      ls -al
      ```
      The file permission settings are displayed.
8. Run the installation or upgrade software:
   ```
   ./NFHarvesterSetupx.x.x.bin
   ```
   example: ./NFHarvesterSetup9.5.0.bin

The language selection screen opens.

9. Verify that the appropriate language is selected, then click **OK**.
   The **Prior Installation Detected** message opens.
10. Review the message and click **OK**.
    The **Welcome** screen opens.
11. Click **Next**.
    The **License Agreement** screen opens.
12. Review and accept the license agreement:
    a. Read the license agreement and scroll down.
    b. If you want to continue, click the option to accept the license agreement.
    c. Click **Next**.
       Prerequisite tests look for problems and may cause an error message to open.
13. If the **Prerequisite Check Warning** message opens, review it, correct or note any non-critical problems, then click **OK**.
    The **Choose Install Folder** screen opens. This screen displays the original root installation path as the default setting.
14. Verify that the specified installation directory is correct, then click **Next**.

    NOTE
    If you do not use the original installation path, the upgraded software will not run properly.

    If the program does not find certain expected directories in the installation path, an error message opens and the upgrade stops. This problem does not occur when the previous software installation is fully functional.
    The **Pre-Installation Summary** screen opens.
15. Review the pre-installation information, then click **Install**.
    The **Installing Harvester** screen opens. When the upgrade is complete, the **Install Complete** screen opens and reports any errors that occurred.
16. (Optional) Review the errors by checking the installation log
    install_path/Harvester_Install_<timestamp>.log
17. Click **Done**.
    The upgrade program closes. The Harvester is upgraded and the DX NetOps services are started automatically.
18. (Optional) Verify that the following conditions are met:
    – (Two-tier architecture deployment) Harvester services are running.
    – Harvester is receiving data.
    – The revision history shows that the component is upgraded to the correct version. To display the revision history, complete the following:
      a. Start MySQL by entering the following command in a Command Prompt window:
         ```
         mysql
         ```
      b. Display the revision history by entering the following command:
         ```
         select * from harvester.revision_history;
         ```

Next:

- To upgrade another Harvester, repeat these steps on the additional Harvester server.
- To continue upgrading a two-tier deployment, upgrade the Console server.

Upgrade the NFA Console

Distributed deployments use separate servers for the NFA console and Harvesters. Complete the steps in this topic to upgrade the NFA console on a dedicated Windows server or virtual machine.

Follow these steps:

1. Verify that the server meets the following requirements:
   – The server is upgrade-ready.
   – The Harvester servers have been upgraded.
2. Log in to the NFA console server as a user who has administrator privileges for the system and for DX NetOps.
3. Start the upgrade: Double-click the `RAConsoleSetupx.x.x.exe` file in Windows Explorer on the NFA console server.
   The language selection screen opens.
4. Verify that the appropriate language is selected, then click **OK**.
   The **Welcome** screen opens.
5. Click **Next**.
   The **License Agreement** screen opens.
6. Review and accept the license agreements:
   a. Read the NFA console license agreement and scroll down.
   b. If you want to continue, click the option to accept the license agreement.
   c. Click **Next**.
      The **Third-Party License Agreement** screen opens.
   d. Read the third-party license agreement and scroll down.
   e. If you want to continue, click the option to accept the third-party license agreement.
   f. Click **Next**.
7. If the **Prerequisite Check Warning** message opens, review the test results:
   a. Correct the problems now or wait until the upgrade program finishes.
   b. Click **OK**. The **Upgrading Existing Installation** message opens.
8. Review the information:
   a. Verify that the existing and post-upgrade version information is correct, then click **OK**.
      The message reopens and reports the root installation path. The upgrade program uses the original path, which is `C:\CA\NFA` by default.
   b. Review the path information, then click **OK**. The **Choose Install Folder** screen opens.
9. (*Optional*) Click **Choose** to change the program installation location when prompted or enter a new path manually.
   The default location is `C:\CA\NFA` . Use the same installation path for the Harvester and for NFA console servers. We recommend that you install DX NetOps components on a non-system drive.
   The **Pre-Installation Summary** screen opens.
10. Review the information, then click **Install**.
    The **Installing NFA** screen opens. When the upgrade is complete, the **Install Complete** screen opens and reports any errors.
11. (*Optional*) See the installation log for error information:
    install_path`\NFA_Install_<`*timestamp*`>.log`
12. Exit from the upgrade program:
    a. Select one of the restart options:
       - **Yes, restart my system**: Restart the system when you click **Done**.
       - **No, I will restart my system myself**: Defer the restart to be performed manually.
    b. Click **Done**.
       The upgrade program closes. If you selected the option to restart now, the system restarts and the upgrade is finalized.
13. (*Optional*) Check the revision history to verify that the software is upgraded to the correct version:
    a. Open a **Command Prompt** window.
    b. Start MySQL by entering the following command:
       ```
       mysql
       ```

c. Display the revision history by entering the following command:

```
select * from reporter.revision_history;
```

14. If you did not choose to automatically restart the system, reboot now.
15. If you are using Performance Center, do a full synchronization.

Migrate NFA Harvester from RHEL 6.8 or 7.3 to RHEL 7.4

This section describes the steps to migrate CA NFA with data from RHEL 6.8 or 7.3 to RHEL 7.4.

- Upgrade your existing CA NFA installation on all servers (Harvester and Console) to current version of CA NFA.
- Do a clean install of current version of CA NFA Harvesters on the RHEL 7.4.
- The server must meet the minimum hardware and software requirements.

To migrate NFA Harvester data from RHEL 6.8 or 7.3 to RHEL 7.4, follow these steps:

1. Back up and restore the harvester data mentioned in Backing Up and Restoring Data.
2. From the Web browser pointed to the NFA console, select **Administration, System: Harvester.** Click **Edit** for this Harvester and change the IP address of the Harvester to reflect the new server's IP address. Do NOT delete the Harvester, as this will result in a deletion of all routers and interfaces associated with that Harvester.
3. Retarget the routers to send NetFlow to the latest version of CA NFA Harvester.

> **NOTE**
> Ensure that permissions are retained during the process of copying the files over. Manual update of folder and file permissions may be necessary.

Prepare to Change the Performance Center Version

If you are using Performance Center, the NFA console or stand-alone server must be registered as a data source for a supported version of CA Performance Center (CA PC) or CA NetQoS Performance Center (CA NPC). If you plan to to switch between CA NPC and CA PC, prepare for the switch as follows:

1. Prepare for unregistering from your current Performance Center version.
2. Unregister from Performance Center.
3. Perform the DX NetOps upgrade.

> **WARNING**
> We generally do not recommend unregistering. Many customizations are lost when you unregister and register again. Read this topic carefully to prepare for these events.

General Guidelines

- If you need to upgrade CA Performance Center, upgrade DX NetOps first.
- If you plan to switch between types of Performance Center, unregister before you upgrade DX NetOps. For example, unregister before you switch from CA NetQoS Performance Center to CA Performance Center or you switch from CA Performance Center to CA NetQoS Performance Center.

Results of Unregistering from CA Performance Center

If you unregister DX NetOps from CA NetQoS Performance Center and register again with CA Performance Center, the following rules apply.

- Domains:

  - The default domain is retained. Groups, users, devices (routers), interfaces, protocol names, and ToS labels that are assigned to the default domain retain their assignments.
  - Custom domains are deleted.
  - Groups, users, devices (routers), and interfaces in custom domains are reassigned to the default domain.
  - Protocol names, ToS labels, AS names, and IP addresses in custom domains become inaccessible.
- User accounts:
  - User accounts are retained if the users have valid product privilege settings (User, Power User, or Administrator) for DX NetOps. User accounts with no product privilege for DX NetOps are deleted.
  - User accounts that are associated with custom domains will be associated with the default domain instead.
  - If the user account `nqadmin` exists and has a product privilege that is lower than Administrator, this user account acquires the Administrator product privilege.

  You cannot add new users or edit user account settings after you unregister.
- Roles:
  - Custom and default roles are retained and continue to be associated with user accounts.
- Groups: Retained if the following conditions are met:
  - The group is a default group in CA NetQoS Performance Center or is a group that was pushed up to CA NetQoS Performance Center. 'Dynamic groups,' for example, cross-product groups, are deleted.
  - The group has contents; that is, the group is not empty.

  Custom and default groups require cleanup on the **Manage Groups** page in CA Performance Center after you unregister and register with the newer software. The following changes may occur:
  - Some group names change slightly. For example, the group 'All Interfaces' is renamed 'Interfaces.'
  - Structures may flatten so that a group that was nested under another group is not nested.
  - Groups may be relocated:
    A custom group that originally was shown on the **Manage Groups** page under **All Groups**/**System Groups**/**Data Sources**/**ReporterAnalyzer** is under **Network Flow Analysis** in the new group tree. The new location is **All Groups**/**Inventory**/**Data Sources**/**Network Flow Analysis**.
    If the custom group originally was not under **ReporterAnalyzer**, it is moved to sit under **Network Flow Analysis**.
  - Duplicate groups may be created.
  - Empty custom groups are deleted.
- SNMP profiles: SNMP profiles from CA NetQoS Performance Center 6.2 are retained with no changes in their status.
- Single Sign-On (SSO) customizations: LDAP and other SSO customizations are retained.
  If you change to a new SSO version, update the SSO configuration settings as described in Single Sign-on in the CA Performance Management documentation.

Follow these steps:

1. Log in to the console for CA NetQoS Performance Center as a user who is a member of the Administrators group.
2. Review your records of the customizations in CA NetQoS Performance Center, such as:
   - User accounts and their roles, product permissions, groups, and domain access
   - Custom roles and standard roles that have been customized, including any assignments for top-level menus, dashboards, and dashboard menus
   - Group structure and naming conventions
   - Custom domains and their contents, such as groups, devices, interfaces, SNMP profiles, report folders, AS names, protocol names, ToS labels, and IP addresses

   Remember that these elements may require checking, restructuring, or restoration.
3. (*Optional*) Prepare for the effects of unregistering:
   Consider giving a unique name to each group so it is easy to restore the group hierarchy. For example, name each group in a way that indicates its relationship to other groups.
   To ensure that no groups are deleted, flatten the group hierarchy before you unregister.
4. Open the **Data Source List** page by clicking **Admin**, **NetQoS Settings: Data Sources**.

5. Select the Reporter Analyzer or DX NetOps data source.
6. Click **Delete**.

Upgrade and Check Performance Center

If you are using Performance Center, make sure the NFA console server or stand-alone server is registered as a data source for:

- CA Performance Center version supported version, or
- CA NetQoS Performance Center 6.2

If you plan to upgrade Performance Center, do it now. For instructions, see the upgrading instructions for your Performance Center.

If DX NetOps is not registered as a data source, some of the function links on the **Administration** page are disabled. After you register, review the results in the Performance Center Console and the NFA console. Make any adjustments that are needed.

NOTE

More information:

- CA Performance Management

Using

DX NetOps is designed to give you the information you need for comprehensive visibility into your enterprise network.

The primary DX NetOps user interface is the NFA console, a web interface that you use to view the collected data, as well as perform administrative tasks.

NFA Console

To start using the NFA console, open a browser window and enter the server name or IP address of the server that hosts the NFA console:

```
http://<IP_Address>
```

You are prompted to log in when you first access the NFA console. You can get the DX NetOps server name or IP address and your login information from your Administrator.

If you are logging in for the first time, you can use the predefined administrator account:

- Login: **admin**
- Password: **admin**

When you log in to the NFA console, the **Interfaces** page opens. You can open the primary pages from the NFA console menu:

- **Enterprise Overview** Page: Quickly determine whether any of the interfaces in your network are nearing or have surpassed an acceptable utilization level.
- **Interfaces** Page: Select one or more interfaces and run reports.
- **Custom Reporting** Page: Define and run Custom Reports.
- **Flow Forensics** Page: Define and run reports on raw data.
- **Analysis** Page: Create proactive troubleshooting reports designed to compare collected network data to a threshold, identifying potential bottlenecks, anomalies, and viruses.
- **Site to Site** Page: Define and run Site to Site reports.
- **Administration** Page: Perform administrative tasks for DX NetOps .

As you use the navigation links to move between console pages, some product settings are saved and other settings are cleared as you leave the page. For example, when you navigate to **Enterprise Overview**, **Interfaces**, or **Flow Forensics** pages, the previous settings are preserved. As you navigate to **Custom Reporting**, **Analysis**, **Site to Site**, or **Administration**, your previous settings are cleared and the default values are restored.

Console Tips and Shortcuts

The NFA console simplifies viewing and using DX NetOps data. Some of the common NFA console features are:

Use Drilldown Links

When you view reports in the NFA console, many items are displayed in blue. Click the blue links for interfaces, hosts, conversations, and other items to drill down to additional information about the items.

For example, from the Interface report page you can open other detailed reports specific to the selected interface, host, conversation, or other traffic type.

Display Tooltips

You can display detailed information for some items in report views by positioning your cursor over the item. For example, place your cursor over a bar that represents an interface to open a Tooltip. The Tooltip shows additional details about the interface, such as its parent router, description, and number of bytes.

Sort Tables by Column Heading

Sortable column headings are provided for tables of interfaces, reports, or other items. Click a column heading to sort the data. Click a second time to switch the sort mode between descending and ascending order.

Jump Down

Some selection dialogs include a blue **Jump Down** arrow, which you can use to jump to the bottom of the page. For example, you can use the **Jump Down** arrow to locate the **Save** button quickly in the **Interface Group Selection** dialog.

Menu Arrow

Depending on your access settings, the built-in views on the NFA console pages may have a blue **Menu** arrow to the left of the view title. This opens a menu containing selections specific to the view.

Change the Interface for a Report

When you click an interface link on the **Interfaces** page, you drill down to an interface report. To view a report for a different interface, click the **[change]** link at the top of the page, then select another interface from the **Interface Index**. The report is updated to show data for the selected interface.

Search for a Router, Interface, or Interface Group

The **Interface Index** page includes a Search utility that you can use to filter the list and locate a router or interface. To perform a search, enter a text string in the text box and click **Search**.

You can include the wild card * as part of your search term. (The wild card * by itself is not a valid entry.) For example, to search for an IP address you can enter 10.0.7* to display only the addresses that begin with 10.0.7. In this example, the filtered list could include 10.0.7.1, but would not include 10.0.8.1.

The page displays a list of items that match the filter expression.

- Under the listed items, click the **Next** arrow or click a page number to display another page of list items.
- To display a different number of items per page, select a different value from the **Max per Page** list.

Save Report Data to CSV Files

You can save a report to a comma-separated value (CSV) file.

Follow these steps:

1. Display the data that interests you in one of the following locations: the **Enterprise Overview** page; an interface drilldown view; or a report you run on the **Custom Reporting**, **Flow Forensics**, **Analysis**, or **Site to Site** page.
2. Click the blue arrow next to a report view name.
3. Select the **Export to CSV** option from the menu that opens.
   The **File Download** dialog opens.
4. Click **Save**.
   The **Save As** dialog opens.
5. Specify a name and location for the `.csv` file, then click **Save**.

Open Online Help

Online help provides useful information that is easy to access when you are working in the NFA console. You can access the help system at any time by clicking the **Help** link that is near the top-right corner.

Email Reports

You can send a displayed report in an email immediately, or you can set up a schedule to generate an updated, complete report automatically as a PDF file.

The Email icon is included at the top of all report views:

- **Enterprise Overview** page views.
- Interface drilldown views.
- Reports that you run from the **Custom Reporting**, **Flow Forensics**, Analysis, and **Site to Site** pages.

If you are logged in with Administrator rights, you can email any of the reports by clicking the **Email** icon and you can schedule reports to be sent as PDFs by email.

> **NOTE**
> To email reports, an email server must be configured for DX NetOps. If no email server is configured, an error message is displayed when you attempt to use the email function. For information about setting up an email server, contact your Administrator.

Follow these steps:

1. Display a completed report.
2. Click the **Email** icon at the top-right corner of the report page.
   The **Email Information** dialog opens.
3. Enter the following information:
   - **Send To**
     Enter the email address to which you want to send the report page. Separate multiple email addresses with commas.
   - **Subject**
     Enter the subject line for the email.
   - **Message**
     Enter a message to explain the report or the purpose of the email.

   Scheduling Options: Select one of the following options:
   - **Send Now**
     Send the report by email immediately.
   - **Send on a Schedule**
     Schedule the report to generate and send on multiple days a week or to send once a week, month, quarter, or year. If you select **Send on a Schedule**, select one of the following options:
     - **Send Daily**: Select which days of the week to send the email.
     - **Send Weekly**: Select which day of the week to send the email.
     - **Send Monthly**: Sets the email to be sent on the last day of the month.
     - **Send Quarterly**: Select the month that designates the end of the first quarter to send the email. The email is sent on the last day of each reporting quarter.
     - **Send Yearly**: Select the last month of the year. The email is sent on the last day of the year.

     NOTE
     Scheduled emails generate a report PDF by using a stored URL address. The saved report definition is used to generate the scheduled report that is sent.
4. Click **OK**.
   - **Send Now**: The email is sent immediately with the current report page attached as a PDF file.
   - **Send on a Schedule**: The email schedule is configured. The report is generated and sent according to the schedule.
     If you have administrator privileges, you can view, edit, or delete the email schedules that you configure in the Administration pages of the NFA console.

Print Reports

You can print a report view from the browser window or save the report as a PDF file.

The **Print** icon is included at the top of all report views:

- **Enterprise Overview** page views
- Interface drilldown views
- Reports that you run from the **Custom Reporting**, **Flow Forensics**, **Analysis**, and **Site to Site** pages

If you are logged in with Administrator rights, you can print any of the reports by clicking the **Print** icon.

Follow these steps:

1. Select the completed report to display it.
2. Click the **Print** icon at the top-right corner of the report page.
   A printable version of the report opens in a new browser window.
3. In the browser toolbar, click the **Printer** icon.

Your browser displays a **Print** dialog box, which you use to select a printer and set other printing options.

4. Click **OK** to print the PDF file.

Refresh the View Data

Turn on **Refresh** mode for the report page to make it automatically update to reflect the most recently collected 15-minute data. When the **Refresh** icon is green and revolving, the page is in Refresh mode. To disable Refresh, click the icon again. Once you enable **Refresh**, data continues to be refreshed even when you navigate away from the page. If you leave the **Enterprise Overview** page, be sure to turn off **Refresh**.

NOTE
The Refresh function is available for real-time data you view in DX NetOps, in the **Enterprise Overview** page and in Interface drilldown reports.

Using Enterprise Overview

The views on the **Enterprise Overview** page give you an overview of network traffic across the enterprise. These articles describe the enterprise-level built-in reports.

Interface Utilization

The **Interface Utilization** view lists the interfaces throughout the enterprise that are the most heavily used. The view is a table summary of the interfaces whose utilization exceeds the user-configured thresholds. This view is located on the **Enterprise Overview** page.

Find Interface Utilization Information in the Performance Center Console

The Performance Center Console has a similar view, **Interfaces Over Threshold**. This view is located by default on the **Infrastructure Overview** dashboard in CA Performance Center and on the **Traffic Analysis** page in CA NetQoS Performance Center.

Interface Utilization Data

The **Interface Utilization** view displays the following information for each interface listed:

- **Status**
  Indicates utilization level: Green (Normal), Orange (Warning or Elevated), Red (Critical).
- **Interface**
  Identifies the interface by name.
- **Traffic Direction**
  Identifies whether the reported traffic is inbound or outbound.
- **Speed**
  Lists the speed that is set for the interface by the Administrator.
- **Average Utilization**
  Lists the percentage of total utilization of the interface on average.
- **Percent Time Utilization ≥ Warning Level**
  Identifies the percentage of the time that interface utilization meets or exceeds the Warning level. The default Warning level is 50 percent utilization for 25 percent of the reporting period. The **Interface Utilization** list contains only the interfaces that meet the Warning level. If an operator changes this setting, the contents of the interface list may change.
- **Percent Time Utilization ≥ Critical Level**

Identifies the percentage of the time that interface utilization meets or exceeds the Critical level. The default Critical level is 75 percent utilization of the interface capacity for 25 percent of the reporting period. The operator can change the Critical level.

- **Legend**
  Describes the criteria that determine which interfaces are displayed and what the status icons represent. The default settings for the icons are defined as follows:
  – Critical (red) status: The interface utilizes 75 percent or more of its bandwidth over 25 percent of the reporting period.
  – Warning/Elevated (orange) status: The interface utilizes 50 percent or more of its bandwidth over 25 percent of the reporting period.

Configuring the Interface Utilization Display

If your user account has the Administrator or Power User role, you can change the configuration of the data displayed in the **Interface Utilization** view of the **Enterprise Overview** page.

For example, you could display the orange status indicator next to interfaces that utilize 65 -74.9 percent of their bandwidth (instead of 50-74.9 percent) for at least 25 percent of the reporting period.

Follow these steps:

1. Click the menu arrow next to the **Interface Utilization** label and select **Configure**.
   The legend at the bottom of the **Interface Utilization** view changes to include editable fields.
2. Enter utilization threshold values for the following settings:
   – **Red Utilization %**
   Set the minimum threshold for assigning a Critical status to interfaces. Interfaces are flagged at the Critical level when their utilization approaches or exceeds this value.
   – **Orange Utilization %**
   Set the minimum threshold for assigning a warning status to interfaces. Interfaces are flagged at the Warning level when their utilization is at or above this value, but is below the minimum threshold for Critical status.
   – **For ... % of reporting period**
   Set the reporting period percentage to use for calculating the thresholds.
   For example, if the value is 25, the report includes only the interfaces that have a utilization level above the threshold for 25 percent of the reporting period. For the default reporting period of 24 hours, this list includes interfaces at or above the threshold value for six hours or more during that period.
   – **Show**
   (Optional) Change the number of interfaces that are displayed on each list page.
3. Click **Submit Changes** when the configuration changes are complete.
   The **Interface Utilization** table and legend are updated to reflect your modified threshold settings.

Top Interfaces

The **Top Interfaces** views display the interfaces that have the most inbound and outbound traffic in your network during the reporting period. These two views are located on the **Enterprise Overview** page.

Each bar is identified on the left by its parent router and interface name. By default, a red bar indicates that the interface exceeds a utilization threshold of 75 percent. An orange bar indicates that the interface utilization is less than 75 percent, but has a utilization of at least 50 percent. A green bar indicates that the interface utilization is less than 50 percent.

You can perform the following tasks in the **Top Interfaces - In** and **Top Interfaces - Out** views:

- Review the information in the graphical display.
- Display a Tooltip with additional details about the interface by holding your cursor over an interface bar or name.

Tooltips display the parent router name, interface name, interface description, flow volume, flow rate, interface utilization, and inbound speed.

- Drill down to display details on corresponding **Interface** page views by clicking a bar or name.
  For example, an interface that exceeds 75 percent utilization for outbound traffic could have degraded application performance. To investigate the issue, click the interface name in the graph. A more detailed report for the interface opens.
- Export the view data to a `.CSV` file.
- Change the utilization thresholds by editing the threshold values in the **Interface Utilization** view.

Find Similar Information in the Performance Center Console

The Performance Center Console has a similar view, **Top IP Interface Utilization (Flow)**. In CA Performance Center, this view is located on the **Infrastructure Overview** dashboard by default. In the CA NetQoS Performance Center Console, the view is located on the **Traffic Analysis** report page by default.

Top Protocols and Top Hosts

The bottom view of the **Enterprise Overview** page displays the protocols and hosts in your enterprise that are most heavily utilized. These views display the protocols and hosts that are transferring the most data in your enterprise and how many bytes of data that each one is transferring.

The **Top Protocols** and **Top Hosts** views provide quick visual indicators of the most utilized protocol and hosts in your network. You can use the links to drill down to more detailed information about a specific protocol or host.

For example, suppose a protocol has a high volume of traffic. To investigate whether the traffic is correctly routed over the network, you click the protocol name in the graph and drill down to details.

Display Tooltips in the **Top Protocols** and **Top Hosts** views by holding your cursor over a name or bar.

- Protocol: Display the protocol name (keyword), encapsulation (transport protocol and port number), and total traffic volume.
- Host: Display the host name, IP address, and volume of inbound, outbound, and total traffic.

Find Similar Views in the Performance Center Console

The Performance Center Console has similar views, the **Top Enterprise Protocols by Volume** and **Top Enterprise Hosts by Volume**. These views are on the **Infrastructure Overview** dashboard (CA PC) and the **Enterprise Dashboard** (NPC).

Drill Down to Protocol Details

In the **Top Protocols** report view on the **Enterprise Overview** page, click an individual protocol to see a more detailed summary report for the protocol, including its top interfaces and hosts. You can use this report to perform a high-level investigation of the related interfaces.

To open an **Interface Protocols** report and see detailed protocol data for the interface, click the interface name or bar. You can drill down to the **Interface Protocols** report from the view in the NFA console. Properly credentialed users also can drill down from the view in the Performance Center Console.

Drill Down to Details About a Host

In the **Top Hosts** view on the **Enterprise Overview** page, you can click a host name to see a more detailed summary report for the host, including its top interfaces and protocols. You can use this report to perform a high-level investigation of the protocols and interfaces for the host traffic.

In the **Top Interfaces for Host** report view, click the name of an interface to open an Interface Hosts report and see detailed protocol data specific to that interface.

To drill down to details, click the host name or bar. Properly credentialed users also can drill down from the view in the Performance Center Console.

Interface Reports

You can use **Interfaces** page reports to review traffic for specific interfaces. You can get an overview of network traffic from the **Enterprise Overview** reports, then get more detail from the **Interfaces** reports. The following topics describe how to view reports on the **Interfaces** pages:

Open Interface Reports

Interface reports show details about a specific interface. If you click an interface name on the **Enterprise Overview** page, for example, you drill down to details on the **Interface** report page. You can change the report presentation mode or open other types of interface reports.

The top right corner of the report page has following options:

- **Refresh**
  Click the **Refresh** icon to make the page update automatically. In Refresh mode, the page shows the most up-to-date data available. The **Refresh** icon is green and revolving as long as the page is in Refresh mode. Data continues to be refreshed even if you navigate away from the page.
  To turn off Refresh mode, click the icon again. Make sure to turn off the Refresh mode before you leave the page.

  NOTE
  The Refresh function is available for real-time data that you view on the **Enterprise Overview** page and in interface drilldown reports.
- **Email**
  Send the reports by email to one or more users (Administrator or Power User accounts only).
- **Print**Print the entire page of reports (Administrator or Power User accounts only).

The **Flow Forensics** links near the top and bottom of the report page open the page for configuring and running Flow Forensics reports. A Flow Forensics report lets you view detail for the raw data flows.

Use the Interface Index

When you log in to the NFA console, the **Interfaces** page opens and shows the **Interface Index**. You can use the **Interface Index** to select an interface and view reports for it. You can search for an interface on the **Router** or **Group** tab.

NOTE
The **Group** tab appears only if the product is registered as a data source for Performance Center. If the product is not registered, the **Interface** tab appears in place of the **Group** tab.

Open an Interface Index Router Tab

You can use the **Router** tab in the **Interface Index** to locate an interface by router. The **Interface Index** shows the available routers in an alphanumerically sorted list. By default, 20 routers are shown on each page of the list.

Follow these steps:

1. Select **Interfaces** in the NFA console menu.
   The **Interfaces** page opens and shows the **Interface Index**.
2. Make sure the **Router** tab is displayed.
3. Locate the interface that interests you. Use any of the following options to locate the interface:

- Click the name of the parent router to expand a list of its interfaces.
- **Search**: Search for whole or partial text strings. Searching filters the list to show only the entries that have an **Interface** or **Description** column value that matches your search term.
- **Max per Page**: Change the **Max per Page** setting to show more routers and interfaces on each page.

4. Click the interface that interests you.
   An **Interface Overview** report page opens, which displays data for the selected interface.
5. (Optional) Change the format or type of data displayed in the report:
   a. Click the gray bar on the left.
      The **Presentation** menu opens.
   b. Select the desired presentation (display and metric) options.
   c. (Optional) Click the bar again to hide the menu.

Open an Interface Index Group Tab

You can locate and select an interface by using the **Group** tab in the **Interface Index**. The **Group** tab shows the groups organized in a tree. The tree can help you locate a specific interface, especially when in an enterprise that has large numbers of routers and interfaces.

The **Group** tab appears only if the product is registered as a data source for Performance Center. If the product is not registered, the **Interface** tab appears in place of the **Group** tab.

Follow these steps:

1. Select **Interfaces** in the NFA console menu, if the **Interface Index** page is not already visible.
   The **Interfaces** page opens and shows the **Interface Index**. This is the first page that you see when you log in to the NFA console.
2. Click the **Group** tab.
   The group tree is displayed in the left pane.
3. Locate the interface that interests you. Use any of the following options to locate the interface:
   - Click the group that interests you.
     To expand the contents of a high-level group, click its arrow icon. For example, you could click the **Inventory** group or expand the Inventory group and select a domain sub-group.
     If the selected group or its sub-groups contain interfaces, the list of the interfaces opens in the right pane.
   - Sort by Column Heading: Click a column heading to re-sort the list. The entire list is sorted, not just the items on the current page.
   - Filter by: Click a **Filter by** option to display active, inactive, or all interfaces.
   - Search: Search for whole or partial text strings. Searching filters the list to show only the entries that have an **Interface** or **Description** column value that matches your search term.
   - Max per Page: Change the **Max per Page** setting to show more routers and interfaces on each page.
4. Click the interface that interests you.
   An **Interface Overview** report page opens, which displays data for the selected interface.
5. (Optional) Change the format or type of data displayed in the report:
   a. Click the gray bar on the left.
      The **Presentation** menu opens.
   b. Select the desired presentation (display and metric) options.
   c. (Optional) Click the bar again to hide the menu.

Interface Tab

The **Interface** tab displays a list of the available interfaces in an alphanumerically sorted list. By default, 10 interfaces are shown on each page. To re-sort the table data, click a column heading.

Open an Interface Report from Other Pages

In addition to opening an interface report from the **Interface Index**, you can drill down to detailed reports by clicking links in other reports. For example, you can drill down to details by clicking an interface name in an **Enterprise Overview** page report.

You can also drill down to interface reports from some Performance Center Console views. This option is available for views of DX NetOps data, provided that your administrator has enabled the drill down function.

Interface Report Types

If you select an interface in the **Interface Index** or you click a drilldown link, a report opens in the **Interface** pages. The initial report is an **Overview** report. To display a different report type, select an option from the **For this interface, show me:** list in the upper left corner.

Use the icons at the top to refresh, print, or email the report page.

> **NOTE**
> If the product is registered with CA Performance Center you can click the blue menu arrow next to the report title and select **CA PC Interface Performance**. The CA Performance Center Console opens to show **Interface Pages: Details** page for the Interface.

Interface Overview Report

An interface **Overview** report is a broad summary of information about the selected interface.

Follow these steps:

1. Display an interface report in either of the following ways:
   - Locate and click an interface on the **Interfaces** page.
   - Click an interface link in an existing view; for example, on the **Enterprise Overview** page.
2. Make sure that **Overview** is selected as the report type at the top of the page.
   The report page shows the following interface data:
   - Protocol data that is inbound and outbound on the interface
   - ToS data that is inbound and outbound on the interface
   - Data that travels to and from hosts
   - Total volume of conversation data

   If you want to display another report type, select an option from the report menu at the top-left corner of the page.

   > **NOTE**
   > The graph in the **Timeframe** panel only displays **Protocol Trend** data for all traffic on the interface that the user has selected. Selecting a different report type does not change the data displayed in the **Timeframe** panel.
3. (*Optional*) Change the type of data presentation and measurement by using the presentation options.
   - **Mixed Chart** of **Rate**, **Volume**, or **Utilization** data:
     - Stacked trend charts of incoming and outgoing protocol and ToS data
     - Pie charts that show the volume of data to and from hosts
     - Pie chart that shows the total volume of conversation data
   - **Mixed Trend** of **Rate**, **Volume**, or **Utilization** data:
     - Stacked trend charts of incoming and outgoing protocol and ToS data
     - Trend summary charts that show the volume of data to and from hosts
     - Trend summary chart that shows the total volume of conversation data

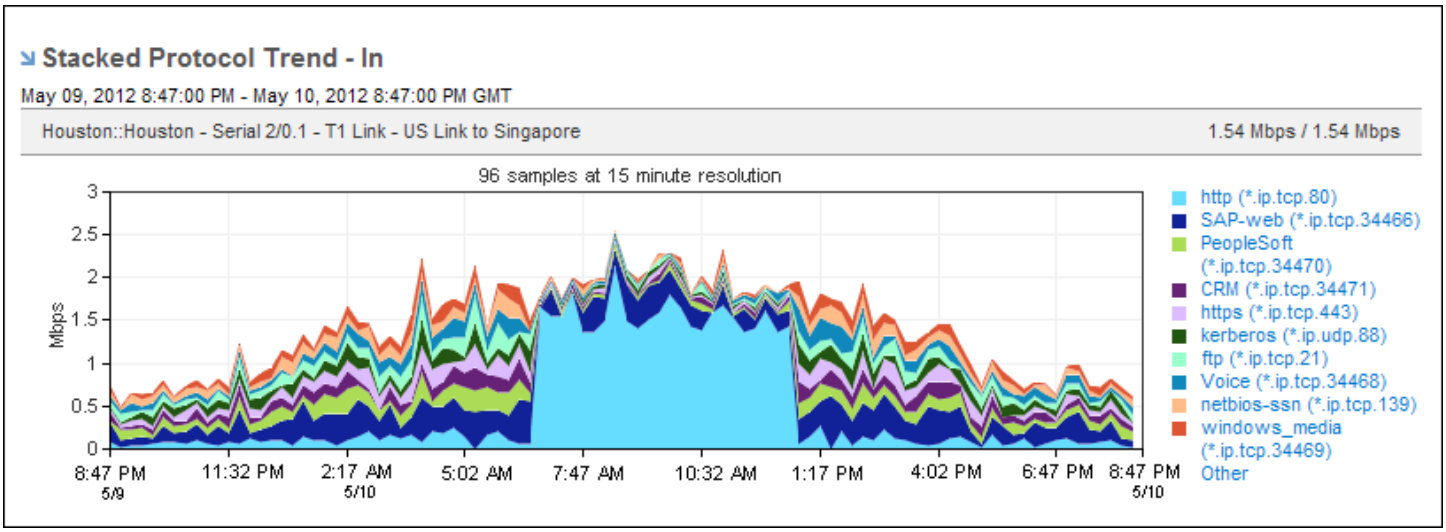
Use the **Show Top** setting to specify the maximum number of conversations to include. (Default setting)

- **Pie Chart**: Shows pie charts of the following data:
  - Incoming and outgoing protocol and ToS data
  - Volume of data to and from hosts
  - Total volume of conversation data

4. (*Optional*) Change the reporting period: Open the **Timeframe** dialog by clicking the timeframe link.
   The reporting period is the most recent 24-hour period by default.

Top N Protocols Report

A Top N Protocols report provides information about the protocols that generate the most traffic on a specific interface. This topic describes how to display a Top N Protocols report.



Follow these steps:

1. Display an interface report in either of the following ways:
   - Locate and click an interface on the **Interfaces** page.
   - Click an interface link in an existing view, for example, on the **Enterprise Overview** page.
2. Select **Protocols** from the report type menu at the top of the page.
3. Make sure that the report scope is set to **Top N Protocols**. The **Top N Protocols** link should appear next to the report type at the top.
   The report page is updated to show protocol data in stacked trend charts by default. The report includes views for inbound, outbound, and total protocol data.
4. (Optional) Change the type of data presentation and measurement by using the **Presentation** options.
   - **Stacked Trend Chart** of **Rate**, **Volume**, or **Utilization** data
   - **Trend Chart** of **Rate**, **Volume**, or **Utilization** data:
     Use the **Show Top** setting to specify the maximum number of conversations to include. (Default setting)
   - **Pie Chart**
   - **Summary Table** of **Rate**, **Volume**, or **Utilization** data

   Each option displays data that is inbound and outbound on the selected interface.
5. (Optional) Change the reporting period: Open the **Timeframe** dialog by clicking the timeframe link.
   The reporting period is the most recent 24-hour period by default.

NOTE
You also can display **Protocol Summary** views in a Custom report.

Open a Drilldown Protocol Report

To drill down to more detailed, protocol-specific data for the selected interface, click the name of a protocol in any of the Top N Protocol views. An overview report opens for the protocol on the selected interface.

Display an Interface Report for a Single Protocol

To drill down to details about a specific protocol, click one of the protocol links in a Top N Protocols view. A report opens, which you can display in **Overview**, **Details**, **Hosts**, or **Conversations** mode. The options in the **Presentation** menu are mode-specific. You can display any of the following types of data and views:

- **Overview** mode **Mixed Chart** or **Mixed Trend** chart: **Rate**, **Volume**, or **Utilization** data for the protocol on the selected interface
- **Overview** mode **Pie Chart** in the following views: **From** (outbound on the interface), **To** (inbound on the interface), and **Total**
- **Details** mode **Multi-Period Trend** chart: **Rate**, **Volume**, or **Utilization** data in any combination of the following views, which are shown with or without baselines:
  - (Displayed by default) **Last Hour**, **Last 2 Hours**, **Last 8 Hours**, and **Daily**
  - **Weekly**, **Monthly**, and **Yearly**
- **Details** mode **Calendar Chart**: Rate in either of the following views:
  - **Direction In**: Protocol data coming into the interface
  - **Direction Out**: Protocol data going out from the interface
- **Hosts** mode **Trend Chart**: **Rate**, **Volume**, or **Utilization** data for the number of top hosts that you specify
- **Hosts** mode **Pie Chart** in the following views: **From** (outbound on the interface), **To** (inbound on the interface), and **Total**
- **Hosts** mode **Summary Table**: Table of **Rate**, **Volume**, or **Utilization** data for hosts who used the protocol on the selected interface
- **Conversations** mode **Trend Chart** or **Summary Table**: **Rate**, **Volume**, or **Utilization** data for conversations that used the protocol on the selected interface
- **Conversations** mode **Pie Chart**: Data for all conversations that used the protocol on the selected interface

To return to the summary view of all protocols on the interface, click the link that is named for the currently selected protocol and click **Select Top N Protocols**.

Find Protocol Views in the Performance Center Console

Protocol data from DX NetOps is displayed in the following locations in the Performance Center Console. (The built-in dashboards and report pages that are noted here show the views by default.)

- Top Enterprise Protocols by Volume
  - (CA PC) **Infrastructure Overview** and **Network Overview** dashboards; **Summary** context view in a custom dashboard
  - (NPC) **Enterprise**, **Traffic Analysis**, **Network Overview**, and custom dashboards
- Top Protocols (Bar) and Top Protocols (Pie)
  - (CA PC) Custom dashboards
  - (NPC) Custom dashboards; **Interface Pages**: Interface QoS and custom tab views
- Top Protocols (Table)
  - (CA PC) Custom dashboards
  - (NPC) Custom dashboards; **Interface Pages** custom tab views
- Stacked Protocol Trend

- (CA PC) **Interface Pages: IP Performance** and **CBQoS** report pages
- (NPC) **Interface Pages: Interface Capacity**, **Interface QoS**, and custom tab views

Top N ToS Report

The Top N ToS report provides information about the Types of Service (ToS) markings of the packets that generate the most traffic for the selected interface. This topic describes how to display a Top N ToS report.

Follow these steps:

1. Display an interface report in either of the following ways:
   - Locate and click an interface on the **Interfaces** page.
   - Click an interface link in an existing view--for example, on the **Enterprise Overview** page.
2. Select **ToS** as the report type at the top of the page.
3. Make sure the report scope is set to **Top N ToS**. The **Top N ToS** link should appear next to the report type setting. The report page is updated to show ToS data in stacked trend charts. The report includes views for inbound, outbound, and total ToS data.
4. (Optional) Change the type of data presentation and measurement by using the Presentation options.
   - **Stacked Trend Chart** of **Rate**, **Volume**, or **Utilization** data (Default setting)
   - **Trend Chart** of **Rate**, **Volume**, or **Utilization** data: Use the **Show Top** setting to specify the maximum number of conversations to include.
   - **Pie Chart**
   - **Summary Table** of **Rate**, **Volume**, or **Utilization** data

   Each option displays data that is inbound and outbound on the selected interface.
5. (Optional) Change the reporting period: Open the **Timeframe** dialog by clicking the timeframe link. The reporting period is the most recent 24-hour period by default.

Display an Interface Report for a Single ToS

To drill down to more detailed, ToS-specific data for the selected interface, click a **ToS** link in a **Top N ToS** view. An overview report for the ToS value on that interface opens.

You can view the report in **Overview** or **Details** mode by selecting one of the following report types:

- **Overview** mode **Mixed Chart** or **Mixed Trend** chart: **Rate**, **Volume**, or **Utilization** data for the ToS on the selected interface
- **Overview** mode **Pie Chart** views:
  - **ToS Protocol Summary - In** or **Out**: Data going in or out of the interface for the protocols that use the ToS
  - **ToS Hosts Summary - From** or **To**: Data going from or to the hosts that use the ToS
  - **ToS Conversations Summary - Total**: Data for all conversations that use the ToS (coming in and going out of the interface)
- **Details** mode: Charts of **Rate**, **Volume**, or **Utilization** data in any combination of the following views, which are shown with or without baselines:

  - (Displayed by default) **Last Hour**, **Last 2 Hours**, **Last 8 Hours**, and **Daily**
  - **Weekly**, **Monthly**, **Yearly**
- **Protocols** mode **Trend Chart**: **Rate**, **Volume**, or **Utilization** data, which are shown with or without baselines
- **Protocols** mode **Summary Table**: **Rate**, **Volume**, or **Utilization** data
- **Protocols** mode **Stacked Trend Chart** or **Pie Chart** views of data for the protocols that used the ToS: **In** (inbound on the interface), **Out** (outbound on the interface), or **Total**
- **Hosts** mode **Trend Chart**: **Rate**, **Volume**, or **Utilization** data for the number of top hosts you specify
- **Hosts** mode **Summary Table**: Table of data for hosts who used the ToS on the selected interface
- **Hosts** mode **Pie Chart**: Summary views of data for the hosts that used the ToS: **From** (data from the host), **To** (data to the host), or **Total**
- **Conversations** mode **Trend Chart**: **Rate**, **Volume**, or **Utilization** data for the number of top conversations you specify
- **Conversations** mode **Summary Table**: Table of **Rate**, **Volume**, or **Utilization** data for conversations that used the ToS on the selected interface
- **Conversations** mode **Pie Chart**: Data for all conversations that used the ToS on the selected interface

To return to the summary view, click the link named for the currently selected ToS and click **Select Top N Hosts**.

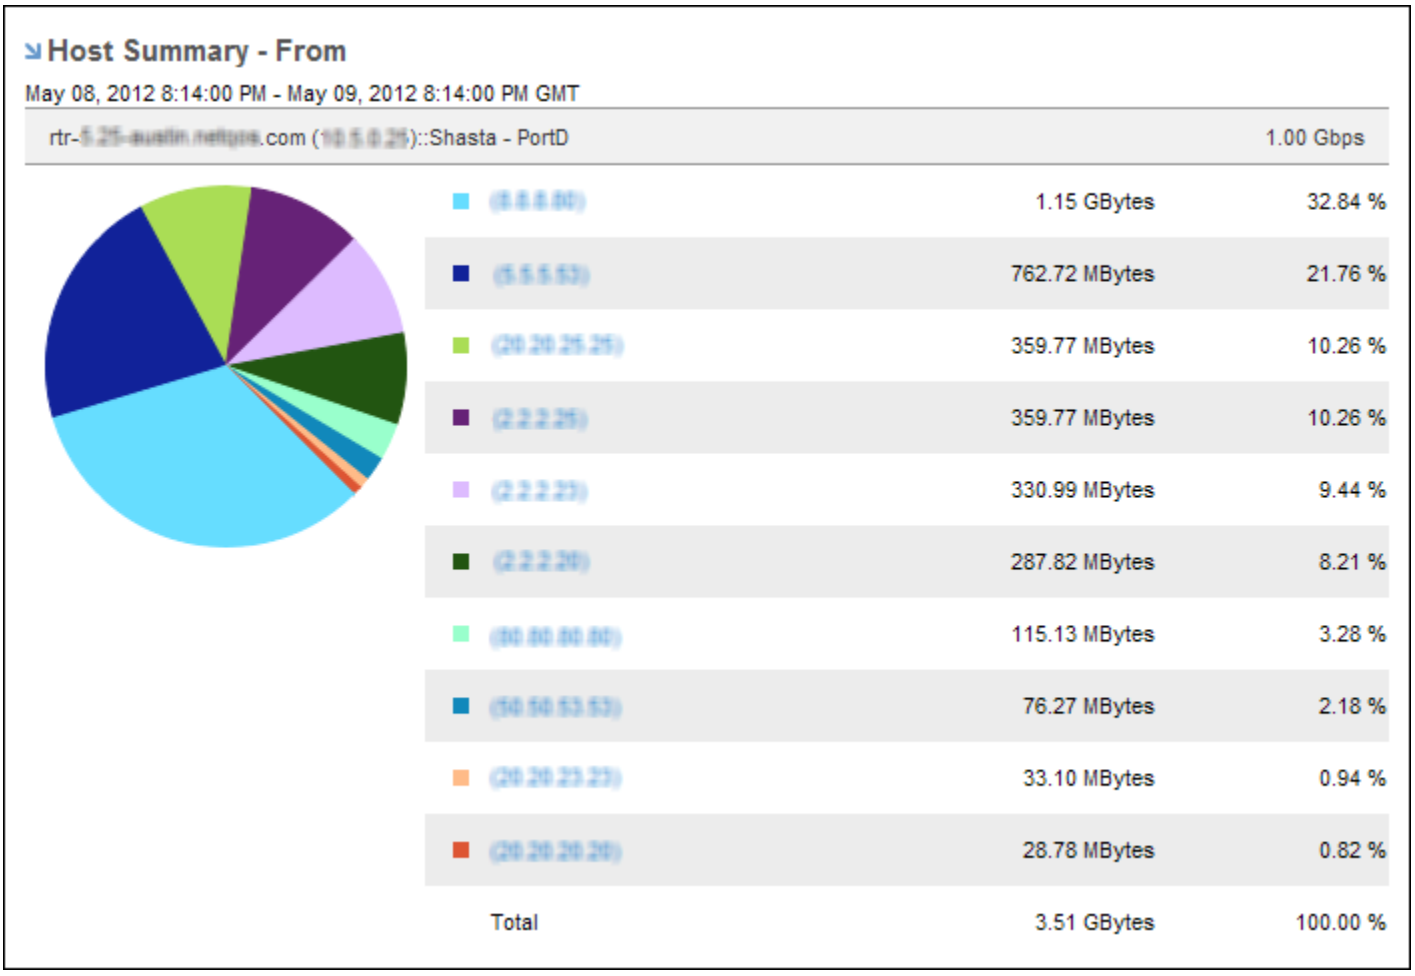
Find ToS Views in the Performance Center Console

ToS data from DX NetOps is displayed in the following Performance Center Console locations. (The built-in dashboards and report pages that are noted here show the views by default.)

- **Stacked ToS Trend**
  - (CA PC) **Interface Pages: CBQoS** report page or a custom dashboard
  - (NPC) **Interface Pages: Interface QoS** or custom tab views
- **ToS Summary Pie**
  - (CA PC) Custom dashboard; **Interface Pages: IP Performance** tab
  - (NPC) **Interface Pages** or custom tab views
- **ToS Summary Table**
  - (CA PC) Custom dashboard
  - (NPC) **Interface Pages: Interface QoS** or custom tab views

Top N Hosts Report

The **Top N Hosts** report provides information about the hosts that generate the most traffic on the selected interface.



Follow these steps:

1. Display an interface report in either of the following ways:
   - Locate and click an interface on the **Interfaces** page.
   - Click an interface link in an existing view, for example, on the **Enterprise Overview** page.
2. Select **Hosts** as the report type at the top of the page.
3. Make sure the report scope is set to **Top N Hosts**. The **Top N Hosts** link should appear next to the report type setting. The report page is updated to show host summary pie charts by default. The report includes views for the following host data:
   - **From**: Top hosts who sent data to the interface.
   - **To**: Top hosts who received data from the interface.
   - **Total**: Top hosts who either sent data to the interface or received data from the interface.
4. (Optional) Change the data presentation type and the data measurement type by using the Presentation options.
   - **Trend Chart** of **Rate**, **Volume**, or **Utilization** data: Show trend charts for data that travels to and from the hosts. Use the **Show Top** setting to specify the maximum number of conversations to include.
   - **Pie Chart**: Show pie charts for data that travels to and from the hosts, with lists of hosts and their data volumes. (Default setting)
   - **Summary Table** of **Rate**, **Volume**, or **Utilization** data: Show a table of data that travels to and from the hosts.
5. (Optional) Change the reporting period: Open the **Timeframe** dialog by clicking the timeframe link. The reporting period is the most recent 24-hour period by default.

Display an Interface Report for a Single Host

To drill down to more detailed, host-specific data for the selected interface, click a host name in a **Top N Hosts** view. An overview report for the host on that interface opens. You can view the host details or the host protocols.

You can view this type of report in **Details** mode or **Protocols** mode, which have the following options:

- **Details** mode: Charts of **Rate**, **Volume**, or **Utilization** data in any combination of the following views:
  - (Displayed by default) **Last Hour**, **Last 2 Hours**, **Last 8 Hours**, and **Daily**
  - **Weekly**, **Monthly**, and **Yearly**
- **Protocols** mode **Trend Chart** or **Summary Table**: **Rate**, **Volume**, or **Utilization** for the protocols that the hosts used. You see the data coming into the interface and the data going out from the interface.
- **Protocols** mode **Stacked Trend Chart**: Data for all protocols that the hosts used (coming into and going out of the interface).

To return to the summary view, click the link that is named for the currently selected host and click **Select Top N Hosts**.

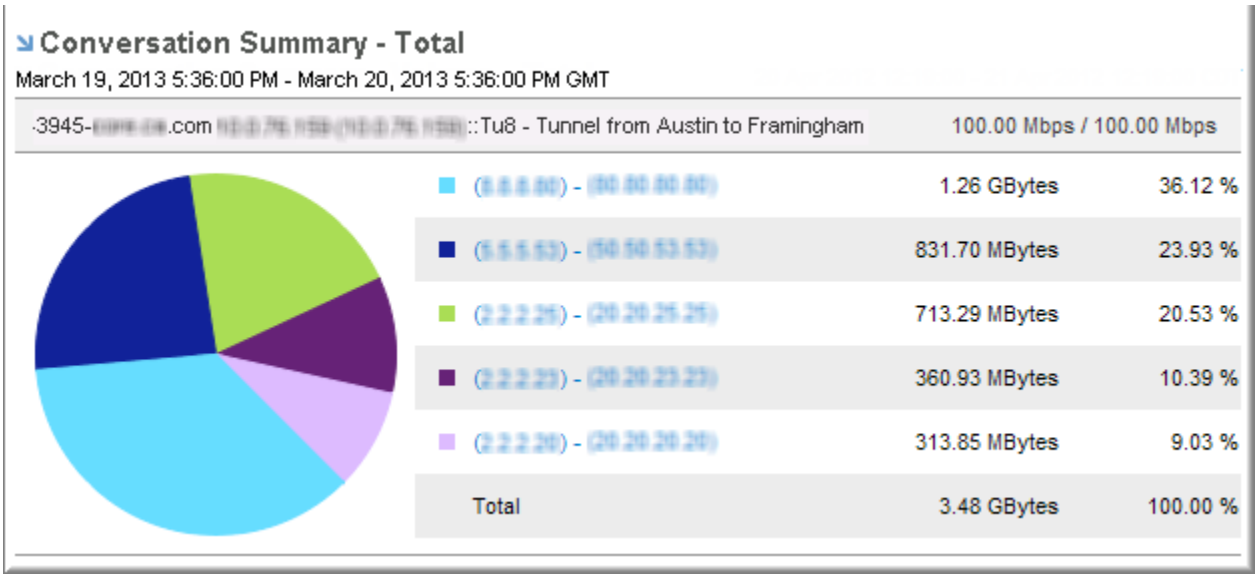
Find Host Views in the Performance Center Console

Host data from DX NetOps is displayed in the following Performance Center Console locations. (The built-in dashboards and report pages that are noted here show the views by default.)

- Top Enterprise Hosts by Volume or Top Hosts (Bar)
  - (CA PC) **Infrastructure Overview**, **Network Overview**, and custom dashboards
  - (NPC) **Enterprise**, **Traffic Analysis**, **Network Overview**, and custom dashboards
- Top Hosts (Bar)
  - (CA PC) Custom dashboards; **Interface Pages: IP Performance** report page
  - (NPC) Custom dashboards; **Interface Pages: Interface Capacity**, **Interface QoS**, and custom tab views
- Top Hosts (Pie)
  - (CA PC) Custom dashboards; **Interface Pages: IP Performance** report page
  - (NPC) Custom dashboards; **Interface Pages: Interface QoS**, and custom tab views
- Top Hosts (Table)
  - (CA PC) Custom dashboards
  - (NPC) Custom dashboards; **Interface Pages** custom tab views

Top N Conversations Report

The **Top N Conversations** report provides information about the hosts that generate the most traffic on the selected interface.



Follow these steps:

1. Display an interface report in either of the following ways:
   – Locate and click an interface on the **Interfaces** page.
   – Click an interface link in an existing view, for example, on the **Enterprise Overview** page.
2. Select **Conversations** as the report type at the top of the page.
3. Make sure the report scope is set to **Top N Conversations**. The **Top N Conversations** link should appear next to the report type setting.
   The report page is updated to show a conversation summary pie chart by default.
4. (Optional) Change the data presentation type and the data measurement type by using the Presentation options.
   – **Trend Chart** of **Rate**, **Volume**, or **Utilization** data: Show a trend chart for data that travels to and from the source host in the conversations. (Default setting)
   Use the **Show Top** setting to specify the maximum number of conversations to include.
   – **Pie Chart**: Show a summary pie chart with a list of conversations and their data volumes.
   – **Summary Table** of **Rate**, **Volume**, or **Utilization** data: Show a table of data that travels to and from the source host in the conversations.
5. (Optional) Change the reporting period: Open the **Timeframe** dialog by clicking the timeframe link.
   The reporting period is the most recent 24-hour period by default.

Display an Interface Report for a Single Conversation

To drill down to details about a specific conversation, click one of the conversation links in the **Top N Conversations** view. A report opens, which you can configure to show any of the following data:

You can view this type of report in **Details** mode or **Protocols** mode, which have the following options:

- **Details** mode: Charts of **Rate**, **Volume**, or **Utilization** data in any combination of the following views:
  – (Displayed by default) **Last Hour**, **Last 2 Hours**, **Last 8 Hours**, and **Daily**
  – **Weekly**, **Monthly**, or **Yearly**
- **Protocols** mode **Trend Chart** or **Summary Table**: **Rate**, **Volume**, or **Utilization** for the protocols that the conversations used. You see the data coming into the interface and the data going out from the interface.
- **Protocols** mode **Stacked Trend Chart**: Data for all protocols that the conversations used (coming into and going out of the interface).

To return to the summary view of all conversations on the interface, click the link that is named for the currently selected conversation and click **Select Top N Conversations**.

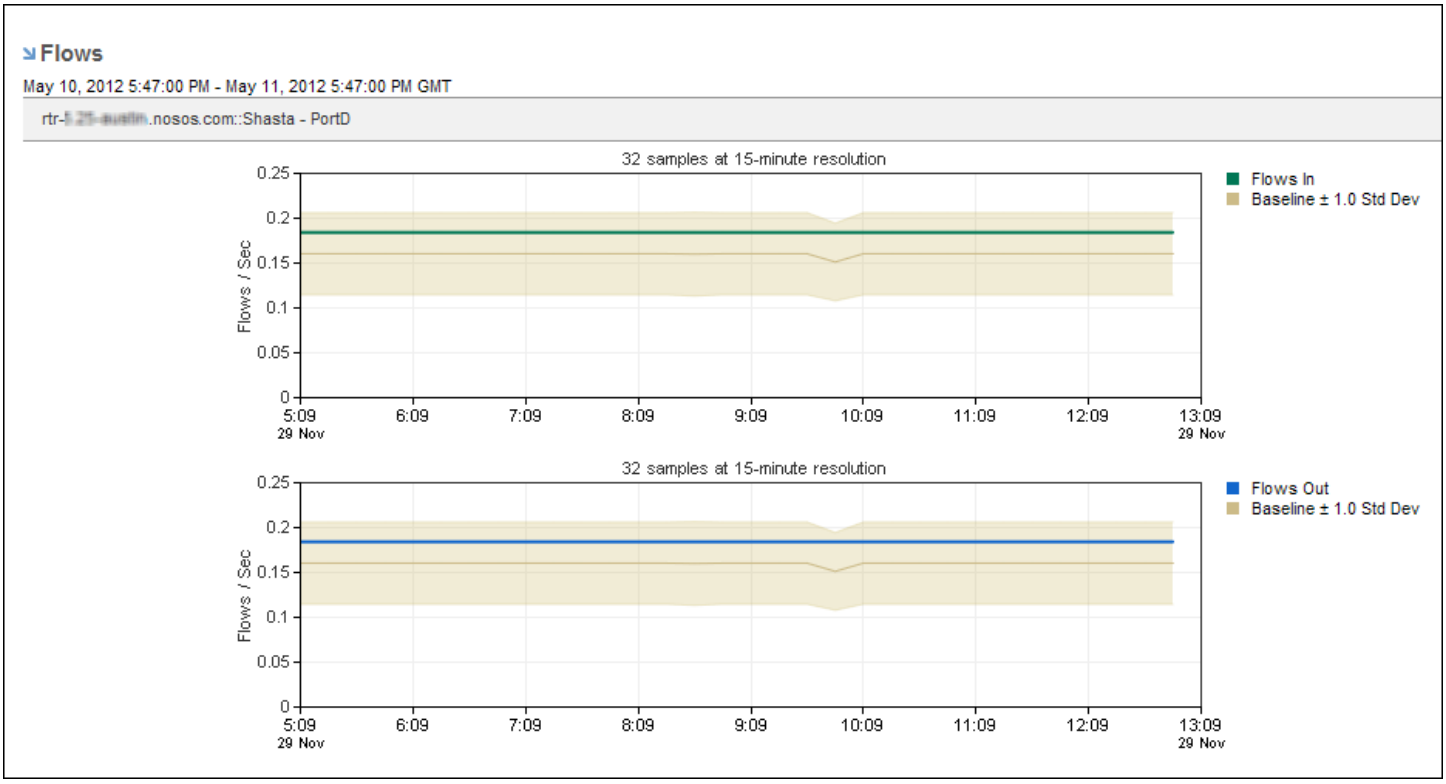
Find Conversation Views in the Performance Center Console

Conversation data from DX NetOps is displayed in the following Performance Center Console locations. (The built-in dashboards and report pages that are noted here show the views by default.)

- Top Conversations (Bar)
  - (CA PC) Custom dashboards
  - (NPC) **Interface Pages: Interface Capacity** and custom tab views
- Top Conversations (Pie)
  - (CA PC) Custom dashboards; **Interface Pages: IP Performance** report page
  - (NPC) **Interface Pages: Interface QoS** and custom tab views
- Top Conversations (Table)
  - (CA PC) Custom dashboards
  - (NPC) **Interface Pages** custom tab views

Flows Report

A **Flows** report is a trend plot that shows the rate of the flows that enter and leave the selected interface. A **Flows** report helps you find patterns or anomalies.



Viruses typically generate large increases in flow counts. The flow rate can indicate the load on the Harvester.

Follow these steps:

1. Display an interface report in either of the following ways:

- Locate and click an interface on the **Interfaces** page.
- Click an interface link in an existing view--for example, on the **Enterprise Overview** page.

2. Select **Flows** as the report type at the top of the page.
   The report page is updated to show flow trend charts.
3. (Optional) Change the data measurement type by using the Presentation options:
   Rate (default setting) or **Volume**
   Each option displays trend charts of data that is inbound and outbound on the selected interface.
   You can also select **Show Baselines** to view +/- 1 Standard Deviation. The baseline is computed by calculating the average and standard deviation for a maximum of 10 samples (the last six weeks and the last four days). This rolling baseline feature provides a visual representation of a current and historical trend overlay. When a current trend line is above or below the baseline, the performance is out of the norm. When the current trend is within the baseline, the performance is within the range of historical behavior.
4. (Optional) Change the reporting period: Open the **Timeframe** dialog by clicking the timeframe link.
   The reporting period is the most recent 24-hour period by default.

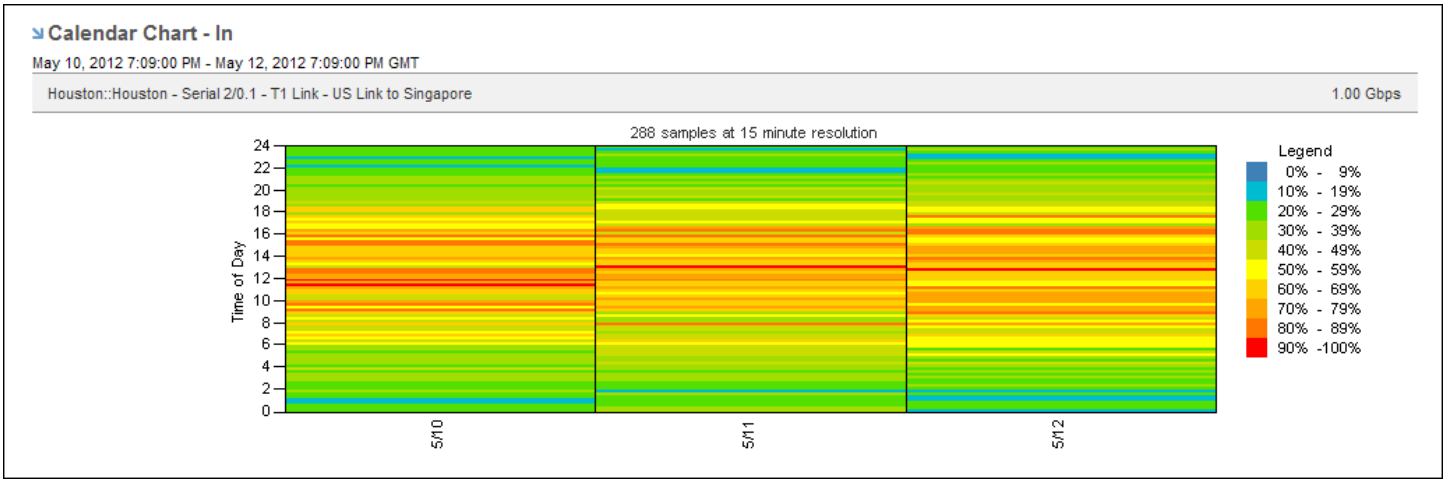
Find Flows Views in the Performance Center Console

The Top Flows by Interface view is displayed in the following Performance Center Console dashboards.

- (CA PC) **Infrastructure Overview** dashboard (by default)
- (CA PC) **Management Overview** dashboard (by default)
- (CA PC) Summary context view in a custom dashboard
- (NPC) Custom dashboard

Utilization (Calendar Chart) Report

The **Utilization** (**Calendar Chart**) report maps the utilization percentage of the selected interface over time. Utilization is calculated on either inbound or outbound traffic, depending on the selected **Presentation** mode.



This view makes it easy to detect recurring data patterns. Finding a pattern can help you identify the source of high traffic rates and potential performance issues. You might discover that the high traffic rates you thought were intermittent actually follow a pattern. The view can show the hour of each day when utilization is the highest, for example.

Each color represents a severity range that is calculated as a percentage of total capacity. High utilization is shown in orange and red. Low utilization is shown in green and blue.

Follow these steps:

1. Display an interface report in either of the following ways:

- Locate and click an interface on the **Interfaces** page.
- Click an interface link in an existing view; for example, on the **Enterprise Overview** page.

2. Select **Utilization** from the report type menu at the top of the page.
   The report page is updated.
3. (*Optional*) Choose the direction of the traffic by using the **Presentation** options:
   - **Direction In**: Show traffic that is inbound on the interface.
   - **Direction Out**: Show traffic that is outbound on the interface.
4. (*Optional*) Change the reporting period: Open the **Timeframe** dialog by clicking the timeframe link.
   The reporting period is the most recent 24-hour period by default.

   NOTE
   The **Calendar Chart** report uses 15-minute resolution when the **Time Period** is **Last Hour** or **Last 2 Hours**.

Find Calendar Chart Views in the Performance Center Console

To see the utilization calendar chart for an interface in the Performance Center Console, add it to a custom dashboard or report page:

- (CA PC) Custom dashboard with **Calendar Heat Chart (Flow) - In** or **- Out**
- (NPC) **Interface** pages: Custom report page with **Calendar Chart (Flow) - Total**

Growth Report

The **Growth Report** provides historical growth statistics for the top protocols on the selected interface, so you can see which applications have increasing capacity needs. This knowledge helps you make decisions about adding capacity in the future.

Follow these steps:

1. Display an interface report in either of the following ways:
   - Locate and click an interface on the **Interfaces** page.
   - Click an interface link in an existing view; for example, on the **Enterprise Overview** page.
2. Select **Growth Report** as the report type at the top of the page.
   The report page is updated to show a **Growth Report** table.
3. (*Optional*) Choose the direction of the traffic to display by using the **Presentation** options.
   - **Direction In**: Show traffic that is inbound to the interface.
   - **Direction Out**: Show traffic that is outbound from the interface.
4. (*Optional*) Change the reporting time period:
   a. Select **Last 6 Weeks** (default setting) or **Last 6 Months** in the **Presentation** options.
      - **Last 6 Weeks**: Sets the report to show six weeks of data. The six most recent weeks are selected by default.
      - **Last 6 Months**: Sets the report to show six months of data. The six most recent months are selected by default.

   b. (*Optional*) Use the **Through week of** or the **Through month of** option to select an alternative ending week or month for the six-week or six-month time period.
   c. (*Optional*) Restrict the reporting range by selecting a time filter from the **Time Filter** option list.
      Time filters are created by the Administrator for DX NetOps. For example, the Administrator could create a time filter to restrict the report data to business hours and business days. If the **Time Filter** list is empty, your Administrator has not created any time filters.
      Select **Time Filter: None** when not using a time filter.

Capacity Planning Report

Capacity Planning reports show traffic trends, which are useful for planning. Future traffic is calculated by analyzing previous traffic. **Capacity Planning** reports project trends for rate, volume, and utilization for the following data on the selected interface:

- Overall traffic (IP Summary)
- Protocol traffic
- ToS traffic

> **NOTE**
> In some cases, when there are short-term variations in the metric of interest that are not reflective of the longer-term trend, the capacity planning tables may show odd numbers.

You can specify several display and calculation options for the report:

- Time span of the historical (actual) data, which is shown with a white background on the view
- Time span of the projected data, which is shown with a gray background on the view
- Time range of the data that is used to calculate projections and (optionally) a time filter to exclude certain time periods from calculations
- Analysis type algorithm: **Daily Percentile** or **Daily Average**
- Threshold line, which is configured based on your selected percentage and selected bandwidth or speed

Follow these steps:

1. Display an interface report in either of the following ways:
   – Locate and click an interface on the **Interfaces** page.
   – Click an interface link in an existing view--for example, on the **Enterprise Overview** page.
2. Select **Capacity Planning** as the report type at the top of the page.
3. Select the report scope:
   – **IP Summary**: Overview of traffic on the selected interface
   – **Protocols**: Protocol traffic on the selected interface
   – **ToS**: ToS traffic on the selected interface
   The report page is updated.
4. (Optional) Change the reporting time frame and calculation options by using the **Trend Settings** options.
5. (Optional) Change the data presentation type and the data measurement type by using the **Presentation** options: **Rate** (default setting), **Volume**, or **Utilization**
   Each option displays views of data that is inbound (**In**) and outbound (**Out**) on the interface.

Views on the Capacity Planning Report Page

You can configure the **Capacity Planning** report views to display historical data and calculate projections for three types of interface data on the selected interface:

- IP Summary - Overview of traffic
- Protocols - Protocol traffic
- ToS - ToS

To change the data type, select a different option from the secondary menu at the top of the page.

The views that are shown on the report page are determined by two sets of options:

- Secondary report mode: **IP Summary** (default setting), **Protocols**, or **ToS**
- Presentation mode: **Rate** (default setting), **Volume**, or **Utilization**

IP Summary Report Page

The **IP Summary** report page displays the following view and table.

- **IP Summary Trend - Total** - Overall traffic inbound and outbound on the selected interface
  Two trend charts are included:
  – **Rate presentation** - **Rate In** and **Rate Out** trend charts show the data rates, expressed in a scale that is appropriate for the highest-rate value in the view (Y-Axis).
  – **Volume presentation** - **Bytes In** and **Bytes Out** trend charts show the data volume, expressed in a scale that is appropriate for the highest volume in the trend chart (Y-Axis).
  – **Utilization presentation** - **Utilization In** and **Utilization Out** trend charts show the utilization of interface capacity, which is measured in percentages (Y-Axis).
  The X-Axis shows date and time progression.
  The charts show color-coded lines:
  – Green line - Rate or volume of inbound data, or the utilization of inbound capacity
  – Blue line - Rate or volume of outbound data, or the utilization of outbound capacity
  – Red line - Threshold, which is configured by setting the Percentage value in the Trend Settings dialog (Calculations area)
  The historical data has a white background; the projected data has a gray background.
- **IP Summary Table**
  The **IP Summary** table contains the following columns:
  – **Direction**: Traffic direction with respect to the interface, either inbound (In) or outbound (Out)
  – **Trend**: Icon that shows whether the traffic is increasing or decreasing
  – **Daily Change**: Change over a day that is calculated for the rate (bps), volume (Bytes), or utilization (%)
  – **Days Until Threshold**: Number of days until the traffic is expected to reach the known capacity of the interface
  – **Date of Threshold**: Calendar date on which the traffic is expected to reach the known capacity of the interface

Protocols or ToS Report Page

The **Protocol** and **ToS** report pages display stacked trend charts of the historical traffic for a maximum of 12 protocols or ToS. A stacked trendline shows the predicted future traffic for each protocol or ToS.

The report page displays the following views and tables.

- **Protocol Stacked Trend** or **ToS Stacked Trend** (In and Out versions) - Inbound and outbound protocol traffic on the selected interface
  – Rate presentation - Data rates, expressed in a scale that is appropriate for the highest-rate value in the view (Y-Axis).
  – Volume presentation - Data volume, expressed in a scale that is appropriate for the highest volume in the view (Y-Axis).
  – Utilization presentation - Utilization of capacity for the selected interface, which is measured in percentages (Y-Axis).
  The X-Axis shows date and time progression.
  The red Threshold line shows the outbound threshold level, which is set in the **Percentage** field of the **Trend Settings (Calculations)** dialog.
  The historical data has a white background; the projected data has a gray background.
- **Protocol** or **ToS Table** (In and Out versions)
  The tables contain the following columns:

- **Protocol Name**: (Protocol table only) Name of the protocol, which may consist of its keyword and encapsulation (transport protocol and port number).
- **Type of Service**: (ToS table only) ToS label, which may be a default label or a label your administrator has configured
- **Trend**: Icon that shows whether the traffic is increasing or decreasing
- **Growth %**: Percentage of traffic increase
- **Current %**: Percentage of the total traffic that the protocol or ToS is using at the end date of the historical analysis (the current date)
- **Projected %**: Percentage of the total traffic that the protocol or ToS is using at the end date of the traffic projection

The **Trend** and **Daily Change** columns are defined in the **IP Summary** table description.

Trend Settings for Capacity Planning Reports

When you open a **Capacity Planning** report, the **Trend Settings** controls are at the top of the page. **Display** options are on the left and **Calculations** options are on the right. Use these settings to control the data display and projection calculations in the report.

Trend Settings Display Options

Use the **Display** options to specify the historical time period and the projection time period displayed in the report. This setting does not determine the data that is used to make projection calculations.

Follow these steps:

1. In the **Historical Display** section, select a time period from the **Show actual data from** list.
   You can select a time period that is relative to today's date, such as **Last 7 days**, **Last 1 month**, **Last 2 months**, and **Last 3 months**. Alternatively, you can select **Custom** to specify a specific date.

   NOTE
   The report displays the data starting at this time but does not necessarily use this time as the starting point to calculate the projection. For example, if you want the projection to calculate from six months of historical data but want to display only seven days of that data. In this scenario, you would select **Last 7 days** in this menu.
2. Accept the default start date or specify a custom start date in any of the following ways:
   - Click the calendar icon and choose a date from the calendar pop-up.
   - Enter a date value in the **Start** box in the DD/MM/YYYY format.
   - Enter a custom start time in the box on the right. Use the 24-hour time format.
3. Accept the default time period or select a time period from the **Show projection for list** in the **Projection Display** section.
   You can select a time period relative to the **Historical Display** end date (such as 1 month) or you can select **Custom** to specify a date.
4. Accept the default end date or specify a custom end date for the projection in any of the following ways:
   - Click the calendar icon and choose a date from the calendar pop-up.
   - Enter a date value in the **End** box in the DD/MM/YYYY format.
   - Enter a custom end time in the box on the right. Use the 24-hour time format.
5. Click **Set**.
   The report views below the **Trend Settings** regenerate and reflect your changes.

   NOTE
   If you make further changes, click **Set** again.

Trend Settings Calculations Options

Use the **Calculations** options to specify the data, calculation method, and threshold for calculating the projection data. These time period settings do not affect the projection data displayed in the report.

Follow these steps:

1. In the **Projection Slope Calculation** section, use the **Use data from** list to select the historical time period you want use to calculate the projection data.
   You can select a time period that is relative to the current date, such as **Last 7 days**, **Last 1 month**, **Last 2 months**, or **Last months**. Alternatively, you can select **Custom** to select a specific start date.

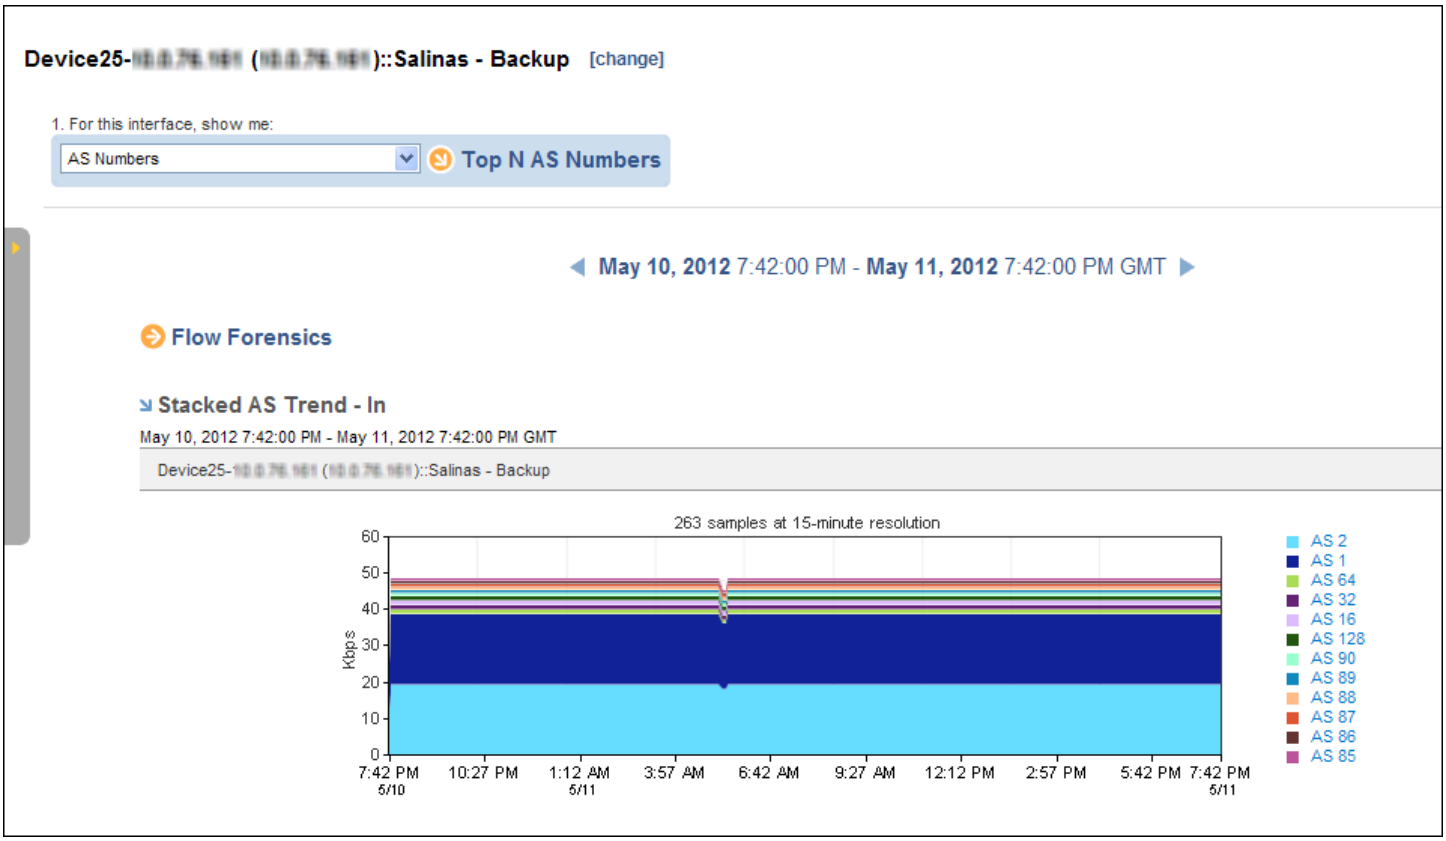
   NOTE
   The report uses this starting time for calculations but does not necessarily use this time to display historical data in the report. For example, if you want the projection to calculate from 6 months of historical data but want to display only seven days of that data. In this scenario, you select **Last 6 months** in this menu.
2. Use the **Time Filters** list to select a filter for restricting the data.

   NOTE
   User accounts that are assigned the Power User or the Administrator role can create custom time filters.
3. Accept the default start date or specify a custom start date in any of the following ways:
   - Click the calendar icon and choose a date from the calendar pop-up.
   - Enter a date value in the **Start** box in the DD/MM/YYYY format.
   - Enter a custom start time in the box on the right. Use 24-hour time format.
4. Select a calculation method from the **Calculate using** list and enter a value in the **Percentage** box.
   You can select **Daily Percentile** or **Daily Average**. To use the **Daily Percentile** method, enter a value in the **Percentage** field.
5. Enter a value in the **Percentage** box and select a measurement from the **Of** list in the **Threshold Line** section.
   The default measurement is **Actual Bandwidth**.
6. Click **Set**.
   The **Trend** report views regenerate and reflect your changes.

   NOTE
   If you make further changes, click **Set** again.

Top N Autonomous System Numbers Report

The **Top N AS** report provides AS (Autonomous System) Next Hop data. The Next Hop data provides high-level summaries of total volume and rate statistics for each AS number on a particular interface. This type of reporting is valuable for managing network routes efficiently. The information helps service providers control costs by comparing traffic usage through transit networks versus traffic through networks with peer agreements.



Follow these steps:

1. Display an interface report in either of the following ways:
   - Locate and click an interface on the **Interfaces** page.
   - Click an interface link in an existing view--for example, on the **Enterprise Overview** page.
2. Select **AS Numbers** as the report type at the top.
3. Make sure the **Top N AS Numbers** link appears next to the report type setting.
   The report page is updated.
4. (Optional) Change the data presentation type and the data measurement type by using the **Presentation** options.
   - **Stacked Trend Chart** of **Rate**, **Volume**, or **Utilization** data
   - **Trend Chart** of **Rate**, **Volume**, or **Utilization** data
   - **Pie Chart**
   - **Summary Table** of **Rate**, **Volume**, or **Utilization** data

   Each option displays views of data that is inbound (**In**) and outbound (**Out**) on the interface and data that is coming from (**From**) the previous hop and going to (**To**) the next hop.
5. (Optional) Change the reporting period: Open the **Timeframe** dialog by clicking the timeframe link.
   The reporting period is the most recent 24-hour period by default.

Work with Interface Reports and Data Views

Each **Interface** report includes specific view types that display the data for the selected interface or group of interfaces. When you open an **Interface** report, the data is displayed in the report views uses the default **Presentation** options and settings.

Change the Interface for a Report

If you click an interface link on the **Interface** page, you drill down to an interface report. You can use the **[change]** link to view a report for a different interface.

Follow these steps:

1. Click the **[change**] option next to the interface name at the top of the report.
   The **Interface Index** opens.
2. Locate the interface that interests you in either of the following ways:
   – Expand the parent router and select an interface from the list of details.
   – Use the **Search** field to locate an interface.
3. Click the link in the **Interface** column.
   The **Interface Index** closes. You return to the **Interfaces** report page, which displays data for the selected interface.

Set the Time Period for a Report

The **Enterprise Overview** displays data for the previous 24-hour period. **Interface** reports also display data for the previous 24 hours by default. You can change the reporting period by using the time period controls at the top of the report page.

When you view **Interfaces** report pages, you can change the time period for the displayed data. For example, if you notice an issue in a 1-day report, you might want to change the time period to be the last seven days. Expanding the time period can reveal whether the issue occurs daily.

The current time period is shown at the top of most **Interfaces** report pages. These interface reports reflect 1-minute resolution data. For a 24-hour time period, the report shows the data points in the previous 24 hours, including the final full 1-minute data point. For example, if you generate or refresh the report on May 11, 2012 at 16:11 GMT, the time period for the report is May 10, 2012 16:10:00 through May 11, 2012 16:10:00.

The time period link is on all top-level **Interfaces** report pages except **Growth Report** and **Capacity Planning**, which have other time options. In addition, if you drill down to a report page to investigate details, the drilldown report page does not include a time period link.

- The **Growth Report** uses a 6-weeks or 6-month time period.
- The **Capacity Planning** report uses two different time periods for calculations and reporting data.

> **NOTE**
> Each user account has an assigned time zone, which determines how time is labeled in reports. For example, if a user who has a time zone of Central Standard Time (CST) views a report with data for 8:00 to 9:00 A.M., the data for 8:00 to 9:00 A.M. CST appears in the report. An Administrator can modify this setting for the user account.

The time period at the top of the report page is a link to the options you use to change the reporting time period.

Scroll the Time Period Interval

You can keep the current time span length for the interface report (such as 24 hours, one week, one month, or custom), but can shift the time period backward or forward. For example, you can scroll the time period back to show data for the week before the week now on display.

To scroll the time period back by one increment, click

the **Back** icon. 

To scroll the time period forward by one increment, click the **Forward** icon.

Specify a Built-In Time Period

You can specify a different time period for **Interface** reports by using one of the built-in options. The built-in time periods let you quickly expand or restrict the reporting time period relative to the current date and time. For example, you can extend the time period to find out if an observed event happens as part of a repeated pattern.

Follow these steps:

1. Click the time period link at the top of the **Interfaces** report page.
   The **Timeframe** options expand.
2. Select a time period for the report from the **Time Period** list.
   The time period is relative to the current date and time. A **Daily** time period produces a report about the 24 hours that precede the current date and time. A **Weekly** time period produces a report the week that precedes the current date and time.
3. Select a time filter from the **Time Filter** list.The available time filters are set up by the Administrator for DX NetOps. Time filters limit the time span for reported data, for example to include only regular business hours.Select **Time Filter: None** when not using a time filter.
4. Click **Set**.The active time period displayed in the **Timeframe** pane changes to give you a preview of the data that is included. The preview helps you verify that you are capturing any specific trends that are of interest.
5. Click **Close** at the top-right corner of the pane.The options are hidden.

Specify a Custom Start and End Time

You can customize the time period for the current report. You can select a specific start date, end date, and time of day for collecting report data, such as the following times:

- Specific hour.
- Specific day.
- Unique week time period by specifying a day within the Saturday-to-Sunday 7-day time period that you want.
- Unique one-month time period by selecting the month start and end dates.
- Unique quarter-year time period by selecting the quarter start and end dates.
- Unique one-year time period by selecting the year start and end dates.

Follow these steps:

1. Click the time period at the top of the report page.
   The **Timeframe** pane expands to display the time period options.
2. Select **Custom** from the **Time Period** list. The end date and time are set to the current time by default.
3. Select **Time Filter: None** when not using a time filter.
4. Select the start date from the **Start Date** day, month, and year lists, or click the calendar icon to locate and select a date.
5. Select a start time from the **Start Date** Hour and Minute lists. The current time (hour:minutes) is selected by default. Hours are shown in 24-hour format.
6. Select an end date from the **End Date** day, month, and year lists, or click the calendar icon to locate and select a date.
7. Select an end time from the **End Date** Hour and Minute lists or click the calendar icon to locate and select a date. The current time (hour:minutes) is selected by default.
8. Click **Set**.
   The preview in the **Timeframe** pane updates to reflect your changes. This view helps you make sure you are capturing the needed data.
9. Click **Close** at the top-right corner of the pane.

The options are hidden.

Set the Presentation Options

You can use the **Presentation** menu to choose the way data is presented in a drilldown **Interface** report.

To open the **Presentation** menu, click the gray bar on the left edge of the page.

The **Presentation** menu opens and gives you access to the options that are appropriate for the selected report type. The display options in the top part of the menu may include one of the following report types:

- Trend Chart
- Pie Chart
- Summary Table

The selected presentation format determines which metric options are available. For example, if you choose a trend chart as the display type, you can choose rate, volume, or utilization for the metric.

Keep Settings at Top: As you scroll up or down the page, the **Presentation** menu moves to remain in view by default. To position the **Presentation** menu in a fixed position at the top of the page, select **Keep Settings at Top**.

Set the Display Option

Display options determine the presentation of the data in the report views. Each **Interface** report has a default display type, but you can use the **Presentation** options to change the display type. The display types that are available depend on the report.

- Stacked Trend Charts
  - Top N Protocols
  - Top N ToS
- Trend Charts
  - Top N Protocols
  - Top N ToS
  - Top N Hosts
  - Top N Conversations
  - Flows
- Mixed Chart
  - Overview
  - Capacity Planning
- Mixed Trend

  - Overview
- Pie Charts
  - Overview
  - Top N Protocols
  - Top N ToS
  - Top N Hosts
  - Top N Conversations
- Summary Tables
  - Top N Protocols
  - Top N ToS
  - Top N Hosts
  - Top N Conversations
- Growth
  - Growth Report
- Calendar Charts
  - Utilization

Set the Rate, Volume, Utilization Option

Interface reports support the display of rate, volume, and utilization metrics. The metrics available for the report depend upon the type of data included in the report, and sometimes the selected display option.

Show Other Option

When you display a Top-N report for protocols, hosts, and conversations, you can include data for items other than the top ten. To include the other items, select the **Show Other** check box in the **Presentation** options. The data for the other protocols, hosts, or conversations is then rolled up and assigned a label of **Other**.

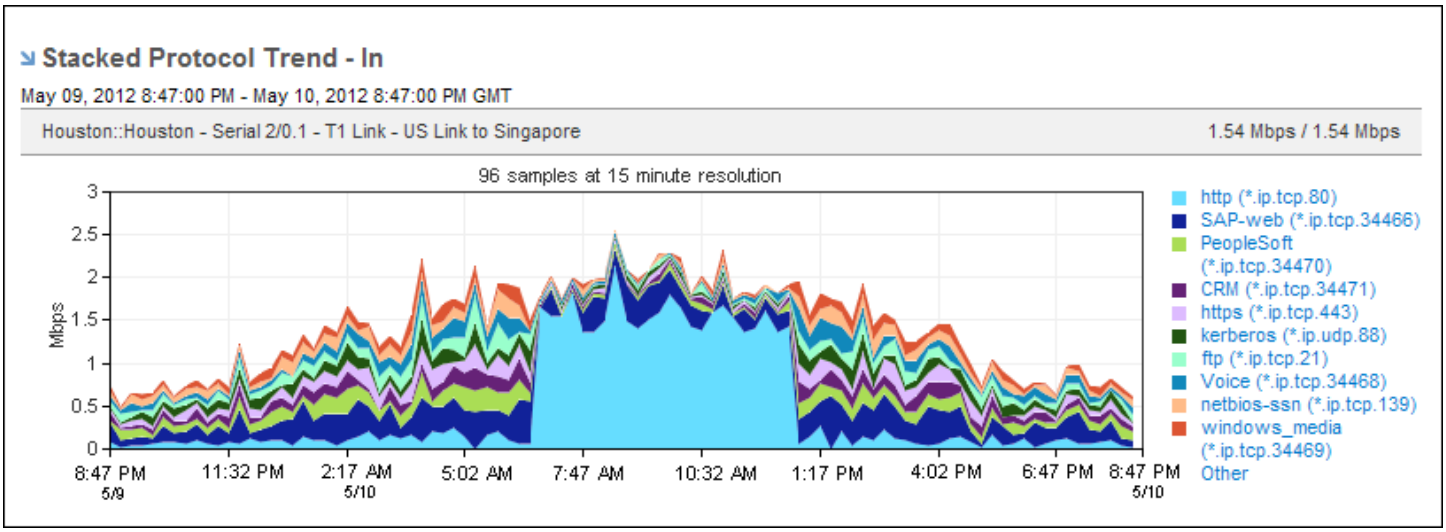
Analyze Interface Report Data

The Interface reports included in DX NetOps include numerous view types that are designed to help you identify and analyze your network traffic. These real-time report views provide the previous hour of performance data by default in a 1-minute granularity view. By using this data, operations center personnel can determine possible causes for new issues and can troubleshoot the issues quickly.

Protocol Trend Views

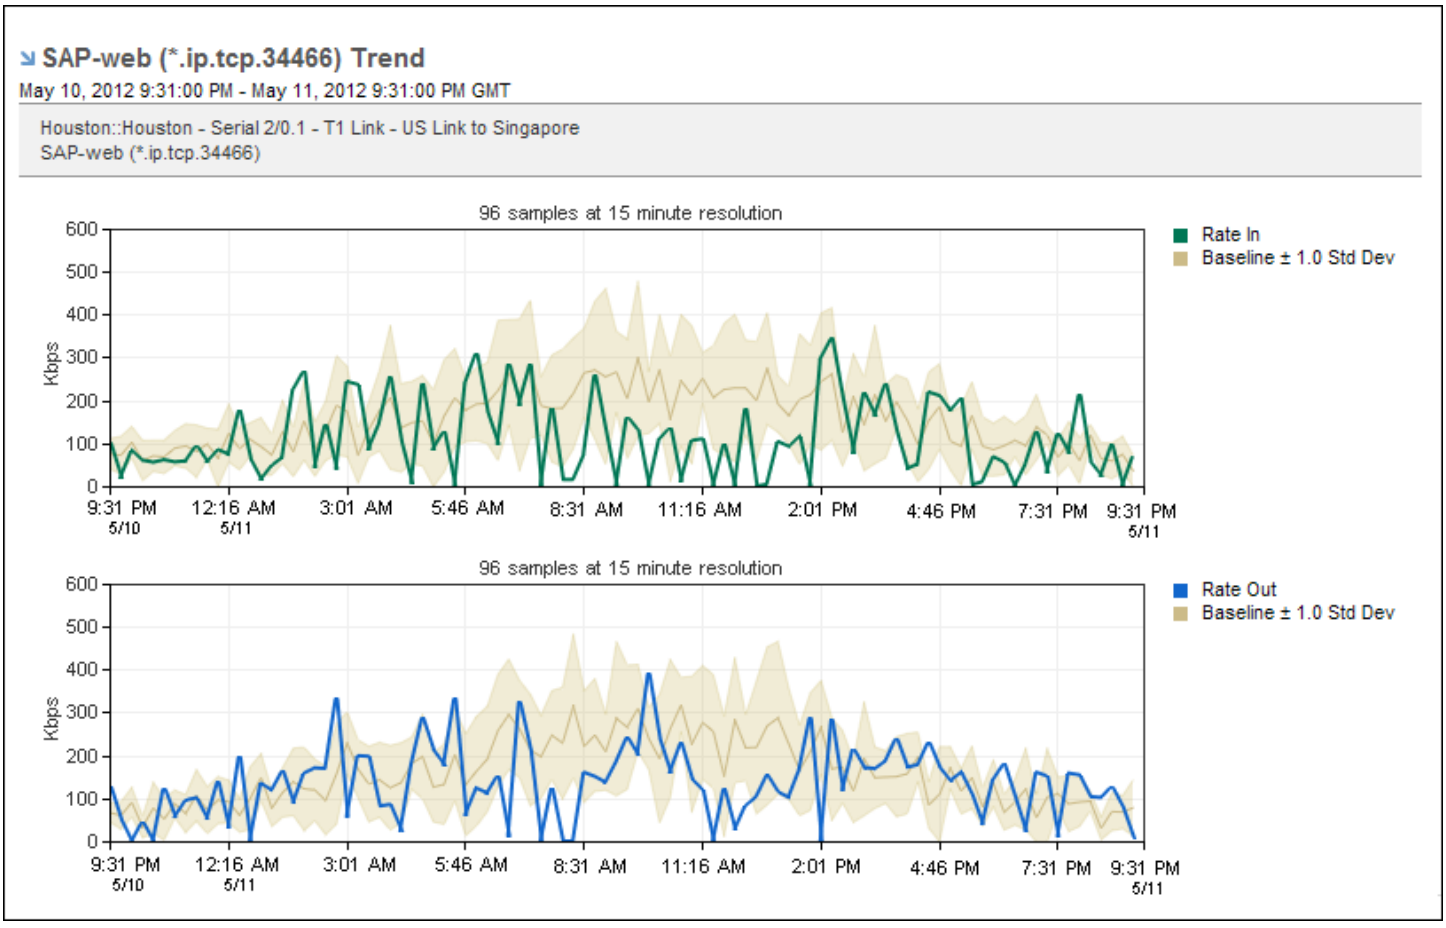
The data in **Stacked Protocol Trend** views helps you determine which type of traffic is consuming bandwidth on the interface. These views also show the way bandwidth consumption changed over the selected time period.

Click the name of a protocol in the legend to display a protocol report with interface data specific to that protocol.



The **Stacked Protocol Trend** views display data for the top ten protocols on the interface. To display data for protocols other than the top ten protocols, select **Show Other** in the **Presentation** menu. Data for protocols other than the top ten is rolled up and assigned a label of **Other**.

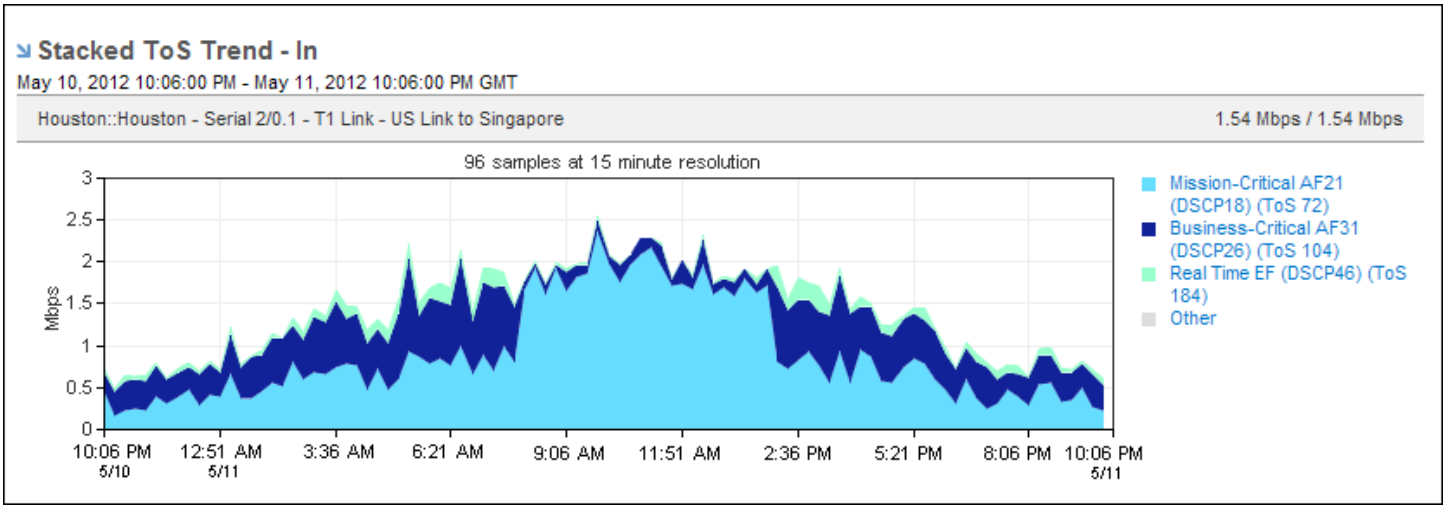
Change the presentation display to a trend chart to display each protocol as an individual trend plot. A trend chart is useful for comparing the protocol data patterns against a baseline.



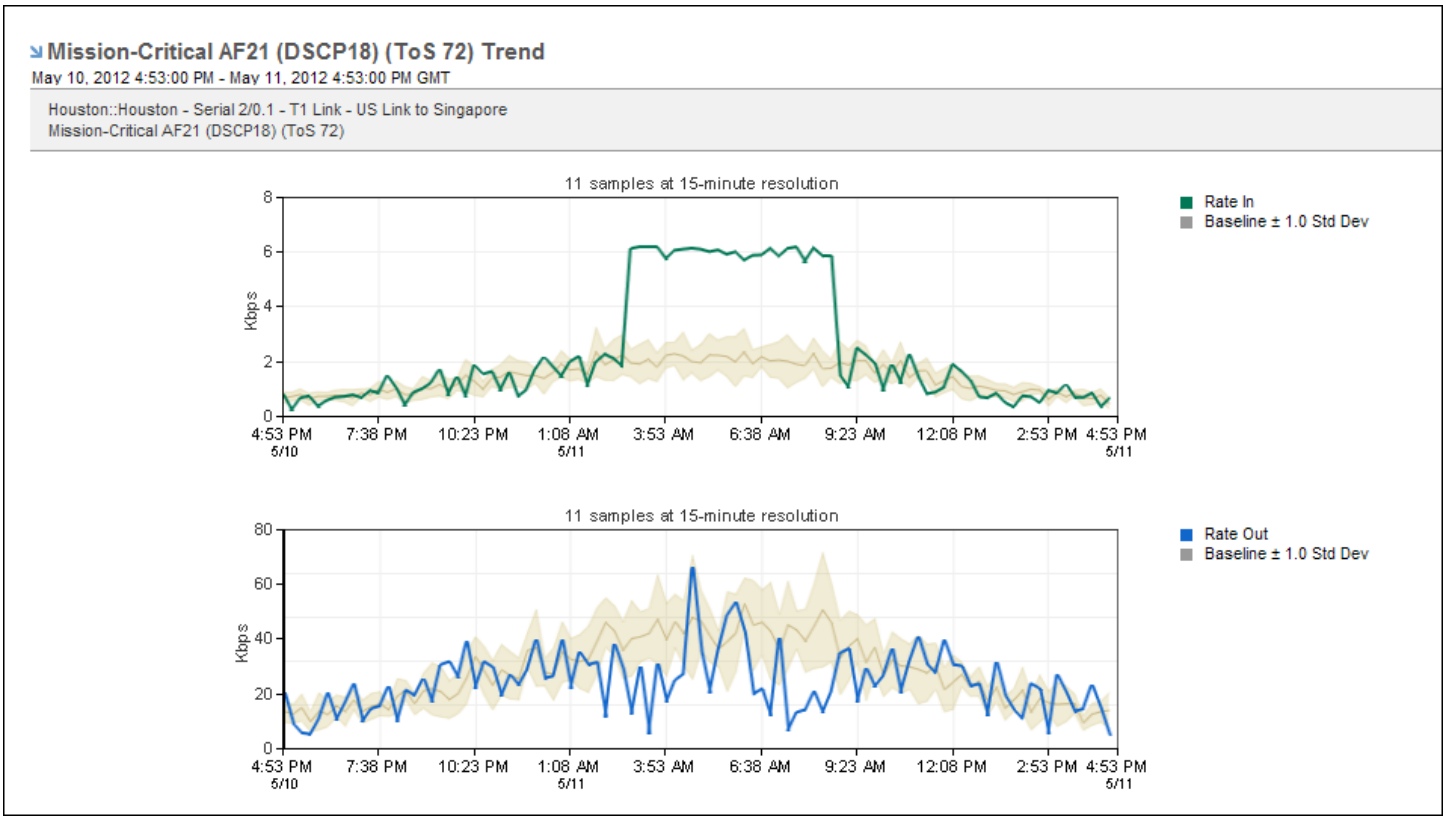
ToS Trend Views

The data in **Stacked ToS Trend** views helps you determine the amount of traffic on the interface by ToS designation and its change over the selected time period.

Click the name of a ToS in the legend to display the ToS report with interface data specific to that ToS.

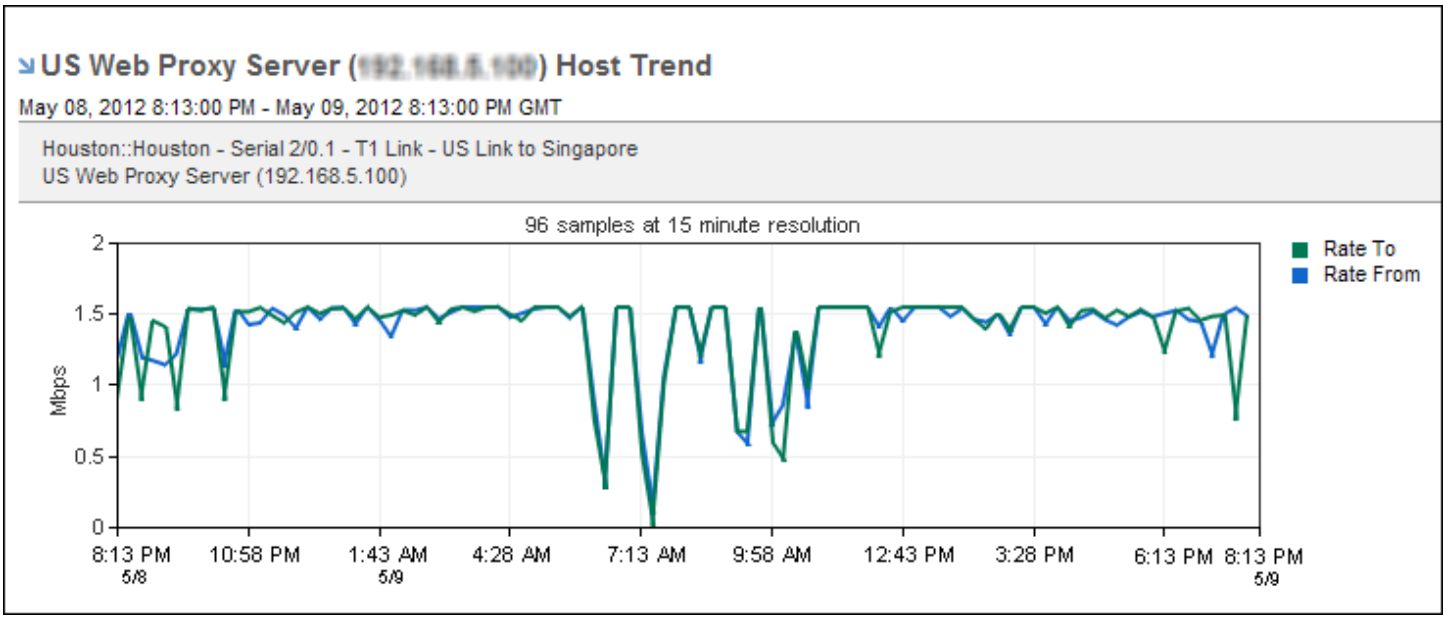


Change the presentation display to a trend chart to display each ToS as an individual trend plot. A trend chart is useful for comparing the ToS data patterns against a baseline.



Host Trend Views

Host data views are displayed as summary views (pie chart or summary table) by default. You can view individual trend plots for each of the hosts on the selected interface. To view individual trend plots, select the **Trend Chart** display type in the **Presentation** options for the **Top-N Hosts** report.

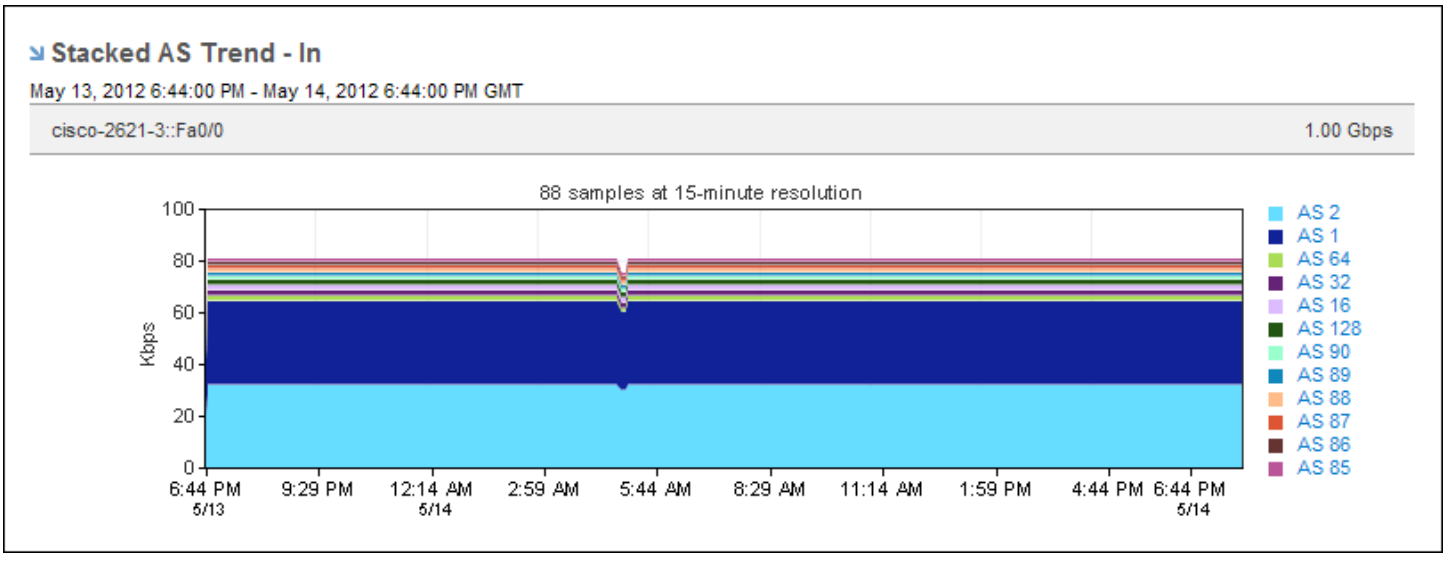


Host trend charts plot a line for each direction of the host traffic on the interface.

AS Number Trend Views

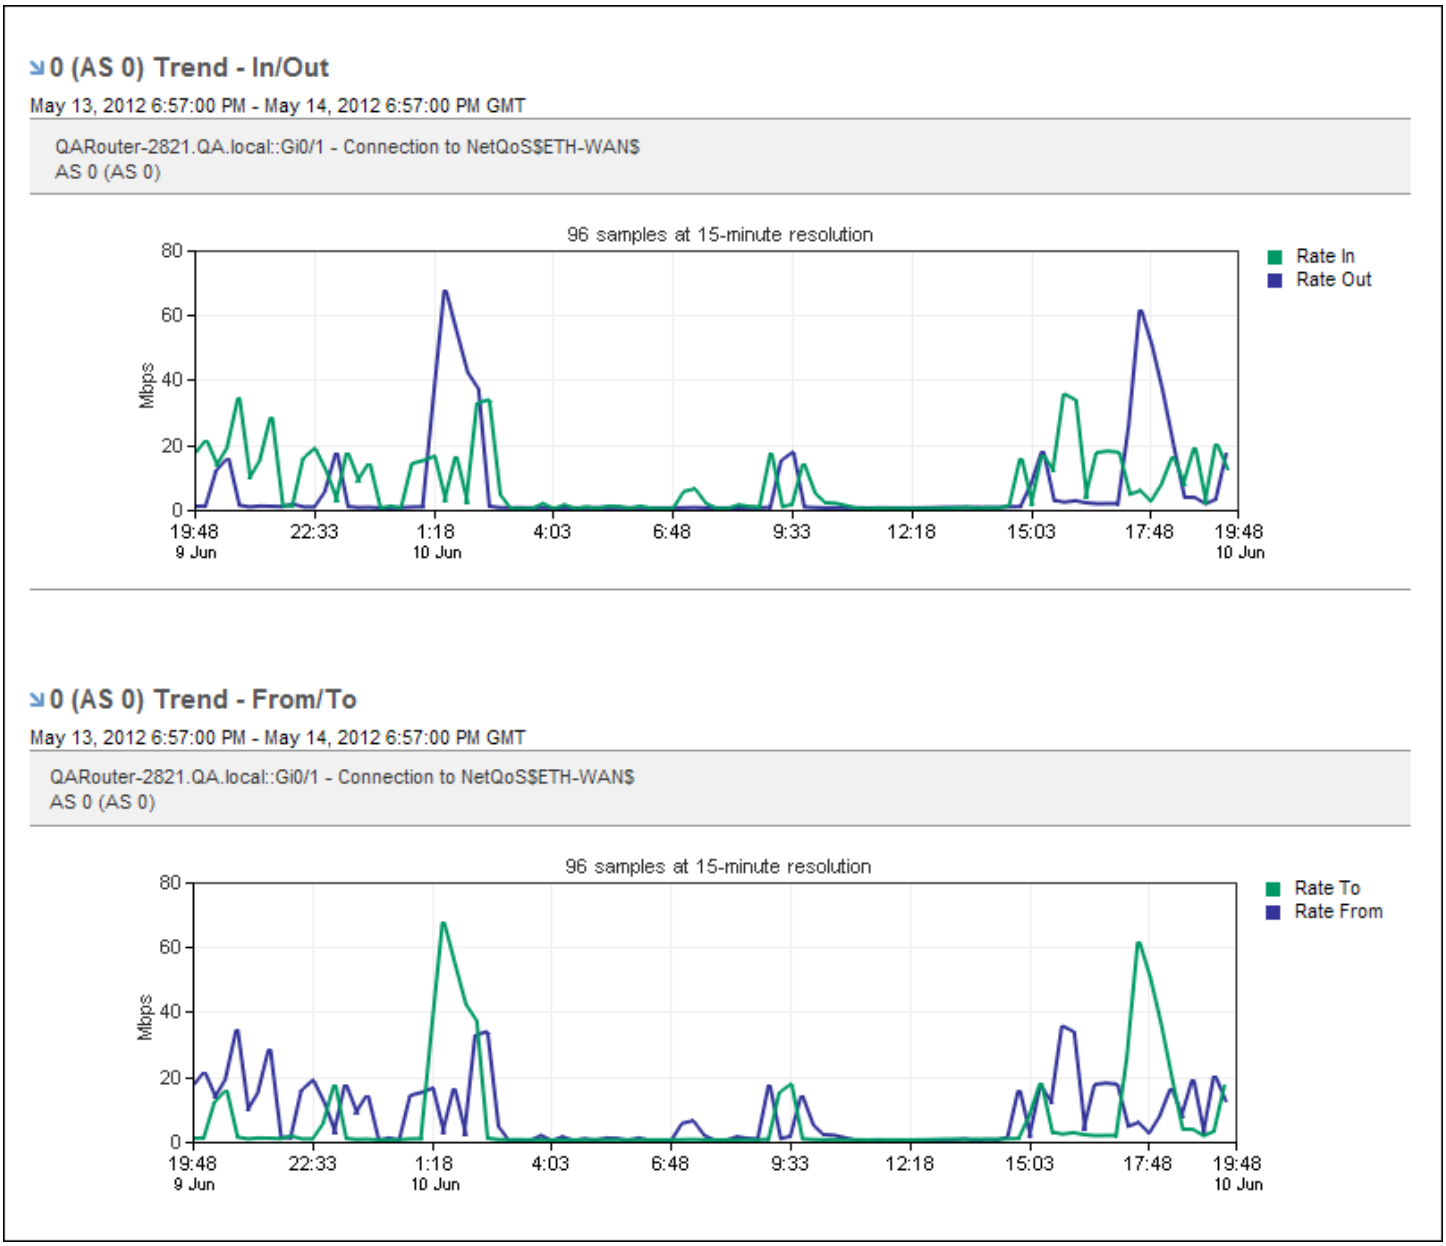
The data in the **Stacked AS Trend** views helps you determine the usage of numbered routes in a network. Use this AS (Autonomous System) Next Hop data to troubleshoot issues.

Click the name of an AS number in the legend to display an AS Next Hop Summary Table specific to that AS number.



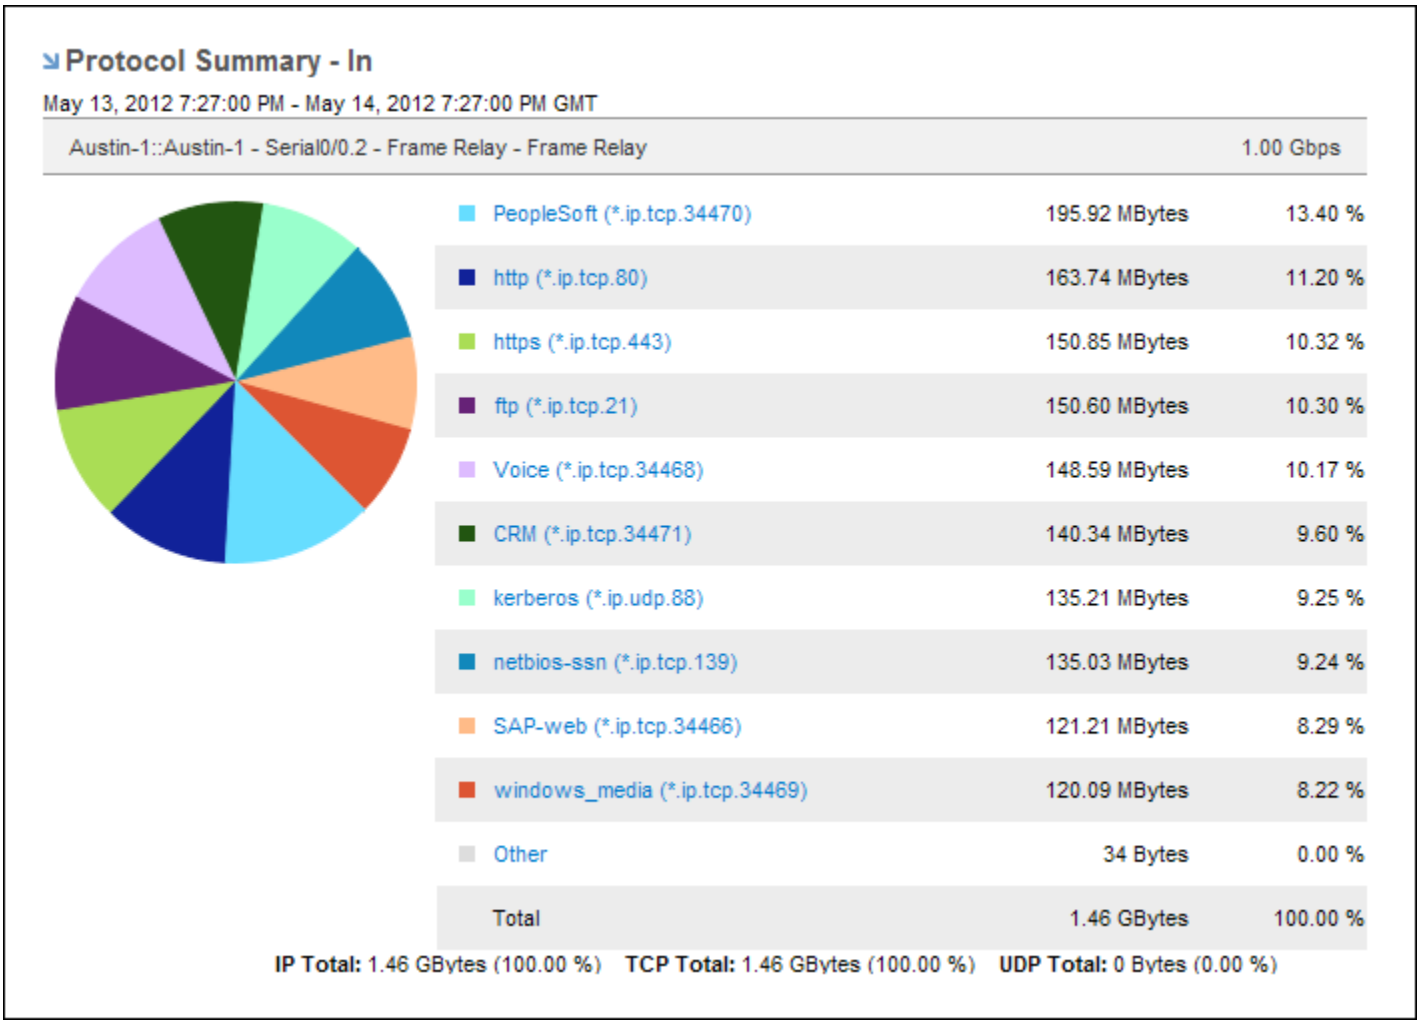
The **Stacked AS Trend** views display data for the top 10 AS numbers on the interface. To display data for AS numbers other than the top ten, select **Show Other** in the **Presentation** menu. Data for AS numbers other than the top ten is rolled up and assigned a label of **Other**.

Change the presentation display to a trend chart to display each AS number as an individual trend plot. A trend chart is useful for comparing the inbound and outbound AS number data patterns.



Protocol Summary Views

The **Protocol Summary** views can help you determine which protocols produce the most traffic over the interface during the selected time period. These views are an overview and provide a good starting point for troubleshooting issues.



Protocol Summary views are included on Interface pages for specific interfaces when the selected report type is **Overview** or **Protocols**, the protocol range is **Top N Protocols**, and the **Presentation** mode is **Pie Chart**.

You also can include **Protocol Summary** views in Custom Reports.

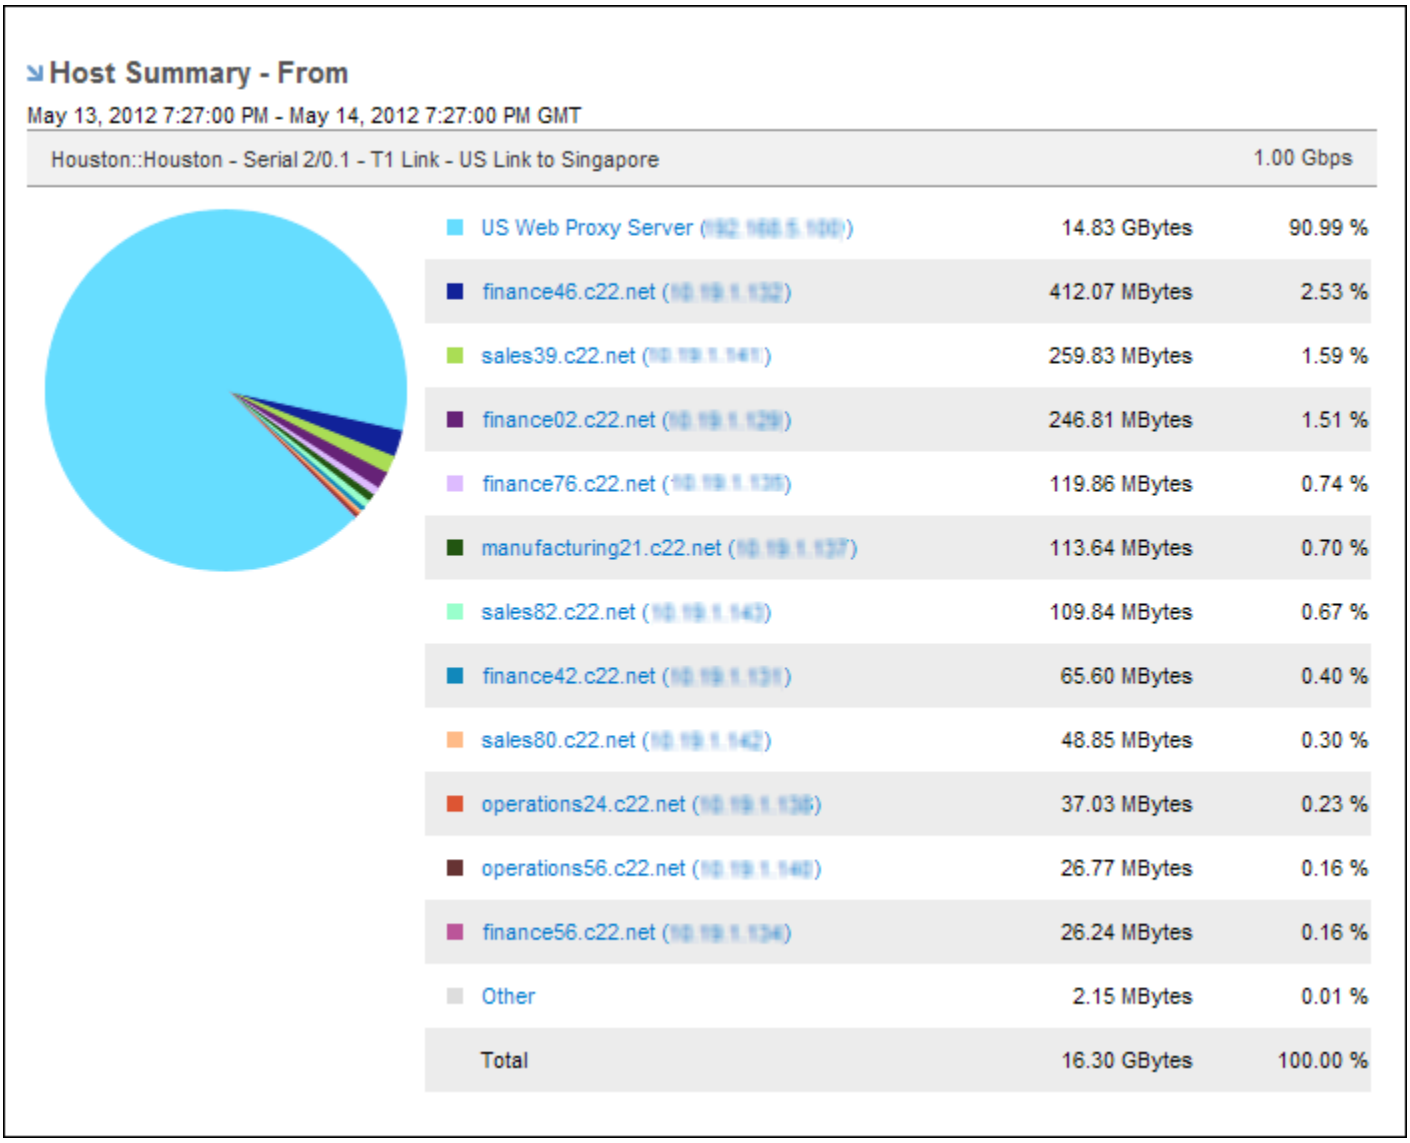
You can display **Top N Protocols** information on **Interface** pages in the following presentation modes:

- Pie charts of protocol summary data on **Overview** reports (inbound and outbound traffic) and **Protocols** report pages (inbound, outbound, and all traffic).
- Stacked trend charts of rate, volume, or utilization data on **Overview** and **Protocols** reports.
- Trend charts of rate, volume, or utilization data on **Protocols** reports.
- Summary tables of rate, volume, or utilization data on **Protocols** reports.

Host Summary Views

The **Host Summary** views can help determine which hosts have the highest traffic volume over the interface during a time period. Access to detailed host information helps pinpoint traffic sources and quickly determine whether traffic is normal. You may be able to resolve a problem quickly because you know which hosts are responsible.

Click the name of a host in a view to display the **Hosts** report with interface data that is specific to the host.



Host Summary views are included on Interface pages for specific interfaces when the selected report type is **Overview** or **Hosts**, the host range is **Top N Hosts**, and the **Presentation** mode is **Pie Chart** or **Mixed Chart**.

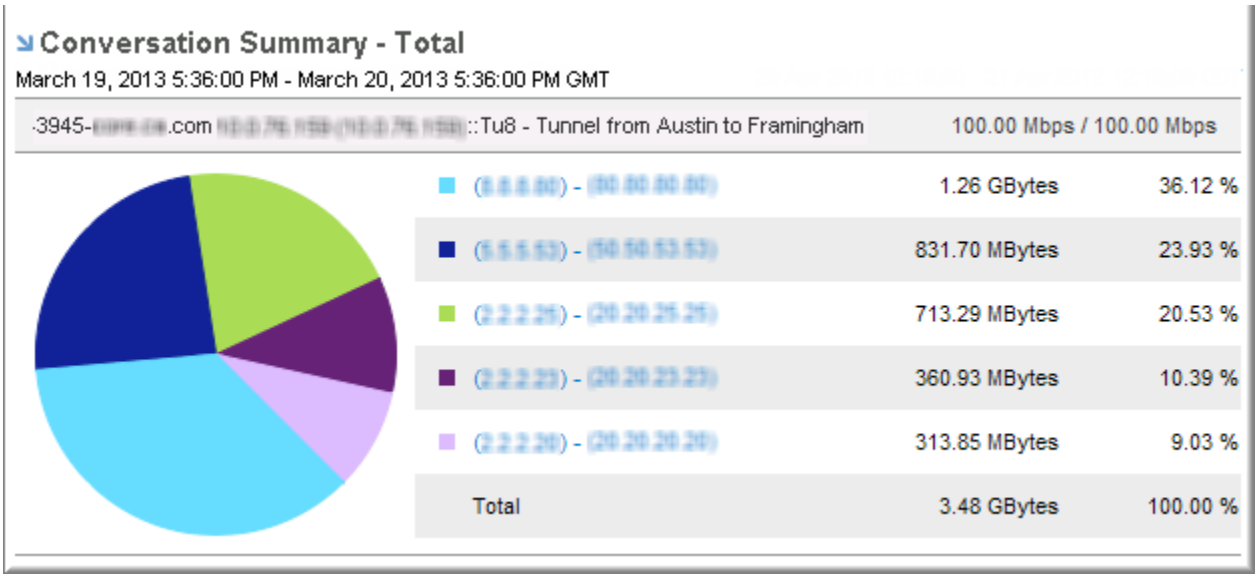
You also can include **Host Summary** views in Custom Reports.

You can display **Top N Hosts** information on **Interface** pages in the following presentation modes:

- Pie charts of host summary data on **Overview** reports (traffic from the host and to the host) and **Hosts** report pages (traffic from the host, traffic to the host, and all traffic).
- Trend charts of rate, volume, or utilization host data on **Overview** or **Hosts** reports.
- Summary tables of rate, volume, or utilization host data on **Hosts** reports. The data in a summary table provides additional data for the hosts, including **Maximum To/From** and **Average To/From** values.

Conversation Summary Views

The data displayed in the **Conversation Summary** views is designed to help you determine the conversations with the most volume of traffic over the interface during the selected time period. Use this information to troubleshoot issues and determine if there is a saturation issue or an area of poor performance.

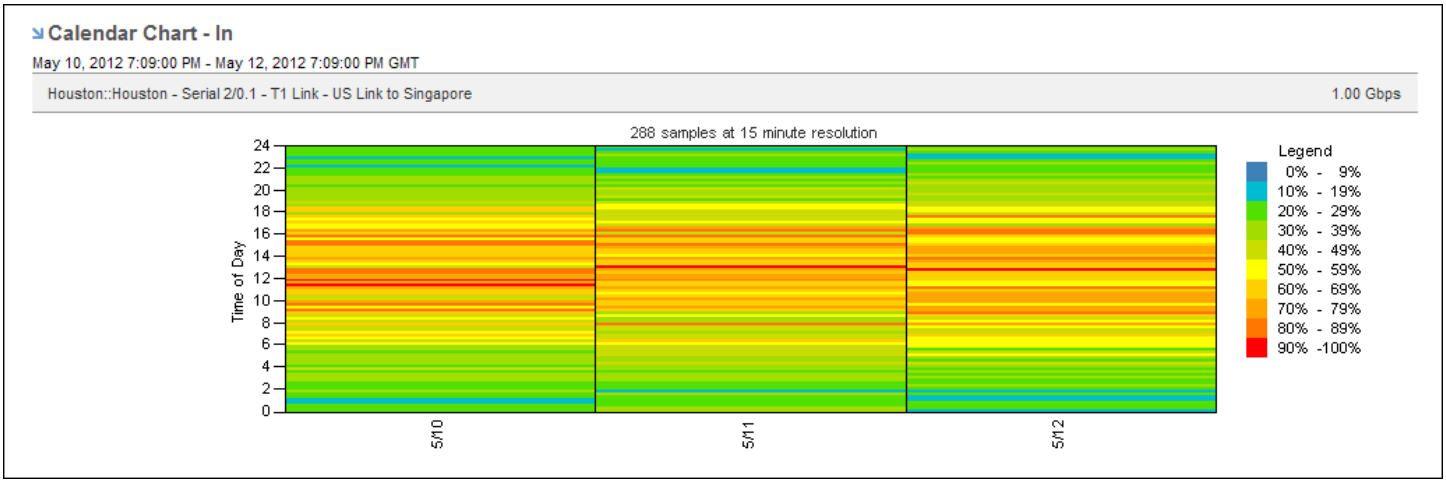


Click the name of a conversation in the view to display the **Conversations** report with interface data specific to that conversation.

These views display data for the top ten conversations on the interface by default. To display data for other conversations, select **Show Other** in the **Presentation** menu. Data for conversations other than the top ten is rolled up and assigned a label of **Other**.

Utilization Calendar Charts

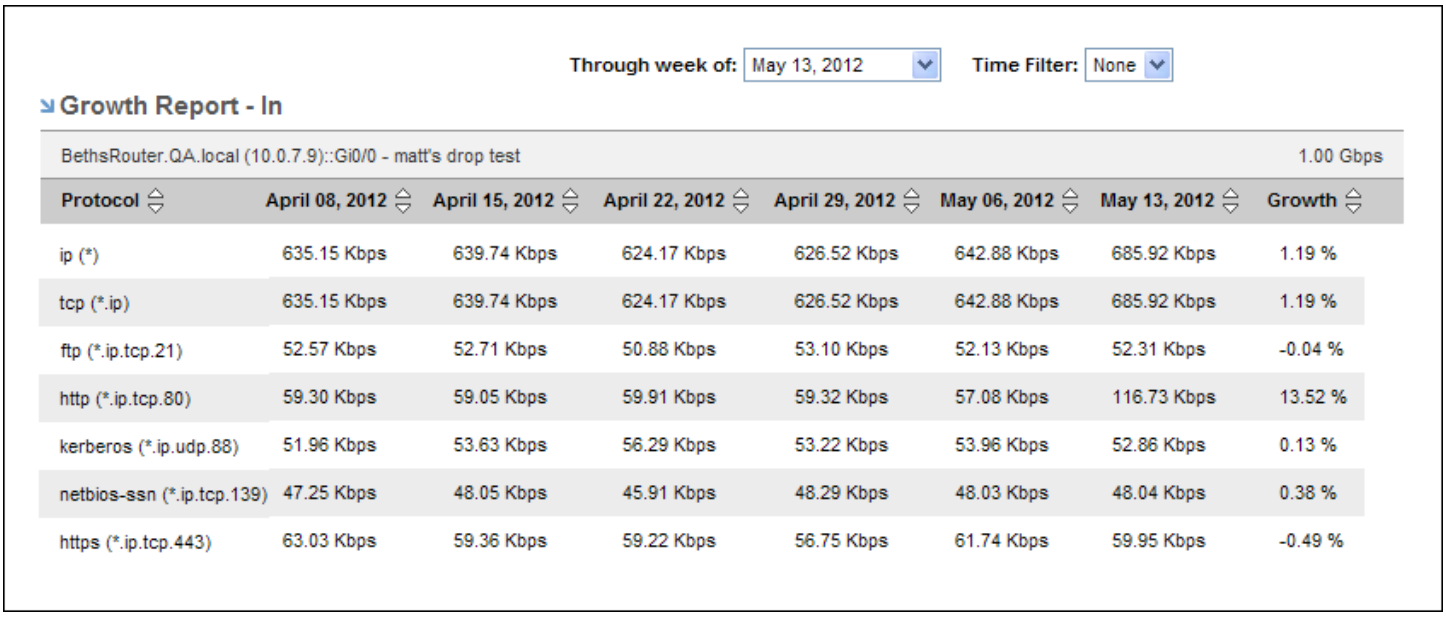
The **Calendar Chart** helps you detect utilization issues on an interface, determine when the problem started, and pinpoint the time of day the problem occurs. In the example chart, you can see that the utilization level for this interface is often at or above 70 percent. The high utilization level means that the performance of the applications sending data over this link is likely to be degraded at those times. Calendar Charts can also reveal patterns from day to day and from week to week so that you can determine whether a problem regularly occurs at a particular time.



Growth Reports

The **Growth Report** includes a specialized summary table. The table helps to identify applications that consume increasing amounts of bandwidth over time. You also can use the table data to determine whether future growth requires

additional capacity. Display data for the previous six weeks or the previous six months and apply any available time filters. You can choose the units to display (such as bits per second) and whether to include inbound traffic, outbound traffic, or all traffic.



Through week of: May 13, 2012 Time Filter: None

Growth Report - In

BethsRouter.QA.local (10.0.7.9)::Gi0/0 - matt's drop test 1.00 Gbps

Protocol	April 08, 2012	April 15, 2012	April 22, 2012	April 29, 2012	May 06, 2012	May 13, 2012	Growth
ip (*)	635.15 Kbps	639.74 Kbps	624.17 Kbps	626.52 Kbps	642.88 Kbps	685.92 Kbps	1.19 %
tcp (*.ip)	635.15 Kbps	639.74 Kbps	624.17 Kbps	626.52 Kbps	642.88 Kbps	685.92 Kbps	1.19 %
ftp (*.ip.tcp.21)	52.57 Kbps	52.71 Kbps	50.88 Kbps	53.10 Kbps	52.13 Kbps	52.31 Kbps	-0.04 %
http (*.ip.tcp.80)	59.30 Kbps	59.05 Kbps	59.91 Kbps	59.32 Kbps	57.08 Kbps	116.73 Kbps	13.52 %
kerberos (*.ip.udp.88)	51.96 Kbps	53.63 Kbps	56.29 Kbps	53.22 Kbps	53.96 Kbps	52.86 Kbps	0.13 %
netbios-ssn (*.ip.tcp.139)	47.25 Kbps	48.05 Kbps	45.91 Kbps	48.29 Kbps	48.03 Kbps	48.04 Kbps	0.38 %
https (*.ip.tcp.443)	63.03 Kbps	59.36 Kbps	59.22 Kbps	56.75 Kbps	61.74 Kbps	59.95 Kbps	-0.49 %

By default, the table is sorted by the total rate of the most recent week. You can sort according to any column by clicking a column heading. You also can change from descending to ascending order by clicking the triangle next to the column heading.

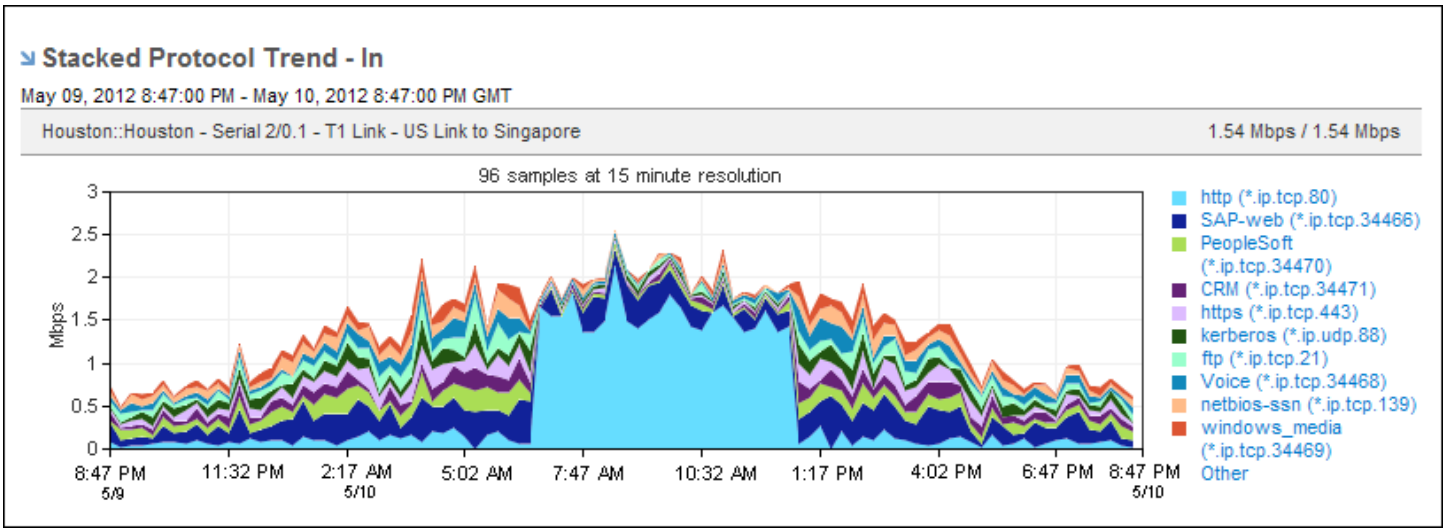
Display Charts and Graphs

When you view information about a specific interface, host, conversation, or protocol, several types of report presentations are available for displaying the data such as charts, graphs, and tables. Each report type is suited to particular data types and situations.

Stacked Trend Charts

The stacked trend plots for Protocol and ToS summary data are excellent for establishing the types of applications that use the most bandwidth for a particular interface. Stacked trend plots also help you compare the use of each application with others.

The legend on the right of the stacked trend chart lists the protocols or ToS values so you can see the amount of data that is transferred for each category. In the example, notice the surge of inbound web (http) traffic.



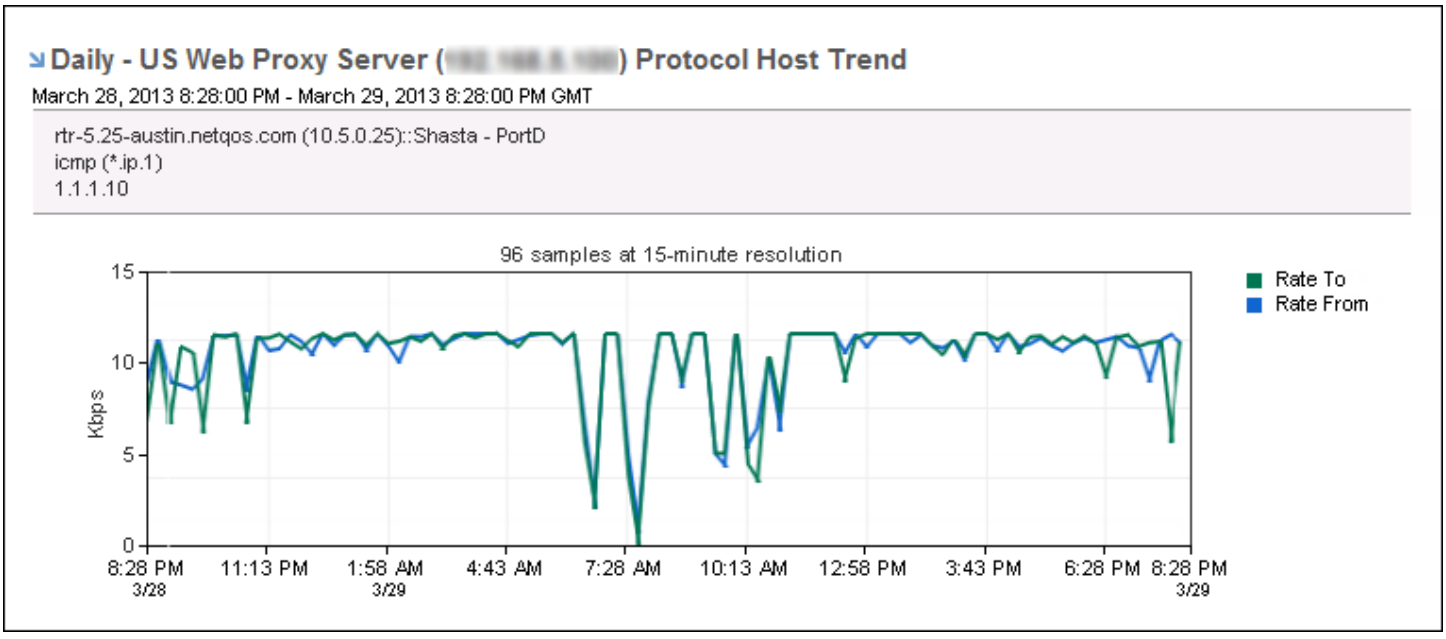
The example report duration is daily. You might want to change the duration to monthly to determine whether the surge is a one-time occurrence or occurs regularly at a particular time. By default, views and reports show the most recent 24 hours of data. To change the time period or apply a time filter, use the **Timeframe** options.

Trend Charts

The trend chart presentation format is available for interface data that is filtered by Protocol, ToS, Hosts, and Conversations. When you choose the trend chart presentation for a **Protocol Summary**, trend plots are shown for each of the top protocols.

Use trend charts to see traffic spikes and dips and to determine whether those patterns are consistent with your expectations for the interface. Click the name of a protocol, host, or conversation to view a more detailed trend chart.

By default, views and reports show the most recent 24 hours of data. To change the time period or apply a time filter, use the **Timeframe** options.



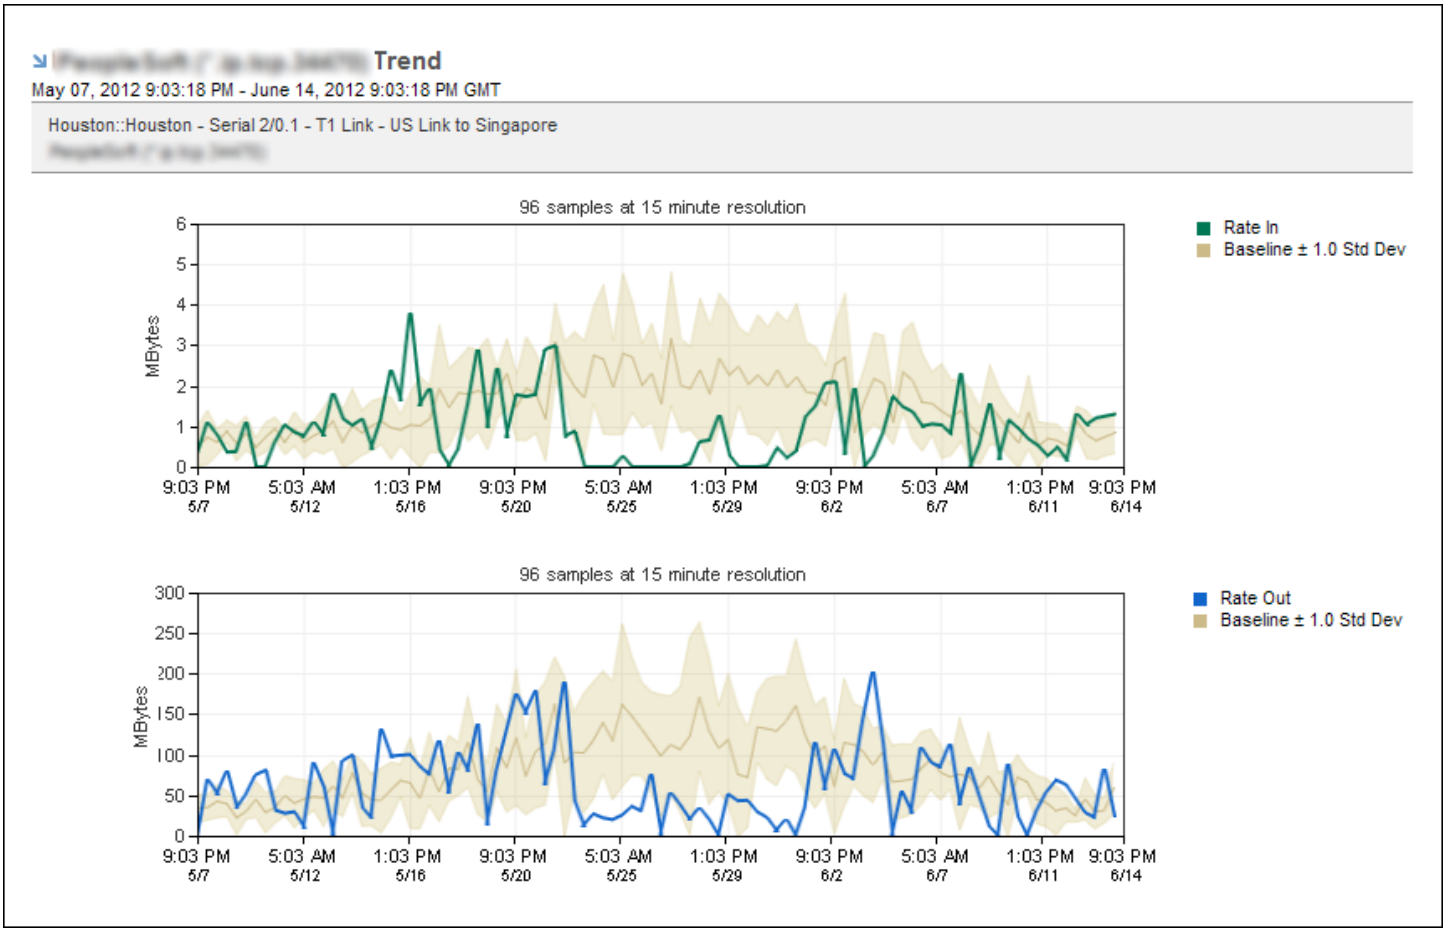
The preceding example shows a trend chart on the **Interface** page with the following settings:

- Report type: Protocols
- Protocol range: Specific protocol
- Report subtype: Hosts
- Hosts range: Top N Hosts
- Presentation type: Trend Chart
- Measurement type: Rate

Baselines

Protocol data views also support baselines for trend plots of some protocol, ToS and flow views. To display baselines, choose from the following settings:

- Protocols report type, Top N Protocols range, Trend Chart presentation type, Show Baselines option selected.
- ToS report type, Top N ToS range, Trend Chart presentation type, Show Baselines option selected.
- Flows report type, Show Baselines option selected.

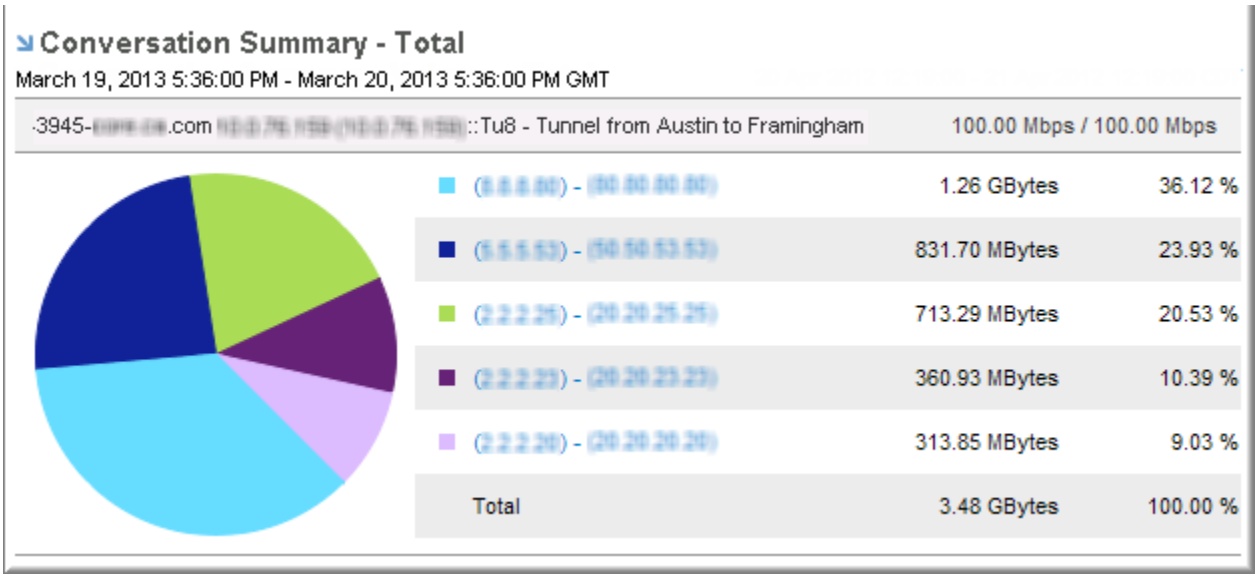


The preceding example shows trend plots on the **Interfaces** page with the following settings:

- Report type: Protocols
- Protocol range: Top N Protocols or a specific protocol with Overview as the report subtype
- Presentation type: Trend Chart or Mixed Chart
- Measurement type: Rate
- Show Baselines: Selected

Pie Charts

Pie charts provide a visual comparison of the protocols, ToS, hosts, or conversations on the interface, making it easy to see which ones use the most or least amount of bandwidth. Pie charts also include a listing of numeric data.

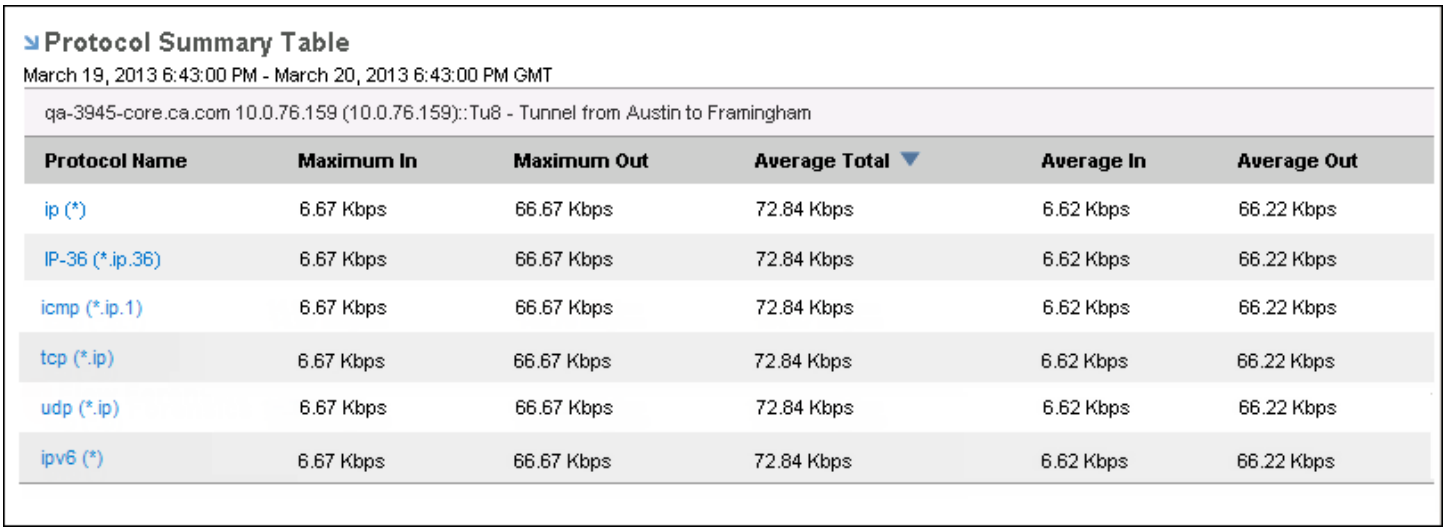


By default, views and reports show the most recent 24 hours of data. To change the time period or apply a time filter, use the Timeframe options.

Summary Tables

A summary table is a good presentation choice when you want Protocol or ToS summary data that can be easily sorted and saved to CSV format for use in a spreadsheet program. Summary tables are available for the following **Top N** report types on **Interface** pages: **Protocols**, **ToS**, **Hosts**, **Conversations**, and **AS Numbers**.

In the following example, the **Protocol Summary Table** lists protocols from the highest to lowest flow volume. You can change the sort order of the list by clicking a column name. Click again to change the order from ascending to descending. The sort column is marked with an arrow.

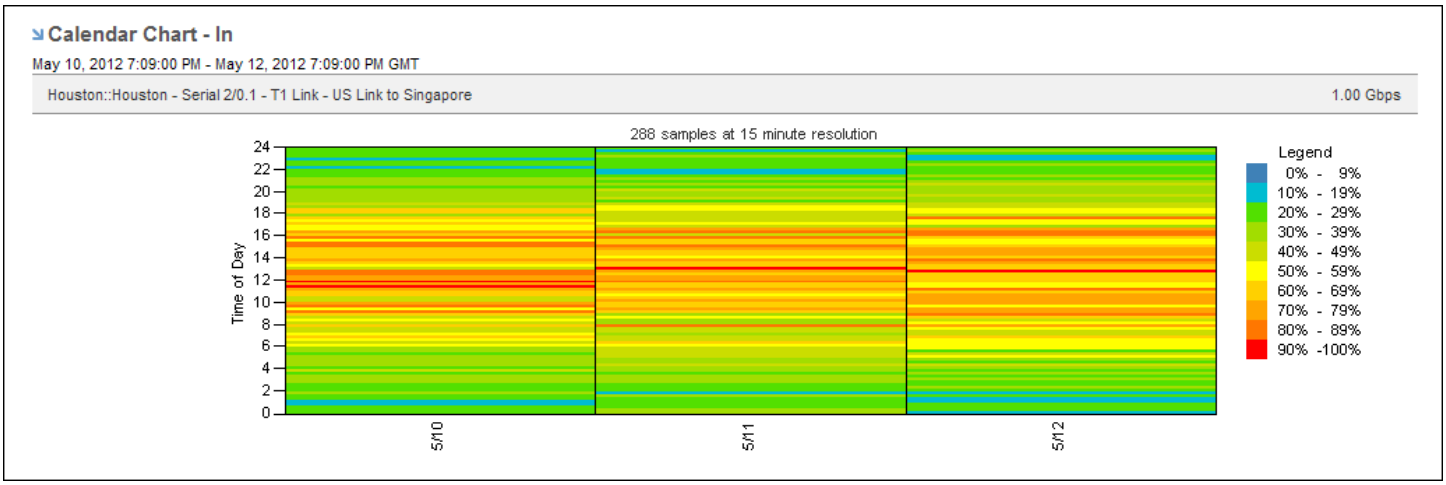


Protocol Name	Maximum In	Maximum Out	Average Total ▼	Average In	Average Out
ip (*)	6.67 Kbps	66.67 Kbps	72.84 Kbps	6.62 Kbps	66.22 Kbps
IP-36 (*.ip.36)	6.67 Kbps	66.67 Kbps	72.84 Kbps	6.62 Kbps	66.22 Kbps
icmp (*.ip.1)	6.67 Kbps	66.67 Kbps	72.84 Kbps	6.62 Kbps	66.22 Kbps
tcp (*.ip)	6.67 Kbps	66.67 Kbps	72.84 Kbps	6.62 Kbps	66.22 Kbps
udp (*.ip)	6.67 Kbps	66.67 Kbps	72.84 Kbps	6.62 Kbps	66.22 Kbps
ipv6 (*)	6.67 Kbps	66.67 Kbps	72.84 Kbps	6.62 Kbps	66.22 Kbps

Calendar Charts

When you choose to view Utilization summary data for an interface, the data is displayed as a calendar chart. You can show inbound, outbound, or total traffic in the chart, choose the month to display, and apply any available time filters.

Excessive utilization of an interface is shown as a block of red extending across the column for the day and rows indicating the time of day. Low utilization is shown in green. Varying shades of each color show the severity degree. The color for each severity range corresponds to a range of utilization values (calculated as percentages of total capacity). The legend explains how the colors are used in the calendar chart.



The calendar chart helps you detect utilization problems with the selected interface, determine when the problem started, and pinpoint the time of day the problem occurs. In the example, the interface utilization level is often at or above 70 percent. The high utilization level means that the performance of the applications sending data over this link is likely to be degraded at those times. Calendar charts can also reveal patterns from day to day and week to week so that you can determine whether a problem occurs regularly at a particular time.

Mixed Display Options

The **Interface Overview** report has additional presentation display types to accommodate a wider array of data--protocol, ToS, host, and conversation data. By using one of the mixed presentation types, you can view the report with the most useful presentation for each report view.

Mixed Chart

When the **Mixed Chart** is selected in the **Presentation** options, the report page displays both stacked trend and pie charts. Protocol and ToS data is presented using stacked trend charts. Host and conversation data is presented using pie charts.

Mixed Trend

When the **Mixed Trend** is selected in the **Presentation** options, the report page displays both stacked trend and trend charts. Protocol and ToS data is presented using stacked trend charts. Host and conversation data is presented using standard trend charts.

Custom Reports

Custom Reports can answer specific technical and business questions in your environment, such as:

- Which applications are used most heavily in the regional offices?
- What is the total volume of traffic for global operations?
- Does the new data center have the capacity to handle additional servers?

To get started, select **Custom Reporting** from the NFA console menu.

The Create New Report Page

The **Create New Report** page lists the existing reports. If you have the required permissions, the page contains functions for creating, managing, and running Custom Reports. You can generate updated versions of reports, add new report definitions, and change report settings.

The **Create New Report** page includes the following functions:

Saved Report Folders:

- **New**: Create a report folder.
- **Rename**: Change the name of a report folder.

Reports:

- **New**: Create a Custom Report definition.
- **Run**: Regenerate the data for one or more Custom Reports.
- **Move to Folder**: Change the parent folder for one or more report definitions.
- **Cancel**: Stop one or more reports from running.

Report Types and Usage

Custom Reports can show a variety of data, including the following types of information:

- *Interface:* View the total volume of traffic that is generated across particular interfaces.
- *Protocol:* Discover which applications are used by various business groups.
- *ToS:* View the distribution of applications by type of service (ToS).
- *Host:* View the activity or usage levels for applications on a server.
- *Conversation:* View the top conversations across interfaces or for a particular protocol.

Report on Network Utilization

Create a custom interface report to select the included interfaces so that you can report on network traffic by:

- Location, such as global, regional, country, state, and individual offices
- Business unit or department, such as Accounting, Marketing, and Sales
- Specific interface groups, such as EMEA, WAN, ATM interfaces, and Ethernet interfaces

Report on Application Distribution

Create a custom protocol report to focus on the applications and protocols in use in your organization. You can generate protocol distribution reports to:

- Show the applications that are used in each region.
- Understand which applications are used the most frequently.
- Determine whether any applications can be removed from the network or de-prioritized.
- Verify that rogue applications are not active on the network.

Report on ToS Distribution

Create a custom ToS report to identify the ToS categories for the most heavily utilized applications in your environment. You can generate ToS reports to:

- Understand which ToS is most widely used in your environment.
- Show the ToS categories in use in each regional location.

Report on Server Activity

Create a custom host report to identify the amount of traffic sent to and from particular servers in your organization. You can generate host reports to:

- Verify that application servers are utilized properly.
- Determine whether a server is vulnerable to any security risks.
- Determine whether a specific data center can handle additional servers.

Set Up Custom Reports

Depending on your user account settings, you may be able to perform a number of actions for Custom Reports:

- View existing reports that have been run.
- Run existing report definitions on demand.
- Set up a schedule for running and sending reports by email (typically for Administrators and Power Users only).
- Create a Custom Report by stepping through the Custom Report wizard.
- Create a Custom Report by using an existing report as a starting point.
- Make changes to the following parts of an existing report definition:
  - Report name, parent folder, and description
  - Report summary types: interface, ToS, protocol, host, and conversation
  - Presentation views used for the summary data
  - Reporting period, data resolution, and time filter
  - Report recurrence schedule and email recipients
- Set the following elements to be included or excluded as report data sources:
  - Interfaces or interface groups
  - Protocols and ToS values
  - A host and subnet
  - A conversation
  - A subnet mask for aggregating data

Scheduled Reports

You can schedule a custom report over a particular duration of time. These duration reports are the only reports which can be scheduled to repeat. You can email a report on a scheduled basis, but the same report is emailed every time unless someone manually runs the report for a different time period.

A scheduled report begins the next scheduled report at the `scheduled_next` value in the database. This value is visible as the **Next run** in the **Reporting Period** when editing a Custom Report. When the report starts this value is set as the **End Time** of the report.

The `scheduled_last` value in the database is updated with this value. This time is the last time the report, which is currently running, was scheduled to run.

Using the report time zone, this time is converted to Unix Time and all further calculations are done in Unix Time. A scheduled report will display the results in GMT regardless of the time zone used to specify the start time for the report.

If a time filter is specified it will alter the data which is displayed but not the duration of the report. The time filter allows the user to create a report that shows data only for a time period of interest. That portion of the reporting period which falls outside the time period of interest will have no data displayed.

A scheduled report can be saved or saved and queued. If the report is saved, it first runs at the next scheduled time for the report. If the report is saved and queued, the first run starts immediately and covers the duration specified in the report, with the end time the point in time when the report was queued, not the scheduled time of the report.

Adding information about the duration, time filters, interfaces, protocols, etc. into the description of the report will help a person reviewing the report understand the data being presented.

NOTE

More information:

Create a Custom Report

Use the Custom Report wizard to create a Custom Report step by step. The wizard guides you to select many options, such as the specific items on which to report, the presentation views, the reporting period, and, optionally, a schedule for running the report automatically.

Follow these steps:

1. Select **Custom Reporting** from the NFA console menu.
2. Click **Create New Report**.
   The **Custom Report** wizard opens and shows the options **Create a new custom report** and **Copy an existing report**.
3. Click **Create a new custom report**, and click **Next**.
   Alternatively, you can select **Copy an existing report** and modify an existing report.
   The **Select Interfaces** page opens.
4. Click one of the following options to select interfaces or interface groups for the report:
   - **Add Interface Filter**: Select one or more individual interfaces from the **Interface Index**.
   - **Add Interface Group Filter**: Select one or more interface groups from the **Interface Group Selection** list.

   The selected interfaces are added to the interface list.
5. Accept the default value or set the Inclusion value for each interface or interface group: **Include** sets the program to use report data from the interface or group. **Exclude** sets the program to bypass data from the interface or group.
6. Click **Next**.
   The **Specify Filters & Rollup** page opens.
7. (Optional) Specify the settings on the **Specify Filters & Rollup** page: Specify filters for gathering or excluding report data:
   - **Add Protocol Filter**: Select individual protocols from the **Protocol Index**.
   - **Add Protocol Group Filter**: Select protocol groups from the **Protocol Group Index**.
   - **Add ToS Filter**: Select individual ToS values from the **ToS Index**.
   - **Add ToS Group Filter**: Select ToS groups from the **ToS Group Index**.
   - **Add Host Filter**: Specify a host IP address and mask.
   - **Add Conversation Filter**: Identify the IP addresses and mask for each party in the conversation pair.
8. Accept the default value or set the Inclusion value for each filter you specified:
   - **Include**: For each filter listed, use only the data of the listed type. For example, use data from the listed protocol group, but not from other protocol groups.
   - **Exclude**: For each filter listed, do not use the data of the listed type. For example, do not use data from the listed protocol group, but do use data from other protocol groups.

9. Select at least one type of summary data to make available for display in the report. Your selections make various report sections available in a later wizard page, but do not require you to include them. Select one or more check boxes in the **Summary Types** section:
   - **Interface Summary**: For example, view the volume of traffic for particular interfaces.
   - **ToS Summary**: For example, view the distribution of applications by type of service (ToS).
   - **Protocol Summary**: For example, view which applications are used by each business group.
   - **Host Summary**: For example, view the application activity or use levels for a server.
   - **Conversation Summary**: For example, view a list of the top conversations across interfaces for a particular protocol.
10. (Optional) Specify a mask for rolling up data by subnet, if you specified a host or conversation filter: Click the **Rollup data using this mask** check box, then select a mask from the list.
11. Click **Next**.
    The **Configure Layout** page opens.
12. (Optional) Add one or more report sections to the report page layout:
    - Select a value from the **Summary Type** list.

      NOTE
      The list of available summary types is limited to the summary types you specified on the previous page.
    - Select a value from the **Presentation** list and the **Measurements** list (if you selected the presentation type as **Table**, **Trend Chart**, or **Stacked Trend Chart**).
    - Click **Add**.

    The new section is added at the end of the report.
13. (Optional) Delete one or more report sections from the report page layout by clicking the X icon next to the section name.
14. (Optional) Re-order the report sections in any of the following ways:
    - Drag and drop the section.
    - Click the Top icon to move the section to the beginning of the report.
    - Delete sections and add them again in the correct order.
15. Click **Next**.
    The **Specify Schedule** page opens.
16. Select the type of reporting period from the **Period** list in the **Specify Schedule** page:
    - **Duration**: Limits the reporting period to an amount of time, ending at the time the report runs. Enter the number of time units in the **Last** box.
      Select a unit of time from the list (days, weeks, months, or years).
      You can set up a schedule for a Duration report or you can run the report on demand.
    - Start and end: Specify a **Start** date and **End** date either by using the calendar icons or by selecting hour and time values from the lists. Hour values are expressed in 24-hour format.
17. Enter the number of time units in the **Resolution** box. Select a value from the list for **Start** and **End**.
    A Start-and-End report runs on demand and cannot be set up to run on a schedule.
18. Accept the default setting or enter the number of time units in the **Resolution** box. Select a unit of time from the list (minutes, hours, days, weeks, months, or years).
19. (Optional) Select a time filter from the list, if your Administrator has created a time filter that is appropriate for your report.

    TIP
    The time filter information does not display on the report as part of the date and time. Give the report a name and description that reflects the selected time filter.
20. (Optional) Select the **Schedule** check box and specify the following options:

- **Schedule**: Select the type from the **Schedule** list (Daily, Weekly, Monthly, Quarterly, Yearly).
- **Daily**: Select the day or days of the week, time of day, and time zone for report generation.
- **Weekly**: Select the day of the week, time of day, and time zone for report generation.
- **Monthly**: Select either the date or the week in the month and day of the week. Select the time of day, and time zone for report generation.
- **Quarterly**: Select a month that ends the first reporting quarter, time of day, and time zone.
- **Yearly**: Select a month that ends the first reporting year, time of day, and time zone.

21. (Optional) Enter the email addresses of all the report recipients in the format *name@domain*. Separate multiple addresses with a comma or semi-colon.

    NOTE
    The options in the **Recurrence** section are available only if you select **duration** as the reporting period type.

22. Click **Next**.
    The **Enter Name** page opens.
23. Identify the report and its location and click **Next**:
    - **Folder**: Accept the default folder or select a different folder to contain the new report.
    - **Name**: Give the new report a name, which appears in the **Reports** list.
    - **Description**: (Optional) Add a description to help identify the report. For example, use the description to identify scheduled reports and to indicate distinguishing features of Duration reports. Include any time filter information, for ease of identification.

    The **Summary & Submit** page opens.
24. Review the information in the **Report Definition Summary**.
    - **Save**: Save the report definition and return to the **Custom Reporting** page. The report will run on the schedule selected.
    - **Save and Queue Report**: Queue the report and return to the **Custom Reporting** page. The report will run now for the data available for the duration selected.

Review Settings for Custom Reports

You can review the **Report Definition Summary** of a Custom Report to ensure that the report definitions are appropriate. From the **Report Definition Summary** page, you can access the **Custom Report Wizard** pages and can modify the report.

Follow these steps:

1. Click the name of the report you want to modify in the **Reports** list on the main **Custom Reporting** page.

   NOTE
   Select a report that is not currently in execution--a report that does not have the status **Running**.
2. Display the **Report Definition Summary** page of the **Custom Report** wizard, if it is not already open. The steps for displaying the **Report Definition Summary** are dependent on the status of the report you select:
   - **Complete**: The report runs and opens. Click the **Edit** button on the left side of the **Report Settings** section to display the **Report Definition Summary**.
   - **Defined**: The **Report Definition Summary** opens automatically.
3. Review the current report settings and click the name of the section you want to modify.
   For example, click **Interface Filters**, **Protocol Filters**, or **ToS Filters** to add new filters or change existing filter settings.
4. The associated page opens, giving you access to the options that you can change.
5. When the changes are complete, click **Queue Report** to regenerate the report with the new settings.
   The **Reports** list opens and the modified report shows a status of **Queued**. When the report has been regenerated and is ready to be viewed, the status displays as **Complete**.
   When you modify a scheduled report, it is queued to be generated at the next scheduled runtime.

Customize Which Interfaces Are in Custom Reports

Before you specify other settings for a new Custom Report, you must add at least one interface or interface group. The **Select Interfaces** page provides options for specifying individual interfaces and interface groups, which you can use to create useful reports quickly.

Select Interfaces and Interface Groups

You can select interfaces from the **Interface Index** or you can select interfaces by group. When you select an interface group, all interfaces in the group and any child groups are included in the report.

> **NOTE**
> Custom groups are defined and managed in CA Performance Center. If DX NetOps is not registered as a data source for CA Performance Center, the only available interface groups are the default groups that are defined by type.

Follow these steps:

1. Select **Custom Reporting** from the NFA console menu if the **Custom Reporting** page is not already open.
2. Put the report that you want to change in editable mode: Click the name of the report. If the report has been run previously, it will run again. In this case, click **Edit** in the **Report Settings** section at the top of the report page.
   The **Report Definition Summary** page opens, which contains links to the Custom Report wizard pages.

   > **NOTE**
   > You can edit a report that appears in the **Reports** list as long as it has a status other than **Running**.
3. (Optional) Click **Add Interface Filter** and select one or more interfaces to include in the report. You can add individual interfaces, interface groups, or both. You must specify some kind of interface filter, however.
   The **Select Interfaces** page of the Custom Report wizard opens.
   - Expand the interface list for the desired router, then select the check box for each interface you want to include in the report.
   - Click **Submit** to add all selected interfaces to the list and close the **Interface Index**.
4. (Optional) Click **Add Interface Group Filter** and select one or more interface groups to include in the report. You can add individual interfaces, interface groups, or both. You must specify some kind of interface filter, however.
   The **Interface Group Selection** page opens.
   - Select check boxes for the groups to add from the **Interface Group Selection** list.
   - Click the blue arrow near the upper right corner to jump to the bottom of the list, then click **Save**.

   You return to the **Select Interfaces** page of the Custom Report wizard. The **Select Interfaces** list now includes the interfaces and interface groups you selected.
5. Check the list of interfaces and interface groups and their Inclusion values.

   > **NOTE**
   > Items that have a value of **Include** are in the report. You can temporarily remove an interface or interface group from the report by setting the **Inclusion** value for that item to **Exclude**.
6. Click **Save Changes**.
   Your changes are saved and you return to the **Report Definition Summary**.

   > **NOTE**
   > To save the report definition, you must have at least one interface set to be included.
7. (Optional) Return to the report list by clicking one of these buttons:
   - **Return to Listing**: Return to the **Custom Reporting** page without queuing the report to run.
   - **Queue Report**: Queue the current report to run and return to the **Custom Reporting** page.

Delete Interfaces and Interface Groups

You can delete filters from Custom Report definitions as needed. When you delete interfaces or interface groups from a report definition, those interfaces are not included in the report data.

Follow these steps:

1. Select **Custom Reporting** from the NFA console menu if the **Custom Reporting** page is not already open.
2. Put the report in editable mode: Click the name of the report. If the report has been run previously, it runs again. In this case, click **Edit** in the **Report Settings** section at the top of the report page.
   The **Report Definition Summary** page opens, which contains links to the Custom Report wizard pages.
3. Click **Interface Filters** to open the **Select Interfaces** page of the Custom Report wizard.
4. Select the check box in the interface list next to each interface you want to delete.
5. Click the **Remove Selected Filters** icon that is located above the check boxes.
   
6. Click **Save Changes**.
   Your changes are saved and you return to the **Report Definition Summary**.

   NOTE
   If you select a scheduled Custom Report that uses a deleted interface or interface group, the "Unknown interface group" message is displayed. If all the associated interfaces or interface groups are deleted, the report will not run.
7. (Optional) Click one of the following buttons to return to the report list:
   - **Return to Listing**: Return to the report list on the **Custom Reporting** page.
   - **Queue Report**: Queue the report to run and return to the **Custom Reporting** page.

Exclude Interfaces or Interface Groups Temporarily

To remove interfaces from a report temporarily, set the Include value for the interfaces to Exclude. For example, suppose that part of your network is temporarily offline and the offline interfaces distort the report data. You can exclude the interfaces, then change the value back to ‘Include’ when the interfaces are online again.

Follow these steps:

1. Select **Custom Reporting** from the NFA console menu if the **Custom Reporting** page is not already open.
2. Put the report in editable mode: Click the name of the report. If the report has been run previously, it runs again. In this case, click **Edit** in the **Report Settings** section at the top of the report page.
   The **Report Definition Summary** page opens, which contains links to the Custom Report wizard pages.
3. Click **Interface Filters** to open the **Select Interfaces** page of the Custom Report wizard.
4. In the **Select Interfaces** list, set the **Inclusion** option to **Exclude**.
5. Click **Save Changes**.
   Your changes are saved and you return to the **Report Definition Summary**.
6. (Optional) Check your changes in the summary, then click one of the following buttons to return to the report list:
   - **Return to Listing**: Return to the report list on the **Custom Reporting** page.
   - **Queue Report**: Queue the report to run and return to the **Custom Reporting** page.

Specify Custom Report Filters

Use Custom Report filters to determine the type of data to include, such as protocol, ToS, host, and conversation data.

You can use various filters to limit the data in a Custom Report, but not all filter combinations are valid. For example, you can filter report data to show either hosts or conversations, but not both.

Valid filter combinations are shown in the list that follows. The filter or combination of filters you apply to a report determine which summary types are available, which are also included in the list:

- *No filters:* Interface, ToS, Protocol, Host, and Conversation summaries
- *Protocol filters:* Interface, ToS, Protocol, Host, and Conversation summaries
- *ToS filters:* Interface, ToS, Protocol, Host, and Conversation summaries
- *Protocol and ToS filters:* Interface, ToS, and Protocol summaries
- *Protocol and host filters:* Interface, Protocol, Host, and Conversation summaries
- *Protocol and conversation filters:* Interface, Protocol, Host, and Conversation summaries
- *ToS and conversation filters:* Interface, ToS, Host, and Conversation summaries
- *ToS and host filters:* Interface, ToS, Host, and Conversation summaries
- *Conversation filters:* Interface, ToS, Protocol, Host, and Conversation summaries
- *Host filters:* Interface, ToS, Protocol, Host, and Conversation summaries

Rules for Utilization Measurements

The following rules apply to utilization measurements:

- Inbound and outbound interface speeds must be set.
- Utilization is applicable only for interface, ToS, and protocol views and for data that has no host or conversation filter applied.
- Protocol or ToS utilization is limited to a single interface.
- Total utilization is not available.

Add, Delete, or Change Protocol Filters

You can add a protocol filter to include report data for the protocols defined in your DX NetOps installation.

You can add a protocol group filter to restrict reported data to one or more protocol groups. Protocol groups are useful for streamlining Custom Report definitions. For example, protocol groups can help users easily report on network traffic that custom applications generate. The Administrator can create a group for each of the applications that includes the range of ports that are used for the application. Users can also choose from the default protocol groups that are provided automatically.

Follow these steps:

1. Select **Custom Reporting** from the NFA console menu if the **Custom Reporting** page is not already open.
2. Put the report in editable mode: Click the name of the report. If the report has been run previously, it runs again. In this case, click **Edit** in the **Report Settings** section at the top of the report page.
   The **Report Definition Summary** page opens, which contains links to the Custom Report wizard pages.
3. Click **Protocol Filters** to open the **Specify Filters & Rollup** page of the Custom Report wizard.
4. (Optional) Select one or more individual protocols to include: Click **Add Protocol Filter**
   The **Protocol Index** dialog opens.
   - (Optional) Select the display mode for the protocols from the **Select by** list:
     - **Protocol Name**: View the protocols groups by name, either divided into alphabetized lists or displayed together in the **All** list (Default setting).
     - **Port Number**: View the protocols in groups by port number. Click the arrows to expand the contents of individual port number groups or click **Expand All** to show the contents of all groups.
     - **Show**: Set the view to include TCP Ports, UDP Ports, or TCP & UDP Ports, when the **Select by** is **Port Number**.
   - Locate and select the protocols in the protocol lists.

To use a protocol that is not listed, add the protocol to the list: Click **Add Protocol**, then specify the new protocol name, port, type, and description.
   - Click **Submit**. To locate the **Submit** button quickly, click the blue arrow to jump to the bottom of the page.
5. (Optional) Select one or more protocol groups to include: Click **Add Protocol Group Filter**
   The **Protocol Group Index** dialog opens.
   - Select check boxes for the protocol groups to add from the list.
   - Click **Submit**. To locate the **Submit** button quickly, click the blue arrow to jump to the bottom of the page.

   You return to the **Select Filters & Rollup** page of the Custom Report wizard.
6. Check the list of filters and their **Inclusion** values.
   Items that have a value of **Include** are in the report. You can remove data for a protocol or protocol group temporarily by setting the Inclusion value for the item to **Exclude**.
7. Click **Save Changes**.
   Your changes are saved and you return to the **Report Definition Summary**.
8. (Optional) Return to the report list by clicking one of these buttons:
   - **Return to Listing**: Return to the **Custom Reporting** page without queuing the report to run.
   - **Queue Report**: Queue the report to run and return to the **Custom Reporting** page.

Add or Modify ToS Filters

You can add ToS filters or ToS group filters to restrict report data. You can filter for individual ToS values, use any ToS groups your Administrator has created, or use the default ToS group, All ToS.

ToS groups are useful for creating Custom Reports for specific classes of applications. For example, suppose that you want to watch applications that your IT department has classified as Gold Class applications. To facilitate reports on Gold Class applications, the Administrator creates a ToS group that includes the ToS values for those applications.

Follow these steps:

1. Select **Custom Reporting** from the NFA console menu if the **Custom Reporting** page is not already open.
2. Put the report in editable mode: Click the name of the report. If the report has been run previously, it runs again. In this case, click **Edit** in the **Report Settings** section at the top of the report page.
   The **Report Definition Summary** page opens, which contains links to the Custom Report wizard pages.
3. Click **ToS Filters**.
4. The **Specify Filters & Rollup** page of the Custom Report wizard opens.
5. (Optional) Select one or more individual ToS values to include: Click **Add ToS Filter**.
   The **Protocol Index** dialog opens.
   - Select the check box for each ToS value you want to include.
   - Click **Submit**. To locate the **Submit** button quickly, click the blue arrow to jump to the bottom of the page.
6. (Optional) Select one or more ToS groups to include: Click **Add ToS Group Filter**.
   The **ToS Group Index** dialog opens.
   - Select check boxes for the ToS groups you want to add.
   - Click **Save**.

   You return to the **Select Filters & Rollup** page of the Custom Report wizard.
7. Check the list of filters and their Inclusion values.
   Items that have a value of **Include** are in the report. You can remove data for a ToS value or ToS group temporarily by setting the Inclusion value for that item to **Exclude**.
8. Click **Save Changes**.
   Your changes are saved and you return to the **Report Definition Summary**.
9. (Optional) Return to the report list by clicking one of these buttons:
   - **Return to Listing**: Return to the **Custom Reporting** page without queuing the report to run.
   - **Queue Report**: Queue the report to run and return to the **Custom Reporting** page.

Add or Modify Host and Conversation Filters

You can add host or conversation filters to limit the report data to specific hosts or conversations, but you cannot add both host and conversation filters. You can apply a single type of filter or you can use one of the following valid filter combinations:

- Protocols/Protocol Groups + ToS/ToS Groups
- Protocols/Protocol Groups + Hosts
- Protocols/Protocol Groups + Conversations
- ToS/ToS Groups + Hosts
- ToS/ToS Groups + Conversations

Add or Modify Host Filters

Adding host filters to a report changes what table you are querying, switching from the `protocol_traffic` table to the `host_traffic` table. The `host_traffic` table has two entries per interface per flow: source/destination for both in and out interface, with perspective (in/out) set appropriately. So, the `host_traffic` table contains twice as many records as the `protocol_traffic` table. Any data that is returned appears up to twice as big because the data is host-oriented.

Follow these steps:

1. Select **Custom Reporting** from the NFA console menu if the **Custom Reporting** page is not already open.
2. Put the report in editable mode: Click the name of the report. If the report has been run previously, it runs again. In this case, click **Edit** in the **Report Settings** section at the top of the report page.
   The **Report Definition Summary** page opens, which contains links to the Custom Report wizard pages.
3. Click **Host/Conversation Filters** to open the **Specify Filters & Rollup** page of the Custom Report wizard.
4. Click **Add Host Filter**.
   The **Apply Host Filter** dialog opens.
5. Specify the following values, then click **Submit**.
   - **Host/Network IP**: Enter the IP address of the host network whose data will be included.
   - **Mask**: Select a mask from the list.

   For example, enter 192.168.1.0 with a mask of 255.255.255.0 to include data from all hosts on the class C network 192.168.1.0. The report will not include any data from hosts at other network addresses.
   You return to the **Select Filters & Rollup** page of the Custom Report wizard.
6. Check the list of filters and their Inclusion values.
   If you specify a single host filter with a value of **Include**, the report contains data only for that host. If you set a host filter to have a value of **Exclude**, the report contains data for all other hosts in the selected set of interfaces.
7. Click **Save Changes**.
   Your changes are saved and you return to the **Report Definition Summary**.
8. (Optional) Return to the report list by clicking one of these buttons:
   - **Return to Listing**: Return to the **Custom Reporting** page without queuing the report to run.
   - **Queue Report**: Queue the report to run and return to the **Custom Reporting** page.

Add or Modify Conversation Filters

Follow these steps:

1. Select **Custom Reporting** from the NFA console menu if the **Custom Reporting** page is not already open.
2. Put the report in editable mode: Click the name of the report. If the report has been run previously, it runs again. In this case, click **Edit** in the **Report Settings** section at the top of the report page.
   The **Report Definition Summary** page opens, which contains links to the Custom Report wizard pages.
3. Click **Host/Conversation Filters** to open the **Specify Filters & Rollup** page of the Custom Report wizard.
4. Click **Add Conversation Filter**.

The **Apply Conversation Filter** dialog opens.

5. Specify the following values for each host in the conversation pair, then click **Submit**.
   - **Host/Network IP**: Enter the IP address of each host network in the conversation pair in the Host/Network IP boxes.
   - Select a mask from the list to the right of the Host/Network IP value.

   For example, specify the two hosts in the conversation by entering 192.168.1.1 with a mask of 255.255.255.225 and 192.168.1.0 with a mask of 255.255.255.0. The report will include conversation data between all hosts on the 192.168.1.1 network and the 192.168.1.0 network.
   You return to the **Select Filters & Rollup** page of the Custom Report wizard.
6. Check the list of filters and their Inclusion values.
   If you specify a single conversation filter with a value of **Include**, the report contains data only for that conversation.
   If you set the conversation filter to **Exclude**, the report contains all data for other conversations in the selected set of interfaces.
7. Click **Save Changes**.
   Your changes are saved and you return to the **Report Definition Summary**.
8. (Optional) Return to the report list by clicking one of these buttons:
   - **Return to Listing**: Return to the **Custom Reporting** page without queuing the report to run.
   - **Queue Report**: Queue the report to run and return to the **Custom Reporting** page.

Delete Custom Report Filters

You can delete filters from Custom Reports to reflect the deletion of protocols, hosts, or TOS values from your network. Any filter you delete is no longer used to define the report data.

Follow these steps:

1. Select **Custom Reporting** from the NFA console menu if the **Custom Reporting** page is not already open.
2. Put the report in editable mode: Click the name of the report. If the report has been run previously, it runs again. In this case, click **Edit** in the **Report Settings** section at the top of the report page.
   The **Report Definition Summary** page opens, which contains links to the Custom Report wizard pages.
3. Click **Host/Conversation Filters** to open the **Specify Filters & Rollup** page of the Custom Report wizard.
4. Select the check box next to each filter that you want to delete.
5. Click the **Remove Selected Filters** icon at the top-left corner of the list.
6. Click **Save Changes**.
   Your changes are saved and you return to the **Report Definition Summary**.
7. (Optional) Return to the report list by clicking one of these buttons:
   - **Return to Listing**: Return to the **Custom Reporting** page without queuing the report to run.
   - **Queue Report**: Queue the report to run and return to the **Custom Reporting** page.

Exclude Custom Report Filters

For each filter you define in a Custom Report, you can opt to include either:

- Only the data that matches the filter criteria
- All the data that does not match the filter criteria

To set the type of filtering action, you set the **Inclusion** value for each filter in the **Specify Filters** list. To display matching data, set the Inclusion value to **Include** (the default setting). To display data that does not match, set the **Inclusion** value to **Exclude**.

Follow these steps:

1. Select **Custom Reporting** from the NFA console menu if the **Custom Reporting** page is not already open.

2. Put the report in editable mode: Click the name of the report. If the report has been run previously, it runs again. In this case, click **Edit** in the **Report Settings** section at the top of the report page.
   The **Report Definition Summary** page opens, which contains links to the Custom Report wizard pages.
3. Click **Host/Conversation Filters** to open the **Specify Filters & Rollup** page of the Custom Report wizard.
4. Locate the filter whose data you want to exclude and select **Exclude** from the **Inclusion** list.
5. Click **Save Changes**.
   Your changes are saved and you return to the **Report Definition Summary**.
6. (Optional) Return to the report list by clicking one of these buttons:
   – **Return to Listing**: Return to the **Custom Reporting** page without queuing the report to run.
   – **Queue Report**: Queue the report to run and return to the **Custom Reporting** page.

Define Custom Report Periods and Schedules

When you define a Custom Report, you must specify the reporting time period and the resolution of the reporting data. You can define a specific, nonrecurring time period (for a start-and-end report) or you can choose a timespan that ends at the report runtime (for a duration report). You also have the option to set a duration report to regenerate on a recurring schedule and to have the automated reports sent out by email.

Specify a Reporting Period for Custom Reports

The Custom Report Wizard provides a **Specify Schedule** page that defines the report time period. For a manually generated report, you can simply select a time period, resolution, and optional time filter. If you want to generate the report automatically at scheduled intervals, you can also use the Schedule option.

Follow these steps:

1. Select **Custom Reporting** from the NFA console menu if the **Custom Reporting** page is not already open.
2. Put the report in editable mode: Click the name of the report. In the **Report Settings** section at the top of the report page, click **Edit**.
   The **Report Definition Summary** page opens, which contains links to the **Custom Report Wizard** pages.
3. Click **Reporting Period** to open the **Specify Schedule** page of the **Custom Report Wizard**.

   NOTE
   Custom Reports display data using the user time zone setting. The time zone selected when scheduling the report is used as the time zone to report against, but the resulting report displays the user setting.
4. Select the type of reporting period from the **Period** list on the **Specify Schedule** page:
   – **duration**: Include data from the block of time that immediately precedes the report runtime. Enter a number of days, weeks, months, or years.
   You can set up a schedule for a duration report or you can run the report on demand. To run a scheduled report on demand, you can make a copy of the report and can disable the schedule in the copy.
   – **start & end**: Include data from a specific, nonrecurring timespan. Use the calendars to specify a **Start** date and **End** date or select hour and time values from the lists.
   Hour values are expressed in 24-hour format.
   A start-and-end report runs on demand. You cannot set up a schedule for a start-and-end report.
5. Set the resolution (granularity for data collection) on the **Specify Schedule** page: Accept the default setting or enter the number of time units in the **Resolution** box. Select a unit of time from the list (minutes, hours, days, weeks, months, or years).
   The default resolution varies depending on the length of the reporting period. For example, if you specify a duration of one month for the period, the default resolution is 8 hours. If you specify a duration of one day, the default resolution is 15 minutes.
6. (Optional) Select a time filter from the list on the **Specify Schedule** page, if your Administrator has created an appropriate time filter.
7. Click **Save Changes**.

Your changes are saved and you return to the **Report Definition Summary**.

8. (Optional) Return to the report list by clicking one of these buttons:
   - **Return to Listing**: Return to the **Custom Reporting** page without queuing the report to run.
   - **Queue Report**: Queue the report to run and return to the **Custom Reporting** page.

Specify Schedules for Auto-Generated Custom Reports

Use the **Schedule** option to set the Custom report to regenerate at specified times.

For example, suppose that you want to check network traffic during the monthly backups that occur on the last Sunday of each month. You schedule a report to be regenerated on the last Sunday of every month. Suppose that operating system updates occur on the 15th of every month. To check the network traffic during those updates, you schedule a report to be regenerated on the 15th of each month.

> **NOTE**
> The options in the **Recurrence** section are available only if you select **duration** as the reporting period type.

Follow these steps:

1. Select **Custom Reporting** from the NFA console menu if the **Custom Reporting** page is not already open.
2. Put the report in editable mode: Click the name of the report. In the **Report Settings** section at the top of the report page, click **Edit**.
   The **Report Definition Summary** page opens, which contains links to the **Custom Report Wizard** pages.
3. Click **Reporting Period** to open the **Specify Schedule** page of the **Custom Report Wizard**.
4. Click the **Schedule** check box and choose a recurrence interval from the list:
   - **Daily**: Select the day or days of the week the report will run.
   - **Weekly**: Select the day of the week the report will run.
   - **Monthly**: Select either a date or a week and day combination to specify the one day per month the report will run.
   - **Quarterly**: Select the month that ends the first quarter in which the report will run. Starting with the specified quarter, the report will run on the last day of each quarter.
   - **Yearly**: Select the month that ends the first year the report will run. The report runs on the last day of the year.

   For all schedule interval types, select the time of day and time zone for the report to run.
5. (Optional) **Email Results To**: Enter the email addresses of anyone who should receive the report by email. Use the format *name@domain*. Separate multiple addresses with a comma or semi-colon.
6. Click **Save Changes**.
   Your changes are saved and you return to the **Report Definition Summary**.
7. (Optional) Return to the report list by clicking one of these buttons:
   - **Return to Listing**: Return to the **Custom Reporting** page without queuing the report to run.
   - **Queue Report**: Queue the report to run and return to the **Custom Reporting** page.

View Custom Reports

When you have defined the Custom Reports that you need, you are ready to generate a new report and view it in the NFA console. You can run and view the following types of reports:

- Unscheduled duration reports on demand.
- The most recent versions of scheduled duration reports that have been generated automatically.
- The most recent versions of start-and-end reports

Follow these steps:

1. Select **Custom Reporting** from the NFA console menu if the **Custom Reporting** page is not already open.
   The **Custom Reporting** page contains two panes. The left pane lists the folders that store saved reports. The right pane lists the reports in the currently selected folder.

2. Click the name of the folder that contains the report you want to view.
3. Click the report name in the **Reports** list.
   The report runs. The results are displayed when report generation is complete.
4. (Optional) Change the type of presentation by selecting an option from the **Report Type** list.
   The default presentation type is **Custom Layout**. The other available options are dependent on the filters that are defined for your report.
   When you select an option other than **Custom Layout**, a **Presentation** menu is added on the left side of the page. You can select from the presentation types and from the data types to modify your view. For example, you could change from a pie chart to a stacked trend chart that shows volume.

Flow Forensics Reports

Flow Forensics reports let you drill down to raw data flows and see a level of detail that is not available in other reports. You can jump to detailed information about any of the fields in a data packet for any monitored interface.

You can run a Flow Forensics report to drill down and view raw flow data. The data is parsed into meaningful reports.

Use Flow Forensics to browse raw flow data for a specified time period. You can filter the results by using a number of fields. You can export the displayed data to a file in comma-separated value (CSV) format.

Flow Forensics reports let you report on all of the flow data that is collected in your environment. You can analyze every protocol, host, and conversation on your network. Other report types are designed to show the most active interfaces, protocols, hosts, and conversations or to show individual instances of these items.

Flow Forensics reports can provide a comprehensive analysis of all traffic for the following categories, for example:

- Protocols that are active for one or more specified hosts
- All protocols that are active on the network
- All hosts that access one or more specified hosts
- Volume of traffic to or from one or more specified hosts

NOTE

More information:

Flow Forensics Report Types

The following topics describe the available Flow Forensics reports.

Address Report Group

The **Address** Flow Forensics reports have the following fields.

Report	Src Addr	Dest Addr	Bytes	Rate (Bits)	% Total (Bytes)	Flows	Pkts	Rate (Pkts)	% Total (Pkts)	# of Src Addr	# of Dest Addr	IP Protocol	Dest Port
Address Pairs	Y	Y	Y	Y	Y	Y	Y	Y	Y				
Destination Address Peer Count		Y				Y				Y			

Destination Addresses		Y	Y	Y	Y	Y	Y	Y	Y				
Source Address Peer Count	Y										Y		
Source Address Peer Count with Destination Port	Y					Y					Y	Y	Y
Source Addresses	Y		Y	Y	Y	Y	Y	Y	Y				

- **Address Pairs Report**
  Displays the following information about pairs of IP addresses that exchanged traffic:
  - IP addresses of the source host and destination host in the conversation
  - Data volume and rate, shown in bytes (or kilobytes, megabytes) and packets
  - Percentage of total traffic that the data represents, shown in bytes (or kilobytes, megabytes) and packets
- **Destination Address Peer Count Report**
  Displays the following information about each traffic destination:
  - Destination address
  - Number of unique source addresses that exchanged traffic with the destination host
  - Flow count
- **Destination Addresses Report**
  Displays the volume, rate, and percent of total inbound bytes/packets, and the flow count of each traffic destination.
- **Source Address Peer Count Report**
  Displays the following information about each traffic source:
  - Source address
  - Number of destination addresses that received traffic from the source host
  - Flow count
- **Source Address Peer Count with Destination Port Report**
  Displays the following information about each traffic source:
  - Source address
  - Destination port
  - IP protocol
  - Number of destination addresses that received traffic from the source host
  - Flow count
- **Source Addresses Report**
  Displays the volume, rate, and percent of total inbound bytes/packets, and the flow count of each source address.

Application Response Time Report Group

The **Application Response Time** reports show Cisco's Application Response Time (ART) metrics. ART metrics are available for IPFIX flows from routers that have Cisco ART metrics enabled.

Meaningful data is shown in the **Application Response Time** reports under the following conditions:

- The routers and interfaces in the report are configured to export IPFIX flow.
- The exported flow includes the appropriate fields.
  If a router is not configured to return data for the appropriate fields, a zero (0) appears in the corresponding table cells. Non-NBAR2 traffic shows a zero for all of the values except the router IP address and application name.
  The **Application** column values show the NBAR2 application name followed by the application ID. The application name is included if it is defined by the standard (not custom) NBAR2 engine. Otherwise the **Application** value may consist of only the application ID.

The **Application Response Time** reports have the following fields.

Report	Router Addr	Application	Transactions	Avg Total Transaction Time	Late Responses	Retransmissions	Client Address	Server Address	New Connections	Avg Client Network Delay	Avg Server Network Delay	Avg Response Time	Avg Application Delay
Application Metrics	Y	Y	Y	Y	Y	Y							
Client Side Metrics	Y	Y					Y	Y	Y	Y			
Server Side Metrics	Y	Y							Y		Y	Y	Y

- **Application Metrics Report**
  Displays a summary of ART metrics for IPFIX flow that includes NBAR2 data. The report table includes a row for each unique combination of the following values:
  – IP address of the router that sent the data
  – NBAR2 application name
  – Number of transactions
  – Number of late responses
  – Number of times that lost packets were retransmitted
  – Average of the total transaction time, which is calculated from the flow record data
- **Client Side Metrics Report**
  Displays client-side ART metrics for IPFIX flow that includes NBAR2 data. Each row shows the values for a unique combination of the following values:
  – IP address of the router that sent the data
  – NBAR2 application name
  – IP addresses of the client and server
  – Number of new connections
  – Average client network delay
- **Server Side Metrics Report**
  Displays server-side ART metrics for IPFIX flow that includes NBAR2 data. Each row shows the values for a unique combination of the following values:
  – IP address of the router that sent the data
  – NBAR2 application name
  – Number of new connections
  – Average server network delay
  – Average response time (includes the network time from the client to the server and the server response time)
  – Average application delay

ICMP Report Group

The **ICMP** Flow Forensics reports have the following fields.

Report	Src Addr	Dest Addr	Dest Network	# of Src Addr	# of Dest Addr	ICMP	Pkts	Flows
Bad IP Headers	Y							Y
Fragmentation Required and DF Flag Set		Y		Y				Y
ICMP Traffic Summary						Y		Y
Ping Conversation Pairs	Y	Y					Y	Y
Ping Destinations		Y					Y	Y
Ping Sources	Y						Y	Y
Traceroute Requests by Destination		Y		Y				Y
Traceroute Requests by Source	Y				Y			Y
Traceroute Requests Pairs	Y	Y						Y
TTL Expired in Transit	Y	Y						Y
Unreachable Destination by Source	Y						Y	Y
Unreachable Destination Networks			Y				Y	Y
Unreachable Destinations	Y		Y				Y	Y

- **Bad IP Headers Report**
  Displays the source address and flow count of each bad IP header--each IP header that failed the checksum.
- **Fragmentation Required and DF Flag Set Report**
  Displays the following information about packets that require fragmentation--packets that had unreachable hosts or that were flagged Fragmentation Needed and Don't Fragment:
  - Destination address
  - Number of source addresses that sent this type of data to the destination address
  - Number of flows that contained packets of this type
- **ICMP Traffic Summary Report**
  Summarizes the Internet Control Message Protocol (ICMP) types and codes that occurred. The report contains the following information:

  - ICMP description, type, and code
  - Volume of inbound packets for each ICMP
  - Flow count for each ICMP
- **Ping Conversation Pairs Report**
  Displays the following information about ping requests:
  - Source address
  - Destination address
  - Volume of inbound packets
  - Flow count
- **Ping Destinations Report**
  Displays the following information about ping request destinations:
  - Destination address that received the request
  - Volume of inbound packets
  - Flow count
- **Ping Sources Report**
  Displays the following information about ping request sources:
  - Source address that generated the request
  - Volume of inbound packets
  - Flow count
- **Traceroute Requests by Destination Report**
  Displays the following information about traceroute request destinations:
  - Destination address of the traceroute request
  - Number of source addresses that sent traceroute requests to the destination
  - Flow count
- **Traceroute Requests by Source Report**
  Displays the following information about traceroute request sources:
  - Source address of each traceroute request
  - Number of destination addresses that received traceroute requests from the source
  - Flow count
- **Traceroute Requests Pairs Report**
  Displays the following information about each traceroute address pair:
  - Source address of the traceroute request
  - Destination address of the traceroute request
  - Flow count
- **TTL Expired in Transit Report**
  Displays the following information about data that met or exceeded the Time To Live (TTL) threshold:
  - Source address
  - Destination address
  - Flow count
- **Unreachable Destination by Source Report**
  Displays the following information about sources that tried to connect with unreachable destinations:
  - Source address
  - Volume of inbound packets
  - Flow count
- **Unreachable Destination Networks Report**
  Displays the following information about unreachable destinations:

  - Destination network and subnet mask
  - Number of inbound packets
  - Flow count
- **Unreachable Destinations Report**
  Displays the following information about sources and unreachable destinations:
  - Source address
  - Destination network and subnet mask
  - Volume of inbound packets
  - Flow count

MAC Report Group

The **MAC** Flow Forensics reports have the following fields.

Report	Dest MAC	Source MAC	Bytes	Rate (Bits)	% Total (Bytes)	Flows	Pkts	Rate (Pkts)	% Total (Pkts)
Destination MAC	Y		Y	Y	Y	Y	Y	Y	Y
MAC Pairs	Y	Y	Y	Y	Y	Y	Y	Y	Y
Source MAC		Y	Y	Y	Y	Y	Y	Y	Y

- **Destination MAC Report**
  Displays the volume, rate, and percent of total inbound bytes/packets, as well as the flow count on each destination Media Access Control (MAC) address.
- **MAC Pairs Report**
  Displays the volume, rate, and percent of total inbound bytes/packets, as well as the flow count on each pair of source and destination MAC addresses.
- **Source MAC Report**
  Displays the volume, rate, and percent of total inbound bytes/packets, as well as the flow count on each source MAC address.

MPLS Reports

The **MPLS Labels** Flow Forensics report has the following fields.

Report	Router Addr	Label Addr	Label Type	Top Label	Bytes	Rate (Bits)	% Total (Bytes)	Flows	Pkts	Rate (Pkts)	% Total (Pkts)
MPLS Labels	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y

MPLS Labels Report
Displays the volume, rate, and percent of total inbound bytes/packets, as well as the flow count of traffic that had a unique combination of the following values:

- Router address
- Multiprotocol Label Switching (MPLS) address
- MPLS label type
- MPLS top label

Network Reports Group

The **Network** Flow Forensics reports have the following fields.

Report	Src AS	Dest AS	Src Network	Dest Network	Src Addr	Dest Addr	ToS	Next Hop	TCP Reset Count	Bytes	Rate (Bits)	% Total (Bytes)	Flows	Pkts	Rate (Pkts)	% Total (Pkts)
Autonomous System Pairs	Y	Y								Y	Y	Y	Y	Y	Y	Y
Autonomous System Pairs (with Destination Network)	Y	Y		Y						Y	Y	Y	Y	Y	Y	Y
Destination Autonomous Systems		Y								Y	Y	Y	Y	Y	Y	Y
Destination Networks				Y						Y	Y	Y	Y	Y	Y	Y
Network Pairs			Y	Y						Y	Y	Y	Y	Y	Y	Y
Network Pairs (with ToS)			Y	Y			Y			Y	Y	Y	Y	Y	Y	Y
Next Hops								Y		Y	Y	Y	Y	Y	Y	Y
Source Autonomous Systems	Y									Y	Y	Y	Y	Y	Y	Y
Source Networks	Y									Y	Y	Y	Y	Y	Y	Y
TCP Resets					Y	Y			Y							

- **Autonomous System Pairs Report**
  Displays the volume, rate, and percent of total inbound bytes and packets. Also displays the flow count of traffic between a pair of source and destination autonomous systems.
- **Autonomous System Pairs (with Destination Network) Report**
  Displays the volume, rate, and percent of total inbound bytes and packets. Also displays the flow count of traffic that had a unique combination of the following values:
  – Source AS
  – Destination AS
  – Destination network and subnet mask
- **Destination Autonomous Systems Report**
  Displays the volume, rate, and percent of total inbound bytes and packets. Also displays the flow count of traffic on each destination autonomous system.
- **Destination Networks Report**

Displays the volume, rate, and percent of total inbound bytes/packets, as well as the flow count of traffic on each destination network and subnet.

- **Network Pairs Report**
  Displays the volume, rate, and percent of total inbound bytes and packets. Also displays the flow count of traffic on each pair of source and destination network subnets.
- **Network Pairs (with ToS) Report**
  Displays the volume, rate, and percent of total inbound bytes and packets. Also displays the flow count of traffic on each network pair that had a unique combination of the following values:
  – Source network and subnet mask
  – Destination network and subnet mask
  – ToS
- **Next Hops Report**
  Displays the volume, rate, and percent of total inbound bytes and packets. Also displays the flow count of traffic for each next-hop address.
- **Source Autonomous Systems Report**
  Displays the volume, rate, and percent of total inbound bytes and packets. Also displays the flow count of traffic on each source autonomous system.
- **Source Networks Report**
  Displays the volume, rate, and percent of total inbound bytes and packets. Also displays the flow count of traffic on each source network and subnet.
- **TCP Resets Report**
  Displays the TCP reset count of traffic on each source and destination address pair.

QoS Report Group

The **QoS** (Quality of Service) Flow Forensics reports have the following fields.

Report	DSCP	ToS	Bytes	Rate (Bits)	% Total (Bytes)	Flows	Pkts	Rate (Pkts)	% Total (Pkts)
Differentiated Services	Y		Y	Y	Y	Y	Y	Y	Y
Type of Service		Y	Y	Y	Y	Y	Y	Y	Y

- **Differentiated Services Report**
  Displays the volume, rate, and percent of total inbound bytes and packets. Also displays the traffic flow count for each DiffServ code point (DSCP) value.
- **Types of Service Report**
  Displays the volume, rate, and percent of total inbound bytes and packets. Also displays the traffic flow count for each Type of Service (ToS).

Session Report Group

The **Session** Flow Forensics reports have the following fields.

Report	Router Addr	Interface In	IP Protocol	Src Addr	Src Addr (IPv6)	Src Port	Interface Out	Dest Addr	Dest Addr (IPv6)	Dest Port	ToS	Bytes	Rate (Bits)	% Total (Bytes)	Flows	Flow Duration	Pkts	Rate (Pkts)	% Total (Pkts)	Engine	Application
Client-Server Sessions			Y					Y		Y		Y	Y	Y	Y		Y	Y	Y		
Conversation Sessions	Y	Y	Y	Y				Y		Y	Y	Y	Y	Y	Y	Y			Y		
Conversation Sessions (NBAR2)	Y	Y	Y	Y		Y		Y		Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
Conversations			Y	Y		Y		Y		Y		Y	Y	Y	Y		Y	Y	Y		
Conversations (IPv6)			Y		Y	Y			Y	Y		Y	Y	Y	Y		Y	Y	Y		
Conversations (with Interfaces)	Y	Y	Y	Y		Y	Y	Y		Y		Y	Y	Y	Y		Y	Y	Y		
Destination Applications			Y							Y		Y	Y	Y	Y		Y	Y	Y		
Destination Endpoints			Y					Y		Y		Y	Y	Y			Y	Y	Y		
Protocols			Y									Y	Y	Y	Y		Y	Y	Y		
Server-Client Sessions			Y	Y		Y		Y				Y	Y	Y	Y		Y	Y	Y		
Source Applications			Y			Y						Y	Y	Y	Y		Y	Y	Y		
Source Endpoints			Y	Y		Y						Y	Y	Y	Y		Y	Y	Y		

- **Client-Server Sessions**
  Displays the volume, rate, and percent of total inbound bytes and packets. Also displays the flow count of each session that had a unique combination of the following values:
  – Source and destination address
  – Destination port
  – IP protocol
- **Conversation Sessions Report**
  Displays the volume, rate, and percent of total inbound bytes and packets. Also displays the flow count and cumulative flow duration of each conversation session that had a unique combination of the following values:

  - Router address
  - Inbound interface
  - Source address and port
  - Destination address and port
  - ToS
  - IP protocol
- **Conversation Sessions (NBAR2) Report**
  Displays conversation session traffic and identifies any NBAR2 (Next Generation Network-Based Application Recognition) data that is included. The report table includes a row for each unique combination of the following values:
  - IP address of the router that sent the data
  - Name of the interface that received the data
  - IP protocol for the data
  - IP addresses and ports of the source host and destination host in the conversation
  - Type of service
  - Volume, rate and percentage of total traffic that the data represents, shown bytes (or megabytes, kilobytes) and packets
  - Flow count
  - Total duration of the flows in the row
  - NBAR2 Engine name and ID
    Standard NBAR2 data has "layer7 (13)" in the Engine column.
  - NBAR2 Application name and ID

  If a router is not configured to return NBAR2 data, a zero (0) appears in its rows under the **Engine** and **Application** columns. If other columns contain a zero for the router rows, the router may not be configured to return the fields for those values.
  The **Application** column values show the NBAR2 application name followed by the application ID. The application name is included if it is defined by the standard (not custom) NBAR2 engine. Otherwise the **Application** value may consist of only the application ID.
- **Conversations Report**
  Displays the volume, rate, and percent of total inbound bytes and packets. Also displays the flow count of traffic for each IPv4 address pair that had a unique combination of the following values:
  - Source address and port
  - Destination address and port
  - IP protocol
- **Conversations (IPv6) Report**
  Displays the volume, rate, and percent of total inbound bytes and packets. Also displays the flow count of traffic for each IPv6 address pair that had a unique combination of the following values:
  - Source address and port
  - Destination address and port
  - IP protocol
- **Conversations (with Interfaces)**
  Displays the volume, rate, and percent of total inbound bytes and packets. Also displays the flow count of each conversation that had a unique combination of the following values:
  - Router address
  - Inbound and outbound interface
  - Source address and port
  - Destination address and port
  - IP protocol
- **Destination Applications Report**

Displays the volume, rate, and percent of total inbound bytes and packets. Also displays the flow count of traffic that had a unique combination of the following values:
  – Destination port
  – IP protocol
- **Destination Endpoints Report**
  Displays the volume, rate, and percent of total inbound bytes and packets. Also displays the flow count of traffic that had a unique combination of the following values:
  – Destination address
  – Destination port
  – IP protocol
- **Protocols Report**
  Displays the volume, rate, and percent of total inbound bytes and packets. Also displays the flow count of traffic that had a unique IP protocol.
- **Server-Client Sessions Report**
  Displays the volume, rate, and percent of total inbound bytes and packets. Also displays the flow count of each traffic session that had a unique combination of the following values:
  – Source address and port
  – Destination address and port
  – IP protocol
- **Source Applications Report**
  Displays the volume, rate, and percent of total inbound bytes and packets. Also displays the flow count of each traffic session that had a unique combination of the following values:
  – Source port
  – IP protocol
- **Source Endpoints Report**
  Displays the volume, rate, and percent of total inbound bytes and packets. Also displays the flow count of each traffic session that had a unique combination of the following values:
  – Source address
  – Source port
  – IP protocol

TCP Reports

The **TCP Flags** Flow Forensics report has the following fields.

Report	TcpFlags	Bytes	Rate (Bits)	% Total (Bytes)	Flows	Pkts	Rate (Pkts)	% Total (Pkts)
TCP Flags	Y	Y	Y	Y	Y	Y	Y	Y

- **TCP Flags Report**
  Displays volume, rate, and percent of total inbound bytes/packets, as well as the flow count of traffic for each TCP flag.

VLAN Report Group

The **VLAN** Flow Forensics reports have the following fields.

Report	Destination VLAN	Source VLAN	Bytes	Rate (Bits)	% Total (Bytes)	Flows	Pkts	Rate (Pkts)	% Total (Pkts)
Destination VLANs	Y		Y	Y	Y	Y	Y	Y	Y
Source VLANs		Y	Y	Y	Y	Y	Y	Y	Y
VLAN Pairs	Y	Y	Y	Y	Y	Y	Y	Y	Y

- **Destination VLANs Report**
  Displays the volume, rate, and percent of total inbound bytes/packets, as well as the flow count of traffic on each destination VLAN.
- **Source VLANs Report**
  Displays the volume, rate, and percent of total inbound bytes/packets, as well as the flow count of traffic on each source VLAN.
- **VLAN Pairs Report**
  Displays the volume, rate, and percent of total bytes in/packets in, as well as the flow count of traffic on each source and destination VLAN pair.

WAAS Segment Report Group

WAAS Segment Report

Displays a report that identifies the WAAS (Wide Area Application Services) segment number and pass-through reason. Having the pass-through reason helps you determine why flow is not optimized.

The report shows meaningful data if the reporting routers have WAAS configured and if Cisco Performance Agent monitors the WAAS traffic. Other traffic does not return any meaningful values except for the router IP address.

The **Application** column values show the NBAR2 application name followed by the application ID. The application name is included if it is defined by the standard (not custom) NBAR2 engine. Otherwise the **Application** value may consist of only the application ID.

The **WAAS Segment** Flow Forensics report has the following fields.

Report	Router Addr	Application	Client Address	Server Address	WAAS Segment	WAAS Passthrough Reason
WAAS Segment	Y	Y	Y	Y	Y	Y

The report table includes a row for each unique combination of the following values:

- IP address of the router that sent the data
- Application name (NBAR2 application name and ID)
- IP addresses of the client and server
- WAAS segment: Type of WAAS data source
- WAAS passthrough reason

Create or View a Flow Forensics Report

Open the **Flow Forensics** page and create Flow Forensics reports to see details about raw data flows for troubleshooting. Use the saved report definitions to generate an updated report at any time. You can also use a report definition as a basis for another Flow Forensics report.

As the number of reports grows, use the folder management system to keep the reports organized and accessible.

Create a Flow Forensics Report

Complete the following steps to create a Flow Forensics report.

Follow these steps:

1. Select **Flow Forensics** from the NFA console menu.
2. Click **Create New Report**.
   The **Report Settings** page opens and displays options for the default report type, **Conversation Sessions**.
3. (*Optional*) Change the report type:
   – Click **[change]** next to the **Report Types** label to select a different report type. The **Report Types** dialog opens.
   – Click the heading for the report group that interests you. The report list expands for the selected group.
   – Select the report type from the expanded list. You return to the **Report Settings** page, which shows a name and label for the new report type.
4. (*Optional*) Identify the report and set the folder for saving it by entering values in the following fields:
   – **Name**: Add a name for the report.
   – **Description**: Add a description for the report.
   – **Folder**: Select a parent folder for the report.
5. (*Optional*) Change the filters that are used in the report definition:**Example:** To exclude the FTP protocol, complete the following steps:
   – **Remove Filters**: Click the **X** next to the filter name in the **Add Filters** list to delete a filter from the report definition.
   – **Add Filters**: Use the **Add Filters** options to filter the displayed data.
   a. Select **RA: Protocol** filter.
   b. Select **NotEqual**.
   c. Click **Index**.
   d. Select the ftp protocol.

   You can get flow forensic report from either specific harvester or from all harvester, when you select the following ROUTER filter types.

   - Router Address
   - Router Address and Interface In
   - Router Address and Interface Out
   - Router Address and Interface In or Out

   When you generate report based on one of these filters, NFA prompts you to enter the router IP. Enter the router IP address. NFA displays a drop down with list of associated harvesters. Based on your selection, the NFA displays report from All Harvesters (Default) or from selected harvester.

   NOTE

   - Harvesters Drop-down is displayed only if the specified IP is available on any of the harvesters.
   - Harvesters Drop-down is displayed even if the router belongs to only one harvester.
6. (*Optional*) Change the timespan for collecting report data: Select **Start Date** and **End Date** values.
7. Run or save the report:

- **Save**: Save the report so it is available for later use, but is not executed immediately.The report is saved and the **Saved** icon is added to the **Report Settings** page.
- **Run**: Save, queue, and run the report.The **Report Queued** message appears. When the report finishes execution, the message closes and the report appears.

Click **Back to Folders** to return to the Flow Forensic **Reports** folders before execution is complete.

Flow Forensics Report Filters

The following list describes the available filters. Certain filters might not be available for all reports.

- **RA: Protocol**: Filters for the actual protocol, including Application mapping rules
- **RA: Interface**: Filters for the actual interface, excluding aggregate and custom virtual interfaces
- **RA Type-of-service**: Filters for the DX NetOps type of service
- **Destination Address**: Filters for the IP address of one or multiple destination hosts
- **Destination Autonomous System**: Filters for the autonomous number for the destination network
- **Destination MAC Address**: Filters for the destination MAC address
- **Destination Mask**: Filters for the IP mask of a destination network
- **Destination Port**: Filters for the destination port number (0 through 65,535)
- **Destination VLAN**: Filters for the destination address of the VLAN
- **Flow Count**: Filters for the number of flows
- **Flow Duration**: Filters for the duration of the flows
- **ICMP**: Filters for information about ICMP
- **MPLS Top Label**: Filters for the top label of MPLS
- **MPLS Top Label IP Address**: Filters for the IP address of the MPLS top label
- **MPLS Top Label Type**: Filters for the type of MPLS top label type
- **Next Hop**: Filters for the IP address of next destination hop
- **Percent of Total Traffic for Bytes In**: Filters for the percentage of bytes in total traffic
- **Percent of Total Traffic for Packets In**: Filters for the percentage if packets in total traffic
- **Protocol**: Filters for the actual IP Protocol Number (6=TCP,17=UDP)
- **Protocol and Destination Port**: Filters for the actual IP Protocol Number (6=TCP,17=UDP) and the destination port number (0 through 65,535)
- **Protocol and Source or Destination Port**: Filters for the actual IP Protocol Number (6=TCP,17=UDP) and the source or destination port number (0 through 65,535)
- **Protocol and Source Port**: Filters for the actual IP Protocol Number (6=TCP,17=UDP) and the IP address of a source host
- **Router Address**: Filters for the IP address of the router
- **Router Address and Interface In**: Filters for the router address and router interface (in) index number
- **Router Address and Interface In or Out**: Filters for the router address and router interface (in or out) index number
- **Router Address and Interface Out**: Filters for the router address and router interface (out) index number
- **Source Address**: Filters for the IP address of one or multiple source hosts
- **Source Autonomous System**: Filters for the autonomous number for the source network
- **Source MAC Address**: Filters for the source MAC address
- **Source Mask**: Filters for the IP mask of a source network
- **Source or Destination Address**: Filters for the IP address of a source host or a destination host
- **Source or Destination MAC Address**: Filters for the source or destination of the MAC address
- **Source or Destination Mask**: Filters for the IP mask of a source network or a destination network
- **Source or Destination Port**: Filters for the source port number or the destination port number
- **Source or Destination VLAN**: Filters for the source or destination of the VLAN
- **Source Port**: Filters for the source port number
- **Source VLAN**: Filters for the source VLAN
- **TCP Flags**: Filters for the Transmission Control Protocol (TCP) flags
- **Type-of-service**: Filters for the IP type of service number (0 through 255)
- **Volume of Bytes In**: Filters for the volume of bytes in
- **Volume of Packets In**: Filters for the volume of packets in

View a Flow Forensics Report

Complete the following steps to view an existing Flow Forensics report.

Follow these steps:

1. Select **Flow Forensics** from the NFA console menu.
2. Click the parent folder that contains the report.
   The list of reports in the folder opens.
3. Click the check box next to the report that you want to view.
4. Click **Run**.
   A verification message opens.
5. Click **OK**.
6. Refresh the view until the report status is **Complete**.
   The report results are displayed.

Analysis Reports

You can troubleshoot problems as they occur by using Analysis reports to identify issues before users in your environment are adversely affected.

An Analysis report is designed to compare collected network data to a threshold so you can identify potential bottlenecks, anomalies, and viruses. Analysis reports help you identify potential problems before they become serious issues. You can schedule these reports to run regularly, which means you can continually analyze your network traffic for potential issues.

To open the Analysis page, click **Analysis** in the NFA console menu.

The **Analysis** page includes the following options:

- **New**
  Create an Analysis report.
- **Run**
  Execute one or more reports at the same time.
- **Move to Folder**
  Transfer one or more reports to a different directory.
- **Cancel**
  Immediately stop the execution of one or more reports that are running.

When you create **Analysis** reports, you specify protocol, ToS, host, and conversation filters to use. The valid filters and combinations of filters are:

- No filters
- Protocol filters
- ToS filters
- Protocol and ToS filters
- Protocol and host filters
- Protocol and conversation filters
- ToS and conversation filters
- ToS and host filters
- Conversation filters
- Host filters

The troubleshooting capabilities of DX NetOps are not limited to the features discussed in these topics.

Scheduled Reports

You can schedule an analysis report over a particular duration of time. These duration reports are the only reports which can be scheduled to repeat. You can email a report on a scheduled basis, but the same report will be emailed every time unless someone manually runs the report for a different time period.

A scheduled report begins the next scheduled report at the `scheduled_next` value in the database. This value is visible as the **Next run** in the **Reporting Period** when editing an Analysis Report. When the report starts this value is set as the **End Time** of the report.

The `scheduled_last` value in the database is updated with this value. This time is the last time the report, which is currently running, was scheduled to run.

Using the report time zone, this time is converted to Unix Time and all further calculations are done in Unix Time. A scheduled report displays the results in GMT regardless of the time zone used to specify the start time for the report.

If a time filter is specified it alters the data which is displayed but not the duration of the report. The time filter allows the user to create a report that shows data only for a time period of interest. That portion of the reporting period which falls outside the time period of interest will have no data displayed.

A scheduled report can be saved or saved and queued. If the report is saved, it first runs at the next scheduled time for the report. If the report is saved and queued, the first run starts immediately and covers the duration specified in the report, with the end time the point in time when the report was queued, not the scheduled time of the report.

Adding information about the duration, time filters, interfaces, protocols, etc. into the description of the report will help a person reviewing the report understand the data being presented.

Create, Change, or View an Analysis Report

No Analysis reports are installed by default. A report folder named **Analyses** exists by default, which you cannot delete. You can store your saved Analysis reports in this folder or you can create other folders to organize your Analysis reports.

Create an Analysis Report

Follow these steps:

1. Select **Create New Report**.
   The **Analysis Wizard** opens and displays options for creating an analysis definition or modifying a copy of an existing analysis definition.
2. Select one of the options and click **Next**.
   – **Create a new analysis**
   Define an entirely new **Analysis** report.
   – **Copy an existing analysis**
   Select an existing report to copy and use as a basis for the new report.
   If you select **Create a new analysis**, the **Select Interfaces** page of the Analysis wizard opens.
3. Select interfaces or interface groups for the report.
   a. Click one of the following options:
   – • **Add Interface Filter**
   Select one or more individual interfaces from the **Interface Index**.
   a. • **Add Interface Group Filter**
   Select one or more interface groups from the **Interface Group Selection** list.
   The selected interfaces are added to the interface list.
   b. Accept the default value or set the **Inclusion** value for each interface or interface group:
   • **Include** sets the program to use report data from the interface or group.
   • **Exclude** sets the program to eliminate data from the interface or group.

c. Click **Next**.
The **Specify Filters & Threshold** page opens.

4. Specify the settings on the **Specify Filters & Threshold** page:
   a. (Optional) Specify filters for gathering or excluding report data, then set the Inclusion value for each filter to **Include** or **Exclude**:
      - **Add Protocol Filter**
        Select individual protocols from the **Protocol Index**.
      - **Add Protocol Group Filter**
        Select protocol groups from the **Protocol Group Index**.
      - **Add ToS Filter**
        Select individual ToS values from the **ToS Index**.
      - **Add ToS Group Filter**
        Select ToS groups from the **ToS Group Index**.
      - **Add Host Filter**
        Specify a host IP address and mask.
      - **Add Conversation Filter**
        Identify the IP addresses and mask for each party in the conversation pair.
   b. Accept the default value or set the Inclusion value for each filter you specified:
      - **Include**
        For each filter listed, use only the data of the listed type. For example, use data from the listed protocol group, but not from other protocol groups.
      - **Exclude**
        For each filter listed, do not use the data of the listed type. For example, do not use data from the listed protocol group, but do use data from other protocol groups.
   c. Set the **Threshold Settings** values to specify the threshold that is used for the Analysis report.
   d. Click **Next**.

   For example, to report on overutilized interfaces you might specify a threshold to examine total traffic that goes above 70 percent utilization.
5. Click **Next**.
   The **Specify Schedule** page opens.
6. Select the type of reporting period from the **Period** list on the **Specify Schedule** page:
   – **Duration**
     Limits the reporting period to an amount of time, ending at the time the report runs. Enter the number of time units in the **Last** box. Select a unit of time from the list (days, weeks, months, or years).
     You can set up a schedule for a **Duration** report or you can run the report on demand.
   – **Start and end**
     a. Use one of the following methods to specify a **Start** date and **End** date:
        Select the calendar icons and click dates to specify the **Start** and **End** of the report period.
        Select hour and time values from the lists. Hour values are expressed in 24-hour format.
     b. Enter the number of time units in the **Resolution** box. Select a value from the list for **Start** and **End**.
        A Start-and-End report runs on demand. You cannot set up a schedule for a Start-and-End report.
7. Accept the default **Resolution** setting on the **Specify Schedule** page or enter the number of time units in the **Resolution** box. Select a unit of time from the list (minutes, hours, days, weeks, months, or years).
8. (Optional) Select a time filter from the list on the **Specify Schedule** page, if your Administrator has created a time filter that is appropriate for your report.

   TIP
   The time filter information does not display on the report as part of the date and time. Give the report a name and description that reflects the selected time filter.

9. (Optional) Select the **Schedule** check box on the **Specify Schedule** page and specify the following options:
   a. **Schedule**: Select the type from the **Schedule** list.
      - **Daily**: Select the day or days of the week, time of day, and time zone for report generation.
      - **Weekly**: Select the day of the week, time of day, and time zone for report generation.
      - **Monthly**: Select either the date or the week in the month and day of the week. Select the time of day, and time zone for report generation.
      - **Quarterly**: Select a month that ends the first reporting quarter, time of day, and time zone.
      - **Yearly**: Select a month that ends the first reporting year, time of day, and time zone.
   b. (Optional) **Email Results To**: Enter the email addresses of all the report recipients in the format name@domain. Separate multiple addresses with a comma or semi-colon.

      NOTE
      The options in the **Recurrence** section are available only if you select **duration** as the reporting period type.
10. Click **Next**.
    The **Enter Name** page opens.
11. Identify the report and its location:
    – **Folder**
      Accept the default folder or select a different folder to contain the new report.
    – **Name**
      Give the new report a name that will appear in the **Reports** list.
    – **Description**
      (Optional) Add a description to help identify the report. For example, you may to use the description to identify scheduled reports and to indicate distinguishing features of Duration reports. Include any time filter information, for ease of identification.

    Click **Next**. The **Summary & Submit** page opens.
12. Review the information in the **Report Definition Summary**.
    – **Save**
      Save the report definition and return to the **Analysis** page. The report will run on the schedule selected.
    – **Save and Queue Report**
      Queue the report to run and return to the **Analysis** page. The report will run now for the data available for the duration selected.
    – **Back**
      Return to previous pages in the wizard to redefine the report.

Edit an Analysis Report

When you view an Analysis report, you may want to review the **Report Definition Summary** to ensure that the report definitions are correct. This summary provides access to the Analysis wizard pages in case you want to change any settings.

Follow these steps:

1. In the **Report Settings** section at the top of the report page, click **Edit**.
   The **Report Definition Summary** is displayed.
2. Review the current settings for the Analysis report.
3. Click the name of a category to open the associated page for making changes.
4. When you have made all the desired changes, click **Queue Report** to regenerate the report with the new settings. You return to the **Reports** list, which shows the modified report with a status of **Queued**. When the report has been regenerated and is ready to be viewed, the status displays as **Complete**.
   A scheduled report will be queued and will be generated at the next scheduled runtime.

View an Analysis Report

When you have defined the Analysis reports that you need, you are ready to generate a new report and to view it in the NFA console. You can run and view the following types of reports:

- Unscheduled duration reports on demand.
- The most recent versions of scheduled duration reports that have been generated automatically.
- The most recent versions of start-and-end reports.

Follow these steps:

1. Select **Analysis** from the NFA console menu if the **Analysis** page is not already open.
   The **Analysis** page contains two panes. The left pane lists the folders that are used to store saved report definitions. The right pane lists the reports in the currently selected folder.
2. Click the name of the folder that contains the report you want to view.
3. Click the report name in the **Reports** list.
   The report runs. The results are displayed when report generation is complete.

You can click an interface name to display more information about that interface. For example, you may be able to view a calendar chart that shows the time and duration of a violation.

Site to Site Reports

Site to Site reports enable you to view volumes of data between two or more sites. Sites can be defined as a collection of subnets that can also be discontiguous.

Use Site to Site reports to compare bytes in, rate in, bytes out, and rate out between pairs of sites. You can export the displayed data to a file in comma-separated value (CSV) format.

The reports can be configured for:

- Sites involved in the report (including creation of site definitions)
- Report schedule (scheduled or on demand)
- Time period
- Selecting data granularity (1-minute or 15-minute data)

You can use saved report definitions to generate an updated report at any time. As the number of reports grows, use the folder management system to keep the reports organized and accessible.

Scheduled Reports

You can schedule a Site to Site report over a particular duration of time. These duration reports are the only reports which can be scheduled to repeat. You can email a report on a scheduled basis, but the same report is emailed every time unless someone manually runs the report for a different time period.

A scheduled report begins the next scheduled report at the `scheduled_next` value in the database. This value is visible as the **Next run** in the **Reporting Period** when editing a Site to Site Report. When the report starts this value is set as the **End Time** of the report.

The `scheduled_last` value in the database is updated with this value. This time is the last time the report, which is currently running, was scheduled to run.

Using the report time zone, this time is converted to Unix Time and all further calculations are done in Unix Time. A scheduled report displays the results in GMT regardless of the time zone used to specify the start time for the report.

If a time filter is specified it will alter the data which is displayed but not the duration of the report. The time filter allows the user to create a report with shows data only for a time period of interest. That portion of the reporting period which falls outside the time period of interest has no data displayed.

A scheduled report can be saved or saved and queued. If the report is saved, it first runs at the next scheduled time for the report. If the report is saved and queued, the first run starts immediately and covers the duration specified in the report, with the end time the point in time when the report was queued, not the scheduled time of the report.

Adding information about the duration, time filters, interfaces, protocols, etc. into the description of the report will be descriptive text to help a person reviewing the report understand the data being presented.

Create or View a Site to Site Report

When you click the **Site to Site** tab, the **Saved Report Folders** pane displays on the left and any existing reports display on the right.

You can perform the following tasks in the **Saved Report Folders** pane: create folders, rename folders, and delete custom folders. You cannot delete the default **Site to Site Reports** folder. Create additional folders to provide more extended organization for your Site to Site reports.

The right pane displays the Site to Site report definitions in the currently selected folder. Use the links at the top and bottom of the pane to delete or run selected reports, as well as to create or move reports.

Create a Site to Site Report

Use the Site to Site wizard to create a site to site report step by step. The wizard guides you to select many options, such as the sites involved in the report, the report schedule, the data resolution (1-minute or 15-minute), and the reporting period.

Follow these steps:

1. Select **Site to Site** from the NFA console menu.
2. Click **New**.
   The **Site to Site Report Wizard** opens and shows the options **Create a new Site to Site report** and **Copy an existing report**.
3. Click **Create a new Site to Site report** and click **Next**.
   Note: Alternatively, you can select the **Copy an existing report** option and modify an existing report.
   The **Select Sites** page opens.
4. Select at least two sites for the report.
   You can either click **Select Sites** to select an existing site or sites, or create a new site definition.
   To create a new site definition:
   a. Click **Create Site**.
   b. Click **Save and Add New Site** to create a new site definition without adding it to the report, or **Save and Add Sites to Report** to add a new definition to the report.
   c. Enter
      - **Site Name**

        NOTE
        Site names are unique within a tenant.
      - **Site Description** (optional)
   d. Click **Add Network.**
      - **Network Name**
      - **Network Subnet**
   e. (Optional) Click **Add Network** to add additional networks to the site definition.
   f. Click **Save and Add Sites to Report**.
   The selected sites are added to the site list.
5. Click **Next**. The **Specify Schedule** page opens.

6. Select the type of reporting period from the **Period** list in the **Reporting Period** area:
   - **duration**: Limits the reporting period to an amount of time, ending at the time the report runs. Enter the number of time units in the **Last** box.
     Select a unit of time from the list (**days**, **weeks**, **months**, or **years**).
     You can set up a schedule for a duration report or you can run the report on demand.
   - **start & end**: Specify a **Start** date and **End** date either by using the calendar icons or by selecting hour and time values from the lists. Hour values are expressed in 24-hour format.
7. Select the data resolution (1-minute or 15-minute) in the **Resolution** box.
8. (Optional) Select the **Schedule** check box in the **Recurrence** area and specify the following options:
   - **Schedule**: Select the type from the Schedule list.
     - **Daily**: Select the day or days of the week, time of day, and time zone for report generation.
     - **Weekly**: Select the day of the week, time of day, and time zone for report generation.
     - **Monthly**: Select either the date or the week in the month and day of the week. Select the time of day, and time zone for report generation.
     - **Quarterly**: Select a month that ends the first reporting quarter, time of day, and time zone.
     - **Yearly**: Select a month that ends the first reporting year, time of day, and time zone.

     NOTE
     The options in the **Recurrence** section are available only if you select **duration** as the reporting period type.
9. (Optional) Enter the email addresses of all the report recipients in the format *name@domain*. Separate multiple addresses with a comma or semi-colon.
10. Click **Next**. The **Enter Name** page opens.
11. Identify the report and its location:
    - **Folder**: Accept the default folder or select a different folder to contain the new report.
    - **Name**: Give the new report a name, which appears in the **Reports** list.
    - **Description**: (Optional) Add a description to help identify the report. For example, use the description to identify scheduled reports and to indicate distinguishing features of duration reports.

    Click **Next**. The **Summary & Submit** page opens.
12. Review the information in the **Report Definition Summary**.
    - **Save**: Save the report definition and return to the **Site to Site** page.
    - **Save and Queue Report**: Queue the report to run and return to the **Site to Site** page.

Define Site to Site Reporting Periods and Schedules

When you define a Site to Site report, you must specify the reporting time period and the resolution of the reporting data. You can define a specific, nonrecurring time period (for a start-and-end report) or you can choose a timespan that ends at the report runtime (for a duration report). You also have the option to set a duration report to regenerate on a recurring schedule and to have the automated reports sent out by email.

Specify a Reporting Period

The Site to Site Wizard provides a **Specify Schedule** page that defines the report time period. For a manually generated report, you can simply select a time period, resolution, and optional time filter. If you want to generate the report automatically at scheduled intervals, you can also use the **Schedule** option.

Follow these steps:

1. Select **Site to Site** from the NFA console menu if the **Site to Site** page is not already open.
2. Put the report in editable mode: Click the name of the report. If the report has been run previously, it runs again. In this case, click **Edit** in the **Report Settings** section at the top of the report page.
   The **Report Definition Summary** page opens, which contains links to the Site to Site wizard pages.
3. Click **Reporting Period** to open the **Specify Schedule** page of the Site to Site wizard.

NOTE
Site to Site reports display data using the Greenwich Mean Time (GMT) time zone. Even if a user has set the time to a specific time zone, the reports display the data using GMT.

4. Select the type of reporting period from the **Period** list on the **Specify Schedule** page:
   – Duration: Include data from the block of time that immediately precedes the report runtime. Enter a number of days, weeks, months, or years.
   You can set up a schedule for a duration report or you can run the report on demand. To run a scheduled report on demand, you can make a copy of the report and can disable the schedule in the copy.
   – Start and end: Include data from a specific, nonrecurring timespan. Use the calendars to specify a Start date and End date or select hour and time values from the lists.
   Hour values are expressed in 24-hour format.
   A start-and-end report runs on demand. You cannot set up a schedule for a start-and-end report.
5. Set the resolution (granularity for data collection) on the **Specify Schedule** page: Accept the default setting or select a value in the **Resolution** box.
6. (Optional) Select a time filter from the list on the **Specify Schedule** page, if your Administrator has created an appropriate time filter.

   TIP
   The time filter information does not display on the report as part of the date and time. Give the report a name and description that reflects the selected time filter.
7. Click **Save Changes**.
   Your changes are saved and you return to the **Report Definition Summary**.
8. (Optional) Return to the report list by clicking one of these buttons:
   – **Return to Listing**: Return to the **Site to Site** page without queuing the report to run.
   – **Queue Report**: Queue the report to run and return to the Site to Site page.

Specify Schedules for Auto-Generated Reports

Use the **Schedule** option to set the Site to Site report to regenerate at specified times.

For example, suppose that you want to check network traffic during the monthly backups that occur on the last Sunday of each month. You schedule a report to be regenerated on the last Sunday of every month. Suppose that operating system updates occur on the 15th of every month. To check the network traffic during those updates, you schedule a report to be regenerated on the 15th of each month.

NOTE
The options in the **Recurrence** section are available only if you select ‘duration’ as the reporting period type.

Follow these steps:

1. Select **Site to Site** from the NFA console menu if the **Site to Site** page is not already open.
2. Put the report in editable mode: Click the name of the report. If the report has been run previously, it runs again. In this case, click **Edit** in the **Report Settings** section at the top of the report page.
   The **Report Definition Summary** page opens, which contains links to the Site to Site wizard pages.
3. Click **Reporting Period** to open the **Specify Schedule** page of the Site to Site wizard.
4. Click the **Schedule** check box and choose a recurrence interval from the list:
   – **Daily**: Select the day or days of the week the report will run.
   – **Weekly**: Select the day of the week the report will run.
   – **Monthly**: Select either a date or a week and day combination to specify the one day per month the report will run.
   – **Quarterly**: Select the month that ends the first quarter in which the report will run. Starting with the specified quarter, the report will run on the last day of each quarter.
   – **Yearly**: Select the month that ends the first year the report will run. The report runs on the last day of the year.
   For all schedule interval types, select the time of day and time zone for the report to run.

5. (Optional) **Email Results To**: Enter the email addresses of anyone who should receive the report by email. Use the format *name@domain*. Separate multiple addresses with a comma or semi-colon.
6. Click **Save Changes**.
   Your changes are saved and you return to the Report Definition Summary.
7. (Optional) Return to the report list by clicking one of these buttons:
   – **Return to Listing**: Return to the **Site to Site** page without queuing the report to run.
   – **Queue Report**: Queue the report to run and return to the **Site to Site** page.

View a Site to Site Report

Complete the following steps to view an existing Site to Site report.

Follow these steps:

1. Select **Site to Site** from the NFA console menu if the **Site to Site** page is not already open.
2. Click the parent folder that contains the report.
   The list of reports in the folder opens.
3. Click the check box next to the report that you want to view.
4. Click **Run**.
   A verification message opens.
5. Click **OK**.
6. Refresh the view until the report status is **Complete**.
   The report results are displayed.

Manage Reports

Creating reports for your organization helps to troubleshoot various issues. Report definitions are saved so you can generate an updated report at any time or can use the report definition as a template to create another report. As the number of reports grows, use the folder management system to keep the report definitions easy to find.

The report folders are listed on the left. There are built-in folders, which you can rename, but cannot delete:

- Custom Reports
- Flow Forensics Reports
- Analyses
- Site to Site Reports

Create additional folders to provide more extended organization for your reports.

The right pane displays the names of the reports in the currently selected folder. Use the links at the top and bottom of the pane to delete or run selected reports, and to create or move report definitions.

Create a Report Folder

Create your own report folders to group reports. For example, you can use folder names to identify the purpose for a set of reports.

Follow these steps:

1. Navigate to the page for the report type: **Custom Reporting**, **Flow Forensics**, **Analysis**, or **Site to Site**.
2. Click **New** at the bottom of the **Saved Report Folders** pane.
   A pop-up dialog opens.
3. Enter a name for the new folder in the pop-up dialog.
4. Click **OK**.

The dialog closes and the new folder appears in the **Saved Report Folders** pane.

Move a Report to Another Folder

You can add folders and move report definitions among the folders to make the report definitions easier to find or to help identify them.

Follow these steps:

1. Navigate to the page for the report type: **Custom Reporting**, **Flow Forensics**, **Analysis**, or **Site to Site**.
2. In the **Reports** pane, select the check box next to all the reports that you want to move.
3. Click **Move to Folder**.
   A pop-up dialog opens.
4. Select a destination folder from the list.
5. Click **OK**.
   The dialog closes. The reports are now in their new location, and are visible when you click that folder name in the **Saved Report Folders** pane.

Rename a Report Folder

You can change the name of a report folder, including the name of the default report folder.

Follow these steps:

1. Navigate to the page for the report type: **Custom Reporting**, **Flow Forensics**, **Analysis**, or **Site to Site**.
2. In the **Reports** pane, select the check box next to the report folder that you want to rename.
3. Click **Rename**.
   A pop-up dialog opens.
4. Enter a new name for the folder in the pop-up dialog.
5. Click **OK**.
   The dialog closes. The new report folder name appears in the **Saved Report Folders** pane.

Delete Saved Report Definitions

When a saved report definition is no longer needed, you can delete it. You can delete one report definition at a time, or you can delete multiple definitions in a single folder simultaneously. Be sure that you do not delete a report definition that is useful as a template for creating other reports. Deleted report definitions cannot be restored.

Follow these steps:

1. In the **Reports** pane, select the check box next to all report definitions that you want to delete.
2. Click **Delete**. A confirmation dialog opens.
3. In the confirmation dialog, click **OK**.
   The confirmation dialog closes. The list of saved report definitions is updated.

Delete Report Folders

You can delete unneeded report folders and their contents. Be sure that you do not delete useful report definitions or folders. Deleted folders and report definitions cannot be restored.

Follow these steps:

1. In the **Saved Report Folders** pane, select the check box next to all the report folders that you want to delete.
2. Click **Delete**.
   A confirmation dialog opens. If the folders contain report definitions, the confirmation dialog reminds you of the number of report definitions that will be deleted.

3. In the confirmation dialog, click **OK**.
   The confirmation dialog closes. The list of saved report definitions is updated.

Views in Performance Center

You can view data from DX NetOps in Performance Center Console dashboards and Interface pages. Some of the views can be found in both consoles, although the view format and options may be different.

The topics in this section describe the Performance Center views that have DX NetOps data. The topics also describe the basics of working with the views.

Dashboards and Views

Dashboards are dynamic report-building pages in the Performance Center Console. Dashboards are accessible from the **Dashboards** tab (CA PC) or **Reports** tab (NPC). Each dashboard is a collection of views that present data from registered data sources on a single web page. The layout, views, time interval, and group context of each dashboard can be customized.

> **NOTE**
> Your user account role rights determine the dashboards that you can see.

Reports are static output from an on-demand selection or an exported dashboard page. Reports that you export from a dashboard create a static data set from the data and information in the associated dashboard. On-demand reports capture a data set from a single managed item or group in the Inventory. You can print reports, send them by email, or export them in CSV or PDF format. For each format, the report captures a selected data set.

Dashboards are organized in menus. *Menus* in the Performance Center Console are lists of items in the **Dashboards** tab (CA PC) or **Reports** tab (NPC). Menus group similar dashboards or report pages together. By default, Administrators and Designers can customize menus and assign them to user account roles.

Performance Center has a set of built-in dashboards and menus, which are available for use immediately after your administrator registers the product as a data source. Users who have the required role rights can customize dashboards, menus, and views to create a custom system for individual operators.

The menus and dashboards that are available to you are displayed when you hover over or click the **Dashboards** or **Reports** tab.

Performance Center Dashboards

Performance Center dashboards display views of data from registered data sources such as DX NetOps. *Views*, or *data views*, present statistical data, usually in a graph or table format. Each view represents a discrete set of collected data. Depending on your user account role rights, you can add and edit individual views or remove them from a dashboard page. In some cases, you can export the data to a file in CSV format.

View placement on dashboard pages is flexible. Users with the required role rights can customize dashboards. They can, for example, place views of application performance data beside views of volume data to help troubleshoot issues from a single page.

The predefined (factory) dashboards are organized into workflows. You can drill down from Top N views to more detailed metrics from a narrow context, such as an individual device. Workflows let you see data that may be related to the metric you are reviewing.

Administrators can create custom groups to display data for a specific set of sites, devices, or interfaces. You can apply groups to dashboards by using the group selector (the 'change' link at the top left). You can change the “context” of the dashboard to analyze data for specific groupings at the summary, device, or item level.

Views that show data for a group are CA Performance Center-generated views that contain rollups of data from data sources. Views that show data for a server or device, or detailed metrics from a narrow context often provide a drilldown path directly to the data source. The Single Sign-On feature lets you navigate seamlessly from a dashboard to a data source interface.

Types of Report Pages

Two categories of dashboards are available by default or through customization:

Summary pages provide high-level information, such as averages from groups of managed items. Summary dashboards often provide a drilldown path to more detailed, related pages from a selected context.

Context pages provide specific, focused performance or status data from a narrow context, such as a single router or server. These pages are available as drill-down links or tabs from Summary dashboards.

To drill in to a detailed view from a Summary dashboard, take one of the following steps:

- Right-click the item to select the context page that you want to see.
- Click the item to open the default context page.

> **NOTE**
> Your role rights must include the ability to Drill into Views.

Default sets of context pages are available for individual devices, interfaces, and servers. These pages include a set of customizable tabs that let you access more specific context data for a selected managed item. For example, the Router context includes tabs for **Health**, **Utilization**, and **Error** data.

Context Page Navigation

You can frequently access more information about individual managed items from dashboards. Most dashboards are composed of views of summary data, such as hourly rollups or averages from a group of items. If additional data is available from the data source, you can click linked items on the dashboard page to drill down into *context pages*.

> **NOTE**
> The role right to Drill into Views is required.

The views on context pages show filtered data from a narrow context, such as a view of data from a single managed item. Use the links to drill down into specific data and home in on the source of a performance problem.

In data views from some data sources, you can also right-click the name of an item in a table view to access a menu. For example, right-click the link that corresponds to an item name in the Inventory section. A menu lets you select a related context page, containing more granular data.

Finally, some context pages include tabs to additional pages of detailed data. Click a tab to see data that has been filtered by a selected managed item or type of item.

CA Network Flow Analysis Views in Performance Center

You can display DX NetOps data in the Performance Center Console in several ways:

CA Performance Center

Built-in CA Performance Center Dashboards with Enterprise-Wide Data:

- **Infrastructure Overview dashboard**:

  - Interfaces Over Threshold
  - Routers with the Most Flow Traffic
  - Top Enterprise Hosts by Volume
  - Top Enterprise Protocols by Volume
  - Top Flows by Interface
  - Top IP Interface Utilization (Flow)
- **Management: Management Overview dashboard**:
  - Top Flows by Interface
  - Top IP Interface Utilization (Flow)
- **Management: Network Overview dashboard**:
  - Top Enterprise Hosts by Volume
  - Top Enterprise Protocols by Volume
- **Capacity Planning: Router/Switch Capacity Watch Lists dashboard**:
  - Routers with the Most Flow Traffic

Custom CA Performance Center Dashboard Views with Interface-Specific Data: Display interface-specific DX NetOps data by adding the following views:

- Calendar Heat Chart (Flow)
- Stacked Protocol Trend
- Stacked ToS Trend
- Top Conversations (Bar)
- Top Conversations (Pie)
- Top Conversations (Table)
- Top Hosts (Bar)
- Top Hosts (Pie)
- Top Hosts (Table)
- Top Protocols (Bar)
- Top Protocols (Pie)
- Top Protocols (Table)
- ToS Summary (Pie)
- ToS Summary (Table)

Built-In CA Performance Center Interface Page Views with DX NetOps Data:

- **IP Performance tab**:
  - Stacked Protocol Trend
  - Top Conversations (Pie)
  - Top Hosts (Pie)
  - ToS Summary (Pie)
- **CBQoS tab**:
  - Stacked Protocol Trend
  - Stacked ToS Trend

CA NetQoS Performance Center

Enterprise-Wide Data on Built-in Dashboards in the CA NetQoS Performance Center Console:

- **Enterprise Dashboard**:

  - Interfaces Over Threshold
  - Top Enterprise Hosts by Volume
  - Top Enterprise Protocols by Volume
- **Traffic Analysis**:
  - Interfaces Over Threshold
  - Top Enterprise Hosts by Volume
  - Top Enterprise Protocols by Volume
  - Top IP Interface Utilization (Flow)
- **Network Overview**:
  - Top Enterprise Hosts by Volume
  - Top Enterprise Protocols by Volume
- **Routers/Switches Overview**:
  - Interfaces Over Threshold

Custom Dashboard Views with DX NetOps Data

Display DX NetOps data on custom report pages by adding the following views:

- Interfaces Over Threshold
- Multi-Interface Stacked Protocol Trends
- Multi-Interface Stacked ToS Trends
- Routers With the Most Flow Traffic
- Top Enterprise Hosts By Volume
- Top Enterprise Protocols By Volume
- Top Flows by Interface
- Top IP Interface Utilization (Flow)

Interface Page Views with DX NetOps Data in the CA NetQoS Performance Center Console:

- **Interface Capacity tab**:
  - Stacked Protocol Trend
  - Top Conversations (Pie)
  - Top Hosts (Pie)
- **Interface QoS tab**:
  - Stacked Protocol Trend
  - Stacked ToS Trend
  - Top Conversations (Pie Chart)
  - Top Hosts (Pie Chart)
  - Top Protocols (Pie Chart)
  - ToS Summary (Table)

Custom Interface Tab with DX NetOps Data Views

Display DX NetOps data on custom **Interface** pages by adding the following views:

- Calendar Chart (Flow)
- Top Conversations (Bar Chart)
- Top Conversations (Pie Chart)
- Top Conversations (Table)
- Top Hosts (Bar Chart)
- Top Hosts (Pie Chart)
- Top Hosts (Table)
- Top Protocols (Bar Chart)
- Top Protocols (Pie Chart)
- Top Protocols (Table)
- ToS Summary (Pie Chart)
- ToS Summary (Table)
- Stacked Protocol Trend
- Stacked ToS Trend

Enterprise-Level Views

You can view enterprise-wide data from DX NetOps in several Performance Center dashboard views, which are described in the topics that follow. The *top* interfaces, hosts, protocols, or ToS are the ones that have the highest traffic volume during the reporting period.

Top Enterprise Hosts by Volume

The **Top Enterprise Hosts by Volume** view in the Performance Center Console shows the enterprise hosts that have the highest traffic volume, as reported by DX NetOps.

The view shows a bar for each of a maximum of 10 hosts that have the highest traffic volume. The bar chart includes the following information:

- **Host**
  Identifies the host server by its name and IP address (Y-Axis). If an administrator has defined an alias for the device, the alias is displayed. Otherwise, the discovered device name is displayed.
- **Volume**
  Measures the total amount of data sent to or from the host, expressed in a scale that is appropriate for the highest-volume host (X-Axis).

Performance Center views show the data from the time range that is defined for the page.

Opening the View

To see this view in the Performance Center Console, go to one of the following locations:

- (CA PC) **Infrastructure Overview**, **Network Overview**, or **Summary** context custom dashboard
- (NPC) **Enterprise**, **Traffic Analysis**, **Network Overview**, and custom dashboards

Available Actions

You can perform several actions in this view, including the following:

- Change the view name by editing the view settings.
- Display details in a Tooltip by holding your cursor over a bar.
- Click a name or bar to open related views in the NFA console.

Find the Comparable View in the NFA Console

The **Top Enterprise Hosts by Volume** view is similar to the **Top Hosts** view on the **Enterprise Overview** page in the NFA console.

Top Enterprise Protocols by Volume

The **Top Enterprise Protocols by Volume** view in the Performance Center Console shows the protocols with the highest volume of network traffic across the enterprise.

The view includes the following information for a maximum of 10 protocols that are associated with the highest traffic during the reporting period:

- **Protocol**
  Identifies the protocol by its keyword (Y-Axis).
- **Volume**
  Measures the total amount of data associated with the protocol expressed in a scale that is appropriate for the highest-volume protocol (X-Axis).

Performance Center views show the data from the time range that is defined for the page.

Opening the View

To see this view in the Performance Center Console, go to one of the following locations:

- (CA PC) **Infrastructure Overview** or **Network Overview** dashboard; **Summary** context view in a custom dashboard
- (NPC) **Enterprise**, **Traffic Analysis**, **Network Overview**, and custom dashboards

Available Actions

You can perform several actions in this view, including the following ones:

- Change the view name in the view settings.
- Display details in a Tooltip by holding your cursor over a bar.
- Click a name or bar to open related views in the NFA console.

Find the Comparable View in the NFA Console

The **Top Enterprise Protocols by Volume** view in the Performance Center Console is similar to the **Top Protocols** view on the **Enterprise Overview** page in the NFA console.

Top IP Interface Utilization (Flow)

The **Top IP Interface Utilization (Flow)** views in the Performance Center Console show the high-utilization interfaces from across the enterprise.

The view includes the following information for a maximum of 10 top interfaces during the reporting period:

- **Name**
  Identifies the interface by its device name/interface name (Y-Axis).
- **Percent (Utilization)**
  Measures the percentage of interface capacity that was used (X-Axis). The view shows the utilization of either inbound or outbound capacity.

Performance Center views show the data from the time range that is defined for the page.

Opening the View

To see this view in the Performance Center Console, go to one of the following locations:

- (CA PC) **Infrastructure Overview** and **Management Overview** dashboards; **Summary-type** view in a custom dashboard
- (NPC) **Traffic Analysis** and custom dashboards

Available Actions

You can perform several actions in this view, including the following ones:

- Change the data direction, view name, and context (the interfaces that are used) by editing the view settings.
- (NPC) Change the utilization thresholds.
- Display details in a Tooltip by holding your cursor over a bar.
- Click a name or bar to open related information on the Interface context pages.

Find the Comparable View in the NFA Console

The **Top IP Interface Utilization (Flow)** view in the Performance Center Console is similar to the **Interface Utilization** view on the **Enterprise Overview** page in the NFA console.

Top Flows by Volume

The **Top Flows by Volume** views in the Performance Center Console show the interfaces across the enterprise that have the highest volume of inbound or outbound traffic.

The view shows the following information for a maximum of 10 top interfaces:

- **Name**
  Identifies the interface by its device name (such as its router name), followed by a colon (:) and the interface name (Y-Axis).
- **Volume**
  Measures the volume of flow data on the interface (X-Axis) expressed in a scale that is appropriate for the highest-volume interface.

Performance Center views show the data from the time range that is defined for the page.

Opening the View

To see this view in the Performance Center Console, go to one of the following locations:

- (CA PC) **Infrastructure Overview** and **Management Overview** dashboards; **Summary** context view in a custom dashboard
- (NPC) Custom dashboard

Available Actions

You can perform several actions in this view, including the following ones:

- Change the data direction or the view name by editing the view settings.
- Display details in a Tooltip by holding your cursor over a bar. The Tooltip identifies the interface position among the top 10, with Interface 0 as the one with the highest traffic volume.
- Click a name or bar to open related information on the Interface context pages.

Find Flow Volume Data in the NFA Console

To see the flow volume of multiple top interfaces in the NFA console, create and run a Custom report. For example, you can view flow volume for the top interfaces in summary pie charts, summary tables, trend charts, and stacked trend charts.

To see the flow volume of a single top interface in the NFA console, drill into details from the **Enterprise Overview** page:

1. Click an interface name or bar in one of the **Top Interfaces** views on the **Enterprise Overview** page.
2. Select **Flows** from the list labeled **For this interface, show me** on the **Interface** page that opens.
3. Click the gray bar on the left edge of the page to change the presentation mode.
4. Click **Volume** in the **Presentation** menu that opens.

The **Flows** views display a trend chart of inbound flow volume and outbound flow volume.
To jump to the Performance Center **Interface Pages** data for the selected interface, click the arrow next to the **Flows** title and select **CA PC/NPC Interface Performance**.

Interfaces Over Threshold

The **Interfaces Over Threshold** view in the Performance Center Console lists the most heavily used interfaces throughout the enterprise. A table summary shows the interfaces with utilization that exceeds the configured thresholds.

The **Interfaces Over Threshold** view shows the interfaces whose traffic exceeded the configured thresholds during the reporting period. The view includes the following information for up to ten top interfaces:

- **Status**
  Identifies the interface status as Critical (Red - Meets or exceeds the user-defined Critical threshold) or Warning (Orange - Meets or exceeds the user-defined Warning threshold).
- **Interface Name**
  Identifies the interface by its name. (Depending on the application setting for the name format, the name may be prefixed by the device name.)
- **Traffic Direction**
  Shows whether the data was inbound or outbound on the interface.
- **Speed**
  (CA PC) Records the data speed that is defined for the interface.
- **Average Utilization**
  Measures the average percentage of interface capacity that was used.
- **Percent Time Critical**
  Shows the percentage of the reporting period the interface met or exceeded the Critical threshold.
- **Percent Time Warning**
  Shows the percentage of the reporting period the interface met or exceeded the Warning threshold.

Performance Center views show the data from the time range that is defined for the page.

Opening the View

To see this view in the Performance Center Console, go to one of the following locations:

- (CA PC) **Infrastructure Overview** dashboard; **Summary** context view in a custom dashboard
- (NPC) **Enterprise**, **Traffic Analysis**, **Routers/Switches Overview**, or custom dashboard

Available Actions

You can perform several actions in this view, including the following ones:

- Change the thresholds, view name, and utilization settings as described in this topic.
- (CA PC) Change the columns that are shown in the table: Click near a column border, click **Columns**, then choose the columns to display.
- Click an interface name to open the Interface context pages. You can review details or open additional views of interface data.

How to Change the View Settings

Follow these steps:

1. Open the dialog for editing the view:
   – (CA PC) Click the **Edit** icon
   
   in the view title bar and click **Edit**.
   – (NPC) Click the arrow next to the title name and select **Edit** from the menu.

The dialog opens.

2. (Optional) Edit the text in the **Title** field to change the name in the view title bar.
3. (Optional) Edit the thresholds by changing any of the following values in the **Interfaces Over Threshold Settings** section:
   - **Critical - % Utilization**: Specify the utilization percentage for flagging interfaces with a status of Critical, the highest level of concern. If the utilization for an interface has met or exceeded this percentage, it is marked with a red (Critical) status symbol.
   - **Warning - % Utilization**: Specify the utilization percentage for flagging interfaces with a status of Warning. If the utilization for an interface has met or exceeded this percentage, but has not met the Critical threshold, the interface is marked with an orange (Warning) status symbol.
   - **Affected % of reporting period**: Specify the percentage of the reporting period that a utilization percentage must be violated in order for the threshold to be met.
     For example, if the **Affected % of reporting period** value is 25, the threshold is met for the interfaces that have a utilization level at or above the threshold level during 25% of the reporting period. With the default reporting period of 24 hours, the list includes interfaces at or above the threshold value for six hours or more during the previous 24 hours.
4. (Optional) (NPC) Define a new context to filter the interfaces that can appear in the view: Select **Filter by value** and select a context type and setting in the **Select Context** dialog.
   Interfaces that are not in the selected group do not appear in the view, even if they violate a threshold. If you select a group, the defined context appears under the view title.
5. (Optional) Specify which users are affected by the settings: Select a value from the **Apply Changes** list:
   - **For All Tenant Users**: Saves the changes so that they are only available to users associated with your tenant (possibly the Default Tenant).
   - **My User Account**: Saves the changes to your user account as a default for this view.
   - **My Current Session**: Reverts the changes when you log out.
6. Click **Save** to save your changes, **Cancel** to exit without saving changes, or **Use Defaults** to restore the default values.
   The dialog closes and the view reflects your changes.

Find the Comparable View in the NFA Console

The **Interfaces Over Threshold** view in the Performance Center Console is similar to the **Interface Utilization** view on the **Enterprise Overview** page in the NFA console.

Routers with the Most Flow Traffic

The **Routers with the Most Flow Traffic** view in the Performance Center Console displays the routers in your network that have the highest traffic. Traffic use is measured for both inbound and outbound traffic during the reporting period, as reported by DX NetOps.

The view includes the following information for a maximum of 10 routers:

- **Name**
  Consists of the router IP address and device name (Y-Axis). If an administrator defined an alias for the device item, the alias is displayed. Otherwise, the discovered device name is displayed.
- **Volume**
  Measures the total amount of traffic for the router expressed in megabytes, for example (X-Axis).

Performance Center views show the data from the time range that is defined for the page.

Opening the View

To see this view in the Performance Center Console, go to one of the following locations:

- (CA PC) **Infrastructure Overview** and **Router/Switch Capacity Watch Lists** dashboards; Summary-type view in a custom dashboard
- (NPC) Custom dashboard

Available Actions

You can perform several actions in this view, including the following ones:

- Change the view name by editing the view settings.
- (NPC) Change the context (the routers that can be used in the view).
- Display details in a Tooltip by holding your cursor over a bar.
- Click a router bar to view details in the Performance Center **Router** pages.

Calendar Chart (Flow)

The **Calendar Heat Chart** (Flow) view maps the utilization percentage of the selected interface over time.

This view makes it easy to detect recurring data patterns. Finding a pattern can help you identify the source of high traffic rates and potential performance issues. You might discover that the high traffic rates you thought were intermittent actually follow a pattern. The view can show the hour of each day when utilization is the highest, for example.

Each color represents a severity range that is calculated as a percentage of total capacity. High utilization is shown in orange and red. Low utilization is shown in green and blue.

The view includes the following information:

- **Identifier**
  Consists of the router name, interface name, and interface description (under the view title). The interface description consists of the ifDescr value by default, so it may be slightly different than the interface description that is shown in the NFA console.
  (NPC) The identifier line also includes the interface speed.
- **Month, Date, and Day of the Week**
  Denote the day that the traffic occurred (X-Axis columns).
- **Hour**
  Denotes the hour of the day that the traffic occurred (Y-Axis).

Opening the View

To see the **Calendar Heat Chart** view in the Performance Center Console, add it to a custom dashboard.

Opening the View

To see this view in the Performance Center Console, go to one of the following locations:

- (CA PC) Custom dashboard
- (NPC) **Interface** pages (with an interface selected): **Custom** tab

Available Actions

You can perform several actions in this view, including the following ones:

- Change the data direction and view name as described in this topic.
- (CA PC) Display details in a Tooltip by holding your cursor over a cell.
- (CA PC) Click **Show All** and choose a pattern-matching filter. For example, select **Busy Hour** to show only the data for the busiest hour of each day.

How to Change the View Settings

1. Open the dialog for editing the view:

– 
(CA PC) Click the **Edit** icon in the view title bar and click **Edit**.
– (NPC) Click the arrow next to the title name and select **Edit** from the menu.
The dialog opens.
2. (Optional) Edit any of the following settings in the **Calendar Heat Chart (Flow) Settings** section:
   – **Title**: Change the name that appears in the view title bar.
   – (CA PC) **Time Display Format**: Select the time format for the chart, either 12 hours or 24 hours.
   – (CA PC) **Zone Start**: Set the starting value of each heat zone. The defaults are based on IT industry standards for performance. For example, the default Red Zone Start value is 70 percent utilization.
   Defaults: Green Zone Start = 0, Yellow Zone Start = 50, Orange Zone Start = 60, Red Zone Start = 70.
   – (CA PC) **Business Week Start**: Select the day that starts the business week.
   Default: Monday.
   – (CA PC) **Direction Settings**: Select the direction of traffic on the selected interface to include in the report:
     • **Out**: Outbound on the interface.
     • **In**: Inbound on the interface.
     • **Total**: Combination of inbound and outbound traffic.
3. (Optional) (CA PC) Change the context for the view data: Select a different interface from the **Context Settings** table.
4. (Optional) Specify which users are affected by the setting changes: Select a value from the **Apply Changes** list:
   – **Default for All Users**: Saves the changes to all user accounts as a default for this view.
   – **For All Tenant Users**: Saves the changes so that they are only available to users associated with your tenant.
   – **My User Account**: Saves the changes to your user account as a default for this view.
   – **My Current Session**: Reverts the changes when you log out.
5. Click **Save** to save your changes.
   The settings dialog closes. The view refreshes to reflect your updates.

Find the Comparable View in the NFA Console

To display Calendar Chart data for an interface in the NFA console, select an interface on the **Interface** page and select the following options:

- **Report type**: **Utilization**
- **Presentation** menu option: **Direction In** or **Direction Out**

To display Flow Forensics-level detail, click the **Flow Forensics** link and run a Flow Forensics report.

Interface: Stacked Trend Charts

The **Stacked Trend** views show the top protocol or ToS values that are used for traffic on the currently selected interface. The views are described in the topics that follow.

Stacked Protocol Trend

The **Stacked Protocol Trend** views in the Performance Center Console show the protocols that are used the most heavily for traffic on the selected interface. The views also show when the traffic occurred. A timeline of rates is included for each listed ToS value. You can configure the view to display rate, utilization, or volume information.

The views include the following information:

- **Identifier**
  Identifies the interface that is used for the report. The identifier string consists of the router name, interface name, and interface description (under the view title).

(NPC) The identifier line also includes the interface speed.

- **Protocol Bands**
  Show the data rate, the data volume, or the interface capacity utilization for each top protocol that is associated with traffic on the interface.
- **Time (All Views)**
  Point in time during data transmission--expressed in hours and minutes (X-Axis).
- **Measurement Setting:**
- **Rate:** Data rate at each point in time expressed in kilobits per second, for example (Y-Axis). The rate is calculated by dividing the data volume by the elapsed transmission time.
- **Bytes** (Volume): Data volume at each point in time expressed in kilobytes, for example (Y-Axis).
- **Percent** (Utilization): Percentage of the total interface capacity that the protocol uses (Y-Axis). The utilization percentage is calculated by dividing the data rate by the data speed.

Depending on the data direction, the view shows inbound, outbound, or total data on the interface.

- **Legend**
  Identifies the protocol for each color band by protocol keyword and tcp/udp port (bottom of the view).

Performance Center views show the data from the time range that is defined for the page.

Opening the Views

To see these views in the Performance Center Console, go to one of the following locations:

- (CA PC) Interface Pages (with an interface selected): Custom dashboard; **IP Performance** and **CBQoS** tabs
- (NPC) Interface Pages (with an interface selected): **Interface Capacity**, **Interface QoS**, and custom tabs

> **NOTE**
> You can add Multi-Interface Stacked Protocol Trend views to a custom dashboard or to a custom tab in the Interface pages in the CA NetQoS Performance Center Console. This view consists of a group of interface-specific stacked protocol trend charts

Available Actions

You can perform several actions in this view, including the following ones:

- Change the traffic direction, the type of measurement (**Rate**, **Volume**, or **Utilization**), and the view name by editing the view settings. If the view is on a custom interface context dashboard in the CA Performance Center Console, you can change the interface.
- (CA PC) Zoom in to narrow the time frame.
- (CA PC) Display only the data for a single protocol: Right-click a protocol in the legend at the bottom of the view and click **Focus**. This menu is available for a view that has multiple protocols. (This option is active when the legend contains multiple protocols.)
- (CA PC) Hide data for one of multiple protocols: Right-click a protocol in the legend at the bottom of the view and click Hide.
- (CA PC) Position your cursor over legend items to display explanatory Tooltips.
- Jump to details on an NFA console Interface page by double-clicking a protocol in the legend.
- (NPC) Jump to details on the corresponding Interface page by double-clicking a protocol band in the view. To choose a destination tab on the Interface page, right-click the protocol band and select a tab from the menu.

Find Protocol Trend Data in the NFA Console

You can display protocol volume in the NFA console in trend charts or stacked trend charts for a selected interface:

- *Overview* -- Report type: Overview. Presentation menu options: Mixed Chart; Volume.
  Views: Stacked Protocol Trend (In and Out) for the Top N Protocols, plus other overview views.
- *Top N Protocols, Stacked Trends* -- Report type: Protocols. Filter: Top N Protocols. Presentation menu options: Stacked Trend Chart; Volume.

Views: Stacked Trend for the Top N Protocols (In, Out, and Total).

- *Top N Protocols, Trends* -- Report type: Protocols. Filter: Top N ToS. Presentation menu options: Trend Chart; Volume. Views: Trend (In, Out, and Total) for each of the Top N Protocols.
- *Single Protocol* -- Report type: Protocols. Filter: Single protocol.
  Views: (Depending on the selected report subtype): trends, stacked trends, trend summaries, and multi-trend summaries for protocols, protocol hosts, and protocols in conversations.

To display Flow Forensics-level detail, click the **Flow Forensics** link and run a Flow Forensics report.

Stacked ToS Trend

The **Stacked ToS Trend** views show the interface traffic for the top ToS, including the time the traffic occurred.

A timeline of rates is included for each ToS value. You can configure the view to display rate, utilization, or volume information.

The view includes the following information:

Identifier

Identifies the interface that is used for the report. The identifier string consists of the router name, interface name, and interface description (under the view title).
(NPC) The identifier line also includes the interface speed.

ToS Bands

Show the data rate, data volume, or interface capacity utilization for each top ToS that is associated with traffic on the interface.

Time

Point in time during data transmission expressed in hours and minutes (X-Axis).

Measurement Setting:

- **Rate:** Data transfer rate at each point in time expressed in kilobits per second or a rate that is appropriate for the highest-volume ToS (Y-Axis). The rate is calculated by dividing the data volume by the elapsed transmission time.
- **Bytes** (Volume): Data volume at each point in time expressed in a scale that is appropriate for the highest-volume ToS (Y-Axis).
- **Percent** (Utilization): Percentage of the total interface capacity that the ToS traffic uses (Y-Axis). The utilization percentage is calculated by dividing the data rate by the data speed.

Depending on the data direction, the view shows inbound, outbound, or total data on the interface.

- **Legend**
  Identifies the ToS for each color band by ToS number and label (bottom of the view).

Performance Center views show the data from the time range that is defined for the page.

Opening the View

To see this view in the Performance Center Console, go to one of the following locations:

- (CA PC) Custom dashboard; **Interface** pages (with an interface selected): **CBQoS** tab
- (NPC) **Interface** pages (with an interface selected): **Interface QoS** and custom tabs

Note: You can add Multi-Interface Stacked ToS Trend views to a custom dashboard or to a custom tab in the Interface pages of the CA NetQoS Performance Center Console. This view consists of a group of interface-specific stacked ToS trend charts.

Available Actions

You can perform several actions in this view, including the following ones:

- Change the traffic direction (In, Out, or Total), the type of measurement (Rate, Volume, or Utilization), and the view name by editing the view settings. If the view is on a custom interface context dashboard in the CA Performance Center Console, you can change the interface.
- (CA PC) Zoom in to narrow the time frame.
- (CA PC) Display only the data for a single ToS: Right-click a ToS in the legend at the bottom of the view and click **Focus**. This menu is available for a view that has multiple ToS values. (This option is active when the view contains multiple ToS values.)
- (CA PC) Hide data for one of multiple ToS values: Right-click a ToS in the legend at the bottom of the view and click **Hide**.
- (CA PC) Position your cursor over legend items to display explanatory Tooltips.
- Jump to details on an NFA console **Interface** page by double-clicking a ToS value in the legend.

Find ToS Trend Data in the NFA Console

You can display ToS volume in trend charts or stacked trend charts in the NFA console for a selected interface:

- *Overview* -- Report type: Overview. Presentation menu options: Mixed Chart or Mixed Trend; Volume.
  Views: Stacked ToS Trend (In and Out) for the Top N ToS, plus other overview views.
- *Top N ToS, Stacked Trends* -- Report type: ToS. Filter: Top N ToS. Presentation menu options: Stacked Trend Chart; Volume.
  Views: Stacked Trend for the Top N ToS (In, Out, and Total).
- *Top N ToS, Trends* -- Report type: ToS. Filter: Top N ToS. Presentation menu options: Trend Chart; Volume.
  Views: Trend (In, Out, and Total) for each of the Top N ToS.
- *Single ToS, Stacked Trends/Trends* -- Report type: ToS. Filter: Single ToS value. Presentation menu options: Mixed Trend; Volume.
  Views: Trend (In and Out with baselines), Stacked ToS Trend (In and Out).
- *Single ToS, Trends* -- Report type: ToS. Filter: Single ToS value. Presentation menu options: Mixed Chart; Volume.
  Views: Stacked ToS Trend (In and Out).
- *Conversation* -- Report type: Conversations. Filter: Single conversation source and destination. Report subtype: Protocols. Presentation menu options: Volume.
  Views: Conversation Trend (maximum of 7 views for different timespans).

To display Flow Forensics-level detail, click the **Flow Forensics** link and run a Flow Forensics report.

Interface: ToS Summaries

The **ToS Summary** views show the Type of Service (ToS) values for traffic on the selected interface. The views are described in the topics that follow.

ToS Summary (Pie)

The **ToS Summary (Pie)** view shows an overview of the Type of Service (ToS) values for traffic on the selected interface.

The view includes a pie chart and table of information about the high-volume ToS values in use on the selected interface. The table includes the following information by default:

- **Identifier**
  Identifies the interface that is used for the report. The identifier string consists of the router name, interface name, and interface description (under the view title).
  (NPC) The identifier line also includes the interface speed.
- **Type of Service**

Name of the ToS values associated with high-volume traffic, identified by number and label.

- **Total**
  Shows the total data volume for the reporting period.
- **Percent**
  (CA PC) Lists the percentage of the total data volume for the Top N ToS.

Performance Center views show the data from the time range that is defined for the page.

Opening the Views

To see these views in the Performance Center Console, go to one of the following locations:

- (CA PC) **Interface** pages (with an interface selected): **IP Performance** tab; **Custom** dashboard
- (NPC) **Interface** pages (with an interface selected): **Custom** tab

Available Actions

You can perform several actions in this view:

- Change the traffic direction and view name by editing the view settings. If the view is on a custom interface context dashboard in the CA Performance Center Console, you can change the interface.
- (CA PC) Change the type of measurement.
- Jump to details on an NFA console **Interface** page by double-clicking a ToS name.

Find ToS Summary Pie Charts in the NFA Console

You can display pie charts of ToS summary data in the NFA console for a selected interface:

- *Overview* -- Report type: Overview. Presentation menu option: Pie Chart.
  View: ToS Summary (In and Out) for the Top N ToS.
- *Top N ToS Summary* -- Report type: ToS. Filter: Top N ToS. Presentation menu option: Pie Chart.
  View: ToS Summary (In, Out, and Total) for the Top N ToS.
- *Single ToS Summaries* -- Report type: ToS. Filter: Single ToS. Report subtype: Overview. Presentation menu option: Pie Chart.
  Views: ToS Protocol Summary (In and Out) for the single ToS; ToS Hosts Summary (From and To) for the single ToS; ToS Conversations Summary (Total) for the single ToS.

  NOTE
  You can view additional versions of the summary pie charts by selecting **Protocols**, **Hosts**, or **Conversations** as the report subtype.

To display Flow Forensics-level detail, click the **Flow Forensics** link and run a Flow Forensics report.

ToS Summary (Table)

The **ToS Summary (Table)** views show rate, volume, or utilization for the top ToS values of the traffic on a particular interface. You can use this information to compare traffic for each of the top ToS values.

An interface identification string is shown under the view title. The table contains a row for each ToS with the Type of Service identifier (EF/AF, DSCP, and ToS values) and the following rate, volume, or utilization information:

- **Rate**:
  - (CA PC/NPC) Average rate of total, inbound, and outbound data for each ToS (**Average Total**, **Average Out**, and **Average In**)
  - (CA PC) Maximum rate of data that is outbound or inbound on the interface for each ToS (**Maximum Out** and **Maximum In**)

The rate is calculated by dividing the data volume by the elapsed transmission time.

- **Volume**: Volume of outbound, inbound, and all data for each ToS (Out, In, and Total), expressed in a scale that is appropriate for the highest-volume ToS.
- **Utilization**:
  - (CA PC/NPC) Average utilization of total, outbound, and inbound data that each ToS consumes (**Average Total**, **Average In**, and **Average Out**)
  - (CA PC) Maximum percentage of interface capacity that the outbound or inbound utilizes for each ToS (**Maximum Out** and **Maximum In**)

  The utilization percentage is calculated by dividing the data rate by the data speed.

Performance Center views show the data from the time range that is defined for the page.

Opening the View

To see this view in the Performance Center Console, go to one of the following locations:

- (CA PC) **Custom** dashboard
- (NPC) **Interface** pages (with an interface selected): **Interface QoS** or custom tab

Available Actions

You can perform several actions in this view, including the following ones:

- Change the type of measurement (Rate, Volume, or Utilization) and the view name by editing the view settings.
- (CA PC) Change the interface.
- Re-sort the table data by clicking a column heading. Click again to toggle between descending and ascending order.
- Change the **Max Per Page** value to show more or fewer items on each table page.
- (CA PC) Change the columns that are shown in the table: Click near a column border, click **Columns**, then choose the columns to display.
- Click a **Type of Service** link to display more information about the ToS on Interface report pages in the NFA console.

Find ToS Summary Tables in the NFA Console

You can display ToS summary tables in the NFA console for a selected interface:

- *Top N ToS Summary* -- Report type: ToS. Filter: Top N ToS. Presentation menu options: Summary Table; Volume.
  View: ToS Summary Table for the Top N ToS.
- *Protocol Summary for a Single ToS* -- Report type: ToS. Filter: Single ToS. Report subtype: Protocols. Subtype filter: Top N Protocols. Presentation menu options: Summary Table; Volume.
  Views: ToS Protocol Summary Table for the single ToS.
- *Host Summary for a Single ToS* -- Report type: ToS. Filter: Single ToS. Report subtype: Hosts. Subtype filter: Top N Hosts. Presentation menu options: Summary Table; Volume.
  Views: ToS Hosts Summary Table for the single ToS.
- *Conversation Summary for a Single ToS* -- Report type: ToS. Filter: Single ToS. Report subtype: Conversations. Subtype filter: Top N Conversations. Presentation menu options: Summary Table; Volume.
  Views: ToS Conversations Summary Table for the single ToS.

To display Flow Forensics-level detail, click the **Flow Forensics** link and run a Flow Forensics report.

Interface: Top Conversations

The **Top Conversations** views show the conversations that generate the highest traffic on the currently selected interface. The views are described in the topics that follow.

Top Conversations (Bar)

The **Top Conversations (Bar)** views show the conversations that have the highest traffic on the selected interface. A bar graph shows the volume for each conversation.

For example, use conversation information to determine the IP addresses of high-volume hosts. Contact the host owners or users to investigate the nature and purpose of the traffic.

You can view the conversations for incoming data, outgoing data, or all data.

The view includes a bar for each top conversation on the selected interface. A maximum of 10 conversations are shown. The view includes the following information:

- **Identifier**
  Identifies the interface that is used for the report. The identifier string consists of the router name, interface name, and interface description (under the view title).
  (NPC) The identifier line also includes the interface speed.
- **Conversation Pair**
  Identifies the conversation source and destination servers by their names (the fully qualified DNS names, if they are available), followed by the IP addresses (Y-Axis).
- **Volume**
  Measures the total amount of data that was exchanged in the conversation expressed in a scale that is appropriate for the highest-volume conversation (X-Axis).

Performance Center views show the data from the time range that is defined for the page.

Opening the View

To see this view in the Performance Center Console, go to one of the following locations:

- (CA PC) Custom dashboard
- (NPC) **Interface** pages (with an interface selected): **Interface Capacity** or custom tab

Available Actions

You can perform several actions in this view, including the following ones:

- Change the view name by editing the view settings.
- (CA PC) Change the traffic direction and the interface.
- Display details in a Tooltip by holding your cursor over a bar.
- Jump to conversation details on an NFA console **Interface** report page by clicking a bar or name.

Find Conversation Data in the NFA Console

You can display conversation volume trend charts in the NFA console for any interface you have selected:

- *Overview Multi-Trend* -- Report type: Overview. Presentation menu options: Mixed Trend; Volume.
  View: Conversations Multi Trend Summary (Total) for the Top N Conversations, plus other views.
- *Top N Conversations Trend* -- Report type: Conversations. Filter: Top N Conversations. Presentation menu options: Trend Chart; Volume.
  View: Conversations Trend for the Top N Conversations.
- *Conversations for a Single Protocol* -- Report type: Protocols. Filter: Single protocol. Report subtype: Conversations. Conversation Filter: Top N Conversations. Presentation menu option: Trend Chart.
  View: Protocol Conversations Summary (Total) for a single protocol.
- *Conversations for a Single ToS* -- Report type: ToS. Filter: Single ToS. Report subtype Conversations. Conversation Filter: Top N Conversations. Presentation menu options: Trend Chart; Volume.
  View: ToS Trend view for each conversation that uses the single ToS.

Note: To see trend charts for a single conversation, click **Top N Conversations** and select a single conversation as the filter.

To display Flow Forensics-level detail, click the **Flow Forensics** link and run a Flow Forensics report.

Top Conversations (Pie)

The **Top Conversations (Pie)** view includes a pie chart of the conversations that account for the most traffic on the selected interface.

The view includes a pie chart and table of information about the high-volume conversations on the selected interface. A text string near the top of the view identifies the interface whose data is displayed. The table includes the following information by default:

- **Identifier**
  Identifies the interface that is used for the report. The identifier string consists of the router name, interface name, and interface description (under the view title).
  (NPC) The identifier line also includes the interface speed.
- **Source - Destination Name**
  Identifies the host servers that initiated and received the conversation data by their fully qualified DNS names (if available) and IP addresses.
- **Total**
  Shows the total amount of data in the conversation expressed in a scale that is appropriate for the highest-volume conversation.
- **Percent**
  (CA PC) Records how much the conversation consumes out of the total traffic that is displayed.

Performance Center views show the data from the time range that is defined for the page.

Opening the Views

To see these views in the Performance Center Console, go to one of the following locations:

- (CA PC) Custom dashboard; **Interface** pages (with an interface selected): **IP Performance** tab
- (NPC) **Interface** pages (with an interface selected): **Interface QoS** or custom tab

Available Actions

You can perform several actions in this view, including the following ones:

- Change the view name by editing the view settings.
- (CA PC) Change the traffic direction and the type of measurement. If the view is on a custom interface context dashboard in the CA Performance Center Console, you can change the interface.
- (CA PC) Change the columns that are shown in the table: Click near a column border, click **Columns**, then choose the columns to display.
- Jump to details on an NFA console **Interface** page by clicking a link.

Find Conversation Pie Charts in the NFA Console

You can display conversation pie charts in the NFA console for any interface you have selected:

- *Overview* -- Report type: Overview. Presentation menu option: Pie Chart.
  View: Conversations Summary (Total) for the Top N Conversations, plus other overview views.
- *Top N Conversations* -- Report type: Conversations. Filter: Top N Conversations. Presentation menu option: Pie Chart.
  View: Conversations Summary (Total) for the Top N Conversations.
- *Conversations for a Single Protocol* -- Report type: Protocols. Filter: Single protocol. Report subtype: Conversations or Overview. Conversations Filter: Top N Conversations. Presentation menu option: Pie Chart or Mixed Chart.
  View: Protocol Conversations Summary (Total) for a single protocol.
- *Conversations for a Single ToS* -- Report type: ToS. Filter: Single ToS. Report subtype: Conversations. Conversation Filter: Top N Conversations. Presentation menu option: Pie Chart.
  View: ToS Conversations Summary (Total) for a single ToS.

To display Flow Forensics-level detail, click the **Flow Forensics** link and run a Flow Forensics report.

Top Conversations (Table)

The **Top Conversations (Table)** views show data for the top highest-volume conversations on a particular interface. The maximum number of top conversations shown is ten.

The table contains a row for each conversation with the source and destination - The fully qualified DNS host name (if available) and IP address of the servers that initiated and received the conversation data. The table also contains the following rate, volume, or utilization information:

- Rate:
  - (CA PC/NPC) For each conversation, the average rate of total data (Average Total), data that goes to the destination host (Average To), and data that comes from the source host (Average From).
  - (CA PC) For each conversation, maximum rate of data that comes from the source host (Maximum From) and goes to the destination host (Maximum To).

  The rate is calculated by dividing the data volume by the elapsed transmission time.
- Volume: For each conversation, total amount of data (Total), data that comes from the source host (From), and data that goes to the destination host (To), expressed in a scale that is appropriate for the highest-volume conversation.
- Utilization:
  - (CA PC/NPC) For each conversation, average utilization by data that comes from the source host (Average From), data that goes to the destination host (Average To), and total data (Average Total).
  - (CA PC) For each conversation, maximum percentage of interface capacity that is used by the data that comes from the source host (Maximum From) or that goes to the destination host (Maximum To).

  The utilization percentage is calculated by dividing the data rate by the data speed.

Performance Center views show the data from the time range that is defined for the page.

Opening the View

To see this view in the Performance Center Console, go to one of the following locations:

- (CA PC) Custom dashboard
- (NPC) **Interface** pages (with an interface selected): Custom tab

Available Actions

You can perform several actions in this view, including the following ones:

- Change the type of measurement (Rate, Volume, or Utilization) and the view name by editing the view settings.
- (CA PC) Change the interface.
- (CA PC) Change the columns that are shown in the table: Click near a column border, click **Columns**, then choose the columns to display.
- Click one of the links to jump to a pre-filtered Interface page report in the NFA console.

Find Conversation Tables in the NFA Console

You can display tables with conversation volumes in the NFA console for a selected interface:

- *Top N Conversations* -- Report type: Conversations. Filter: Top N Conversations. Presentation menu option: Summary Table; Volume.
  View: Conversation Summary Table for the Top N Conversations.
- *Conversations for a Single Protocol* -- Report type: Protocols. Filter: Single protocol. Report subtype: Conversations. Subtype filter: Top N Conversations. Presentation menu option: Summary Table; Volume.
  View: Protocol Conversation Summary Table for a single protocol.
- *Conversations for a Single ToS* -- Report type: ToS. Filter: Single ToS. Report subtype: Conversations. Subtype filter: Top N Conversations. Presentation menu options: Summary Table; Volume.

View: ToS Conversations Summary Table for a single ToS.

To display Flow Forensics-level detail, click the **Flow Forensics** link and run a Flow Forensics report.

Interface: Top Hosts

The **Top Hosts** views show the hosts that generate the highest traffic on the currently selected interface. The views are described in the topics that follow.

Top Hosts (Bar)

The **Top Hosts (Bar)** views show the top high-volume hosts for a particular interface. You can use this view to determine the IP addresses of hosts that are responsible for high volumes of network traffic. You can then contact the owner or user of each host to investigate the nature and purpose of the traffic.

You can view the hosts for incoming flows, outgoing flows, or all flows.

The bar chart includes the following information for a maximum of 10 hosts:

- **Identifier**
  Identifies the interface that is used for the report. The identifier string consists of the router name, interface name, and interface description (under the view title).
  (NPC) The identifier line also includes the interface speed.
- **Host Name**
  Identifies the host server by its fully qualified DNS name (if available) and IP address (Y-Axis).
- **Volume**
  Measures the total amount of data for the host on the interface, expressed in a scale that is appropriate for the highest-volume host (X-Axis).

Performance Center views show the data from the time range that is defined for the page.

Opening the View

To see this view in the Performance Center Console, go to one of the following locations:

- (CA PC) Custom dashboard
- (NPC) **Interface** pages (with an interface selected): **Interface Capacity** or custom tab

Available Actions

You can perform several actions in this view, including the following ones:

- Change the traffic direction and the view name by editing the view settings.
- (CA PC) Change the interface.
- Display details in a Tooltip by holding your cursor over a bar.
- Jump to details for a specific host on an NFA console Interface page by clicking a bar.

Find Host Trend Views in the NFA Console

The **Enterprise Overview** page in the NFA console displays traffic volume for the top hosts in a bar chart.

You also can display host volume in trend charts for a selected interface:

- *Overview* -- Report type: Overview. Presentation menu options: Mixed Trend; Volume.
  View: Hosts Multi Trend Summary (From and To) for the Top N Hosts, plus other overview views.
- *Top N Host Trend* -- Report type: Hosts. Filter: Top N Hosts. Presentation menu options: Trend Chart; Volume.
  View: Host Trend for each of the Top N Hosts.

Note: To see trend charts for a single host, click **Top N Hosts** and select a host as the filter.

To display Flow Forensics-level detail, click the **Flow Forensics** link and run a Flow Forensics report.

Top Hosts (Pie)

The **Top Hosts (Pie)** views show the hosts that account for the highest volumes of network traffic on the selected interface.

The table includes the following information by default:

- **Identifier**
  Identifies the interface that is used for the report. The identifier string consists of the router name, interface name, and interface description (under the view title).
  (NPC) The identifier line also includes the interface speed.
- **Host Name**
  Identifies the host server by its fully qualified DNS name (if available) and IP address.
- **Total**
  Records the total amount of data for the host on the interface, expressed in a scale that is appropriate for the highest-volume host.
- **Percent**
  (CA PC) Records how much the host consumes out of the total traffic that is displayed.

Performance Center views show the data from the time range that is defined for the page.

Opening the Views

To see these views in the Performance Center Console, go to one of the following locations:

- (CA PC) Custom dashboard; **Interface** pages (with an interface selected): **IP Performance** tab
- (NPC) **Interface** pages (with an interface selected): **Interface QoS** or custom tab

Available Actions

You can perform several actions in this view, including the following ones:

- Change the traffic direction and the view name by editing the view settings. If the view is on a custom interface context dashboard in the CA Performance Center Console, you can change the interface.
- (CA PC) Change the columns that are shown in the table: Click near a column border, click **Columns**, then choose the columns to display.
- Jump to details on an Interface report page in the NFA console by clicking a host link in the view.

Find Host Pie Charts in the NFA Console

You can display pie charts with host volumes in the NFA console for a selected interface:

- *Overview* -- Report type: Overview. Presentation menu option: Pie Chart.
  View: Host Summary (From and To) for the Top N Hosts, plus other overview views.
- *Top N Hosts Summary* -- Report type: Hosts. Filter: Top N Hosts. Presentation menu option: Pie Chart.
  View: Host Summary (From, To, and Total) for the Top N Hosts.
- *Hosts for a Single Protocol* -- Report type: Protocols. Filter: Single protocol. Report subtype: Overview. Presentation menu option: Pie Chart.
  View: Protocol Hosts Summary (From, To, and Total) for the single protocol.

To display Flow Forensics-level detail, click the **Flow Forensics** link and run a Flow Forensics report.

Top Hosts (Table)

The **Top Hosts (Table)** views show rate, volume, or utilization for the hosts who exchange the highest volume of data on a particular interface.

The view contains an interface identification string and a table. The table contains a row for each host with the fully qualified DNS host name (if available) and IP address, as well as the following rate, volume, or utilization information (by default):

- Rate:
  - (CA PC/NPC) For each host, the average rate of total data (Average Total), data that goes to the host (Average To), and data that comes from the host (Average From).
  - (CA PC) For each host, maximum rate of data that comes from the host (Maximum From) and goes to the host (Maximum To).

  The rate is calculated by dividing the data volume by the elapsed transmission time.
- Volume: For each host, total amount of data (Total), data from the host (From), and data to the host (To), expressed in a scale that is appropriate for the highest-volume host.
- Utilization:
  - (CA PC/NPC) For each host, average utilization by data that comes from the host (Average From), data that goes to the host (Average To), and total data (Average Total).
  - (CA PC) For each host, maximum percentage of interface capacity that is used by the data from the host (Maximum From) or that goes to the host (Maximum To).

  The utilization percentage is calculated by dividing the data rate by the data speed.

Performance Center views show the data from the time range that is defined for the page.

Opening the View

To see this view in the Performance Center Console, go to one of the following locations:

- (CA PC) Custom dashboard
- (NPC) **Interface** pages (with an interface selected): Custom tab

Available Actions

You can perform several actions in this view, including the following ones:

- Change the type of measurement and the view name by editing the view settings.
- (CA PC) Change the interface.
- (CA PC) Change the columns that are shown in the table: Click near a column border, click **Columns**, then choose the columns to display.
- Click a name to jump to a pre-filtered Interface page report in the NFA console.

Find Host Tables in the NFA Console

You can display tables with host volumes in the NFA console for a selected interface:

- *Top N Hosts Summary* -- Report type: Hosts. Filter: Top N Hosts. Presentation menu option: Summary Table; Volume.
  View: Host Summary Table for the Top N Hosts.
- *Hosts for a Single Protocol* -- Report type: Protocols. Filter: Single protocol. Report subtype: Overview. Presentation menu option: Summary Table; Volume.
  View: Protocol Host Summary Table for the single protocol.
- *Hosts for a Single ToS* -- Report type: ToS. Filter: Single ToS. Report subtype: Hosts. Subtype filter: Top N Hosts. Presentation menu options: Summary Table; Volume.
  View: ToS Hosts Summary Table for the single ToS.

To display Flow Forensics-level detail, click the **Flow Forensics** link and run a Flow Forensics report.

Interface: Top Protocols

The **Top Protocols** views show the protocols associated with the highest traffic on the currently selected interface. The views are described in the topics that follow.

Top Protocols (Bar)

The **Top Protocols (Bar)** views show the top high-volume IP protocols for traffic on a particular interface. A bar chart shows which protocols account for the most traffic on the selected interface.

This view gives you an overall picture of how much data is associated with particular protocols--and, therefore, with applications--on the interface. The view also lets you determine whether the application protocols are related to business-critical processes, or are related to low-priority or non-business related processes such as unauthorized web use.

You can view protocol traffic for incoming flows, outgoing flows, or all flows.

The bar chart includes the following information for a maximum of 10 protocols:

- **Identifier**
  Identifies the interface that is used for the report. The identifier string consists of the router name, interface name, and interface description (under the view title).
  (NPC) The identifier line also includes the interface speed.
- **Protocol**
  Identifies the protocol by its descriptor (Y-Axis).
- **Volume**
  Measures the total amount of protocol data expressed in a scale that is appropriate for the highest-volume protocol (X-Axis).

Performance Center views show the data from the time range that is defined for the page.

Opening the View

To see this view in the Performance Center Console, go to one of the following locations:

- (CA PC) Custom dashboard
- (NPC) **Interface** pages (with an interface selected): Custom tab

Available Actions

You can perform several actions in this view, including the following ones:

- Change the traffic direction and the view name by editing the view settings.
- (CA PC) Change the interface.
- Display details in a Tooltip by holding your cursor over a bar.
- Jump to details for a specific protocol on an NFA console Interface page by clicking a bar or name.

Find the Comparable View in the NFA Console

The **Top Protocols** bar charts in the Performance Center Console are similar to the **Top Protocol** view on the **Enterprise Overview** page in the NFA console.

Top Protocols (Pie)

The **Top Protocols (Pie)** views show the protocols that are associated with the highest traffic volumes on the selected interface.

The table includes the following information by default:

- **Identifier**

Identifies the interface that is used for the report. The identifier string consists of the router name, interface name, and interface description (under the view title).
(NPC) The identifier line also includes the interface speed.

- **Protocol Name**
  Identifies the protocol by its keyword and TCP/UDP port assignment.
- **Total**
  Records the total volume of network traffic on the interface that is associated with the protocol
- **Percent**
  (CA PC) Records how much the protocol consumes out of the total traffic that is displayed.

Performance Center views show the data from the time range that is defined for the page.

Opening the Views

To see these views in the Performance Center Console, go to one of the following locations:

- (CA PC) Custom dashboard
- (NPC) Interface Pages (with an interface selected): **Interface QoS** or custom tab

Available Actions

You can perform several actions in this view, including the following ones:

- Change the traffic direction and the view name by editing the view settings.
- (CA PC) Change the interface.
- (CA PC) Change the columns that are shown in the table: Click near a column border, click **Columns**, then choose the columns to display.
- Jump to details on an NFA console **Interface** page by clicking a protocol name.

Find Protocol Pie Charts in the NFA Console

You can display pie charts with protocol traffic volumes in the NFA console for a selected interface:

- *Overview* -- Report type: Overview. Presentation menu option: Pie Chart.
  View: Protocol Summary (In and Out) for the Top N Protocols, plus other overview views.
- *Top N Protocol Summaries* -- Report type: Protocols. Filter: Top N Protocols. Presentation menu option: Pie Chart.
  View: Protocol Summary (In, Out, and Total) for the Top N Protocols.
- *Hosts or Conversations for Single Protocol* -- Report type: Protocols. Filter: Single protocol. Presentation menu option: Pie Chart.
  Views: Protocol Hosts Summary (From and To) for the single protocol; Protocol Conversations Summary (Total) for the single protocol.

To display Flow Forensics-level detail, click the **Flow Forensics** link and run a Flow Forensics report.

Top Protocols (Table)

The **Top Protocols (Table)** views are tables that show the rate, volume, or utilization for the highest-volume protocol traffic on a particular interface. You can use this information to compare the data volume or utilization for particular protocols, for example.

The view contains an interface identification string and table. The table has a row for each protocol with the protocol name (keyword and TCP/UDP port assignment) and the following rate, volume, or utilization information (by default):

- Rate:
  - (CA PC/NPC) Average rate of total (**Average Total**), inbound (**Average In**), and outbound data (**Average Out**) for each protocol.
  - (CA PC) Maximum rate of data that is outbound, inbound, or both outbound and inbound (**Maximum Out**, **Maximum In**, and **Maximum Total**) on the interface for each protocol

The rate is calculated by dividing the data volume by the elapsed transmission time.

- Volume: Number of bytes/megabytes of outbound data (**Out**), inbound data (**To**), and all data (**Total**) for each protocol.
- Utilization:
  - (CA PC/NPC) Average utilization by inbound data (**Average In**), outbound data (**Average Out**), and total data (**Average Total**) for each protocol.
  - (CA PC) Maximum percentage of interface capacity that the outbound (**Maximum Out**) or inbound protocol data utilizes (**Maximum In**)

  The utilization percentage is calculated by dividing the data rate by the data speed.

Performance Center views show the data from the time range that is defined for the page.

Opening the View

To see this view in the Performance Center Console, go to one of the following locations:

- (CA PC) Custom dashboard
- (NPC) Interface pages (with an interface selected): Custom tab

Available Actions

You can perform several actions in this view, including the following:

- Change the type of measurement (Rate, Volume, or Utilization) and the view name by editing the view settings.
- (CA PC) Change the interface.
- Re-sort the table data by clicking a column heading. Click again to toggle between descending and ascending order.
- Change the **Max Per Page** value to show more or fewer items on each table page.
- (CA PC) Change the columns that are shown in the table: Click near a column border, click **Columns**, then choose the columns to display.
- Click a name to jump to a pre-filtered **Interfaces** report in DX NetOps.

Find Protocol Tables in the NFA Console

You can use these ways to display tables of protocol volume data in the NFA console for a selected interface:

- *Top N Protocols* -- Report type: Protocols. Filter: Top N Protocols. Presentation menu options: Summary Table; Volume.
  View: Protocol Summary Table for the Top N Protocols, plus other overview views.
- *Protocols for a Single Host* -- Report type: Hosts. Filter: Single host. Report subtype: Protocols. Presentation menu options: Summary Table; Volume.
  View: Host Protocol Summary Table for the single host.
- *Protocols for a Single Conversation* -- Report type: Conversations. Filter: Single conversation. Report subtype: Protocols. Presentation menu options: Summary Table; Volume.
  View: Conversation Protocol Summary Table for the single conversation.

To display Flow Forensics-level detail, click the **Flow Forensics** link and run a Flow Forensics report.

Customizing Dashboards and Views

The icons at the top of each dashboard or view page give you access to time frame settings and other options for all of the views. The icons in the title bar of each view let you modify view settings, export views, and access Help.

You can select predefined or custom time frames for dashboards. The time frame setting affects all of the views on the page.

View Options in CA Performance Center

This article describes some of the view options in the CA Performance Center Console.

Many views offer a search feature and other settings that you can change to modify the view. In addition to filtering and time frame options, the following options are available for most views:

- Editing view settings, such as changing the view title or data direction.
- Seeing more data by selecting another "page" of a table view.
- Increasing or decreasing the number of items that are shown per "page".
- Collapsing the view so that the data is hidden.
- Changing the managed item context for the data shown in the view.

> **NOTE**
> Users with the 'Save Changes to Shared Views' role right can save view modifications to their own user account. The changes persist after logout. However, other users cannot see changes to views.

Other view options are specific to the selected view. The available options depend on the view format and data source.

Trend View Options

The trend views that are available in context pages let you quickly and easily change the trend lines that are displayed on the graph. The following options also apply to multitrend views:

- Right-click a metric in the chart legend and select **Hide** to remove it from the view.
- Exclude all other metrics by right-clicking a metric in the legend and selecting **Focus**.
- Narrow the focus to a precise time frame using the zoom feature.

Trend views also include an option to add a "goal line" as a visual indication of performance levels or thresholds. You can supply any value or label for the goal line, and you can show or hide the goal line for a selected trend view.

Table View Options

In table views, you can drill down to detailed data for individual items. Use the page feature to see metrics from a longer list of items. Increase the **Max Per Page** value to increase the size of the view and the number of table rows per page.

You can sort table data columns by selected metrics and also select columns to include. Click a table column to sort. A white arrow on the column lets you access a menu of table column options. Select **Columns** to enable and disable the metrics that were enabled for the table by default.

Browser View Options

The *browser view* is a unique view type that lets you add a URL to a selected report page. You can use this view to compare external factors alongside your network performance views. Also, the browser view lets you update internal and external data dynamically. The URL must be for a web page that supports embedded iframes.

Multiple external factors can affect the performance of your network and servers, such as world events and adverse weather conditions. The ability to view a weather map and news headlines alongside performance data views on a single report page can help you better understand patterns in network performance.

Device Admin Option

When a view does not display CA Infrastructure Manager Data Aggregator data, this option lets you drill down directly to the CA Infrastructure Manager Data Aggregator **Admin** page to troubleshoot monitored devices and items.

View Options in CA NetQoS Performance Center

This topic describes some of the view options in the CA NetQoS Performance Center Console.

Many views offer a search feature and other settings that you can change to modify the view. In addition to filtering and time frame options, the following options are available for most views:

- Editing view settings , such as changing the view title or data direction.
  
- Increasing or decreasing the number of items on a table "page" by using the **Max Per Page** option.
- Changing the context, so that the view data is restricted to a particular group.

> **NOTE**
> Users with the 'Persist Shared View Edits' role right can save view modifications to their own user account, but other users cannot see the changes. The changes persist after logout.

Many view options are specific to the selected view. The available options depend on the view format and data source.

Table View Options

In table views, you can drill down to detailed data for individual items. Use the page feature to see metrics from a longer list of items. Increase the **Max Per Page** value to increase the size of the view and the number of table rows per page.

You can click a table column to sort the table data by the values in the column.

Browser View Options

The *browser view* is a unique view type that lets you add a URL to a selected report page. You can use this view to compare external factors alongside your network performance views. Also, the browser view lets you update internal and external data dynamically. The URL must be for a web page that supports embedded iframes.

Multiple external factors can affect the performance of your network and servers, such as world events and adverse weather conditions. The ability to view a weather map and news headlines alongside performance data views on a single report page can help you better understand patterns in network performance.

View In Option

Some **Interface** page views allow you go directly to the data source to see detailed data. Click the arrow and select the **View in** option.

The option opens the view in the NFA console, for example.

Change the View Settings

You can change several settings for an enterprise-wide view or an interface-specific view. The available settings depend on the view.

For example, some views have settings for data direction--so you can display inbound data, outbound data, or all data. Other views have settings for the type of measurement--so you can set the view to display data rates, data volumes, or interface capacity utilization.

Follow these steps:

1. Open the dashboard that contains the view that you want to modify.

2. (Optional) Change the time frame, if necessary.
3. Open the dialog for editing the view settings:
   – (CA PC)
   
   Click the **Edit** icon in the view title bar and select **Edit** from the menu.
   – (NPC)
   
   Click the **View** icon next to the view name and select **Edit** from the menu.
4. (Optional) Edit the **Title** to change the name in the view title bar.
5. (Optional) If the view has **Measurement Settings**, select the type of measurement to show in the report:
   – **Rate**: Rate of traffic, expressed in Mbps.
   – **Bytes**: Volume of traffic.
   – **Utilization**: Percentage of total capacity used by the traffic.
6. (Optional) If the view has **Direction** settings, select the direction of the data on the selected interface:
   – **Out**: Outbound traffic on the interface.
   – **In**: Inbound traffic on the interface.
   – **From**: Traffic on the interface that comes from the host (**Host** view) or the source host (**Conversation** view).
   – **To**: Traffic on the interface that goes to the host (**Host** view) or the destination host (**Conversation** view).
   – **Total**: All traffic on the interface.
7. (Optional) (CA PC) For an enterprise-wide view or interface-specific view, change the interface for the view: Select a different interface from the **Context Settings** table.
   For example, to restrict the interface set to a domain, select the domain from the **IP Domains** list.
   Note: You can change the context for a view on some custom dashboards in the CA Performance Center Console. You cannot change the context for built-in views or for interface context pages.
   To re-sort the table, click a column heading. Click the arrow to sort in the opposite direction.
   (CA PC) To change the columns that are included in the table, display the **Columns** list: Click near the right edge of a column heading, then click the white arrow and select **Columns**.
8. (Optional) Specify which users are affected by the setting changes: Select a value from the **Apply Changes** list:
   – **For All Tenant Users**: (CA PC) Saves the changes so that they apply to all users.
   – **My User Account**: Saves the changes to your user account as the default setting for this view.
   – **My Current Session**: Reverts the changes when you log out.
   Note: The availability of these options depends on your user account role rights.
9. Click **Save** (CA PC) or **OK** (NPC) to save your changes.
   The settings dialog closes. The view reflects your changes.

> **NOTE**
> You can also change the context for a dashboard in the CA Performance Center Console. In this case the context change applies the selected group or managed item as a filter to all views on the page.

Change the Context for a View

You can change the context for some individual views on a dashboard. Change the context of an enterprise-wide view to show data from a different set of managed items. Change the context of an interface-specific view in the CA Performance Center Console to show data from a different interface.

Changing the view context can be useful for troubleshooting. You can compare data from different locations, for example.

Follow these steps:

1. Open the dashboard that contains the view that you want to change.

2. (Optional) Change the time frame, if necessary.
3. Open the dialog for editing the view settings:
   – (CA PC)
   
   Click the **Edit** icon in the view title bar and select **Edit** from the menu.
   – (NPC)
   
   Click the **View** icon next to the view name and select **Edit** from the menu.
4. Take one of the following steps:
   – (CA PC) Enterprise view: Click to expand folders in the **Groups** filter tree, and select the group whose data you want to see in the view.
   – (CA PC) Interface view: Locate the interface whose data you want to see in the view, and click the link in the table.
   – (NPC) Click the **Filter by** value and select a group in the **Select Context** dialog.
   If the settings dialog does not contain a **Filter by** option, you cannot change the context for the view.
   The context types that are available depend on the type of view.
5. (Optional) Change the view **Title** to reflect the new context.
6. Select the scope of your changes from the **Apply Changes** drop-down. Select one of the following options:
   – (CA PC) **For All Tenant Users**: Saves the changes so that they are only available to users associated with your tenant (possibly the Default Tenant).
   – **My User Account**: Saves the changes to your user account as a default for this view.
   – **My Current Session**: Reverts the changes when you log out.
   Note: The availability of these options depends on your user account role rights.
7. Click **Save** (CA PC) or **OK** (NPC).
   The view is updated to show data from the new context.

You can also change the context for a custom dashboard, which applies the selected group or managed item as a filter to all views on the page.

Set a Custom Time Frame

You can select a different time frame for the data shown in the current dashboard or view page. You can select the day, the start time, and the end time using the time period selectors.

Follow these steps:

1. Navigate to a dashboard or view page.
2. Click the date links in the upper-left corner of the dashboard page to open the calendar panes.
3. Select the beginning day and ending day of the new time period on the calendar panes.
4. Click the hours or minutes links to specify the beginning and ending times of the new time period.
5. Click **Set**.
   The custom time frame is applied to all of the views on the dashboard or page.

Zoom In to Narrow the Time Frame

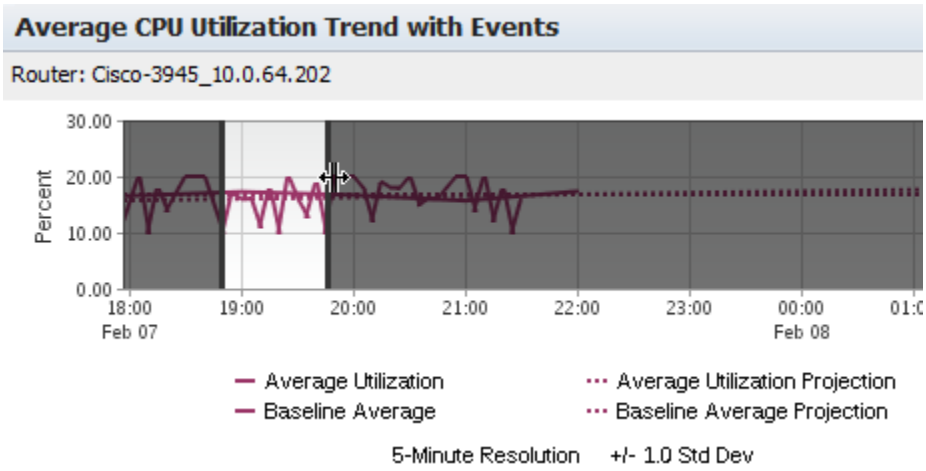
This topic describes how to zoom in to narrow the time frame for a trend chart in the CA Performance Center Console. This option is not applicable to trend charts in the CA NetQoS Performance Center Console.

You can look more closely at the data points from a small range by using the zoom feature. The ability to "zoom in" on a time frame is available for views that contain trend (line) charts. The feature is not available for bar charts, tables, or gauges.

Follow these steps:

1. Navigate to a dashboard page.
2. (Optional) Change the time frame, if necessary.
3. Select a view that contains a line chart.

   NOTE
   You cannot zoom in on a bar chart, table, or gauge.
4. Click and drag, using the mouse to select an area of the chart.



Select an area that spans at least 30 minutes. Black lines appear to indicate a valid selection.

When you release the mouse button, the custom time period you selected is applied to the current view.

- (Optional) Click **Undo**, just below the view, to return to the previous time frame.
  The view is refreshed. The previous time period is now applied to the view.
- (Optional) Click **Apply to Dashboard**.
  The dashboard page is refreshed. The new time period is now applied to all views on the current dashboard page.

Custom Dashboards

Custom dashboards are useful for displaying data from a particular item or group of items. With a custom dashboard, you can select the item context for individual views and can make other modifications to meet the requirements of a selected operator.

Custom dashboards are often used on a temporary basis to troubleshoot an issue. However, they are also deployed on a long-term basis to monitor categories of items. For example, an operator who is responsible for a region requires a dashboard that shows only items in that region. Or an operator might require a dashboard to monitor all ESX servers.

To create a custom dashboard quickly, you can edit an existing dashboard and save it with a new title. Your user account must have the Edit Dashboards role right.

If you have the necessary role rights, you can create custom dashboards. You can select views for the dashboard and set their location on the page. You also can select the menus that list the dashboard so that it can be shared with other operators.

NOTE
Role rights are slightly different in CA NetQoS Performance Center. For more information, see the *CA NetQoS Performance Center* documentation.

Edit a Dashboard

This topic describes how to customize dashboard pages in the CA Performance Center Console.

You can customize dashboard pages if your user account has the 'Administer Shared Dashboards' or the 'Create a Dashboard' role right. You can add or remove data views, rearrange views, or select a different context filter for a dashboard. You can then export the new dashboard as a report.

Follow these steps:

1. Log in as a user with the required administrative role rights.
2. Use the **Dashboards** tab to access the dashboard that you want to edit.
3. Click the **More** menu, and select **Edit Dashboard**.
   The **Edit Dashboard Layout** page opens.
4. Change the following menu and dashboard options, as needed:
   - **Menu for Dashboard**
     Is the menu where you want the dashboard to appear. The default is the menu that you used to open this dashboard page.
   - **Menu Item**
     Is the name of the dashboard as you want it to appear in the menu.
   - **Dashboard Title**
     Is the name that you want to appear at the top of the new dashboard.
5. Select a layout template for the dashboard from the **Layout** buttons.
6. Remove unwanted views from the dashboard page if desired. In the **Layout** pane, click:
   - **Clear** to remove all views from the page.
   - An **[X]** to remove an individual view from the page.
     Note: By default, the context is **Summary**. With the *Summary context* setting, the available views display summary data for the current group context of the dashboard. The Summary setting does not require you to select a specific group or item. Summary views dynamically update the context when you change the context of the page.
7. (Optional) Apply a group or context filter to the views. You can select a group, device, or interface by taking the following steps:
   a. Click **Select Context**.
   b. Select a **Context Type**, such as a type of managed item. Select **Group** to see the Groups tree.
      By default, the list is filtered to show only items and item types to which you have access. For example, if you are not monitoring any servers, the **Context Type** list does not include the Servers option. Select **Show All Context Types** to see all context options.
   c. Select a specific context item or a group context.
   d. Click **OK** to save the new context filter.
      The views that are available to be added to the page are shown in categorized lists. The lists are filtered by the selected group or item context.
      All registered data sources are represented.
8. Click to expand the categories of views. Check the **Display All Views** option only if you want to see views from data sources that you have not registered.
9. Select a view, drag it to the **Layout** pane, and drop it where you want it to appear.
   Note: The maximum number of views per dashboard is 25.
10. (Optional) Use the editing shortcut buttons to create a copy of the view or access view settings, such as the Metric Family.
    For example, click the **Copy** icon to place a copy of the view just below the original view in the layout.
    
    You can then alter view settings so that two similar views display different data.
11. (Optional) Click **Revert** to discard your changes.

The layout returns to the settings that you last saved. Or, if you have not customized the dashboard, it returns to the predefined settings.

12. Click **Save**.
    The dashboard page refreshes to reflect your changes. The changes persist across login sessions.

Change the Context for a Dashboard

You can customize a dashboard by selecting a different data context for the data. The default group setting for the views that are shown on all dashboards is **All Groups**. When you select another group for a standard dashboard, you apply a new filter to all views on the page. From a context page, such as details about a single router, you can select another managed item as the view context.

You can also view dashboards in multiple windows and apply a different data context to each dashboard.

Follow these steps:

1. Navigate to the dashboard that you want to modify.
2. (Optional) Change the time frame, if necessary.
3. Click the **[change]** link above the time period selectors.
   A dialog opens with filtering options.
4. Click to select another managed item. Or expand nodes in the **Groups** tree to select a group context.
   Data from the new item or group appears in the view.
5. Click **OK**.
   All views on the page are refreshed to reflect the new data context. The change applies until you log out. To change the context so that the change persists across login sessions, edit the dashboard.
6. (Optional) Open another browser instance, log in, and open the same dashboard.
   You can now compare the same views with two different item context settings.

Change the Time Frame for a Dashboard

You can change the time frame for a dashboard or Interface page that you are viewing. Change the time frame to see data from an earlier time of day or from another date, for example

Changing the time frame is useful for troubleshooting performance issues. For example, if data from the past day contains an anomaly, you can change the time frame to show data from the last seven days. The time frame helps you determine whether the issue occurs repeatedly.

When you change the time frame for a dashboard or Interface page, it is applied to all views on the page, and to all dashboards in that window. You can view dashboards in multiple windows and can apply a different time frame to each dashboard, however.

Follow these steps:

1. Select a dashboard from the Dashboards tab or navigate to an Interface page.
2. (Optional) Click to select any of the following time and date options at the top of the page:
   - **Time period drop-down list**
     Lets you select a predefined time frame for the data.
     Default: Last Hour.
   - **Back button**
     Shifts the time frame for the data back by one increment of the present interval (such as Last Day or Last Hour).
   - **Date and Calendar drop-down lists**

Let you select a start and end date for the data from a calendar view.
- **Time of Day drop-down lists**
  Let you select a start and end time from a list of 15-minute time intervals in the 24-hour format.
- **Forward button**
  Shifts the time frame for the data forward by one increment of the present interval (such as Last Day or Last Hour).

3. (Optional) Define a custom time frame:
   a. Complete one or more of the following steps
      - Click the start date and select a new start date from the calendar that opens.
      - Click the end date and select a new end date from the calendar that opens.
      - Click the start hour or minute and select a new hour or minute from the drop-down menu.
      - Click the end hour or minute and select a new hour or minute from the drop-down menu.
   b. Click **Set**.
      The data in the views reflects the new time frame.
4. (Optional) Scroll backward or forward in time. Use the Back and Forward buttons on either side of the timestamp to shift the time frame by one increment of the present interval.
   If you are viewing data for the last day, click the left arrow to scroll back in time by one day. Or click Latest to see the most recently collected data.

Build a Custom View for a Single Interface

You can create custom views that contain DX NetOps data for a single interface. You can add these interface views to a custom dashboard in the Performance Center Console.

Several interface views are available in addition to the views that are displayed by default on the interface pages.

Follow these steps:

1. Log in as a user with the required administrative role rights.
2. Navigate to the dashboard page that will contain the new custom view.
3. Click the **More** menu, and select **Edit Dashboard** (CA PC) or **Edit Report** (NPC).
   The page for editing the dashboard opens.
4. Open the dialog for selecting the context:
   - (CA PC) Click the **Select Context** link in the **Views** pane.
   - (NPC) Click the **Filter by** value in the left pane.

   The dialog for selecting the context opens.
5. Select **Interface** from the **Context Type** list (CA PC) or **Type** list (NPC).
   A table of interfaces opens, which shows the available interfaces or interfaces and routers (CA PC).
6. Locate and select an interface.
7. (CA PC) Click **OK**.
   You return to the **Edit Dashboard Layout** page.
8. Expand the view category:
   - (CA PC) **IP Flow**
   - (NPC) **Interface**
9. Drag one or more of the interface views into the layout.
   A dashboard can contain a maximum of 25 views. If you include multiple copies of the same view type, you can edit each view on the custom dashboard to show content from a different interface.
10. Click **Save**.
    The dashboard page refreshes.

Sharing Data with Other Users

Multiple options let you share dashboards and views with coworkers. You can export a dashboard to a static report in PDF format. You can print reports or send them by email. You can set up a schedule to send a report automatically on a regular basis.

You can also export individual views. You can publish views on a web page, such as an intranet site. Or you can export data from a view to a file in CSV format. For all data-export options, certain user account role rights are required.

Print a Report

If your user account has the required role right, you can export the current dashboard contents as a printed report. The **Print** feature first displays the current dashboard page in PDF format.

Follow these steps:

1. Navigate to the dashboard that you want to export as a report.
2. (Optional) Change the time frame.
3. Click the **Print** link on the toolbar.
   The report is exported as a PDF. Typically, it is displayed in a separate browser window.
   The data uses the current dashboard settings.
4. (Optional) Save the PDF to the local computer using the options in your PDF viewer.
5. Click the **Print** icon in the browser toolbar.
   The report page is sent to the local default printer.

Send a Report by Email

You can export the current dashboard or **Interface** page as a PDF report attached to an email message. The Email feature lets you specify the email address of the recipient and the Subject line of the email message.

Sending reports as email attachments requires an administrator to specify an SMTP server. In CA Performance Center, your user account must also have the required 'Send Reports by Email' role.

Follow these steps:

1. Open the dashboard or Interface page that you want to send in an email message.
2. (Optional) Change the time frame, if necessary.
3. Click the **Email** icon on the toolbar.
4. Supply information for the following fields:
   - **Send To**
     Specifies the email addresses where the report should be sent. Use the standard format:

     ```
     <name>@<domain>
     ```

     NOTE
     Use commas or semicolons to separate multiple addresses. Or you can enter an email alias that includes multiple recipients.
5. Select **Send Now** to send the email message immediately.
   Or select **Send on a Schedule** to create a schedule to send the email message on a regular basis.
   If the dashboard contains at least one multiview, a check box labeled **Display maximum results for multiple-chart views** appears. Select this option if you want to include more charts from the multiview than can be displayed on the current page of results.
6. Click **OK**.

The server generates a PDF from the current dashboard and sends the report as an attachment to an email message.

Set Up a Recurring Email Schedule

Each dashboard and Interface page contains options to export and send data in reports.

You can send a report by email immediately, or you can create a schedule for recurring emailed reports. For example, you can email interface utilization reports each week to coworkers in the IT department for capacity planning.

> **NOTE**
> The administrator must specify an email server to enable this feature. In CA Performance Center, your user account must have the 'Send Reports by Email' role.

Follow these steps:

1. Log in to the Performance Center Console.
2. Navigate to the dashboard or Interface report page that interests you.
3. Click **Email**.
   The **Email Dashboard** dialog opens.
4. Supply information in the following fields:
   - **Send To**
     Specifies the email addresses where the report should be sent. Use the standard format:

     ```
     <name>@<domain>
     ```

   - **Subject**
     Appears in the email Subject line; describes the emailed report.
     Example: The dashboard title and any components whose data is included in the report.
   - **Message**
     (Optional) Is a message to accompany the emailed report.
5. Select one of the following **Scheduling Options**:
   - **Send Now**
     Sends the email message immediately. Scheduling is not enabled.
   - **Send Daily**
     Sends the email message once or more per day. If you select this option, select the day or days of the week when the report is sent.
     Default: Send the emailed report every weekday (Monday - Friday) at 0:30 hours in the time zone of the logged-in user. The data in the report reflects the previous 24 hours.
   - **Send Weekly**
     Sends the email message once per week. If enabled, lets you select the day of the week to send the report.
     By default, the weekly schedule sends the emailed report every Sunday at 01:00 in your time zone.
     Default: The data in the report reflects the previous seven days (Saturday - Sunday).
     - **Week Ends on**
       Determines the day when the week ends. The start of the week is automatically adjusted to include seven days.
   - **Send Monthly**
     Sends the email message once per month. The report is sent on the first Sunday of each month at 01:00 in the time zone of the Management Console. The data in the report reflects the previous 30 days.
     - **Send Email at**
       Determines the time of day when the message is sent. The start of the month is automatically adjusted to include 30 days.
   - **Send Quarterly**

Sends the email message once per quarter. The report is sent on the first Sunday of each quarter at 01:00 in the time zone of the Performance Center Console. The data in the report reflects the previous three months.
    - **First Quarter Ends in**
      Determines the month when the quarter ends. The start of the quarter is automatically adjusted to include three months. All other quarters are also adjusted to proceed from the first quarter.
  - **Send Yearly**
    Sends the email message once per calendar year. Sends the report on the last day of the month you select for the 'Year ends in' parameter. The data in the report reflects the previous 12 months.
    - **Year Ends in**
      Determines the month when the year ends. The start of the year is automatically adjusted to include 365 days.
  - **Send email at [time of day]**
    Sends the email message at a time you select.
6. Click **Save** to save the schedule.
   The report is saved as a PDF file and attached to an email message. It is sent immediately or according to the schedule you selected.

Manage Email Schedules

Users with the required role rights can set up schedules to send reports by email on a recurring basis. Selected dashboard or Interface page data is exported in report format and sent to designated users according to a regular schedule.

Users who have the role right to schedule emails can also manage email schedules for other users.

Follow these steps:

1. Log in to the Performance Center Console as a user with the appropriate role right. In CA Performance Center, you need the 'Send Reports by Email' role right.
2. Open the list of scheduled emails:
   - (CA PC) Select **Admin**, **System Settings**, and click **Scheduled Emails**.
   - (NPC) Select **Admin**, **User Settings**, and click **Scheduled Emails**.

   The list of scheduled emails opens.

   NOTE
   Tenant administrators only see the items that are associated with their tenant.
3. Select the email schedule that you want to change, and click **Edit**.
   The dialog for editing the email schedule opens.
4. View or change the settings for email schedules.
5. Click **Save**. The list of scheduled emails reflects your changes.

Generate a URL for a View

You can export a view and share it with coworkers who do not have access to dashboards. Performance Center can generate a special uniform resource locator (URL) to recreate a selected data view on demand. The URL lets you add the view to a web page or intranet site. The Generate URL feature lets you involve others in capacity planning and infrastructure upgrade decisions, for example. This feature also lets you share status information.

A security token is included with each URL. This token is based on the user who is logged in at the time of URL generation. Consequently, any user who can access the exported view can see the same data that the original user who exported the URL could see. Note, however, that the token applies only to the initial view. If the user who is accessing the exported view attempts to drill in, he or she is asked to authenticate. The drilldown only succeeds after successful authentication, and then only for a user account with the Drill into Views role right. Finally, an option is included to let the token (and thus, the view) expire after a selected time period.

Follow these steps:

1. Log in as a user with the appropriate role right: 'Generate URLs from Views' (CA PC) or 'Allow User to Generate URLs' (NPC).
2. Navigate to the dashboard or Interface report page that contains the view that you want to generate as a URL.
3. Open the **Generate URL** dialog:
   - (CA PC)
     
     Click the **Edit** icon on the view, and select **Generate URL**.
   - (NPC)
     
     Click the **Edit** icon on the view, and select **Generate URL**.

   The **Generate URL** dialog opens. The URL is displayed in the **URL** field.
4. Enable or disable the following required parameters for the exported view:
   - **View Container**
     Displays the chart or graph with a surrounding container. The container includes the title of the view in a title bar and a black outline around the chart or graph.
     Default: Enabled
   - **Copyright**
     (CA PC) If enabled, shows the copyright information for the web page in the view.
   - **Drill Down**
     Enables users to drill down from the view into the underlying data source for more detailed data. These users must have a minimal product privilege to the data source and the 'Drill into Data Sources' role right to use this feature.
     Default: Enabled.
5. Select from the following time frame options:
   - **Time Options**
     (CA PC) Let you change the time frame for the data in the exported view. Supply a custom time frame in the Start Time and End Time fields, or select a Time Range from the drop-down list.
   - **Time Span**
     (NPC) Let you select a time frame for the data in the exported view.
   - **Token Expiration Options**
     Control view expiration. The default, 'Never' expires, lets the exported view display indefinitely.
     If you want the view to expire, select a timeout period from the **Token Expiration** list. The URL includes an encrypted token that causes the view to expire after the specified timeout period.
     The token does not enable the user who interacts with the generated view to drill down for more data.
6. (Optional) Click **Preview** (CA PC) or **View Preview** (NPC) to see how the view looks with the options you selected.
7. Copy the URL displayed at the top of the page to the Clipboard.
8. Paste the URL to the destination for displaying the view.
9. Click **OK**.
10. The **Generate URL** window closes.

Organizing Dashboards in Menus

Dashboards are organized into menus that have a central troubleshooting or monitoring purpose. You see a list of available dashboards and menus when you hover on the **Dashboards** tab (CA PC) or **Reports** tab (NPC).

Users with the required administrative role rights can reorganize menus. They also can create custom menus that contain built-in or custom dashboards. The users can associate the new menus with user account roles. When product operators log in, the dashboards they need for their daily tasks are organized in a meaningful way.

Administrators can remove a dashboard from any menu and add it to a shared menu.

View a List of Menus

This topic describes the menus in the CA Performance Center Console.

The **Manage Menus** page contains a list of currently defined menus. Before you add custom menus, only predefined menus are included in the list. The user account role determines the menus that each user can access.

Custom menus are defined for each tenant. Only the factory menus are shared among tenants. The global administrator sees a list of menus not explicitly associated with a tenant.

Follow these steps:

1. Log in as a user with the required administrative role rights.
2. Select **Admin**, **User Settings**, and click **Menus**.
   The **Manage Menus** page opens.
   The page displays the current list of menus. The following menus are provided with CA Performance Center and appear by default in the **Menu** List:
   - **Infrastructure Health**
     Contains summary and overview dashboards with at-a-glance views of system and device health and performance, events, and threshold compliance.
   - **Application Health**
     Contains overviews and detailed analysis of application performance. Also contains related dashboards, such as performance by protocol and server performance.
   - **Capacity Planning**
     Contains dashboards that are related to projections, thresholds, and recent changes to systems or devices.
   - **Management**
     Contains at-a-glance scorecards and overview dashboards, as well as high-level summary and comparison dashboards.
   - **Operations Displays**
     Contains high-level overview dashboards appropriate for display in the Operations Center and for use by Network Operators.

   To perform any action on this page, select a menu, and then click a button.
3. If any dashboards have been customized, the following additional menu appears:
   - **My Dashboards**
     Contains frequently used dashboards for an individual user account. Any dashboards that this user modified become available in this menu.

     NOTE
     Users with the required role right can edit the **My Dashboards** menu for a user account by proxying that user account.

Custom Menus

Administrators and designers can create custom menus for the **Dashboards** tab (CA PC) or **Reports** tab (NPC). Custom menus let you determine which dashboards are available to each user account. For example, an operator might log in and see three or four menus of dashboards. The menus can be configured sot that the operators see only the data that they require.

If your user account has the necessary role right, you also can create custom dashboards to populate a custom menu.

Custom dashboards that are in a user's **My Dashboards** (CA PC) or **My Reports** (NPC) menu are not visible to other users. Users can therefore copy a dashboard from a factory menu to their **My Dashboards** or **My Reports** menu and customize it.

A custom menu is not available to any users until the administrator edits a role to include it. The role must, in turn, be assigned to a user account.

Add a Menu

Custom menus let you organize dashboards and make them available to selected roles. Administrators and designers can create custom menus and can select dashboards for each menu.

A custom menu is not available to any users until the administrator edits a role to include it. The role must, in turn, be assigned to a user account.

Follow these steps:

1. Log in as a user with the required administrative role rights.
2. Select **Admin**, **Menus**.
   The current list of menus opens.
3. Click **New**.
   The **Add Menu** page opens.
4. Supply values in the following fields:
   - **Name**
     Is a name for the menu. This name appears when you click the **Dashboards** tab.
   - **Description**
     (Optional) Describes the menu to help other operators identify it.
5. Select a dashboard to include from the **Available Dashboards** list (CA PC) or **Available Reports** list (NPC).
6. Click the right arrow.
   The dashboard moves to the **Selected Dashboards** list (CA PC) or **Selected Reports** list (NPC).
   Use **Shift** + **Click** or **Ctrl** + **Click** to select multiple dashboards.
   (CA PC) Use the up and down arrows to change the order of the dashboards in the menu.
   Note: A maximum of 20 dashboards can be assigned to a single menu. An error message appears if you try to add more than 20 dashboards.
7. Click **Save** to save the menu and close the **Add Menu** page. Click **Save & Add Another** to save the menu and add another menu.

Edit a Menu

Administrators and designers can edit menus to meet the changing needs and new job responsibilities of operators. Administrators can edit custom or built-in menus by adding, removing, and reordering dashboards.

Follow these steps:

1. Log in as a user with the required administrative role rights.
2. Select **Admin**, **Menus**.
   The current list of menus opens.
3. Select the menu that you want to modify.
4. Click **Edit**.
5. Modify the menu settings as required.
   For example, to remove a dashboard from the menu:
   - Select the menu in the **Selected** list.
   - Use the arrow button to move it to the **Available** list.

     NOTE
     A maximum of 20 dashboards can be assigned to a single menu. An error message appears if you try to add more than 20 dashboards.

6. Click **Save**.

NFA QueryBuilder

This feature is available from NFA 10.0.3.

The ODataAPI is a flexible tool that lets users extract data from the DX NetOps database. The ODataAPI enables integration between DX NetOps data and external applications.

The ODataAPI is a public API that uses the QueryBuilder GUI. The QueryBuilder is a guided URL builder that lets you create custom Query URLs to extract and explore flow data. The URLs return customized data in the specified format. You can view the data in a browser or process the data in a custom web application. The ODataAPI uses the OData 4.0 industry standards.

Access the QueryBuilder

All the users who have credentials can use QueryBuilder and ODataAPI. To log in to the ODataAPI QueryBuilder, use your credentials.

To access the QueryBuilder, go to the following URL:

```
http://<nfa odata host>:<nfa odata port>/ODataQueryBuilder
```

The schema XML description provides detailed information about the items and relationships in your system. To review the schema XML description and metadata, go to the following URL:

```
http://<nfa odata host>:<nfa odata port>/odata/api/$metadata
```

More Information:

Use the ODataAPI QueryBuilder

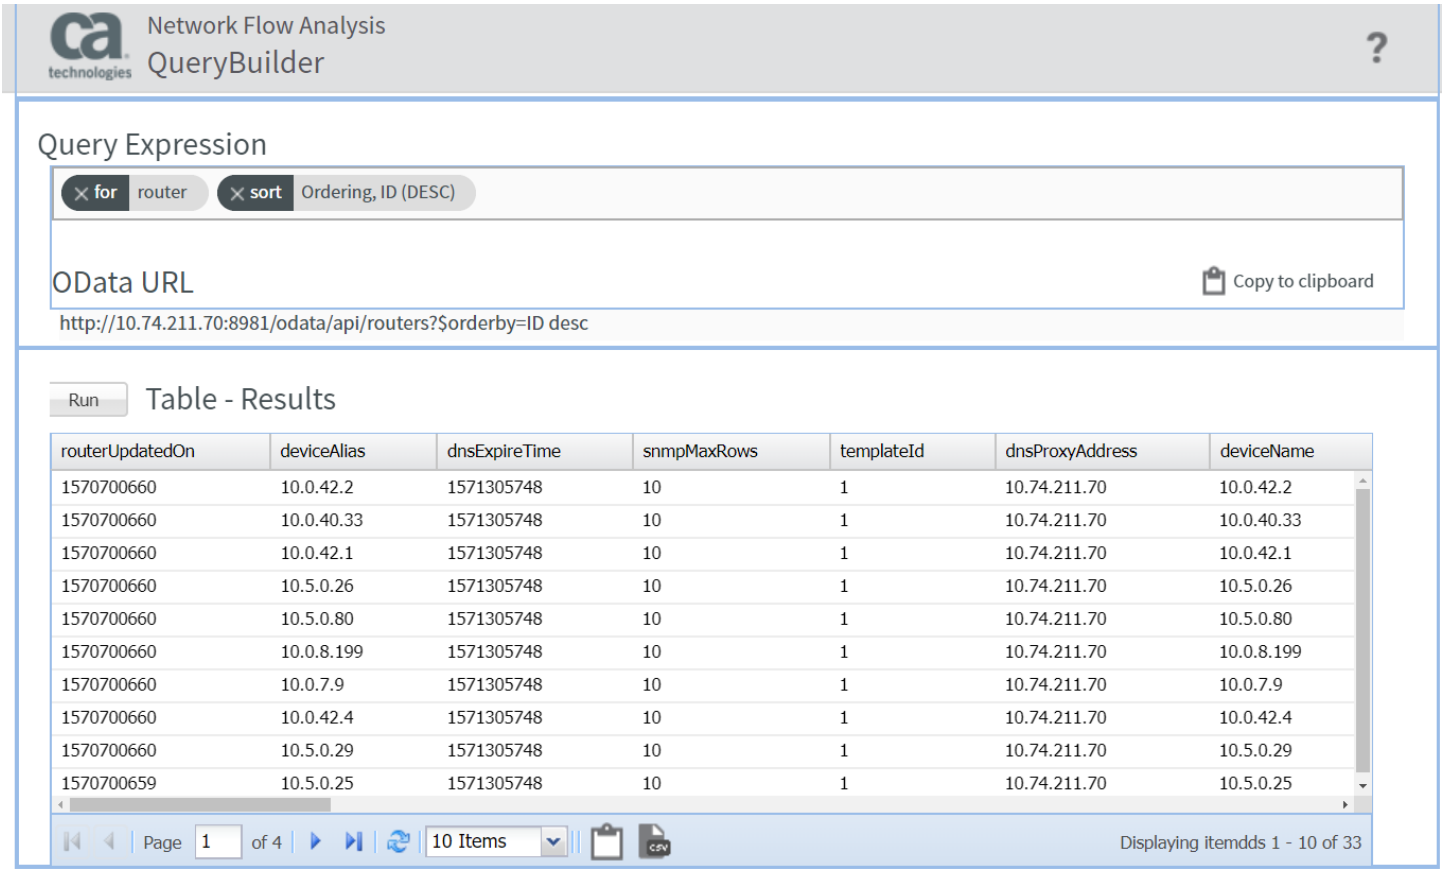
nfa1003

HID_ODataAPI_QueryBuilder

The ODataAPI QueryBuilder creates query URLs that export configuration and polled data.

NFA ODataAPI QueryBuilder User Interface

The following image shows the user interface of the NFA ODataAPI QueryBuilder.



Understanding the QueryBuilder Interface and Results

Use the **Query Expression** field to create your queries. The application creates the URL for your query and displays the URL in the **OData URL** section. The **Table - Results** section displays the results of the query. You can sort the results table in either ascending or descending order. You can select any column and customize the results table to show only the desired columns. You can also use the arrow buttons at the bottom of the **Table Results** section to view more results, if any. Click on the clipboard icon to copy the results to another application. Click on the export to CSV icon to export the results in CSV format. Click the ? (help) link, to see the NFA ODataAPI QueryBuilder documentation.

More Information

ODataAPI QueryBuilder Examples

Create an ODataAPI Query

To extract customized data sets from the data source, use the QueryBuilder to generate ODataAPI queries.

> **WARNING**
> Queries that return a large set of results can negatively affect your system. Refine your queries to return only the results that are relevant to your needs.
>
> **NOTE**
>
> The address bar of the Web browser updates to show the selected tokens in the Query Expression field. To continue editing the query later, copy and save this URL.

Follow these steps:

1. Click the Query Expression field to start a query.

2. Select the **for,** an option that represents what you want in the data set.
3. Add the **select**, **expand**, and **filter** tokens to define the output data.
4. Add more tokens to refine the results.
   The QueryBuilder creates the OData URL.
5. **Run the Odata Query -** To run the query in the QueryBuilder browser window, click **Run**.
6. **Copy OData URL to Clipboard** - After you build the query using the available expressions, select the **Odata URL** and click **Copy to clipboard**, to run the query from a Web browser, REST tool, or custom application.
   The report displays the result of the query in a table.

NFA QueryBuilder ODataAPI Controls

The ODataAPI QueryBuilder uses tokens that represent logical elements in the ODataAPI query syntax. Tokens appear when you click the Query Expression field. A token lets you select the type of available property for the selected entity. Selecting token updates the Query URL.

Use the following tokens to create and export Query URLs:

- **for**
  This token determines the type of entity that the query retrieves data about. This token appears only once in each query.
  Most options for this token include selections that set up an automatic filter. For example, when you select interface in the token, you see expand token option. When you select routers, expand token option is not available.
- **expand**
  The expand token indicates the related entities and stream values that must be represented inline. The CA NFA OData service must return the specified content and may return additional information.
- **navigation**
  The navigation token is similar to the CA Network Flow Analysis console user interface. The navigation property name is optionally followed by a /$count path segment, and optionally a parenthesized set of expand options like, filtering, sorting, selecting, paging, or expanding the related entities.

  NOTE
  The QueryBuilder currently supports navigation up to two levels.
- **select**
  This token determines the item properties to include in the data set. Property order is not supported in the results.
- **filter**

  This token adds custom filters that are based on logical functions using the AND and OR operations. Select whether the filter is case-sensitive for all logical functions. When OData evaluates a filter expression, the 'Any' operator is used to determine whether the Boolean expression is True or False for a collection of items. The following example returns True:

  ```
  odata/api/interfaces?$filter=((ID eq 10) and (contains(RouterAddress,'10.0.0.19'))
  ```
- **custom parameter**
  This token adds custom parameters in OData syntax to the query.
- **sort**

  This token controls the sorting of the query output. For example, the following query sorts the interface entity by ID:

  ```
  /interfaces?$orderby=ID
  ```
- **limit (top)**
  This token specifies the maximum number of rows or expanded rows in the query output.
  - **Maximum number of rows:** The number of rows in the Results table
  - **Number of rows to skip:** The number of leading rows to omit from the query output
- **format**

This token determines the format of the returned data set. The ODataAPI supports the HTML format.

HTML Table
If the query does not include this token, HTML Table is the default format.

NOTE
The HTML table format is supported only in the ODataAPI QueryBuilder. Direct ODataAPI queries support HTML and JSON.

Export the Query Results

You can download the query result in the CSV format.

For example: Using the following steps, you can download the report of the selected properties of the interfaces.

Follow these steps:

1. Select the following query options, in the Query Expression field.
   a. **for: interfaces**
   b. **select: AgentType,Description,Enabled,HarvesterAddress,ID,IfIndex**
2. Select **Run** to execute the query.
3. Select the  butt to export the query results in CSV format.

The report is saved in CSV format to your default download directory.

Configure ODataAPI Defaults and Limits

To perform operations that affect the system during off-hours, override the QueryBuilder properties. You can override several parameters in the QueryBuilder. The default parameter values that are defined in the OData limiters configuration file protect the system from ODataAPI queries that negatively affect the overall system performance. These parameters either limit the returned set of results or define the timeout threshold for potentially large operations. You can customize and override the default parameter values, which vary according to the scale and capability of the system.

For more information on the default limits and to override the default limiters, see theLimiterspage.

ODataAPI QueryBuilder Examples

nfa1003

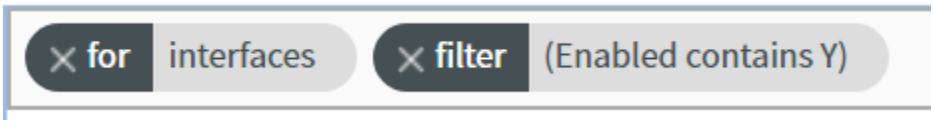
The following examples highlight the flexibility of the ODataAPI. Use these examples as a model to create your own ODataAPI queries:

Extract the Entity Information

The following examples show how to extract lists of entities with specific details.

Show all the Flow Enabled Interfaces

You want to get all the interfaces that are in the enabled state using this query.



To get this list, use the following tokens to build the query:

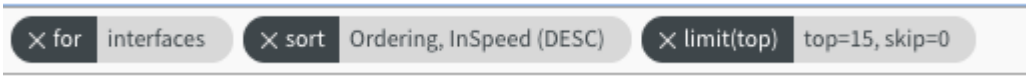
- **for: interfaces**
- **filter: Enabled contains Y**

ODataAPI URL:

```
http://<nfa odata host>:<nfa odata port>/odata/api/interfaces?$filter=contains(Enabled,'Y')
```

Show the Top Interfaces With High Inspeed

You want to get the list of interfaces sorted in the descending order of the Inspeed.



To get this list, use the following tokens to build the query:

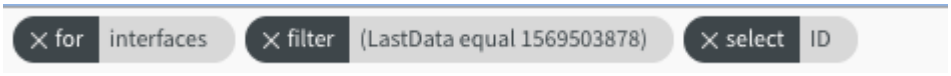
- **for: interfaces**
- **sort: Ordering, InSpeed (DESC)**
- **limit: Top=15, Skip=0**

ODataAPI URL:

```
http://<nfa odata host>:<nfa odata port>/odata/api/interfaces?$orderby=InSpeed desc&$top=15
```

Show 'Id' of Interfaces That Has Not Received Data After Specific Timestamp

You want a list of all interfaces that have not received data after a specific time.



To get this list, use the following tokens to build the query:

- **for: interfaces**
- **filter: LastData = 1547805618**
- **select: ID**

ODataAPI URL:

```
http://<nfa odata host>:<nfa odata port>/odata/api/interfaces?$filter = LastData eq 1547805618&$select =ID
```

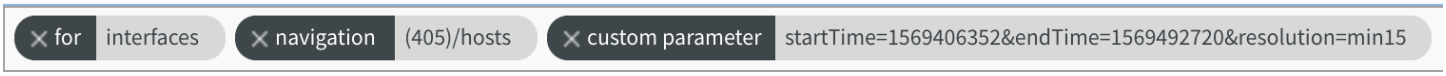
> **NOTE**
> Similarly, you can view the information for available interfaces, domains, templates and so on.

Extract the Interface Information Using Navigation

The following examples show how to extract interface information using the navigation tokens.

Show 15 Min Aggregated Information Of An Interface Within Specified Time

You want to know the fifteen minutes' aggregate information of the interface with ID 405 between 1569406352 and 1569492720.



To get this list, use the following tokens to build the query:

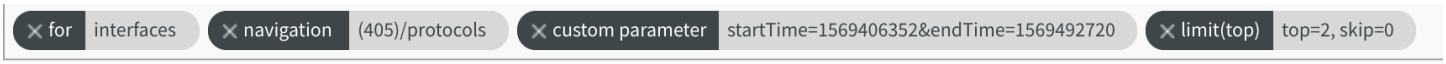
- **for: interface**
- **navigation: Enter interface Id = 405, Select Entity Name = hosts**
- **customparameter: startTime=1569406352&endTime=1569492720&resolution=min15**

ODataAPI URL:

```
http://<nfa odata host>:<nfa odata port>/odata/api/interfaces(405)/hosts?
&startTime=1569406352&endTime=1569492720&resolution=min15
```

Show The Top Two Protocols Information Of An Interface During The Specified Time

You want to see the top two protocol information of the interface with ID 405 between 1569406352 and 1569492720.



To get this list, use the following tokens to build the query:

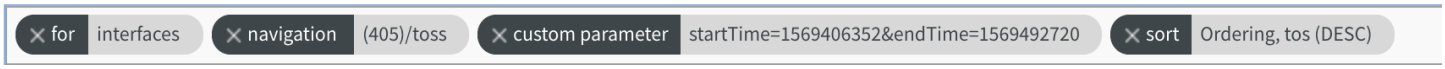
- **for: interface**
- **navigation: Enter interface Id = 405, Select Entity Name = hosts**
- **customparameter: startTime=1569406352&endTime=1569492720**
- **limit: Maximum Number of rows = 2, Number of rows to skip = 0**

ODataAPI URL:

```
http://<nfa odata host>:<nfa odata port>/odata/api/interfaces(405)/hosts?
&startTime=1569406352&endTime=156949272$top=2
```

Show The TOS Information Of An Interface During The Specified Time And Order By Most Recent To Older

You want to see the top two protocol information of the interface with ID 405 between 1569406352 and 1569492720.



To get this list, use the following tokens to build the query:

- **for: interface**
- **navigation: Enter interface Id = 405, Select Entity Name = hosts**
- **customparameter: startTime=1569406352&endTime=1569492720**
- **sort: Ordering, tos (DESC)**

ODataAPI URL:

```
http://<nfa odata host>:<nfa odata port>/odata/api/interfaces(405)/toss?
&startTime=1569406352&endTime=1569492720&$orderby=tos desc
```

Extract the Interface Information Using Expand

The following examples show how to extract the interface information using the expand token.

Show the Protocol Details of a Specific Interface

You want to know the protocol details of the interface-id 405.

To get this list, use the following tokens to build the query:

- **for: interface**
- **filter: ID equal 405**
- **expand: protocols, select=inoctets,outoctets,protocol**

ODataAPI URL:

```
http://<nfa odata host>:<nfa odata port>/odata/api/interfaces?
$expand=protocols($select=inoctets,outoctets,protocol)&$filter=((ID eq 405))
```

Show the Conversation Details of an Interface in JSON Format

You want to view the conversation details of the interface with id 405 in JSON format.

To get this data, use the following tokens to build the query:

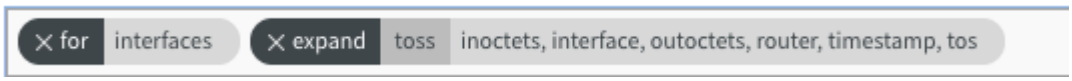
- **for: interface**
- **filter: ID equal 405**
- **expand: conversations($select=DestHost,SrcHost)**
- **format: JSON**

ODataAPI URL:

```
http://<nfa odata host>:<nfa odata port>/odata/api/interfaces?$expand=conversations&$filter=((ID eq 405))&
$format=json
```

Show the TOSS Information for all Interfaces

You want to view the conversation details of the interface with id 405 in JSON format.



To get this data, use the following tokens to build the query:

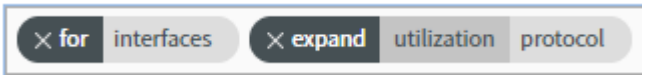
- **for: interface**
- **expand: toss($select=inoctets,interface)**

ODataAPI URL:

```
http://<nfa odata host>:<nfa odata port>/odata/api/interfaces?$expand=toss($select=inoctets,interface)
```

Get the Utilization Information for a Particular Entity

You want to view the utilization details of a protocol



To get this data, use the following tokens to build the query:

- **for: interface**
- **expand: utilization/ protocol**

ODataAPI URL:

```
http://<nfa odata host>:<nfa odata port>/odata/api/interfaces?$expand=utilization&$apply=groupby((utilization/
protocol),aggregate(Utilization))&resolution=MIN1&timeout=120
```

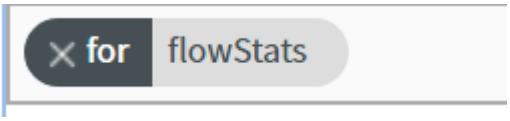
> **NOTE**
> The utilization report is shown only in JSON format.

Extract Settings and Health Information

The following examples show how to extract general application settings and health information.

View the Overall Flow Statistics

You want to view the overall flow statistics.



To get this data, use the following tokens to build the query:

- **for: flowStats**

ODataAPI URL:

```
http://<nfa odata host>:<nfa odata port>/odata/api/flowStats?
```

View the WatchDog Settings

You want to view the watchDog settings.

To get this data, use the following tokens to build the query:

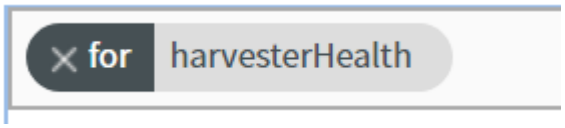
- **for: watchDogSettings**

ODataAPI URL:

```
http://<nfa odata host>:<nfa odata port>/odata/api/watchDogSettings
```

View the Health Of Harvester

You want to view the harvester health.



To get this data, use the following tokens to build the query:

- **for: harvesterHealth**

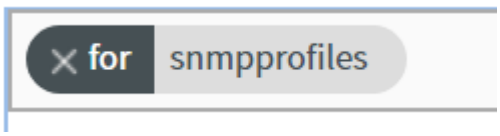
ODataAPI URL:

```
http://<nfa odata host>:<nfa odata port>/odata/api/harvesterHealth
```

> **NOTE**
> Similarly, you can view the health of the reporter.

View the Available SNMP Profiles

You want to view the list of available SNMP profiles.



To get this data, use the following tokens to build the query:

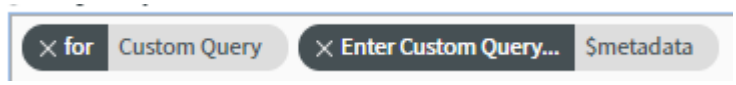
- **for: snmpprofiles**

ODataAPI URL:

```
http://<nfa odata host>:<nfa odata port>/odata/api/snmpprofiles?
```

Running a Custom Query

You want to run a custom query to view the metadata.



To get this data, use the following tokens to build the query:

- **for: Custom Query**
- **Enter a Custom Query: $metadata**

ODataAPI URL:

```
http://<nfa odata host>:<nfa odata port>/odata/api/$metadata
```

> **NOTE**
> You can run any custom query by providing only actual path information.

Integrating

DX NetOps (CA NFA) can be integrated with CA Unified Infrastructure Management (CA UIM) to display flow information.

The views displayed are:

- **Stacked Protocol Trend - In**
- **Stacked Protocol Trend - Out**
- **Top Hosts**
- **Top Conversations**

The **Advanced** tab is available when you select an individual interface in USM. The **Advanced** tab displays graphs for SNMPcollector probe metrics, as well as the following CA NFA views:

- **Stacked ToS Trend In**
- **Stacked ToS Trend Out**
- **Top Hosts per ToS**
- **Top Conversations per ToS**

Drilling down from within any of these views opens DX NetOps. Users can navigate back to the UIM console by clicking the portal link in the NFA console.

The CA Unified Infrastructure Management documentation can be accessed here, or you can use the field below to search the CA Unified Infrastructure Management documentation from this site:

Search this CA UIM keyword UIM847Search this CA UIM keyword

CA Digital Operational Integration

> **NOTE**
>
> : CA Digital Operations Intelligence 1.3 is an early access release and is available on request.

CA Network Flow Analysis (CA NFA) integrates with CA Digital Operational Intelligence. The OI Connector collects polling metrics from CA NFA and events, and inventory from CA PM and transmits them to the analytics platform. You install the connector to enable the integration with CA Digital Operational Intelligence.

Configuring the OI Connector also enables communication between CA NFA and the Operations Intelligence solution in one easy step.

By default, the OI Connector collects events every one minute with a 5-minute delay. Every minute, the OI Connector collects events that occurred in the 60-second interval that occurred 5 minutes before the collection started.

> **NOTE**
>
> **More Information:** Compatibility Matrix

Integrate CA NFA and CA Digital Operational Intelligence

To collect polling metrics and events from CA NFA, integrate CA NFA and CA DIgital Operational Intelligence. For more information about integrating CA Digital Operational Intelligence, see CA NFA - CA Digital Operational Intelligence Integration.

View CA NFA Metrics on CA Digital Operational Intelligence

You can view metrics information using Alarms Analytics and Performance Analytics. For more information, see Alarm Analytics and Performance Analytics.

View CA NFA Dashboard on CA Digital Operational Intelligence

You can create, view the CA NFA dashboard using Data Studio and Self Service Dashboards. For more information, see Unified Dashboards.

CA UIM Integration

DX NetOps (NFA) integration with CA Unified Infrastructure Management (CA UIM) requires the following:

- Integration is enabled by the nfa_inventory probe
  This is a local or remote probe used to send DX NetOps inventory to UDM for reconciliation with snmpcollector.
- The nq_services probe, which makes services internally available to DX NetOps and other NetQoS productsThis allows these products to interrogate CA UIM for data.
- DX NetOps inventory information is synced to UIM where it is correlated with inventory from other sources
- SNMP profiles are synced from CA UIM to DX NetOps
- In CA UIM, DX NetOps data displays along with SNMP data

NOTE

More Information: Compatibility Matrix

The steps required to accomplish the integration are:

1. Deployment
2. Configuration

Deployment

To deploy the necessary components to integrate DX NetOps with CA Unified Infrastructure Management:

1. Download CA UIM 8.4 or later.
2. Download CA NFA.
3. Install CA NFA.
4. Install CA UIM 8.4 (or later).
5. From the CA UIM Admin Console, download the nfa_inventory probe package into your archive.
6. From the CA UIM Admin Console, deploy the nfa_inventory probe to a robot either installed on the NFA console or remote to the NFA console.

   NOTE
   We recommend that you install a robot on the NFA console server, but it is not required.
7. Deploy the nq_services probe on the same robot as the trellis probe.
   After deploying the nq_services probe, restart trellis.
8. Deploy snmpcollector to a hub in the same domain as the NFA robot.

Configuration

1. Configure routers to send NetFlow to DX NetOps.
2. Using the CA UIM Admin Console, configure the nfa_inventory probe to point at the NFA console (by specifying the IP Address).
3. On a periodic basis, the nfa_inventory probe queries NFA for inventory information (routers, interfaces, data access and cross-launch URLs).

   NOTE
   If the nfa_inventory probe is on a non-wasp hub, the
   `/ump_common/nfa_inventory`
   key must be added to the
   `wasp config`
   using Raw Configure in the Admin Console.

   The value of the
   `nfa_inventory`
   key should be the bus address (/*domain*/*hub*/*robot*/nfa_inventory) for the nfa_inventory probe.
4. Configure snmpcollector so that all snmpcollector instances and DX NetOps have the same origin.

System Data Flow

1. The nfa_inventory probe calls DX NetOps and gets current routers and interfaces, creates a CTD and puts it on the bus.
2. The nfa_inventory probe calls DX NetOps to get the data and cross-launch URLs (which for UIM 8.4 and later are stored locally, and made available via the `get_info()` call).
3. The DiscoveryServer consumes the CTD while additionally doing correlation with any routers or interfaces found by other probes (for example, snmpcollector).
4. The DiscoveryServer inserts IPDevices and NetworkInterfaces into UDM.

User Data Flow

1. In USM, the user selects a router of interest, and then selects an interface.
2. USM calls the MetricsAPI, with the master interface ID, and timeframe.
3. The MetricsAPI calls UDM to get the local interface ID and the IP Address of the NFA console.
4. The MetricsAPI calls the data web service on DX NetOps, transforms the data into the format expected by USM, and returns that data to be displayed.

   NOTE

   More information:

   - nfa_inventory AC Configuration

Managing

These articles describe administration tasks that you perform in the NFA console.

Note: The term *Performance Center* refers to CA Performance Center and CA NetQoS Performance Center collectively. Program-specific pages names or functions may be identified by the full program name or acronym, which is *CA PC* for CA Performance Center and *CA NPC* for CA NetQoS Performance Center.

Administration Page Options

The DX NetOps **Administration** page lets you review, administer, and customize the network data view. When you open this page, the **System Status** is displayed. The **System Status** uses the following status icons:

- *Green* check mark: Component is running without any errors.
- *Red* exclamation mark: Component is running but has errors.

Click a red exclamation mark to view the associated error report. The error report includes the IP address, the type of component, and more information about the error. No error messages are displayed for a green check mark.

NOTE

- To perform administration tasks, log in as a user who has Administrator rights.
- A few options take you to a page in the Console for the Performance Center version that you use with DX NetOps. If the product is currently registered as a data source for CA Performance Center or CA NetQoS Performance Center, the following options are enabled:
  - CA PC Groups or NPC Groups
  - SNMP Profiles

A menu of administrative options is on the left side of the page.

Interfaces

Physical & Virtual

View the status of the interfaces on the **Active Interfaces** page. You can also edit, delete, or merge interfaces or create and edit custom virtual interfaces (CVIs).

Aggregations

Aggregate interfaces on the **Interface Aggregations** page. Interface aggregations let you view and report on interfaces as a unified group.

Enable Interfaces

View the router list and status of routers on the **Available Interfaces** page. Enable, disable, or delete interfaces on this page.

Templates

Use the **Interface Templates** page to view, add, edit, and delete the templates that determine the way interface names and descriptions are displayed.

Alerts

Traps

Review, add, edit, and delete traps on the **Trap Configuration** page.

Anomaly Detector

Display the Anomaly Detector window to perform administrative functions for CA Anomaly Detector. These functions have been added to the NFA console to accommodate users in a deployment that includes CA Performance Center.

The **Anomaly Detector** window gives you access to the following tabs:

- **View Monitored Products**: Add products for CA Anomaly Detector to monitor and review the list of monitored products.
  The other page functions are enabled as soon as you add an instance of DX NetOps to be monitored.
- **View Collection Sources**: View, enable, and disable the collection sources that the CA Anomaly Detector monitors.
- **View Sensors**: View and edit the default configuration settings for the sensors.
- **View Alert Targets**: Configure alert targets for snmp_traps and syslogging.

Define an Application

Application Definitions

Create and edit rules for application mapping, port priorities, or Reserved Seating on the **Application Definitions** page.

Protocol Names

Use the **Protocol Configuration** page to edit protocol names and descriptions. In a deployment that has multiple domains, protocol names are domain-specific.

Protocol Groups

Review, add, delete, or edit protocol groups on the **Protocol Group Configuration** page.

ToS Names

Use the **ToS Configuration** page to edit a ToS label (description) in the context of a particular domain. You also can add, remove, or edit groups of ToS values. In a deployment that has multiple domains, ToS names are domain-specific.

ToS Groups

Review, add, delete, or edit ToS groups on the **ToS Group Configuration** page.

AS Names

Use the **AS Names** page to search and edit Autonomous System names in the context of a particular domain. In a deployment that has multiple domains, AS names are domain-specific.

Reporting

Reporting Periods

Use the **Reporting Periods Configuration** page to add, edit, and delete reporting periods. Operators can use the reporting periods to limit the time frames for the data in Interface reports.

Time Filters

View, add, edit, and delete time filters on the **Time Filter Configuration** page.

Scheduled Emails

Use the **Scheduled Emails** page to review the reports that are scheduled for email delivery. You can change the destination address, Subject line, accompanying message text, and schedule options.

Addresses

Use the **Address-Hostname Configuration** page to specify a mask and options for resolving IP addresses to DNS names. You can list, edit, delete, and expire IP addresses. Expiring IP addresses schedules them to be refreshed. In a deployment that has multiple domains, address configuration is domain-specific.

Sites

Use the **Sites** page to add, edit, and delete site definitions.

Groups

Open the specific group-type page to review, add, edit, and remove groups.

- **Custom Report Groups**
- **Flow Forensics Report Groups**
- **Analysis Report Groups**
- **Site to Site Report Groups**
- **Site Groups**
- **Interface Groups**

Groups (CA PC or CA NPC)

Open the **Manage Groups** page in the Performance Center Console. Review system groups and add, remove, or edit custom groups and site groups. This option is enabled if DX NetOps is registered as a data source for Performance Center.

Authentication

Users

Open the page for managing user accounts. Review the user accounts and their settings. Add, remove, and edit user accounts.

This sends you to the Performance Center Console if the product is registered as a data source for CA PC or CA NPC.

Roles

Open the page to manage roles. Review the existing role names and the capabilities and menus that are available for each role. Add, delete, and edit roles.

This sends you to the Performance Center Console if the product is registered as a data source for CA PC or CA NPC.

Permissions

Open the **View Permissions** page to define sets of included groups. Then, if you have User product privileges, and that permission set, you are able to view those reports.

SNMP Profiles

Open the **SNMP Profiles** page to view, add, edit, delete, and re-order the SNMP profiles that Harvesters use for polling. In a multi-tenant environment, a Harvester uses the SNMP profiles that are assigned to its tenant. This sends you to the Performance Center Console if the product is registered as a data source for CA PC or CA NPC.

System

Harvester

Harvester is a software which parses data for processing.

Application Settings

Edit a wide range of application settings on the **Application Settings** page.

Health

Flow Statistics

The **Flow Statistics** determines the overall load for each harvester. The flow statistics allows you to make decisions about where new flows should be sent, whether rebalancing is needed. You can view the flow rates on harvesters for the last day, last week, or last 30 days.

Harvester

The harvester health shows the different metrics of the network that you monitor.

System Status

View the overall status of the DX NetOps components on the **System Status** page. Click a warning icon to display a list of the problem reports for the component.

Watchdog Settings

View and edit the Watchdog configuration settings on the **Watchdog Settings** page.

> **NOTE**
>
> **More information:**
>
> - View Flow Statistics
> - View System Status
> - How to Monitor the Components

About

The About page displays the following details about your DX NetOps installation:

- Version
- Date and Time of installation
- Link to view the version history
- Licensed Devices in Use
- License Utilization
- Link to product documentation

Manage Sites

Sites in DX NetOps are defined and managed from the **Administration** page, in the **Reporting, Sites** menu.

Sites can be defined as a collection of subnets that can also be discontiguous.

Follow these steps:

1. Select **Administration** from the NFA console menu.
   The **Administration** page opens.
2. Select **Reporting, Sites** from the menu on the left side of the page.
   The **Sites** page opens and displays a list of the current site definitions.
3. Select one of the following actions:

Create a Site Definition

1. Click **Save and Add New Site**.
   Fields and options for adding a site are displayed.
   The default **Site Name** is "`NewSite`*`nn`* ", where *`nn`* is the next number in the sequence. This can (and should) be changed.
2. Specify the following values:
   - **Site Name**: The default site name is shown. You can edit it as desired.

     NOTE
     Site names are unique within a tenant.
   - **Site Description**: (*Optional*) Additional notes to help identify the site. The description appears in the **Site to Site Report Wizard**.
3. Click **Add Network**.
4. Enter the **Network Name** and **Network Subnet**.
5. Repeat steps 3 and 4 to add more networks to this site definition.
6. Click **Save Changes to Site**.

Change a Site Definition

1. Select the site from the list.
2. Change any of the fields that are displayed.
   You can add networks to the site definition by clicking **Add Network**.
3. Click **Save Changes to Site**.

Delete a Site Definition

1. Select the site from the list.
2. Click **Delete Site**.

Managing Users, Groups, Roles, and Permissions

The DX NetOps (CA NFA) Administrator may set up accounts for operators to access various reports and functions, add those user accounts to the system, and assign them roles and product privileges.

You can create user accounts, groups, roles, and permissions in the NFA console (without using CA PC or CA NPC).

Manage User Accounts

DX NetOps (CA NFA) includes one automatically maintained user account, `admin` . This user account has full administrative and reporting privileges, which means that anyone who logs in using this account can create and run all available reports and also perform all tasks available from the **Administration** page, including creating user accounts and roles.

If the role for your user account is Administrator (like `admin`), you can create more user accounts, and new roles for those accounts.

The role for a user account must exist before you create the user account that requires it.

Creating a User Account

Follow these steps:

1. On the **Administration** page, select **Authentication, Users** from the menu on the left side of the page.
2. Click **New**.
3. In the **New User** page, enter the following information:

User Property	Description
Name	A name for the user.
Description	A description of the user.
Email Address	The email address of the user.
Authentication Type	The type of authentication to use for this user. Specify either **Product** or **LDAP** to determine where the user password is stored. To use Lightweight Directory Access Protocol (LDAP), you must install and use the *Single Sign-On Configuration Tool*.
Password	A password for this user.
Confirm Password	Enter the password again to confirm it.
Time Zone	Select the time zone. If you have users in different time zones, you can assign their local time zones to them. CA NFA displays reports in their time zone. These user settings are acquired from CA NPC or CA PC. CA UIM uses the CA NFA settings. The default time zone is the UTC time zone.
Product Privilege	Determines access to the **Administration** page. Select **None**, **Administrator**, **Power User**, or **User**. • **Administrator**: Allows access to all functionality on the **Administration** page • **Power User**: Allows access only to the reports on the **Administration** page • **User**: (Default) No access to the **Administration** page
Role	A role for the user. The default role is **Network Administrator**.
Permission Group	A permission set for the user. The default permission set is **All Groups**.
Account Status	The status of this user account. Select **Enabled** or **Disabled**.

Changing a User Account

Not all user information can be edited. You can change the email address, password, or time zone for the user.

Follow these steps:

1. Select the user account from the **Users** page.
2. Click **Edit**.
3. Change the information as necessary.
4. Click **Save**.

Deleting a User Account

Follow these steps:

1. Select the user account from the **Users** page.
2. If the user account can be deleted, the **Delete** button is active. Click **Delete**.
3. Confirm the deletion by clicking **Delete**.

Manage Groups

If you are not connected with a Performance Center, group types in DX NetOps are on the **Administration** page, in the **Reporting**, **Groups** menu:

- **Custom Report Groups**
- **Flow Forensics Report Groups**
- **Analysis Report Groups**
- **Site to Site Report Groups**
- **Site Groups**
- **Interface Groups**

The *Report Groups* allow you to control which groups of users have access to reports.

Site Groups allow you to create groups of sites, which can then be used to control who has access to those sites.

Custom *Interface Groups* can help users get the best results from custom reports and analyses. For example, interface groups can help operators set up custom reports that are based on geographic location, interface speed, T1 sites, or load balancing. You can create and manage interface groups in the NFA console, or in Performance Center as soon as you register the product as a data source.

You must have Administrator product privileges to add, edit, or delete a group.

Create a Group

1. Select the group type from the **Groups** menu.
2. In the **View** page for the group type, click **New**.
3. Enter a **Name** and **Description**.
4. Click **Edit** to select the items to include in the group.
   a. Click the items you want to add to the group, then click **Add**.
      Use **Shift + Click** or **Ctrl + Click** to select multiple items from the list.
      You can also use the **Filter <*group_type*> List** field to display only the items that match the pattern you enter. Click **Apply** after you type the pattern.
   b. Click **OK** when all the items you want have been added to the group.
5. Click **Save**.

Change a Group

1. Select the group type from the **Groups** menu.
2. Select the **Group Name** to edit.
3. Click **Edit**.
   If the group is not editable, the header displays the group title followed by **(Non-Editable)**. Click **OK** or **Cancel** to return to the group list.
4. Edit the **Name** or **Description** as needed.

5. Click **Edit** to change the items to include in the group.
   a. Select the items to add or remove.
      Use **Shift + Click** or **Ctrl + Click** to select multiple items from the list.
      You can also use the **Filter <*group_type*> List** field to display only the items that match the pattern you enter.
      Click **Apply** after you type the pattern.
   b. Click **OK**.
6. Click **Save**.

Delete a Group

1. Select the group type from the **Groups** menu.
2. Select the **Group Name** to delete.
3. Click **Delete**.
4. If the group is editable, you are asked to confirm the deletion. Click **Delete**.

Manage Roles

DX NetOps includes a Network Administrator role. You can create new roles in DX NetOps. For example, you might create a role that enables users to run existing reports without the ability to create and save new reports.

The role must exist before you create the user account that requires it.

Creating a Role

1. On the **Administration** page, select **Authentication, Roles** from the menu on the left side of the page.
2. Click **New**.
3. Enter the following information:

Name	Enter a name for the role.
Description	Enter a description of the role.
Enable Role	Leave this selected if you want this role to have permission to run reports.

4. Click **Edit** to select the access rights for this role. The **Select Access Rights** page displays.
5. In the **AVAILABLE RIGHTS** pane, select the rights for this role. Click the blue arrow to move the rights to the **SELECTED RIGHTS** pane.
   a. Use **Shift + Click** or **Ctrl + Click** to select multiple rights from the list.
   b. Click **OK** when all the rights you want have been added to the role.
6. Click **Save**. The new role is created with the selected rights.

Changing a Role

1. Select the role to change.
2. Click **Edit**.
3. Make changes as necessary.
4. Click **Save**.

Deleting a Role

1. Select the role to delete.
2. Click **Delete**.

3. Verify your selection.
4. Click **Yes**.

Manage Permissions

The default permissions in DX NetOps are:

Permission Name	Description
All Groups	Includes every group and item type defined within DX NetOps
None	This group contains no groups or items

Follow these steps:

1. Select **Authentication, Permissions** from the menu on the left side of the page.
   The list of currently configured permissions displays.
2. Select an action.

Creating a Permission

1. In the **View Permissions** page, click **New**.
2. Enter a **Name** and **Description** for the new permission.
3. Select a **Group Type** from the list of **Permitted Groups**.
   a. To change a **Group Type** definition, select the group and click **Edit**.
   b. Select an item or items from the **AVAILABLE** list and click the right arrow to move them to the **SELECTED** list.
      Use **Shift + Click** or **Ctrl + Click** to select multiple groups from the list.
   c. Click **OK**.
4. Click **Save**. The new permission is listed in the **View Permissions** page.

Changing a Permission

1. In the **View Permissions** page, select the permission to edit and click **Edit**.
   Note: If the permission is not editable, the permission information is displayed, but cannot be changed.
2. Edit the **Name** and **Description**, if necessary.
3. Select a **Group Type** from the list of **Permitted Groups**.
   a. To change a **Group Type** definition, select the group and click **Edit**.
   b. Select an item or items from the **AVAILABLE** list and click the right arrow to move them to the **SELECTED** list.
      Use **Shift + Click** or **Ctrl + Click** to select multiple groups from the list.
   c. Click **OK**.
4. Click **Save**.

Deleting a Permission

1. In the **View Permissions** page, select the permission to delete and click **Delete**.
   Note: If the permission is not editable, the permission information is displayed, but cannot be deleted.
2. Click **Delete**.
3. You are prompted to confirm the deletion. Click **Delete**.

Working with Interfaces and Routers

You use several different pages to perform the tasks for interfaces and routers:

Active Interfaces Page

The **Active Interfaces** page shows interfaces, routers, custom virtual interfaces (CVIs), and interface aggregations. The page shows only the routers and interfaces that have contributed to the collected data at some time. You can create and delete CVIs, merge interfaces, and edit properties. You also can delete routers and interfaces without deleting them from the system entirely, for example, to address capacity issues.

Select **Interfaces, Physical & Virtual** from the menu on the left side of the **Administration** page, then use the **Active Interfaces** page to perform the following main tasks:

- View details.
- Edit details.

  NOTE
  Interface names may not contain the characters < or >. Names with these characters are detected as a cross-site scripting attack from the UI.
- Delete interfaces or routers from the page.
- Create custom virtual interfaces (CVIs).
- Merge interfaces.

Available Interfaces Page

The **Available Interfaces** page shows information about all of the interfaces and routers, including the ones that have not contributed to the collected data at any time. You can enable or disable interfaces, delete routers and their interfaces from the system, and perform some polling troubleshooting.

Select **Interfaces, Enable Interfaces** from the menu on the left side of the **Administration** page, then use the **Available Interfaces** page to perform the following tasks:

- Check polling and view details about routers and interfaces.
- Enable or disable interfaces.
- Delete end-of-life routers from the system.

Interface Templates Page

You can create a custom interface template to change the way interface names and descriptions appear in several reports.

Select **Interfaces, Templates** from the menu on the left side of the **Administration** page, then use the **Interface Templates** page to perform the following tasks:

- Create and apply a template
- Edit a template

Application Settings Page

You can use a setting on the **Application Settings** page to control whether device names are included in interface names.

Select **System, Application Settings**, then use the **Application Settings** page to perform the following task:

- Show or remove the device name from interface names

  NOTE
  More information:

Active Interfaces Page

Use the **Active Interfaces** page to view the routers, interfaces, and custom virtual interfaces (CVIs). The page shows only the routers and interfaces that have contributed to the collected data at some time. You can perform the following actions on the **Active Interfaces** page:

- Review the routers, interfaces, and other elements without seeing the routers and interfaces that have never contributed to the collected data.
- Create and delete CVIs.
- Merge interfaces.
- Delete routers and interfaces to reclaim capacity without deleting them from the **Available Interfaces** page.
- Edit properties, such as:
  - Router name, domain, assigned SNMP profile/version, port, and interface naming template
  - Interface name, description, speed, type, and domain
  - CVI name, description, speed, type, domain, and subnets

Follow these steps:

1. Open the **Active Interfaces** page:
   a. Select **Administration** from the NFA console menu.
   The **Administration** page opens.
   b. Select **Interfaces, Physical & Virtual** from the menu on the left side of the page.
   The **Active Interfaces** page opens.

The **Active Interfaces** page includes the following options:

- **Search**
  Use a text string to search for routers, interfaces, or other elements with a matching address or name.
- **Edit**
  Modify properties of the selected item or items.
- **Delete**
  Remove routers and interfaces from the page; for example, to address capacity issues.
- **Merge**
  Combine the data for two selected physical interfaces or CVIs.
- **Add Custom Virtual Interface**
  Create a custom virtual interface based on the selected physical interface.

Active Interfaces: Router Information

Routers are listed in tables on the **Active Interfaces** page. The router tables contain the following columns.

- Flow
  Status 
  
  Indicator to show the status of the last flow at the router:
  - Red: Any enabled interfaces have not had flow for longer than the **Interface Data Absence Limit**.
  - Yellow: Any enabled interfaces have not had flow between 30 minutes and the **Interface Data Absence Limit**.
  - Green: All enabled interfaces have had flow in the last 30 minutes.
  - Gray: The router is a retired router.
- **Router Address**
  IP address of the router
- **Router Name**

User-assigned name of the router, such as *lab1 router*

- **Template**
  Interface naming template that is assigned
- **Interfaces**
  Total number of interfaces and CVIs for the router. This count includes only the interfaces that have contributed to the collected data at some time. To review all interfaces, go to the **Available Interfaces** page.
- **Harvester**
  IP address of the Harvester that collects data from the router

Active Interfaces: Interface Information

Interfaces and custom virtual interfaces (CVIs) are listed on the **Active Interfaces** page in tables nested under their parent routers. To display the interfaces and CVIs for a router, click the arrow next to the router name. Interface tables contain the following columns.

- Traffic
  Status 
  
  Indicator to show the status of the last flow at the interface:
  - Red: Inactive interface
  - Green: Active interface
  - Gray: Inactive Interface
- **Class**
  Icon for the interface type, such as a physical interface or CVI. To display the interface type name, position the cursor over the icon.
- **Interface Name**
  User-assigned name of the interface or CVI
- **Description**
  Optional information for identification
- **If Index**
  Index value, which is assigned by the device that sends flows to the interface
- **Type**
  Connection type, such as WAN or LAN
- **In Speed**
  Inbound speed of the interface, provided the speed is known
- **Out Speed**
  Outbound speed of the interface, provided the speed is known
- **Domain**
  Domain of the interface. If the environment has only one domain, the **Domain** column is not visible.
- **Notes**
  Link to add, edit, or view notes about an interface. If the note is empty, the Notes icon is dimmed. For example, you could add information about the time zone, business unit, geographical location, alternate bandwidth, circuit ID, or history. Notes icons are dimmed until they are populated and the page is refreshed.
  To display the Notes icon, set the **Display Notes Field** value to **True** on the **Application Settings** page.

Search for a Router or Interface

Use the **Search** function on the **Active Interfaces** page to locate routers, interfaces, or CVIs. To search for aggregations, use the **Search** function on the **Interface Aggregations** page.

Follow these steps:

1. Open the **Active Interfaces** page:
   a. Select **Administration** from the NFA console menu.
      The **Administration** page opens.
   b. Select **Interfaces, Physical & Virtual** from the menu on the left side of the page.
      The **Active Interfaces** page opens.
2. Enter a text string in the **Search** field. Search for whole or partial text strings that match the addresses, names, or descriptions of routers, interfaces, or CVIs.

   NOTE
   Do not use wildcards.
3. Click **Search**.
   The list is filtered to display only the matching entries. If you search for interfaces or CVIs, the search returns a list of routers that contain matching items. When you expand router details, all items appear in the sublists.

To clear the search, click **Clear Filter**.

Edit Router and Interface Details

Edit the properties of a router or interface. For example, you can edit properties to make corrections or to supply missing information. If you delete an interface without disabling it, the interface is automatically added again when the interface begins to send flow. You cannot Edit a Retired router and Interfaces. When you edit retired and active interface or router together, you see the following error message "Cannot save properties for RETIRED routers interfaces". However the changes are saved on the Active routers and interfaces.

You can also edit properties for CVIs and aggregations. If you select multiple elements to edit, editing options are restricted to their shared properties. The tenant-domain setting for interfaces need not match the parent router settings. Changing the domain can affect access permissions of the operators and reports to the related data.

Changing the tenant of a router in CA Performance Center can affect which SNMP profiles are available for polling the router interfaces. Changing the tenant of a router in CA NetQoS Performance Center does not affect the polling of SNMP profiles, as CA NetQoS Performance Center uses the same list of SNMP profiles for all routers.

Follow these steps:

1. Open the **Active Interfaces** page:
   a. Select **Administration** from the NFA console menu.
      The **Administration** page opens.
   b. Select **Interfaces, Physical & Virtual** from the menu on the left side of the page.
      The **Active Interfaces** page opens.
2. Locate the routers, interfaces, or other elements that interest you.
3. To display the contents under a router, select the arrow next to the router name.
4. Select the check box next to the items you want to edit.
   You can edit multiple interfaces and CVIs simultaneously or can edit multiple routers simultaneously. You cannot edit a mix of routers, interfaces, and CVIs simultaneously.
5. Select **Edit**.
   The **Edit Router** or **Edit Interface** dialog opens for editing the selected item or items.
6. Modify the properties as needed, such as:
   – Router name, tenant-domain (if applicable), SNMP profile/version, port, and template
     (CA PC deployment) The options to edit the SNMP profile and port are enabled once a tenant-domain is selected.
   – Interface name, description, speed, connection type, and domain (if applicable)
7. Select **Save**.
   The dialog closes. The changes are shown on the **Active Interfaces** page.

Delete Routers from the Active Interfaces Page

You can delete a router on the **Active Interfaces** page, but leave it in place on the **Available Interfaces** page. For example, you may want to delete a router in this way to address capacity issues. Later, you can restore the router (but not its historical data) by enabling its interfaces on the **Available Interfaces** page.

Deleting a router removes its interfaces, CVIs, 15-minute (historical) data, and traps. The deletion also affects any related aggregations, views, and reports.

NOTE
If you delete the router from the **Available Interfaces** page, the system has no further record of the router.

Follow these steps:

1. Verify that the router is no longer sending flows to the product.
2. Disable the router interfaces, if they are not disabled already:
   a. Open the **Available Interfaces** page:
      - Select **Administration** from the NFA console menu.
        The **Administration** page opens.
      - Select **Interfaces, Enable Interfaces** from the menu on the left side of the page.
        The **Available Interfaces** page opens.
   b. Locate the router by using the **Search** function or by paging through the table contents.
   c. Select the check box next to the router.
      You can select and disable multiple routers simultaneously provided the selections are on the same page.
   d. Click **Disable**.
      A confirmation message opens.
   e. Click **Yes**.
      The **Enabled** status for the interfaces changes to **No**. New data from the interfaces is no longer collected or shown in reports. Data that is already collected is still available for reports.
   f. (*Optional*) Update the **Enabled** value for the router by refreshing the page; for example, by pressing F5.
3. Open the **Active Interfaces** page:
   a. Select **Administration** from the NFA console menu.
      The **Administration** page opens.
   b. Select **Interfaces, Physical & Virtual** from the menu on the left side of the page.
      The **Active Interfaces** page opens.
4. Locate the router and select its check box.
5. Click **Delete**.
   A confirmation message opens.
6. Click **Yes**.
   The following events result:
   – The confirmation message closes.
   – The router is deleted from the **Active Interfaces** page and stops consuming capacity.
   – All related interfaces, CVIs, 15-minute (historical) data, and traps are deleted.
   – The router is deleted from any related aggregations.
   – The data for the deleted interfaces no longer appears in the NFA console or in reports.

NOTE
A router that you delete from the **Active Interfaces** page reappears if the router interfaces are enabled on the **Available Interfaces** page and the interfaces begin to send flow again.

Delete Interfaces

If you delete an interface on the **Active Interfaces** page, its historical data, related CVIs, and traps are deleted. The deletion also affects any aggregations, views, and reports that previously included the interface.

Follow these steps:

1. Disable the interface, if it is not disabled already:
   a. Open the **Available Interfaces** page:
      - Select **Administration** from the NFA console menu.
        The **Administration** page opens.
      - Select **Interfaces, Enable Interfaces** from the menu on the left side of the page.
        The **Available Interfaces** page opens.
   b. Locate the interface, using the **Search** function or by expanding the contents of the routers.
   c. Select the check box next to the interface.
      You can select and disable multiple interfaces simultaneously, including interfaces with different parent routers. All of your selections must be on the same display page.
   d. Click **Disable**.
      The **Enabled** status is changed to **No** for the interface. New data from the interface is no longer collected or shown in reports, but data that is already collected is still available for reports.
2. Open the **Active Interfaces** page:
   a. Select **Administration** from the NFA console menu.
      The **Administration** page opens.
   b. Select **Interfaces, Physical & Virtual** from the menu on the left side of the page.
      The **Active Interfaces** page opens.
3. Locate the interface and select its check box.
4. Click **Delete**.
   A confirmation message warns you about the results of the deletion.
5. Click **Yes**.
   The following events result:
   – The confirmation message closes.
   – The interface is deleted from the **Active Interfaces** page, but not from the **Available Interfaces** page.
   – All related historical data is purged permanently.
   – Data for the deleted interface no longer appears in NFA console views and reports.
   – All related CVIs and traps are deleted.
   – The interface is deleted from any related aggregations.
   – The interface stops consuming capacity on the server that stored its data.

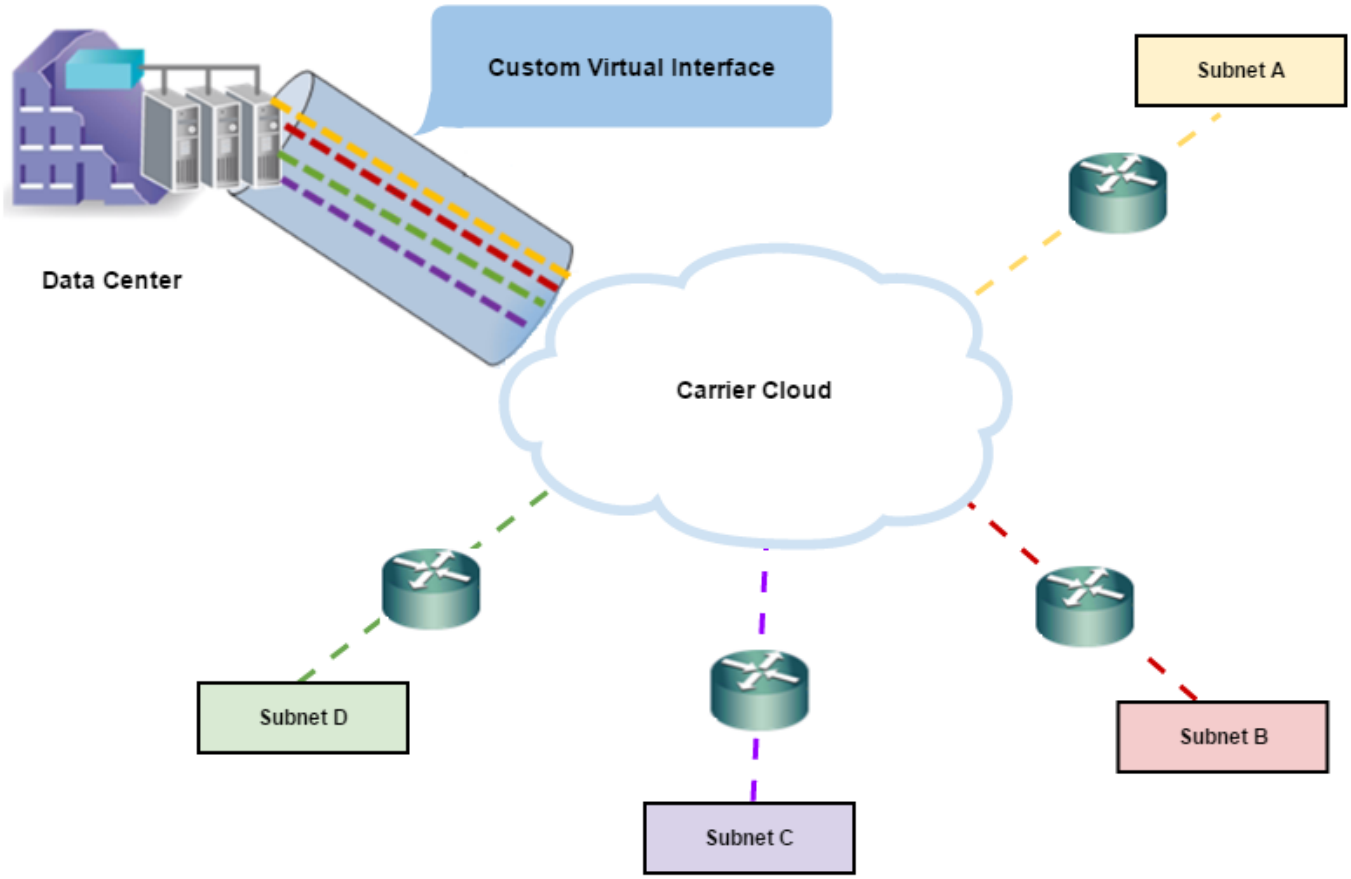
Custom Virtual Interfaces

You can create custom virtual interfaces (CVIs) to report on subnet traffic. Create CVIs for a network that is designed in the following way:

- Traffic from a data center is transferred to subnets through a multiprotocol label switching (MPLS) carrier cloud, and
- Flow is enabled on the routers in the data center rather than on the routers on the edge of the cloud.

Without virtual interfaces, you have limited visibility into which subnets actually generate the network traffic for the carrier cloud. Virtual interfaces help ensure that you can collect detailed data about the subnet traffic in this type of configuration.

Figure 99: Custom Virtual Interface



Defining a custom virtual interface (CVI) separates traffic for an interface from other traffic. The CVI in the diagram separates specific traffic from other traffic traveling to and from the data center into the cloud.

How to Configure Custom Virtual Interfaces

Create custom virtual interfaces (CVIs) to separate traffic on a particular interface and subnet from other traffic on the interface.

Create a Custom Virtual Interface

Follow these steps:

1. Open the **Active Interfaces** page:
   a. Select **Administration** from the NFA console menu.
   The **Administration** page opens.
   b. Select **Interfaces, Physical & Virtual** from the menu on the left side of the page.

The **Active Interfaces** page opens.

2. Expand the interface list for the parent router by clicking the arrow next to the router name.
3. Select the check box next to the name of a single interface.
4. Click **Add Custom Virtual Interface**.
   The **Add Custom Virtual Interface** dialog opens.
5. Enter values for the following fields:
   - **Interface Name**: Replace the default value in the **Interface Name** field with a meaningful name for the interface list. **Default:** Parent interface name, which you must replace.
   - **Description**: (*Optional*) Enter a text string to help identify the interface.
   - **In Speed** and **Out Speed**: (*Optional*) Identify the speed of data that is inbound to the parent interface and outbound from the parent interface.
   - **Type**: (*Optional*) Select the interface type from the list.
   - **Domain**: Select a tenant-domain combination from the list or accept the default setting.
     Changing the domain can affect which operators and reports have access to the data. The **Domain** option is visible only in an environment that contains multiple domains.
   - **Subnet**: Enter a subnet and mask identification for each subnet filter you want to use for this CVI, then click **Add**. Use the format:
     `<subnet IP address/subnet mask>`
     The CVI must contain at least one subnet filter.
6. Click **Save**.
   The **Custom Virtual Interface** is automatically deployed within one minute. The Class icon for the new CVI distinguishes it from the physical interfaces.

WARNING
If you delete a parent CVI, all the children CVIs are deleted automatically.

Custom Virtual Interface Priorities

CVI priorities are set according to how narrowly you specify the subnet mask. Subnet masks that are most specific have the highest priority. A CVI that has a single-node subnet mask (such as 192.168.20.2/32) has higher priority than a CVI that has a multiple-node subnet mask (such as 192.0.0.0/8). Establishing priorities in this way helps ensure that CVI traffic remains separate from other traffic, especially for a host on a large subnet.

NOTE
Reports for traffic between two CVIs with the same priority can be inconsistent.

Examples of Custom Virtual Interface Definitions

If you define the following CVIs:

- CVI-A: 192.168.0.0/16
- CVI-B: 192.168.100.0/24
- CVI-C: 192.168.100.123/32

The following reporting is enabled:

- CVI-A reports traffic that involves subnet 192.168.*x.x* except traffic that involves subnet 192.168.100.*x.*
- CVI-B reports traffic that involves subnet 192.168.100.*x* except traffic that involves host 192.168.100.123.
- CVI-C reports traffic that involves host 192.168.100.123.

If you add 192.168.100.124/32 as CVI-D, either CVI-C or CVI-D reports the traffic between 192.168.100.123 and 192.168.100.124. Only one of the CVIs reports the traffic.

If you add 192.168.200.0/24 as CVI-E, either CVI-B or CVI-E reports the traffic between 192.168.100.*x* and 192.168.200.*x*. Only one of the CVIs reports the traffic.

Merge Interfaces

You can merge interfaces so they are shown as one interface in reports. You may want to do this whenever major logical changes to a device cause a new interface to be created in the system.

Consider the following guidelines when you merge interfaces:

- You can merge two interfaces, which can be on different routers.
- The data collection period for the interfaces can contain gaps.
- If you merge interfaces that have overlapping time frames, the overlapping data is discarded. Precedence is given to the newer interface (the interface that has the later start date).
  For example, suppose you merge Interface A and B. Interface A has collected data that starts at 1:00 P.M. and ends at 5:00 P.M. on the same day. The data collected for Interface B starts at 3:00 P.M. The merged data consists of Interface A data from 1:00 to 3:00 P.M. and Interface B data from 3:00 P.M. onward.
- You cannot merge interfaces that started collecting data at the same time.

Example

For example, suppose that your 512-Kbps link that has been running for a year is upgraded to a T1 link (a 1.54-Mbps link). Using the new T1 link causes the interface `ifindex` to change. For example, the previous `ifIndex` of 5 changes to 13--the next available `ifindex` for the T1 link. Other settings are changed or created, such as the `ifdescr` and `ifAlias` settings.

These changes cause the program to see the interface as a new interface. You enable the new interface so the program can collect its data.

At this point, the history of the interface is divided. To unify the history, you merge the two versions of the interface. After the merge, the history includes the data that was collected previously from the interface on the slower link and the data from the interface on the new link. The data is combined end-to-end with no overlaps or duplication.

Steps for Merging Interfaces

Follow these steps:

1. Open the **Active Interfaces** page:
   a. Select **Administration** from the NFA console menu.
      The **Administration** page opens.
   b. Select **Interfaces, Physical & Virtual** from the menu on the left side of the page.
      The **Active Interfaces** page opens.
2. Expand the interface list for a router by clicking the arrow next to the router.
   The view expands to show a list of the interfaces for the selected router.
3. Select the check box next to two interfaces that you want to merge.
   The **Merge** button at the top of the page is activated and no longer appears dimmed.
   Note: The **Merge** button is enabled only when you have selected two interfaces.
4. Click **Merge**.
   The **Merge Interface Confirmation** dialog opens.
5. Verify that the information in the confirmation dialog is correct:
   – Verify that the interface shown as the source interface (as defined in the fields under the **Copy data from** label) is the interface from which you want to copy data.
   – Verify that the interface shown as the destination interface (as defined in the fields under the **Copy data to** label) is the interface to which you want to copy data.
   – Select the **Delete source interface after merging data** check box to delete the source interface automatically after its data is copied.
6. Click **Save**.
   The selected interfaces are merged according to the values in the **Merge Interface Confirmation** dialog box.

Customize the Active Interfaces Page

Customize the appearance of the **Active Interfaces** page as needed to make it easier to find information. You can sort tables, display details for routers, and change the maximum number of interfaces and CVIs that appear in detail pages under each router.

Sort Table Data

To sort the data, click a menu field. For example, to view all the routers with a red status indicator click **Flow Status**. The results are sorted by the Flow Status timestamp.

Expand the Details for Routers

To expand the details for one of the routers, click the arrow on the left side of the router row. A list of interfaces is shown below the router line.

> **NOTE**
> The number of details that are visible in the expanded view is limited to the **Max per Page** value for the selected router.

To display or hide details for all the routers, interfaces, or CVIs, click **Expand All** or **Collapse All** in the upper-right corner.

Change the Number of Visible Details

To change the number of items that are displayed, select a different maximum value from the **Max per Page** drop-down list. You can change the **Max per Page** value for the router list. You also can set a **Max per Page** value for the sublist of interfaces and CVIs under each router.

Available Interfaces Page

The **Available Interfaces** page displays information about routers and interfaces. The list of routers and interfaces include the interfaces that have never been enabled and have never been the source of collected data. You can enable or disable interfaces, delete end-of-life routers and their interfaces, and perform some polling troubleshooting.

Router Tasks

Review the displayed data, including the total number of interfaces, number of enabled interfaces, and the SNMP profile that was used.

- Perform a test poll with the current SNMP profile (Test).
- Look for an SNMP profile (Discover).
- Refresh the polling and interface information for the poller (Refresh).
- Enable or disable all of the interfaces for a router.
- Delete an end-of-life router and its interfaces from the system.

Interface Tasks

Review the displayed data, including the most recent time that flow was received and the enabled or disabled status.

- Enable or disable interfaces individually.

Follow these steps:

1. Open the **Available Interfaces** page:
   a. Select **Administration** from the NFA console menu.
      The **Administration** page opens.

b. Select **Interfaces, Enable Interfaces** from the menu on the left side of the page.
The **Available Interfaces** page opens.

2. Use the information and options in the following ways, for example:
   – Enable interfaces that you want to begin using.
   – Disable interfaces that you are not using.
   – Delete routers that you will not use again.
   – Review the router and interface information.

Available Interfaces: Router Information

The **Available Interfaces** page includes the following options and information for routers.

- Test

  Attempts to poll the interfaces for the router by using the settings that are displayed. You can use this option in troubleshooting to test SNMP connectivity. If the SNMP Profile value is missing, the test fails.
  – Success: If the test succeeds, click **Refresh**.
  – Failure: If the test fails, you can click the **Discover** option to try to find an SNMP profile that works. Alternatively, you can assign a different SNMP profile on the **Active Interfaces** page and click **Test** again.
- Discover

  Looks for an SNMP profile to use for polling the router's interfaces. You can use the **Discover** option if the SNMP Profile value is missing and you do not know which profile to use.
  – Success: If discovery succeeds click **Refresh**, then click **Test**. If the profile is different from the current one, the **SNMP Profile** value is updated.
  – Failure: Any SNMP Profile value that was displayed before discovery is removed. Discovery can fail for several reasons. For example, a valid SNMP profile may not be available, access to the profile may be blocked, or the router may be offline.
- Refresh

  Sends updated polling and interface information to the poller. Click the **Refresh** option after a successful **Discover** or **Test** operation.
- **Enable and Disable**
  Control whether the interface (or router and its interfaces) is allowed to send flow to DX NetOps.
- **Delete**
  Removes the router and its interfaces from the system.

  NOTE

  The Test, Discover and Refresh buttons are disabled for retired routers.

Standard Page Options

- **Search**: Search for routers or interfaces by address or name.
- **Max per Page**: Change the number of items that are displayed.
- Expand or collapse router contents.
- Sort contents by column.

Router Columns

- **Flow Status**

  Indicator to show the status of the last flow:

- – Red: Any enabled interfaces have not had flow for longer than the **Interface Data Absence Limit**.
  – Yellow: Any enabled interfaces have not had flow between 30 minutes and the **Interface Data Absence Limit**.
  – Green: All enabled interfaces have had flow in the last 30 minutes.
  – Gray: The router is a retired router.
- **Router Address**IP address of the router.
- **Router Name**Name of the router.
- **SNMP Profile**Name of the SNMP profile that was used in the most recent successful polling attempt. If this profile is not successful in the next polling attempt, the poller uses the next available profile until polling succeeds. In this case, the SNMP Profile value is updated. If polling fails for all of the profiles, the SNMP Profile value is blank.

  NOTE

  SNMP profile is shown blank for retired routers.
- **Total Interfaces**Number of interfaces for the router.
- **Enabled Interfaces**Number of enabled interfaces for the router.
- **Harvester**IP address of the parent Harvester for the router.

Available Interfaces: Interface Information

The **Available Interfaces** page includes the following options and information for interfaces.

- **Enable and Disable**
  Control whether the interface (or the router and its interfaces) is allowed to send flow to the product.
- **Standard Page Options**
  – **Search**: Search for routers or interfaces by address or name.
  – **Max per Page**: Change the number of items that are displayed.
  – Expand or collapse router contents.
  – Sort contents by column.

Interface Columns

The ifName, ifAlias, Port Name, and vrfName values are present only if the parent router is configured to provide this information to the poller. This information comes from the interfaces database. If you make changes to the corresponding properties on the **Active Interfaces** page, your changes are not shown here.

- **Enabled**Setting to let the interface send flow to the product (**Yes**) or not send flow (**No**).
- **License**
  Status that shows whether the interface has sent flow to the product (**Yes**) or has never sent flow (**No**). If the value is **No**, the system has no records for the interface.
- **ifIndex**
  Identifying index value that is automatically assigned to the interface
- **ifName**
  Interface name
- **ifAlias**
  Interface alias
- **Port Name**

Interface port name
- **vrfName**
  Virtual routing and forwarding name
- **Speed**
  Maximum data transmission speed for the interface
- **Last Flow**
  Most recent date and time that flow was processed. If flow is being collected currently, the **Last Flow** value is updated every 15 minutes.

Enable or Disable Interfaces

Interfaces are enabled automatically on the **Application Settings** page by default. You may want to enable interfaces manually in some cases, such as in the following example scenarios:

- Interfaces have been disabled temporarily and you want to re-enable them.
- The program is not configured to enable newly discovered interfaces automatically (the **Auto-Enable Interfaces** option is set to **False** in the **Application Settings** page).

Enabling an interface causes the following events to occur immediately:

- The interface can be used as a filter in Flow Forensics reports.
  The data that is available in Flow Forensics reports includes data that was collected while the interface was disabled.
- Other types of interface data begin to be collected and stored, such as data for hosts, conversations, ToS, and protocols. Once the initial period of data collection is complete, the additional interface data can be displayed in drilldown interface reports, Analysis reports, and Custom reports.

NOTE

- The interfaces for retired routers are set to disabled.
- Enable/ Disable action on interfaces of retired routers does not change anything.

Follow these steps:

1. Open the **Available Interfaces** page:
   a. Select **Administration** from the NFA console menu.
      The **Administration** page opens.
   b. Select **Interfaces, Enable Interfaces** from the menu on the left side of the page.
      The **Available Interfaces** page opens.
2. Click the arrow next to the router that contains the interfaces.
   The view expands to show the interface list. The **Enabled** status column shows which interfaces are enabled.
3. Select the check box next to one or more interfaces.
4. Click one of the following options:
   – **Enable** (enable data collection for the interface)
   – **Disable** (prevent the collection of data for the interface)

Data collection for the selected interfaces is enabled or disabled immediately.

Delete Routers from the System

If you delete a router on the **Available Interfaces** page, the router is deleted from the system entirely. The deletion removes the router, its configuration information, 15-minute (historical) data, interfaces, CVIs, and traps. The deletion also affects any aggregations, views, and reports that previously included the interfaces. Deleting an Active router deletes all the routers and interfaces including retired routers and interfaces. Deleting a Retired router deletes its data.

NOTE
If the interfaces from the deleted router begin to send flow again, a new router appears on the **Available Interfaces** page. If the program is configured to enable new interfaces automatically, the new router and interfaces also appear on the **Active Interfaces** page. The new router inherits the current tenant-domain setting of its parent Harvester. Configuration settings for the previous router are lost. If your deployment includes CA Performance Center, the router polls by using the SNMP profiles that are assigned to the Harvester tenant.

Follow these steps:

1. Verify that the router is no longer sending flows to DX NetOps.
2. Open the **Available Interfaces** page:
   a. Select **Administration** from the NFA console menu.
      The **Administration** page opens.
   b. Select **Interfaces, Enable Interfaces** from the menu on the left side of the page.
      The **Available Interfaces** page opens.
3. Locate the router and select its check box.
4. Click **Delete**.
   A confirmation message opens.
5. Click **Yes**.
   The following events result:
   – The confirmation message closes.
   – The router is deleted from the system, the **Available Interfaces** page, and the **Active Interfaces** page.
   – The router configuration information is deleted from the NFA console server.
   – All related interfaces, CVIs, 15-minute (historical) data, and traps are deleted.
   – The router is deleted from any related aggregations.
   – The data for the deleted interfaces no longer appears in the NFA console or in reports.

Define Interface Name Templates

To change the rules that determine how interface names and descriptions appear in the NFA console, use any or all of the following procedures:

- Create an interface template and make it the active template for DX NetOps.
- Edit the current interface template.
- Refine the interface naming convention for specific NFA console views by using the **Application Settings** page.

You can create multiple interface templates, but only the currently selected interface template determines the names and descriptions of interfaces in the NFA console, its views, and its printed reports.

(CA PC only) The currently selected interface template also affects interface names and descriptions in some CA Performance Center views of DX NetOps data. The following locations in CA Performance Center may display different interface names and descriptions: **Interface Pages** (**Details** tab), **Inventory** pages, and **Trend** views. To customize interface descriptions in CA Performance Center, apply **Interface Description Overrides** to specific domains.

Create or Change a Custom Interface Template

Create a custom interface template to change the way all interface names and descriptions appear in the NFA console.

Follow these steps:

1. Log in as a user who has administrator privileges for DX NetOps.
2. Display the **Interface Templates** page in the NFA console:
   a. Select **Administration** from the NFA console menu.

The **Administration** page opens.

b. Select **Interfaces, Templates** from the menu on the left side of the page.
The **Interface Templates** page opens.

3. Select an action:

Create an Interface Template

1. Click **Add**. The **Interface Templates** page displays options for adding an interface template.
2. Specify the interface template settings:
   - **Name**: Identifying text string that appears in the template list.
   - **Interface Name**: Properties, text, or properties and text that comprise the name of each interface in the NFA console.
   - **Interface Description**: Properties, text, or properties and text that appear as the description of each interface in the NFA console.

   Use properties from the following list for both settings:
   - *[DeviceAlias]*: Device (router) name that is displayed in the NFA console
   - *[DeviceName]*: DNS name or IP address of the device (router)
   - *[ifDescr]*: Interface description, which is taken from the original `ifDescr` value in the SNMP `ifEntry` table unless the interface description has been customized. If the interface description has been customized on the **Active Interfaces** page, the customized value is used.
   - *[ifAlias]*: Interface alias
   - *[ifName]*: Name of the interface, which is taken from the original `ifName` value in the SNMP `ifEntry` table value unless the interface name has been customized. If the interface name has been customized on the **Active Interfaces** page, the customized value is used.
   - *[portName]*: Port name, which may be the port number
   - *[ifIndex]:* Unique numerical identifier for the interface as defined in the SNMP `ifEntry` table
   - *[ifType]:* Interface type as defined in the `ifType` field of the SNMP `ifEntry` table
3. Click **Submit**.
   The new template is created and is added to the template list. The extra options are removed from the **Interface Templates** page.
4. (*Optional*) Apply the template:
   a. Select **Interfaces**, **Physical & Virtual** from the menu on the left side of the **Administration** page.
   b. Select one or more routers, then click **Edit**.
   c. Change the template to your new template.
   d. Click **Save**.
   The template is applied to the NFA console almost immediately. The Performance Center views that use the template reflect the changes at the next synchronization, which occurs within 5 minutes.
5. (*Optional*) Review the results of changing the template. For example, review the new labels on **Interface** pages and on the **Enterprise Overview** page.

Conventions for Interface Templates

Interface template settings consist of properties, plain text, or properties and plain text. The following conventions apply to interface templates:

- Enclose properties in square brackets.
- Separate multiple properties with a pipe symbol. The first property that returns a value is displayed. Specify enough properties to allow for any interfaces that have missing property definitions.
- To display plain text in the interface names or descriptions, include the text without enclosing it in brackets.

Change an Interface Template

Edit an interface template to change the way all interface names and descriptions appear in the NFA console when the template is selected.

Follow these steps:

1. Select the template from the list at the top of the page.
2. Click **Edit**.
   A confirmation message opens.
3. Click **OK**.
   The contents of the **Interface Name** and **Interface Description** fields become editable.
4. Specify the interface template settings:
   - **Interface Name**: Text and/or properties that comprise the names of interfaces in the NFA console.
   - **Interface Description**: Text and/or properties that appear as the description of interfaces in the NFA console.
5. Click **Update**.
   The contents of the fields are updated and are no longer editable.
   The interface names and definitions are displayed in the NFA console almost immediately. The CA Performance Center views that use the template reflect the changes at the next synchronization, which occurs automatically within 5 minutes.
6. (*Optional*) Review the results of changing the template. For example, review the new labels on **Interface** pages and on the **Enterprise Overview** page.

Change the Application Setting for Interface Names

You can use a setting on the **Application Settings** page to change the naming convention for interfaces. The default setting adds the device name in front of the interface name. This setting affects the way interface names appear in some NFA console report views, such as the **Enterprise Overview** views, **Interface** pages, and **Custom Report Interface Summaries**.

The interface names that result can include unwanted duplications. If a device and an interface are both named Device1, for example, by default the interface name is shown as Device1::Device1. The following example illustrates this repetition.

Status	Interface ▲
	Device1::Device1 - 0
	Device2::Device2 - 0

To eliminate the duplication, edit the **Show Device Name** setting on the **Application Settings** page.

Follow these steps:

1. Display the **Application Settings** page:
   a. Select **Administration** from the NFA console menu.
      The **Administration** page opens.
   b. Select **System, Application Settings** from the menu on the left side of the page.
      The **Application Settings** page opens.
2. Set the **Show Device Name** value to **False**.
3. Click **Save**.
   With the **Show Device Name** value set to **False**, device names in reports and views are not prepended to interface names.

Working with Interface Aggregations

You can create and manage interface aggregations in the NFA console. An interface aggregation combines traffic from two or more interfaces so the traffic is reported together. For example, suppose you have two load-balanced circuits and you want to report on their interfaces as a single unit. Aggregations let you report on interfaces as a single unit without setting up a custom report for that purpose. All aggregations appear in the **Interface Index** under the label *Aggregations*.

> **NOTE**
> You can aggregate interfaces only when their data is collected by the same Harvester. Do not attempt to aggregate interfaces from multiple Harvesters.

Create, Change, or Delete Interface Aggregations

Interface aggregations combine traffic from two or more interfaces so the traffic is reported together.

For example, suppose that you create aggregations for each of several geographical regions. Operators use the aggregations in reports to review and compare the totals for specific regions. Before you created the aggregations, operators had the following problems:

- Data was scattered throughout reports.
- Values were not totaled by region, so quick overviews and comparisons were difficult to make.
- Operators spent too much time designing specialized reports to collect the data and create the totals they needed.

Follow these steps:

1. Display the **Interface Aggregations** page:
   a. Select **Administration** from the DX NetOps console menu.
      The **Administration** page opens.
   b. Select **Aggregations** from the **Interfaces** menu.
      The **Interface Aggregations** page opens and shows the list of current interface aggregations.
2. Select an action:

Create an Aggregation

1. Click **New**.
   The page changes to show options for adding an aggregation.
2. Select interfaces to add to the aggregation by using any of the following methods:
   – *Select routers:* Select the check boxes next to one or more router names. You can select one router, multiple routers, or a combination of routers and individual interfaces from any routers that are not selected. When a router has been selected, you cannot select any of its individual interfaces.
   – *Select interfaces:* Click **Expand All** or click the arrow icon next to a router name, then select the interfaces from the list. To select all the interfaces for a router, select the check box in the heading row.
   – *Filter the list to find routers or interfaces:* Filter your view by entering a text string in the **Search** box, then clicking **Search**. You can search for a full or partial name or address of a router or interface. The router/interface list is filtered to display matching routers or routers that contain matching interfaces.
   – *Filter the list to check your selections:* Click **Show Selected** to show only the routers that are selected or that contain selected interfaces. You can combine this function with a search string and with **Expand All** to locate and review your selections quickly.
3. Specify the following values:

- **Routers and/or Interfaces**: Select one or more of the routers or interfaces that are listed at the bottom of the page. Your selections are added to the aggregation.
- **Aggregation Name**: Specify a name for the aggregation.
- **Description**: (*Optional*) Add a notation to help identify the aggregation.
- **In Speed**: (*Optional*) Specify the inbound speed of the selected interfaces.
- **Out Speed**: (*Optional*) Specify the outbound speed of the selected interfaces.
  If you do not specify the **In Speed** and **Out Speed**, both values are set to 0 by default. Inaccurate speeds cause some report results to be inaccurate, such as utilization percentages.
- **Type**: (*Optional*) Select the mode of interface connection from the **Type** list, such as WAN or Ethernet.
  If you do not specify the interface type, the type is set to **Unknown** by default.

4. Click **Save**.
   The aggregation is automatically deployed within one minute of creation.

Change an Aggregation

1. Click the check box next to the aggregation that you want to edit, then click **Edit**.
   The page changes to the **Edit Aggregation** view, which includes editable options.
2. Make any changes that are needed, such as adding or removing interfaces or changing the aggregation name, description, in/out speed, or type.
3. Click **Save**.
   Your changes are saved and you return to the list of aggregations.

Delete an Aggregation

1. Select the check box next to each aggregation that you want to delete.
2. Click **Delete**.
3. Click **Yes** in the confirmation message box that opens.
   All of the selected aggregations are deleted automatically.

Working with Harvesters

Use the **Harvester** page to view, add, delete, and edit details about the Harvesters that supply flows to the NFA console.

Follow these steps:

1. Open the **Harvester** page:
   a. Select **Administration** from the NFA console menu.
      The **Administration** page opens.
   b. Select **System, Harvester** from the menu on the left side of the page.
      The **Harvester** page opens and displays a table of information about the current Harvesters.
2. Select an action to perform on the Harvester:

Add a Harvester

Make sure the Harvesters you add have not been deleted from the **Harvester** page previously. To add a Harvester instance successfully in DX NetOps after deleting it, the Harvester installation server must be re-imaged and the Harvester software must be re-installed.

Follow these steps:

1. Click **Add**.
   The **Add Harvester** dialog opens.
2. Enter the following information:

- **IP Address**
  Address of the Harvester server.
- **Description**
  Identifying text about the Harvester, which appears in the **Harvester** page table.
- **Domain**
  Parent tenant and domain combination for the Harvester and for any routers and interfaces that begin to supply data to the Harvester.
  Changing this setting affects the tenant-domain association for new routers that begin exporting flow data and any new interfaces that begin generating flow.
  In a multi-tenant environment, the Harvester tenant affects which SNMP profiles are available for routers to poll interfaces.
  The domain affects which operators and reports have access to the data from routers and interfaces.
  This option is visible only in an environment that contains multiple domains.

3. Click **Save**.
   The new Harvester is added and appears in the Harvester list, provided that the IP address passes the connection test. If the test connection to the web service fails, an error message opens.
   The usual process is to add one or more Harvesters, then configure the router interfaces to export flow to the Harvesters. If you configure the routers to export flow to the Harvesters first, the DX NetOps console immediately begins to collect data from the new Harvester. In this case, the domain for the routers is set at the time you add the parent Harvester.

Edit the Details for Harvesters on the Harvester Page

You can edit the IP address, description, and tenant-domain setting.

Follow these steps:

1. Click **Edit** on the Harvester row that you want to edit.
   The **Edit Harvester** dialog opens.
2. Change any of the following settings:
   - **IP Address**
     Address of the Harvester
   - **Description**
     (*Optional*) Additional information to help identify the Harvester
   - **Domain**
     The tenant-domain association of the Harvester in a multi-domain deployment.
     Changing this setting affects the tenant-domain for any new routers that begin exporting flow data. Existing routers and interfaces retain their previous tenant-domain associations.
     The domain affects which operators and reports have access to the data from routers and interfaces.
     Changing the tenant of a router in CA Performance Center can affect which SNMP profiles are available for polling. This is not applicable to CA NetQoS Performance Center, which uses the same list of SNMP profiles for all routers.
     Default: Default Tenant\Default Domain

   If no custom IP domains have been created, the **Harvester** table includes only the **IP Address** and **Description** columns.
3. Click **Save**.
   Your changes are saved immediately and appear in the **Harvester** table.

Delete a Harvester

Once you delete a Harvester, you cannot recover any of the data that the Harvester collected previously.

Follow these steps:

1. Click **Delete** in the row for the Harvester that you want to delete.

A confirmation message opens.

2. Click **Yes** to confirm that you want to delete the Harvester.
   The Harvester is deleted and is not listed in the **Harvester** table. The NFA console no longer collects data from the routers that are associated with the deleted Harvester. The data that was collected from those routers previously is not available in reports.

Creating Names and Groups for Protocols, ToS, and AS Data

You can create and manage protocol groups, ToS labels, ToS groups, and customized autonomous system (AS) names from the **Administration** page. You use several different pages to perform the functions.

Protocol Group Configuration Page

You use the **Protocol Group Configuration** page to view the existing protocol groups and their contents. You can add, edit, and delete custom protocol groups.

On the **Administration** page, select **Define an Application, Protocol Groups** from the menu on the left side of the page. Use the **Protocol Group Configuration** page to perform the following main tasks:

- Create a shell protocol group.
- Configure the protocol group.
- Review and edit the group.

ToS Configuration Page

You use the **ToS Configuration** page to view and edit the labels and descriptions for ToS values.

On the **Administration** page, select **Define an Application, ToS Names** from the menu on the left side of the page. Use the **ToS Configuration** page to perform the following task:

- Label ToS values.

ToS Group Configuration Page

You use the **ToS Group Configuration** page to view the existing ToS groups and their contents. You can add, edit, and delete custom ToS groups.

On the **Administration** page, select **Define an Application, ToS Groups** from the menu on the left side of the page. Use the **ToS Group Configuration** page to perform the following main tasks:

- Create a shell ToS group.
- Configure the ToS group.
- Edit ToS groups.
- Delete ToS groups.

AS Names Page

You use the **AS Names** page to view and edit AS names.

On the **Administration** page, select **Define an Application, AS Names** from the menu on the left side of the page. Use the **AS Names** page to perform the following main tasks:

- Review AS names.
- Edit AS names.

Create Protocol Groups

Protocol groups can be used to filter data in Custom and Analysis reports. As an administrator, you can set up custom protocol groups that contain the protocols for particular types of network traffic.

For example, suppose that operators want to report on network traffic for different types of applications, such as email, videoconferencing, VoIP, and streaming media. No default protocol groups are defined for this purpose, so you create a custom protocol group for each of the application types. Each protocol group includes all the protocol values that are used in your enterprise for the target applications.

Operators can use a custom protocol group without having a thorough knowledge of the way each protocol is used and without adding individual protocol filters to report definitions.

Create a Shell Protocol Group

Create a shell protocol group that you can configure to filter reports for a particular type of network traffic.

Follow these steps:

1. Log in as a user who has administrator privileges for DX NetOps.
2. Display the **Protocol Group Configuration** page:
   a. Select **Administration** from the NFA console menu.
      The **Administration** page opens.
   b. Select **Define an Application, Protocol Groups** from the menu on the left side of the page.
      The **Protocol Group Configuration** page opens and displays information about the currently selected protocol group.
3. Click **Add**.
   The options for identifying a new protocol group are displayed on the **Protocol Group Configuration** page.
4. Enter values in the **Group Name** and **Description** boxes.
   The name and description appear in the following locations in DX NetOps:
   – List of protocol groups on the **Protocol Group Configuration** page
   – **Protocol Group Index** that an operator can display from the report wizard for defining an Analysis or Custom report

   A new shell protocol group is created. The new protocol group name is added to the list of protocol groups on the **Protocol Group Configuration** page.

Configure the Shell Protocol Group

Configure the shell protocol group to represent a particular type of network traffic.

Follow these steps:

1. Select the protocol group from the **Select a Protocol Group** list on the **Protocol Group Configuration** page.
2. Click **List**.
   Configuration options are added to the **Protocol Group Configuration** page.
3. (*Optional*) Review and correct the **Domain** setting if necessary.
   The **Domain** setting is displayed only in an environment that has multiple domains.
   The contents of the selected protocol group are displayed with the protocol names for the selected tenant-domain combination. If an Administrator defines domain-specific protocol names, selecting that domain displays the appropriate protocol names.
   The **Domain** setting does not restrict access to the protocol group or to reports that use the protocol group as a filter.
4. Select the protocols for the group:
   a. Click **Add/Remove**.
      A dialog opens, which shows a list of available protocols and a list of any protocols that are included in the list currently.

If the **Add/Remove** link is not visible, click **List**.

b. Select the protocols in the top pane that you want to add to the group.
To select multiple protocols to add simultaneously, use the **Shift** or **Control** key.
To filter the protocol list, enter a search string in the **Filter the Protocol List** field box, then click **Apply**. For example, to show only UDP protocols, enter **udp**.

c. Click **Add**.
The selected protocols are added to the protocol list.

d. Select any protocols in the bottom pane that you want to remove from the group.

e. Click **Remove**.
The selected protocols are removed from the protocol list.

f. Click **Done** when you finish configuring the contents of the protocol group.
To review a list of protocol groups that contain a particular protocol, select the protocol and click **Jump to Protocol**. The **Protocol Configuration** page opens and displays all of the protocol lists that contain the selected protocol.

The protocol group is configured with your settings. Operators can select the configured protocol group as a filter for an Analysis or Custom report.

NOTE
Operators can define reports only if their user settings are set up to enable this capability.

Change a Shell Protocol Group

After you create a protocol group and operators use it in reports, you may want to make changes. For example, you may want to rename the protocol group to reflect the way operators use it. You also may want to change the list of protocols in the group.

Follow these steps:

1. Select the protocol group from the **Select a Protocol Group** list on the **Protocol Group Configuration** page.
2. (*Optional*) Edit the name or description of the protocol group:
   a. Click **Edit**.
   The **Edit a Protocol Group** page opens.
   b. Change the values for the **Group Name** and **Description** fields to help identify the purpose of the protocol group more clearly.
   c. Click **Submit**.
   The name and description are updated in the **Protocol Group Configuration** page list and in the **Protocol Group Index**.
3. (*Optional*) Review and revise the list of protocols that are included:
   a. Click **List**.
   A table is added to the bottom of the page, which lists the protocols.
   b. Select the appropriate domain from the **Domain** list, if custom protocol names have been defined.
   The **Domain** setting is displayed only in an environment that has multiple domains.
   c. Click **Add/Remove** and change the contents of the protocol group as needed
   d. Click **Done** when you finish configuring the contents of the protocol group.

   The protocol group is configured with your settings. Operators can select the reconfigured protocol group as a filter for an Analysis or Custom report.

Label ToS Values

You can create labels (or descriptions) for ToS values to ensure that operators know which service or application the ToS values represent. If you do not label ToS values, the numeric ToS value is displayed by default.

NOTE

- The ToS labels that you create affect all uses of the ToS in the assigned domain, but do not affect ToS labels in other domains. ToS labels are domain-specific in a deployment that has multiple domains.
- You can display custom ToS names in trap alerts (in a single-domain environment).

Follow these steps:

1. Open the **ToS Configuration** page:
   a. Select **Administration** from the DX NetOps console menu.
      The **Administration** page opens.
   b. Select **Define an Application, ToS Names** from the menu on the left side of the page.
      The **ToS Configuration** page opens and displays information about the selected ToS and domain.
2. (*Multiple-domain environment*) Select the domain that contains the ToS values that you want to edit.
3. Select a ToS value from the list, then click **Edit**.
   The **Description** becomes editable.
4. Enter the new description for the ToS value in the **Description** field and click **Save**.
   Your change is saved and the **Description** and **Value** fields for the selected ToS are updated.

You can also use the **ToS Configuration** page to add or delete ToS values to ToS groups.

1. Select the domain and the ToS value.
2. Click the **Add/Remove** link at the top of the ToS groups list.
3. The **ToS Group Index** dialog opens, which you use to make changes for user-configured groups. (You cannot change the built-in **All ToS** group.)

Create and Manage ToS Groups

An administrator can create ToS groups that act as filters for report data. The administrator sets up each ToS group to contain the ToS values that characterize a particular type of network traffic. Operators can use the ToS group as a filter in reports instead of adding filters for each ToS value.

For example, suppose that operators want to report on network traffic for the Low Drop Assured Forwarding group. The Low Drop Assured Forwarding group is a group of ToS values that are assigned to applications that should have priority over less critical traffic. The administrator creates a ToS group named Low Drop, which includes all the ToS values for AF11, AF21, AF31, and AF41. Operators can create a report about the application traffic by using the new Low Drop ToS group.

NOTE
In an environment that includes domains, ToS groups are available in all domains as filters for Analysis reports and Custom reports. The ToS labels that administrators see displayed for the contents of a ToS group are domain-specific, however.

Create, Change, or Delete a ToS Group

Create ToS groups to help users get optimal results from Analysis and Custom reports quickly.

Follow these steps:

1. Log in as a user who has administrator privileges for DX NetOps.
   a. Select **Administration** from the console menu.
      The **Administration** page opens.
   b. Select **Define an Application, ToS Groups** from the menu on the left side of the page.

The **ToS Group Configuration** page opens and displays information specific to the selected ToS group and domain (if applicable).

2. Select an action:

Create a ToS Group

1. Click **Add**.
   The **ToS Group Configuration** page displays options for identifying a new shell ToS group.
2. Enter values in the **Name** and **Description** boxes.
   The name and description appear in the following locations:
   – List of ToS groups on the **ToS Group Configuration** page
   – **ToS Group Index** that a user can display from the report wizard for defining an Analysis report or Custom report
3. Click **Add**.
   A new shell ToS group is created. The new ToS group name appears in the list of ToS groups on the **ToS Group Configuration** page.

Add ToS Values to a ToS Group

1. Select the ToS group from the **Select a ToS group** list on the **ToS Group Configuration** page.
   a. (*Optional*) Select a tenant-domain combination from the **Domain** list, provided that you have multiple domains and domain-specific ToS labels.
      The **Domain** setting is displayed only in a multi-domain environment.
      By selecting a tenant-domain combination, you display any available domain-specific ToS labels, which help you identify the ToS values to use. The ToS group will not be restricted to the selected domain: ToS groups are available in all domains.
2. Click **Add/Remove**.
   The **ToS Index** dialog opens. The ToS list displays the ToS index values and the ToS labels that have been defined. In a multi-domain environment, the ToS labels are displayed for the currently selected domain.
3. Select the ToS values to add by clicking their check boxes.
4. Scroll to the bottom of the list and click **Save**.
   The ToS values are added to the ToS group.
   An operator can select the ToS group from the **ToS Group Index** when defining an Analysis or Custom report.

   NOTE
   To define reports, the operator must have the necessary role and permission group settings.

Change the Contents of a ToS Group

1. Select the ToS group to edit from the **Select a ToS group** list.
   The **ToS Group Configuration** page opens and displays information for the currently selected ToS group and domain (if applicable).

   NOTE
   You cannot edit built-in groups, such as the **All ToS** group in the **Default Domain**.
2. (Multi-domain environment only) Select a tenant-domain combination from the **Domain** list, provided that you have multiple domains and ToS labels. In a multi-domain environment, ToS labels are domain-specific.
   The **Domain** setting is displayed only if multiple domains exist.
3. Click the **Add/Remove** link above the list of ToS values that are included in the group.
   The **ToS Index** dialog opens. The ToS list displays the ToS labels that have been defined.
4. Select or clear check boxes to include only the ToS values you want.
5. Click **Save** when your changes are complete. The list of ToS values is updated.

Delete a ToS Group

1. Select the ToS group to delete from the **Select a ToS group** list.
   Select a configurable ToS group. For example, you cannot delete the **All ToS** group.

   NOTE
   The **Domain** setting, if any, has no effect on the list of available ToS groups. If you delete a ToS group, it is deleted for all domains.
2. Click **Delete**.
   A confirmation message opens.
3. Click **OK**.
   The selected ToS group is deleted. The list of ToS values is updated.

Customize AS Names

Interface reports that show data about Autonomous System (AS) traffic typically label the AS traffic by name and number. Administrators can customize AS names to make the AS references in reports shorter or more descriptive.

For example, suppose that operators frequently view reports about network traffic for AS 4000000. The label with the default AS name is "UUNET-CANADA - Progressive Communications Services, Inc. d/b/a Acme Business (4000000)." The administrator can customize the AS name so that the report label is "Acme (4000000)."

In a multi-domain environment, AS names are domain-specific. In this type of environment, the AS names that appear in reports are taken from the domain of the interface for the report.

Prerequisites

These instructions assume that you:

- Installed the DX NetOps software on the servers that collect and process the data.
- Configured your NetFlow or NetFlow-compliant flow to support AS reporting.
  To view meaningful AS data in reports, you must enable it: NetFlow does not export full AS information by default. For information about enabling AS data, refer to the Knowledge Base article TEC562036, *Viewing AS Numbers in Reports*, at CA Support (http://ca.com/support).
  AS data is shown as AS 0 in reports when any of the following conditions apply:
  - Flow is not configured to support AS reporting.
  - The data source route is unknown.
  - The data originates from within the local system.

Review Autonomous System Names

Review the AS references in the interface reports for your enterprise and locate any AS numbers in use that have long or unclear AS references.

The interface reports that contain AS references are:

- Single interface AS Next Hop summary table
- Top N AS summary tables, trend charts, and pie charts

Follow these steps:

1. Collect information about which AS names are used in interface reports for your enterprise.
   The list of all AS numbers and names is extensive. You will not want to customize every AS name in the list.
   For example, compile a list of commonly used AS names by examining AS reports or by asking operators which AS numbers they track.

2. Display the **AS Names** page:
   a. Log in as a user who has administrator privileges for DX NetOps.
   b. Select **Administration** from the NFA console menu.
      The **Administration** page opens.
   c. Select **Define an Application, AS Names** from the menu on the left side of the page.
      The **AS Names** page opens and displays information about the first page of AS values.
3. Locate each AS with a name that you want to customize:
   – To change the number of rows on each page, use the **Max per Page** option.
   – To view a different page, use the navigation elements at the bottom of the page.
   – To search, enter one or more text strings in the **Search** box, then click **Search**.
     Rules for matches:
     • Searches are case-insensitive.
     • All of the specified search strings must be found in either the **AS Number** or **Description** column.
     • Enclose the search string in double quotation marks if you want order and completeness to be limiting factors. For example, matching results for *internet back* without quotation marks include *internet global backbone* and *Backbone Internet Service*.
4. Review the AS names that appear in the **Description** column.
   Once you locate a default AS name that requires customization, you are ready to edit the AS name.

Edit Autonomous System Names

Edit AS names as needed to make interface report labels more user-friendly.

Follow these steps:

1. (*Optional*) Review and correct the **Domain** setting if necessary.
   In a multi-domain environment, AS names are domain-specific. In this case, changes to AS names affect reports about interfaces in the selected domain.
2. Select the row for the AS number that you want to edit.
3. Click **Edit**.
   The **Edit AS Number Description** dialog opens.
4. Enter the custom name (description) in the **New Name** box.
   The **Old Name** value is the official (base) name for the AS, which cannot be edited.
5. Click **Save**.
   The name that you specified appears in the **Description** column for the selected AS number. All custom AS names are shown in bold.
   The updated AS names also appear in labels and other references in the following DX NetOps Interface views:
   – Single interface AS Next Hop summary table
   – Top N AS summary tables, trend charts, and pie charts
6. Repeat these steps for each AS that you want to customize.

   NOTE
   To restore the AS name to its official value, click **Reset** on the appropriate row, then **OK** in the confirmation box that opens.

Report Customizations

You can make additional customizations to ensure that operators get the best results from reports.

Once the product is registered as a data source, you use the Performance Center Console to administrate users, roles, SNMP profiles, and many types of groups.

This section describes how to perform the following customization tasks in the NFA console:

Create, Change, or Delete Time Filters

Use time filters to help users create reports that contain streamlined data. For example, suppose that your users need some reports that describe network traffic during business hours. You create a time filter for Monday through Friday from 8:00 A.M. to 5:00 P.M. You may also want to create time filters for the time frames of specific operations that occur in your environment, such as automated backups.

You can also use the time filters that you create to configure traps on the **Trap Configuration** page.

The custom time filters are available to users in **Time Filter** option lists in the following locations:

- **Specify Schedule** page of the **Custom Report** wizard or **Analysis** wizard.
- Options that operators display by clicking the time period setting in a drilldown interface report of any of the following types: Overview, Protocols, ToS, Hosts, Conversations, Flows, Utilization, and AS Numbers.

Follow these steps:

1. Select **Administration** from the NFA console menu.
   The **Administration** page opens.
2. Select **Reporting, Time Filters** from the menu on the left side of the page.
   The **Time Filter Configuration** page opens and displays a list of the currently configured time filters.
3. Select one of the following actions:

Create a Time Filter

1. Click **Add**.
   The **Time Filter Configuration** page displays options for adding a time filter.
2. Enter values for the following options:
   - **Time Filter Name**: Define the time filter identifier, which appears in the following lists:
     - **Time Filter Configuration** page list (for administrators)
     - Time Filter options that are available on the **Specify Schedule** page of the **Custom Report** wizard
     - Time Filter options that are available when a user or administrator clicks the time period setting in a drilldown interface report of any of the following types: Overview, Protocols, ToS, Hosts, Conversations, Flows, Utilization, and AS Numbers
   - **Description**: (*Optional*) Add information to identify the time filter, which appears in the list of time filters on the **Time Filter Configuration** page.
   - **on**: Accept the default settings (Monday through Friday) or select other days for collecting report data.
   - **Start Time** and **End Time**: Accept the default settings for the start and end of the daily time span or select custom settings, using the 24-hour clock system.
     For example, to restrict the reporting period to business hours, select 08:00 as the start time and 17:00 as the end time. To set up a filter for backups that run from 11 P.M. Tuesday to 3:00 A.M. Wednesday, select Tuesday, then select 23:00 and 03:00.

     NOTE
     Time filters are applied using the time zone that was set for the report when the report was created. Mailed reports use the time zone set in the report.
3. Save the time filter by clicking one of the following buttons:
   - **Submit, finished**: Save the time filter and return to the time filter list.
   - **Submit, add another**: Save the time filter and keep the page open so you can configure another time filter.

Edit a Time Filter

1. Select a time filter from the list of available filters.

2. Change any of the options that are displayed.
3. Click **Submit**.

Delete a Time Filter

1. Select a time filter from the list of available filters.
2. Click **Delete**.
3. Confirm the deletion when prompted.

Create, Change, or Delete Reporting Periods

Create reporting periods to get the best results from reports. For example, suppose that your users typically analyze network traffic that occurs over two weeks. To make it easier to display interface data over this timespan, you create a two-week reporting period.

Custom reporting periods are available as **Time Period** options when a user clicks the time period setting in a drilldown interface report of any of the following types: Overview, Protocols, ToS, Hosts, Conversations, Flows, Utilization, and AS Numbers.

Follow these steps:

1. Select **Administration** from the NFA console menu.
   The **Administration** page opens.
2. Select **Reporting, Reporting Periods** from the menu on the left side of the page.
   The **Reporting Periods Configuration** page opens and displays a list of the current reporting periods, including the built-in and customized reporting periods.
3. Perform one of the following actions:

Create a Reporting Period

1. Click **Add**.
   Fields and options for adding a reporting period are displayed.
2. Specify the following values:
   - **Reporting Period**: Identifier for the reporting period, which appears in the following lists of available reporting periods:
     - **Reporting Periods Configuration** page list (visible to administrators)
     - **Time Period** options available when a user or Administrator clicks the time period setting in a drilldown interface report of any of the following types: Overview, Protocols, ToS, Hosts, Conversations, Flows, Utilization, and AS Numbers.
   - **Duration**: Number of time units and type of time units: years, months, weeks, days, or hours.
   - **Description**: (Optional) Additional notes to help identify the reporting period. The description appears in the **Reporting Periods Configuration** page list and is visible only to administrators.
3. Save the reporting period by clicking one of the following buttons:
   - **Submit, finished**: Save the current reporting period and return to the list of available reporting periods.
   - **Submit, add another**: Save the current reporting period and keep the Add options open so you can continue to configure additional reporting periods.

Change a Reporting Period

1. Select the reporting period from the list.
2. Change any of the options that are displayed.

3. Click **Submit**.

Delete a Reporting Period

1. Select the reporting period from the list.
2. Click **Delete**.
3. Confirm the deletion when prompted.

Set Up Application Mapping

Create application mapping rules to identify traffic in reports. Rules can identify traffic types such as a ToS, host, subnet, or NBAR2 application.

You can use application mapping to combine, differentiate, or more clearly identify traffic in reports:

- Differentiate Traffic: Separate larger traffic blocks by re-mapping traffic sub-types to separate destination ports.
  For example, suppose reports show a large block of FTP traffic on TCP port 20. You want to track the FTP traffic from your internal FTP server separately from internet traffic. To accomplish this, you create a Host application mapping rule, which you name *Internal FTP Traffic.* The Host value of the rule matches the IP address of the internal FTP server. The Port value is 20. You specify 65000 as the Destination Port; a port that does not currently receive any traffic.
  Reports now show traffic from the FTP server on TCP port 65000 with the label *Internal FTP Traffic.* Other TCP port 20 traffic is still labeled *FTP.*
- Combine Traffic: Report traffic of different types as a single unit by re-mapping them to a single destination port.
  For example, suppose your enterprise mail systems use the IMAP and POP protocols. The IMAP mail uses TCP port 443 and the POP mail uses TCP ports 109 and 100. You want reports to show the combined mail traffic, so you create application mapping rules that re-map each type of mail traffic to port 3100. The traffic is combined in reports and is labeled with the rule name, *Mail*. Even though you created several rules, the program uses the same name for all of the rules that map traffic to port 3100.
- Identify Traffic: Use application mapping to re-label traffic without combining or separating it.

Application mapping affects the following reports:

- **Enterprise Overview** page: **Top Protocols** report
- **Interface** page: All reports that show protocol data
- **Custom Reporting** page and **Analysis** page: **Protocol Index**, which you use to select protocols to filter a new or edited report.

Notes:

- Application mapping does not affect Flow Forensics reports.
  To continue the example for differentiating types of FTP traffic, the **Flow Forensics Session Protocols** reports show the FTP traffic as it was before you mapped the FTP sub-category.
  The Flow Forensics reports that display NBAR2 data show the official application name and ID regardless of any application mapping rules that you have.
- Reports show mapping results within the time frame that the rules are in effect. If you create rules today, reports of last week's data do not show the effects of the rules. If you create, delete, or edit application mapping rules within a report time frame, the report may show a dramatic change at the time you made the rule changes.

You can perform the following application mapping tasks:

- Use Administration functions in the NFA console to set up or modify application mapping rules to aggregate or segregate data:

  - Create an All (ToS) application mapping rule
  - Create a Host application mapping rule
  - Create a Subnet application mapping rule
  - Create an NBAR2 application mapping rule
  - Edit application mapping rules
- Configure global settings to support application mapping rules in reports
- Understand how application mapping rule priorities work
- Perform batch Import operations by using a `.csv` file:
  - Import the default NBAR2 application mapping rules
  - Import custom application mapping rules
  - Import application mapping rule updates
  - Review errors for failed rule imports

Application Mapping Priorities

If incoming flow matches the combination of criteria that are specified in an application mapping rule, the flow is mapped to the rule destination port. If rules conflict, the following priorities apply. A rule takes precedence when its criteria are ranked higher than the criteria of another rule.

- *Priority 1:* Host rule with Host, Protocol, Port, and ToS specified
- *Priority 2:* Host rule with Host, Protocol, and Port specified, but with the ToS set to ALL
- *Priority 3:* All (ToS) rule with ToS specified
- *Priority 4:* Host rule with the Host specified, but with the Protocol and ToS set to ALL
- *Priority 5:* Subnet rule
- *Priority 6:* NBAR2 rule

Configure Global Settings for Application Mapping

Review the global settings that affect application mappings. Make any adjustments that are needed to customize application mapping behavior. The global settings that affect application mapping include the following options:

- *TCP Rebase Port:* Target port for redirected TCP traffic. If an application mapping rule sends TCP traffic to a port that already has native (non-mapped) traffic, the native traffic is redirected to the TCP rebase port.
- *ToS Mask:* Setting to determine whether all ToS bits are used for ToS values.
- *UDP Rebase Port:* Target port for redirected UDP traffic. The UDP rebase port receives redirected native UDP traffic in the way the TCP rebase port receives redirected native TCP traffic.
- *Preserve ToS Map Proto:* Setting to determine whether protocol values are reported in addition to ToS values.

Follow these steps:

1. Open the **Application Definitions** page:
   a. Select **Administration** from the NFA console menu.
      The **Administration** page opens.
   b. Select **Define an Application**, **Application Definitions** from the menu on the left side of the page.
      The **Application Definitions** page opens.
2. Click **Additional Settings**.
   The **Application Settings** page opens.
3. Review and correct the global settings that affect application mapping:
   - **TCP Rebase Port**: Target port for redirecting native TCP traffic, which is used if an application mapping rule sends TCP traffic to a port that already receives native (non-mapped) traffic.

For example, suppose that you create an application mapping rule that has port 655 as the destination port. You set the TCP Rebase Port value to 630. If port 655 is receiving native (non-mapped) traffic, the native traffic is redirected to port 630.

NOTE
The rebase port is used to avoid merging mapped traffic with other types of traffic. If application mapping rules are configured with unused destination ports, the rebase port is not used: Reports do not show traffic on the rebase port. If your reports show traffic on the rebase port, you may want to specify a new destination port for the mapped traffic. Examine the rebase port traffic to determine which rules are involved.

- **ToS Mask**: Limits the 8-bit ToS values reported for flow. The default value for this setting is 255, which enables all ToS bits.
- **UDP Rebase Port**: Redirects native UDP traffic in the same way the TCP Rebase Port setting redirects native TCP traffic.
- **Preserve ToS Map Proto**: Setting to determine whether protocol values are reported in addition to ToS values. **Y**(es) retains the protocols that are used and reports ToS data separately. **N**(o) shows you the ToS values for traffic, but you do not see which protocols are involved. The default setting is **Y**.

4. Click **Save**.
   Your changes are saved. The **Application Settings** page remains open.

Create an All (ToS) Application Mapping Rule

Create an *All application mapping rule* to combine, separate, or more clearly identify traffic by its ToS (Type of Service) value.

Follow these steps:

1. Open the **Application Definitions** page:
   a. Select **Administration** from the NFA console menu.
      The **Administration** page opens.
   b. Select **Define an Application**, **Application Definitions** from the menu on the left side of the page.
      The **Application Definitions** page opens.
2. Verify that **Application Mapping** is the selected value for **Rules**.
3. Click **Add Rule**.
   The **Add Application Mapping** dialog opens.
4. Select **All** from the list of rule types at the top of the dialog.
   The **Add Application Mapping** dialog switches to **All (ToS)** rule mode.
5. Specify the setting values:
   - **ToS**: Type of Service (ToS) to use as a filter for the collected data.
     ALL is the ToS value that is shown initially when you open the dialog. If left unchanged, this setting would map traffic for all ToS values to the destination port.
   - **Destination Port**: Target port that collects the mapped data
     If you specify a destination port that is already used by other rules, the traffic for the related rules will be combined.
   - (*Optional*) Click **Check** to run a general check to detect whether the specified port is already receiving data. The check fails if the port is receiving native data--that is, data that is not mapped by application mapping rules. If any native data is on the specified destination port, that data is redirected to the rebase port.
   - **Name**: Identifier for the rule as it is listed on the **Application Definitions** page
     The rule name also is the label for the mapped traffic in certain reports. If other rules map traffic to the same destination port that you specify for this rule, specify the name that you want to use for the combined traffic.
   - **Description**: (Optional) Additional descriptive text to identify the rule type and its use, which is displayed only on the **Application Definitions** page
6. Click **Save**.

The dialog closes. The new rule is added to the **Application Mapping** rule list. If any other rules map traffic to the same port and you specified a new rule name, the other rule names are updated.

7. (*Optional*) Run reports to verify that the traffic on the designated destination port fits the rule.
8. (*Optional*) Review the effects of the new or changed application mapping rules on reports, then consider renaming the rule to label the mapped traffic more clearly in reports.

Create a Host Application Mapping Rule

Create a Host application mapping rule to combine, separate, or identify traffic based on its source host. For example, a Host application mapping rule can report the total traffic from a particular server or from an application on the server.

Follow these steps:

1. Open the **Application Definitions** page:
   a. Select **Administration** from the NFA console menu.
      The **Administration** page opens.
   b. Select **Define an Application, Application Definitions** from the menu on the left side of the page.
      The **Application Definitions** page opens.
2. Verify that **Application Mapping** is the selected value for **Rules**.
3. Click **Add Rule**.
   The **Add Application Mapping** dialog opens.
4. Select **Host** from the list of rule types at the top of the dialog.
   The **Add Application Mapping** dialog switches to **Host rule** mode.
5. Specify values for the following settings:
   – **Host**: IP address of the server whose network traffic you are mapping
   – **ToS**: Type of Service (ToS) to use as a filter for the collected data. To match all ToS values, accept the default value of **ALL** or leave the ToS box blank.
   – **Protocol:** Protocol of the data that is affected by the rule, either TCP or UDP
   – **Port**: Port to use for collecting data. To match all ports, accept the default value of **ALL** or leave the Port box blank.
   – **Destination Port**: Target port that collects the mapped data
     If you specify a destination port that is already used by other rules, the traffic for the related rules will be combined.
     (*Optional*) Click **Check** to run a general check to detect whether the specified port is already receiving data. The check fails if the port is receiving native data; that is, data that is not mapped by application mapping rules. If any native data is on the specified destination port, that data is redirected to the rebase port.
   – **Name**: Identifier for the rule as it is listed on the **Application Definitions** page
     The rule name also is the label for the mapped traffic in certain reports. If other rules map traffic to the same destination port that you specify for this rule, specify the name that you want to use for the combined traffic.
   – **Description**: (*Optional*) Additional descriptive text to identify the rule type and its use, which is displayed only on the **Application Definitions** page
6. Click **Save**.
   The dialog closes. The new rule is added to the **Application Mapping** rule list. If any other rules map traffic to the same port and you specified a new rule name, the other rule names are updated.
7. (*Optional*) Run reports to verify that the traffic on the designated destination port fits the rule.
8. (*Optional*) Review the effects of the new or changed application mapping rules on reports, then consider renaming the rule to label the mapped traffic more clearly in reports.

Create a Subnet Application Mapping Rule

Create a subnet application mapping rule to combine, separate, or more clearly identify traffic that originates from a particular subnet and mask. For example, a subnet rule can enable reports to show the total traffic for an application.

DX NetOps applies subnet application mapping rules by first finding the most specific subnet match, then looking at all port ranges defined for that subnet. If no matches are found, either by subnet or port range within the most specific matching subnet, any rules defined for the 0.0.0.0/0 subnet are evaluated. If overlapping subnets are defined (other than 0.0.0.0/0), only port ranges for the most specific subnet match are considered.

Follow these steps:

1. Open the **Application Definitions** page:
   a. Select **Administration** from the NFA console menu.
      The **Administration** page opens.
   b. Select **Define an Application**, **Application Definitions** from the menu on the left side of the page.
      The **Application Definitions** page opens.
2. Verify that **Application Mapping** is the selected value for **Rules**.
3. Click **Add Rule**.
   The **Add Application Mapping** dialog opens.
4. Select **Subnet** as the rule type at the top of the dialog. (**Subnet** is selected by default.)
   The **Add Application Mapping** dialog displays the options for a subnet application mapping rule.
5. Specify values for the following settings:
   – **Subnet**: IP address of the data source, expressed in dotted decimal format. To specify a subnet that matches all addresses, use 0.0.0.0/0 as the subnet and mask.
   – **Mask**: Mask to apply to the subnet.
   – **Protocol**: Protocol of the data that is affected by the rule, either TCP or UDP
   – **Start Port**: Beginning of the port range for collected data, expressed in Base 10 decimal format. The start port is included in the port range. The maximum port value that is allowed is 65535.
   – **End Port**: Last port in the range to use for collecting data. The end port is included in the port range.
   – **Destination Port**: Target port that collects the mapped data.
   If you specify a destination port that is already used by other rules, the traffic for the related rules are combined.
   (*Optional*) Click **Check** to run a general check to detect whether the specified port is already receiving data. The check fails if the port is receiving native data; that is, data that is not mapped by application mapping rules. If any native data is on the specified destination port, that data is redirected to the rebase port.
   – **Name**: Identifier for the rule as it is listed on the **Application Definitions** page
   The rule name also is the label for the mapped traffic in certain reports. If other rules map traffic to the same destination port that you specify for this rule, specify the name that you want to use for the combined traffic.
   – **Description**: (*Optional*) Additional descriptive text to identify the rule type and its use, which is displayed only on the **Application Definitions** page
6. Click **Save**.
   The dialog closes. The new rule is added to the **Application Mapping** rule list. If any other rules map traffic to the same port and you specified a new rule name, the other rule names are updated.
7. (*Optional*) Run reports to verify that the traffic on the designated destination port fits the rule.
8. (*Optional*) Review the effects of the new or changed application mapping rules on reports, then consider renaming the rule to label the mapped traffic more clearly in reports.

Create an NBAR2 Application Mapping Rule

Create NBAR2 (Next Generation Network-Based Application Recognition) application mapping rules to identify NBAR2 application traffic in reports. NBAR2 rules can identify traffic for individual applications, combine traffic for multiple applications, or separate NBAR2 traffic from other traffic.

If multiple rules map traffic to the same destination port, the program gives the rules the same name - the name you specified most recently. The rule name is the label for the NBAR2 traffic in reports.

You can create NBAR2 application mapping rules individually on the **Applications Definitions** page. You also can batch import NBAR2 application rules by using the command line.

Notes:

- To display NBAR2 data in reports, your routers must be configured to return IPFIX flows that include the appropriate NBAR2 fields
- Application mapping supports rules for the applications that are identified by the standard Cisco NBAR2 engine (NBAR2 engine 13), but not for applications that are identified by custom NBAR2 engines.

Follow these steps:

1. Open the **Application Definitions** page:
   a. Select **Administration** from the NFA console menu. The **Administration** page opens.
   b. Select **Define an Application, Application Definitions** from the menu on the left side of the page. The **Application Definitions** page opens.
2. Verify that **Application Mapping** is the selected value for **Rules**.
3. Click **Add Rule**. The **Add Application Mapping** dialog opens.
4. Select **NBAR2** from the list of rule types. The dialog switches to NBAR2 rule mode.
5. Specify values for the following settings:
   – **NBAR2 Application ID**: The application ID that is defined by the standard NBAR2 engine.
   Specify the application ID correctly or the rule does not function as expected. The application IDs are included in the `nbar2.csv` file:

   ```
   install_path\reporter\racmd\nbar2.csv
   ```

   – **Destination Port**: Target port that collects the mapped data
   If you specify a destination port that is already used by other rules, the traffic for the related rules will be combined. (*Optional*) Click **Check** to run a general check to detect whether the specified port is already receiving data. The check fails if the port is receiving native data--that is, data that is not mapped by application mapping rules. If any native data is on the specified destination port, that data is redirected to the rebase port.
   – **Name**: Identifier for the rule as it is listed on the **Application Definitions** page
   The rule name also is the label for the mapped traffic in certain reports. If other rules map traffic to the same destination port that you specify for this rule, specify the name that you want to use for the combined traffic.
   – **Description**: (*Optional*) Additional descriptive text to identify the rule type and its use, which is displayed only on the **Application Definitions** page.

   NOTE
   The **NBAR2 Engine ID** value is pre-populated and cannot be edited. The value is 13, the standard NBAR2 engine.
6. Click **Save**.
   The dialog closes. The new rule is added to the **Application Mapping** rule list. If any other rules map traffic to the same port and you specified a new rule name, the other rule names are updated.
7. (*Optional*) Run reports to verify that the traffic on the designated destination port fits the rule.
8. (*Optional*) Review the effects of the new or changed application mapping rules on reports, then consider renaming the rule to label the mapped traffic more clearly in reports.

Change or Delete Application Mapping Rules

Edit an Application Mapping rule when you want to change the specified source port or port range, destination port, protocol, host, ToS, subnet, mask, rule name, rule description, or rule type.

Follow these steps:

1. Open the **Application Definitions** page:
   a. Select **Administration** from the NFA console menu.
      The **Administration** page opens.
   b. Select **Define an Application, Application Definitions** from the menu on the left side of the page.
      The **Application Definitions page** opens.
2. Select an action:

Change an Application Mapping Rule

1. Click the check box next to the rule.
2. Click **Edit**.
   The **Edit Application Mapping** dialog opens.
3. Make the needed changes.
4. Click **Save**.
   If the changes are successful, the dialog closes. The list of rules is updated to reflect your changes. If multiple rules map traffic to the same destination port and you change one of the rule names, the other names are updated to match. This name is used to label the combined traffic in reports.

Delete an Application Mapping Rule

You can delete one or more rules.

1. Click the check box next to the rule.
2. Click **Delete**.

Import Application Mapping Rules

You can create or update application mapping rules by importing a `.csv` file that is formatted for the rule type. You can perform several types of application mapping rule imports:

Importing rules has the following effects and characteristics:

- After the import, the new or updated rules are shown in the **Application Definitions** page list.
- Reports show mapped traffic with labels that match the new rule names.
- Perform this type of import operation locally. You cannot perform the import remotely.
- You can work on the application mapping rules in a Microsoft Excel spreadsheet, then export the rules to `.csv` format.
- If you import the default NBAR2 rule set, each NBAR2 application is mapped to a separate port by default. The default port range is port 65001 and above.

NOTE

More information:

- Troubleshoot Importing Application Mapping Rules

Import the Default NBAR2 Application Mapping Rules

You can add a complete set of default NBAR2 application mapping rules in a batch import operation. You perform this task on the command line by using the `nbar2.csv` file that comes with the product.

NOTE
The NBAR2 application mapping rules that you import represent the set of NBAR2 application definitions compatible with NBAR2 Engine 13.

Follow these steps:

1. Log in to the NFA console server or stand-alone server as a user who is a member of the Administrators group.
2. Open a command prompt.
3. Navigate to the directory that contains the `nbar2.csv` file:

   ```
   cd install_path\reporter\racmd
   ```

   where:
   - *install_path* is the product installation path. The default path is `C:\CA\NFA`.
   - `racmd` is the directory that contains the `nbar2.csv` file. The file is written to this directory when you install the product.
4. Enter the following command:

   ```
   racmd -import nbar2.csv
   ```

   where:
   - `nbar2.csv` is the name of the application mapping rule file that you want to import. The command string is based on the expectation that the `racmd` command and `.csv` file are in their default location. If you have moved the `.csv` file, include the fully qualified path (the path and file name).
     If any errors occur during the import, error messages are shown. If no message is returned, the import succeeded with no problems.
5. (*Optional*) Verify that the rules are listed on the **Applications Definitions** page:
   a. Select **Administration** from the NFA console menu.
      The **Administration** page opens.
   b. Select **Define an Application, Application Definitions** from the menu on the left side of the page.
      The **Application Definitions** page opens. The new rules are shown in the **Application Definitions** page list.
6. (*Optional*) Verify that the mapped NBAR2 application traffic is labeled appropriately in the following locations:
   - **Enterprise Overview** page: **Top Protocols** report
   - **Interface** page: All reports that show protocol data
   - **Custom Reporting** page and **Analysis** page: **Protocol Index**, which you use to select protocols to filter a new or edited report
7. (*Optional*) Combine traffic reporting for selected applications.
   a. Identify a set of applications that you want to see reported as combined traffic.
   b. Edit the corresponding application rules to send the data to a single destination port.
      By default, each NBAR2 application is mapped to a separate port. The default ports are above 65000.
   c. Use an appropriate name for the rules: Use a name that reflects the type of applications that are included. Reports use this name to label the combined traffic.
      If you update a rule name, all rules that use that destination port are renamed to match the new definition. The rule name and label is set when you edit the final rule name.

Import Custom Application Mapping Rules

You can create application mapping rules of a single type by importing a properly formatted `.csv` file. Example `.csv` files are provided, which show the required fields to include in the import file for each rule type.

Follow these steps:

1. Log in to the NFA console server or stand-alone server as a user who is a member of the Administrators group.
2. Open a command prompt.
3. Open the example import file for your rule type:

- All (ToS) rule - `tos.csv`
- Host rule with a specified protocol - `server-protocol.csv`
- Host rule without a specified protocol - `server.csv`
- Subnet rule - `subnet.csv`
- NBAR2 rule - `nbar2.csv`

4. Follow the format in the example file for your rule type:
   - The first row in the file is the column name row, which identifies the fields. Leave the first row exactly as it is shown in the example file. Do not change the spelling or order of the column name row.
   - Add a row below the top row for each rule that you want to import.
   - Enter values for each required field.
     Separate the field values with commas. Do not include a comma inside any value string. A comma signals the import utility to go the next field.
     All fields are required except for the desc (Description) field. To specify a blank desc value, enter only a comma (with no space).
   - The import file columns correspond to the following columns on the **Application Definitions** page:
     - name = **Name**: Rule name
     - desc = (*Optional*) **Description**
     - protocolName - **Protocol**
       To specify all protocols, enter the value -1.
     - tos = **ToS** (Type of Service)
       To specify all ToS, enter the value -1.
     - ip = **IP/Subnet**: Host IP address
     - mask = IP/Subnet: Subnet addition to the host IP address
     - newPort = **Destination Port**
     - beginPort = **Start Port**: Starting port in a port range or port number for a server-protocol rule
     - endPort = **End Port**: Ending port in a port range
     - applicationID = **NBAR2 Application ID**

     Some fields apply only to particular rule types, as shown in the table at the end of these steps.
5. Go to the directory that contains the `.csv` file. The following command shows the default location:

   ```
   cd install_path\reporter\racmd
   ```

   where:
   - *install_path* is the product installation path. The product installation path is `C:\CA\NFA` by default.
   - `racmd` is the directory that contains the `.csv` import file. The file is written to this directory when you install the product.
6. Perform the import by entering the following command:

   ```
   racmd -import nbar2.csv
   ```

   where:
   - `nbar2.csv` is the name of the application mapping rule file that you want to import. The command string is based on the expectation that the racmd command and .csv file are in their default location. If you have moved the .csv file, include the fully qualified path (the path and file name).
     If any errors occur during the import, error messages are shown. If no message is returned, the import succeeded with no problems.
7. (*Optional*) Verify that the rules are listed on the **Applications Definitions** page:
   a. Select **Administration** from the NFA console menu.

The **Administration** page opens.

b. Select **Application Definitions** in the **Define an Application** menu.
The **Application Definitions** page opens.

8. (*Optional*) Verify that the application traffic is labeled appropriately in the following locations:
   - **Enterprise Overview** page: **Top Protocols** report
   - **Interface** page: All reports that show protocol data
   - **Custom Reporting** page and **Analysis** page: **Protocol Index**, which you use to select protocols to filter a new or edited report
9. (*Optional*) Combine or separate traffic for selected applications.

The following table lists the fields that apply to each rule type. List the fields in the order that is shown in the import file example, not the order shown in the table.

Rule Type	name	desc	protocolName	tos	ip	mask	newPort	beginPort	endPort	applicationID
All - tos	Y	Y		Y			Y			
Host - server	Y	Y			Y		Y			
Host - server-protocol	Y	Y	Y	Y	Y		Y	Y		
NBAR2 - nbar2	Y	Y					Y			Y
Subnet - subnet	Y	Y	Y		Y	Y	Y	Y	Y	

Import Application Mapping Rule Updates

You can create application mapping rules of a single type by importing a properly formatted `.csv` file. Example `.csv` files are provided, which show the fields to include in each type of import file.

Follow these steps:

1. Log in to the NFA console server or stand-alone server as a user who is a member of the Administrators group.
2. Get the rule ID for the existing rules that you want to update.
   a. Open a command prompt and go to the directory that contains the `.csv` file. The following command shows the default location:

      ```
      cd install_path\reporter\racmd
      ```

      where:
      - *`install_path`* is the product installation path. The product installation path is `C:\CA\NFA` by default.
      - `racmd` is the directory that contains the `.csv` import file. The file is written to this directory when you install the product.

   b. Export the rule definitions by entering the following command:

      ```
      racmd -export csv
      ```

      The export file is named `getapplicationmapping_<timestamp>.csv`. The file is located in the current directory.

The command returns the status message: `Creating csv file .` When the operation is complete, the command prompt reappears.

NOTE
Rule IDs are specific to the current stand-alone or NFA console system.

3. Open the export file in a spreadsheet or text editor.
   The export file contains a line for each current application mapping rule, which begins with the rule ID. The line also includes extra information that you can ignore.
4. Locate and make a note of the ID for each rule that you want to edit.
5. Prepare the import file:
   a. Open a copy of the example import file for your rule type:
      - All (ToS) rule - `tos.csv`
      - Host rule with a specified protocol - `server-protocol.csv`
      - Host rule without a specified protocol - `server.csv`
      - Subnet rule - `subnet.csv`
      - NBAR2 rule - `nbar2.csv`
   b. Add the appID column and rule values, as shown in the following examples:
      Example: First two lines in an import file to add NBAR2 rules

      ```
      name,desc,newPort,applicationid

      youtube,Youtube video streaming,65035,82
      ```

      where:
      - name = Rule name
      - desc = Rule description
      - newPort = Destination port
      - applicationID = NBAR2 application ID

      Example: First two lines in an import file to update NBAR2 rules

      ```
      appID,name,desc,newPort,applicationid

      35,YouTube,Youtube video streaming,65035,82
      ```

      where:
      - applicationID = Rule ID

      NOTE
      If you update NBAR2 application mapping rules, do not change the NBAR2 application ID value. If you change this value, the rule will not function as expected.
   c. Other than adding the appID column and values, follow the import mapping guidelines for custom Application Mapping Rules.
   d. Save the import file.
      We recommend that you save the import file to the same directory that contains the import command: *install_path*`\reporter\racmd .`
6. Go to the directory that contains the .csv file:

   ```
   cd install_path\reporter\racmd
   ```

   where:

- *install_path* is the product installation path. The product installation path is `C:\CA\NFA` by default.
- `racmd` is the directory that contains the `.csv` import file. The file is written to this directory when you install the product.

7. Enter the following command:

```
racmd -import nbar2_updated.csv
```

where:

- `nbar2_updated.csv` is the name of the update file that you just created. If you have moved the `.csv` file, include the fully qualified path (the path and file name).

If any errors occur during the import, error messages are shown. If no message is returned, the import succeeded with no problems.

8. (*Optional*) Verify that the updated rules are listed correctly on the **Applications Definitions** page:
   a. Select **Administration** from the NFA console menu.
      The **Administration** page opens.
   b. Select **Define an Application, Application Definitions** from the menu on the left side of the page.
      The **Application Definitions** page opens.
9. (*Optional*) Verify that the application traffic is labeled correctly in the following locations:
   - **Enterprise Overview** page: **Top Protocols** report
   - **Interface** page: All reports that show protocol data
   - **Custom Reporting** page and **Analysis** page: **Protocol Index**, which you use to select protocols to filter a new or edited report

Create, Change, or Delete Reserved Seating Rules

You can create Reserved Seating rules to help ensure that reports include the port and protocol combinations that interest you, regardless of traffic volume or rates. The rules create ‘reserved seats’ for the ports that are used by those protocols so the data is sure to be included in reports.

For example, during an application rollout you want to watch the traffic for a particular application, but the **Top N Protocols** reports for interfaces do not show the traffic for the application. The protocol that the application uses is not included in the Top N Protocol group; the group of protocols with the highest traffic volume or utilization rate. You create a Reserved Seating rule to collect data for the specific protocol and port that the application uses. The protocol now is included in the **Top N Protocols** reports.

NOTE

More information:

- Data Collection

Follow these steps:

1. Open the **Application Definitions** page:
   a. Select **Administration** from the NFA console menu.
      The **Administration** page opens.
   b. Select **Define an Application**, **Application Definitions** from the menu on the left side of the page.
      The **Application Definitions** page opens.
2. Select **Reserved Seating** from the **Rules** list.
   The **Application Definitions** page switches to **Reserved Seating** mode and displays a list of the current **Reserved Seating** rules.
3. Select one of the following actions:

Add a Rule

1. Click **Add Rule**.
2. Specify ports as follows:
   - **Protocol**: Protocol of the data that is affected by the rule, either TCP or UDP
   - **Port**: Target port for the Reserved Seating rule. Enter the port number in the **Port** box, a value from 0 through 65535, expressed in Base 10 decimal format. If you do not enter a value, port 0 is assigned. The port and protocol combination must be unique; that is, it cannot match any other Reserved Seating rule.
     Data of the specified protocol type is reported for this port regardless of traffic rate or volume.
   - **Description**: (*Optional*) Identifying text for the Reserved Seating rule. The description appears in the list of **Reserved Seating** rules on the **Application Definitions** page.
3. Click **Save**.
   If you entered a valid port and protocol combination and you have not yet reached the maximum number of rules, the dialog closes. The new rule appears in the list of **Reserved Seating** rules.
4. Repeat this process for each Reserved Seating rule you want to add.
   You can specify a maximum of 50 Reserved Seating rules.

Change a Rule

1. Click the check box next to the rule you want to edit, then click **Edit**.
   The **Edit Reserved Seating** dialog opens.
2. Make the needed changes in the **Protocol**, **Port**, and **Description** values.
3. Click **Save**.
   If the changes are successful, the **Edit Reserved Seating** dialog closes.

Delete a Rule

1. Click the check box next to one or more rules you want to delete. To select the check boxes for all the rules, click the check box in the heading row.
2. Click **Delete**.
   A confirmation message opens.
3. Click **Yes**.
   The list of **Reserved Seating** rules is updated to reflect your deletions.

Work with Port Priorities

By default, DX NetOps (CA NFA) defines the server port and protocol as the lower number in the flow record.

Source port: 80

Destination port: 8000

In this case, CA NFA determines that the lower port is 80, and therefore http.

When the server port (tcp / udp) is a high number, the port priority can be used.

For example:

Server port: 8888

Client port: 6000

By default, CA NFA would use the lower port (6000) as the server port. The Port Priority functionality tells it to use 8888 as the server port when it is present in the data.

Create Port Priority Rules

Create Port Priority rules to help ensure that the correct protocols are identified for each range of ports.

Follow these steps:

1. Open the **Application Definitions** page:
   a. Select **Administration** from the NFA console menu. The **Administration** page opens.
   b. Select **Define and Application, Application Definitions** from the menu on the left side of the page. The **Application Definitions** page opens.
2. Select **Port Priority** from the **Rules** list.
   The **Application Definitions** page switches to **Port Priority** mode and displays a list of the current Port Priority rules.
3. Click **Add Rule**.
   The **Add Port Priority** dialog opens.
4. Specify ports as follows:
   – **Protocol**: Protocol of the data that is affected by the rule, either **TCP** or **UDP**
   – **Start Port**: Target starting port for the Port Priority rule. Enter the port number in the **Start Port** box, a value from 0 through 65535, expressed in Base 10 decimal format. If you do not enter a value, port 0 is assigned.
   – **End Port**: Target ending port for the Port Priority rule. Enter the port number in the **End Port** box, a value from 0 through 65535, expressed in Base 10 decimal format. If you do not enter a value, port 0 is assigned.
   Note: The start port, end port, and protocol combination must be unique; that is, it cannot match any other **Port Priority** rule.
   – **Description**: (*Optional*) Identifying text for the Port Priority rule. The description appears in the list of **Port Priority** rules on the **Application Definitions** page.
5. Click **Save**.
   If you entered a valid start port, end port, and protocol combination and you have not yet reached the maximum number of rules, the dialog closes. The new rule appears in the list of Port Priority rules.
6. Repeat this process for each Port Priority rule you want to add.
   You can specify a maximum of 50 rules.

Maintenance and Data Collection

Maintain DX NetOps to ensure that all features are performing well. You will want to perform some maintenance tasks regularly. For example, when a user sets up a trap, the Administrator must deploy that trap.

> **NOTE**
> To complete the tasks that are described in this section, the role for your DX NetOps user account must be either Administrator or Power User.

View Flow Statistics

View the **Flow Statistics** page at any time to view the flow rates on a per harvester basis.

Flow Rate by Harvester

An interactive time series graph at the top of the screen that contains flow rates for each harvester on a single graph. This view defaults to showing data over the last 24 hours, with selectable time periods. You can hover over a point on the graph to see the Harvester name, data point value, date, and time.

The interactive legend (to the right of the graph) allows you to control which Harvesters are included in the graph. Click the checkmark next to the Harvester name to add or remove it from the graph. Click a Harvester name to display only that Harvester in the graph.

The graph types are:

- **area**
- **bar**
- **line**
- **scatter**

Within each graph type, you can define the form (not all forms are available for all graph types):

- **stack**
- **stream**
- **percent**
- **value**

Within each form, you can define the line smoothing method (not all methods are available for all forms):

- **cardinal**
- **linear**
- **step**

The range slider (under the graph) allows you to zoom in to the data that is shown in the graph.

Time Period

The time period is defined as the time specified by the **From** and **To** date and time. Selecting the time period allows you to compress or expand the amount of data shown in the graph. Different time periods use different data intervals:

Time Period	Data interval
24 hours or less	5 Minute Data
24 hours to 1 week	15 Minute Data
1 to 2 weeks	30 Minute Data
Greater than 2 weeks	60 Minute Data

Only one month of data (rolling month) is kept in the database.

Update

Clicking **Update** reloads the graph with the most current data based on the time period. Because it updates the data, it resets the Harvester selections and closes any tables opened from the **Flow Statistics by Harvester** table.

Flow Statistics by Harvester

A table view that contains individual harvesters with all of the processing metrics above (dropped flows, dropped packets, map failures, etc.). This view defaults to showing data over the defined time period.

- - **IP**
    The IP address of the Harvester.
  - **Description**
    The name of the Harvester (the name used in the interactive legend).
  - **Routers**
    The number of routers on the Harvester, in the defined time period.
  - **Interfaces**
    The number of interfaces on the Harvester, in the defined time period.
  - **Min Flow Rate**
    The minimum flow rate for the Harvester, in the defined time period.
  - **Max Flow Rate**

The maximum flow rate for the Harvester, in the defined time period.

- **Avg Flow Rate**
  The average flow rate for the Harvester, in the defined time period.
- **95th Pct Flow Rate**
  The 95th percentile flow rate for the Harvester, in the defined time period.
- **Discarded Packets**
  The number of packets that were discarded on the Harvester, in the defined time period.
  Discarded packets are packets that were successfully received, but for some reason are not valid for further processing. The next three columns reflect reasons that packets might have been discarded.
  - **No Flows Found**
    The number of NetFlow FlowSets that had either no content or invalid content for the Harvester, in the defined time period.
  - **Header Failures**
    The number of NetFlow header parse failures for the Harvester, in the defined time period.
  - **Router Reboots**The number of times the Harvester detected that a router has been rebooted, in the defined time period.This could indicate device or NetFlow configuration issues, or normal behavior if planned maintenance is being performed.
- **Discarded Flows**
  The number of flows that were discarded on the Harvester, in the defined time period.
  Discarded flows are flows that were successfully received and parsed, but were disqualified from further processing based on the state of the interfaces reported in the flow. The next column reflects reasons that flows might have been discarded.
  - **Map Failures**
    The number of interfaces that are either new to the Harvester or are disabled on the Harvester, in the defined time period.
    For new interfaces, a poll is scheduled to discover the type and speed of the interface, and to potentially remap any pre-existing interfaces on the same router.

Follow these steps:

1. Display the **Flow Statistics** page:
   a. Select **Administration** from the NFA console menu.
      The **System Status** page opens.
   b. Select **Health, Flow Statistics** from the menu on the left side of the page.The **Flow Statistics** page opens.
2. The **Flow Rate by Harvester** chart defaults to **area**, **stack**, **cardinal**, with a time period of **Daily**. Select the graph, form, and smoothing method.
3. Specify the **Time Period**.
4. Click **Update**. The graph and table update with the latest information available for the requested time period.
5. Click a row in the **Flow Statistics by Harvester** table to display the **Router Information** table for that Harvester. Click a row in the **Router Information** table to display the **Interface Information** table for that router.

View System Status

View the **System Status** page at any time to see the overall status of DX NetOps components.

Follow these steps:

1. Display the **System Status** page:
   - Select **Administration** from the NFA console menu.
     or
   - Select **Health, System Status** from the menu on the left side of the **Administration** page.

The **System Status** page opens and shows a quick overview of the status of DX NetOps components. Status symbols identify any components that have generated warnings. The number of warnings appears in parentheses after the component label.

2. Click any component that has a warning symbol to see details.
   A table of warnings appears.
3. Review any warnings that you find for each component.

Configure Application Settings

You can configure a wide range of settings on the **Application Settings** page.

Follow these steps:

1. Select **Administration** from the NFA console menu.
   The **System Status** page opens.
2. Select **System, Application Settings** from the menu on the left side of the page.
   The **Application Settings** page opens.
3. (*Optional*) Change any of the following settings as needed, then click **Save**.
   - **Interface Data Absence Limit**
     Specifies how long the program waits before it flags an interface as inactive, starting from the **Last Flow** value on the **Available Interfaces** page. When the limit is reached, the interface status changes in the following locations:
     - **Interface Index**: Active column value changes to **No**.
     - **Active Interfaces** page: **Traffic Status** value changes to **Inactive/Red**.

     Default: 4 Hours
   - **TCP Rebase Port**
     Specifies the target port for TCP traffic that is redirected by an application mapping rule. TCP traffic that you do not want to go to a target port goes to the TCP Rebase Port instead. Other settings that affect application mapping behavior are **UDP Rebase Port**, **ToS Mask**, and **Preserve ToS Map Proto**.
     Default: 9000
   - **ToS Mask**
     Specifies the number of bits that application mapping rules use for matching ToS values. The default value of 255 sets the program to look for matches throughout all ToS values. Other settings that affect application mapping behavior are **TCP Rebase Port**, **UDP Rebase Port**, and **Preserve ToS Map Proto**.
     Default: 255
   - **UDP Rebase Port**
     Specifies the target port for UDP traffic that is redirected by an application mapping rule. UDP traffic that you do not want to go to a target port goes to the UDP Rebase Port instead. Other settings that affect application mapping behavior are **TCP Rebase Port**, **ToS Mask**, and **Preserve ToS Map Proto**.
     Default: 8000
   - **Auto-Enable Interfaces**
     Specifies whether newly discovered interfaces are enabled automatically (True) or are disabled (False). If you want to control which interfaces are reported and consume licenses, set the value to False. In this case you enable the interfaces manually on the **Available Interfaces** page. This setting affects the **Enabled** status for new interfaces. Interfaces that have already been discovered are not affected by changes to this setting.
     Default: True
   - **DNS Domains**
     Removes the specified suffixes from host names in NFA console views and reports. If you include `.my_company.com`, for example, this suffix is not shown in the host names that appear in any views or reports. To specify multiple entries, separate the entries with commas and without intervening spaces.
     Default: <no default>
   - **Show Trendline Zeroes**
     Specifies whether trendline reports show data with interconnecting lines.

If the value is True, trend lines connect data points in reports such as the **Multi Trend Summary** and **Stacked Trend** on the **Interface** pages. Fill pattern is shown beneath the lines.
If the value is False, the reports show only the data points that are real. The trend line ends at the last data point and starts at the next data point. The reports show gaps wherever data points are missing. The reports do not have boundary lines for fill pattern, so the fill pattern is missing.
Default: False

– **From Address**
Specifies the email address of the DX NetOps Administrator, which is used as the **From** value when reports are emailed. If this setting is not configured properly, users cannot send scheduled or on-the-fly reports. These functions also require a properly configured **SMTP Server** value.
Default: <no default>

– **SMTP Server**
Specifies the IP address of the SMTP mail server that is used for emailing reports. If this setting is not configured properly, users cannot send scheduled or on-the-fly reports. These functions also require a properly configured **From Address** value.
Default: <no default>

– **Licensed Devices**
Records the total number of licenses that you purchased from CA. This value is used to calculate the percentage of licenses in use, which is displayed on the **About** page. The **License Utilization** percentage is accurate only if the **Licensed Devices** value is accurate.
Default: 50

– **Preserve ToS Map Proto**
Specifies whether protocol traffic for ToS-based application-mapped data is combined (N) or is shown as separate data streams that are labeled with the original protocol designators (Y).
For example, suppose the value is Y and you map TCP, UDP, and some other IP protocol traffic to one port. To continue the example, suppose you drill in to a link in the **Enterprise Overview: Top Host** view for a host that has the mapped data. In this case the **Stacked Protocol Trend** and **Protocol Trend** views show and label the protocol traffic separately, whether the protocol traffic is for TCP, UDP, or some other IP protocol.
  - **Stacked Protocol Trend** and **Protocol Trend** views show protocol traffic that meets the following conditions: (1) The traffic passes the minimum threshold and (2) The protocol volume is high enough to place it in the Top N group.

If the **Preserve ToS Map Proto** value is N and the **Stacked Protocol Trend** views show related protocol traffic, all of the protocols for the mapped traffic are combined in a single traffic stream that has a TCP label.
Other settings that affect application mapping are **TCP Rebase Port**, **UDP Rebase Port**, and **ToS Mask**.
Default: Y

– **Pump Broadcast/Multicast**
Specifies whether interface views and reports include (True) or hide (False) broadcast/multicast traffic.
Default: True

– **Reporter IP**
Specifies the IP address of the NFA console.
Default:
  - Stand-alone deployment: Loopback IP address of the stand-alone server
  - Distributed 2-tier deployment: Loopback IP address of the NFA console

– **Report Service Polling Delay**
Specifies the number of seconds between checks to see if reports have finished running. The status **Complete** is displayed when both of the following conditions are met:
  - The Report Service check confirms that the report is finished.
  - You refresh the report list on the **Custom Reporting** page, **Analysis** page, or **Flow Forensics** page.

Default: 15

– **Router Domains**

Removes the specified suffixes from router names that appear in the NFA console views and reports. To specify multiple entries, separate the entries with commas and without intervening spaces.
Default: <no default>

- **Show Aggregations**
  Specifies whether to include interface aggregations in **Enterprise Overview** page views. If the value is True, interface aggregations are included in the views. To be included in **Enterprise Overview** page views, the aggregations must have enough traffic to pass the minimum thresholds and to rank in the Top N group.
  Default: False
- **Show Device Name**
  Specifies whether the interface name format starts with the device name (True) or omits it (False). This setting affects the interface names that appear in views and reports, such as the **Enterprise Overview** views, **Interface** page reports, and **Custom Report Interface Summaries**.
  Default: True
- **Display Notes Field**
  Displays (True) or hides (False) the **Notes** icon for interface rows on the **Active Interfaces** page. If the **Notes** icon is visible, you can click it to add, edit, or view additional information about an interface.
  Default: False
- **Trap Destination**
  IP address or DNS name of the target server for sending the traps that are shown as events in the Performance Center console:
  - (CA PC) **Events Display** page
  - (CA NPC) **Event List** page

  Traps can be displayed as events only when this setting is configured correctly. Set the **Trap Destination** value to match the IP address of one of the following servers:
  - (CA PC) NFA console or stand-alone server that is registered as a data source for Performance Center
  - (CA NPC) Event Manager server

  Default: IP address of the NFA console (distributed deployment) or stand-alone server (stand-alone deployment)

How to Monitor the Components

Watchdog Services let you monitor DX NetOps components. The Watchdog Services poll each server in your DX NetOps configuration once every two hours to determine the status of all components. You can establish thresholds, an email address for receiving messages, and other settings for the Watchdog Services to ensure that you are notified of issues with the components as soon as possible.

Edit Watchdog Service Settings

Edit the Watchdog settings to change configuration values such as thresholds, trap settings, polling settings, notification address, and community strings.

Follow these steps:

1. Display the **Watchdog Settings** page:
   a. Select **Administration** from the NFA console menu.
      The **Administration** page opens.
   b. Select **Health, Watchdog Settings** from the menu on the left side of the page.
      The **Watchdog Settings** page opens and displays the current settings.
2. Edit the **Watchdog Service** settings:
   - **Community String**
     SNMP string that the Watchdog Services use to verify the identity of components in a distributed deployment. The community string is used for gathering information from Harvesters. Use the same community name throughout the DX NetOps deployment:

- **Watchdog Settings** page
- SNMP service on each Windows server
- `snmpd.conf` file on each Linux server

Default: public

– **CPU Threshold**
Threshold for CPU utilization. You are notified by email when the CPU threshold on a server is exceeded on any server and an SNMP trap notification is generated, provided that the address and string are set.
Default: 80 percent CPU utilization

– **Disk Threshold**
Threshold for disk utilization. If the disk threshold on a server is exceeded, you are notified by email and an SNMP trap notification is generated, provided that the address and string are set.
Default: 80 percent disk utilization

– **Email Address**
Destination email address to use for email notifications when thresholds are exceeded. To notify multiple recipients, separate the addresses with commas. The **Email Address** setting has no default value.
Default: (none)

– **Memory Threshold**
Threshold for memory utilization. You are notified by email when the memory threshold on a server is exceeded, provided that the address and string are set.
Default: 80 percent memory utilization

– **SNMP Retries**
Number of times the program attempts to poll an SNMP device. A high number of SNMP Retries can affect performance, depending on your network configuration.
Default: 2

– **SNMP Timeout**
Number of seconds before an SNMP poll times out.
Default: 5

– **System Check Interval**
Number of minutes between Watchdog system checks.
Default: 60

– **Trap Community String**
SNMP string to use for sending traps to a third-party trap receiver. Use one of the community names that the trap receiver is configured to accept.
Default: public

– **Trap Destination**
IP address of the server that receives SNMP traps from the Watchdog Services. The traps are generated when thresholds for DX NetOps component performance are violated.
Default: (none)

3. Click **Save** when you finish editing the settings.

Work with Traps

Create traps to notify network management when certain events occur. Administrators can create traps and must deploy any traps that users create.

DX NetOps traps can be integrated with external fault management packages.

NOTE
More information:

Create, Change, or Delete Traps

You can create traps to notify network management when certain events occur.

TIP

You can display custom ToS and Protocol names in trap alerts with interface groups using the `trapsHaveUniqueDomain` parameter. This should only be used in a single-domain environment.

1. On the NFA console, in the `reporter.parameter_descriptions` table, set the `trapsHaveUniqueDomain` parameter to `True` .
2. Restart the NFA console services.

This parameter only affects new traps; it does not have any effect on existing traps.

Follow these steps:

1. Display the **Add a Trap Configuration** page:
   a. Select **Administration** from the NFA console menu.
   The **Administration** page opens.
   b. Select **Alerts, Traps** from the menu on the left side of the page.
   The **Trap Configuration** page opens and displays a list of the current traps.
2. Select an action:

Create a Trap

1. Click **Add**.
   The **Add a Trap Definition** page opens.
2. Define the trap description and the interfaces that the trap monitors:
   – **Description**: Identification for the new trap. Include information about the protocol and threshold, such as "Microsoft SQL Monitor utilization above 65%".
   – **Select Interface** or **Select Interface Group**: Link to an index of interfaces or interface groups, which you use to select which interfaces that the trap monitors.

   NOTE

   - If the interface speed is unknown or 0, any attempt to set a trap is logged. The trap is not sent to the Harvester and therefore no alerts on this interface are generated. This interface is not included in any statistics calculations.
   - If the associated interface or interface group is deleted after you deploy the trap, an "Unknown interface group error" occurs. To eliminate this error, associate the trap with a different interface or interface group.
   - If using interface groups, custom ToS or Protocol names do not apply unless you have set the `trapsHaveUniqueDomain` parameter.
3. (*Optional*) Create a Utilization-based trap by providing the following information:
   – **Thresholds: Utilization**: Setting to make the trap threshold type utilization. Use the context-sensitive fields that are added for this trap type.

- **Utilization: In** field: Percentage of utilization that acts as the inbound threshold value
- **Utilization: In: minutes** list: Number of minutes of inbound threshold violation that generates a trap
- **Utilization: Out** field: Percentage of utilization that acts as the outbound threshold value
- **Utilization: Out: minutes** list: Number of minutes of outbound threshold violation that generates a trap

– **Protocol**: Protocol for the monitored traffic. Select the protocol in the **Protocol Index** dialog. The trap applies to the selected interfaces and protocol.
– **ToS**: (*Optional*) Type of Service (ToS) of the monitored traffic The trap applies to the selected interfaces, protocol, and ToS. To monitor all ToS traffic, select **All**.
– **Time Filter**: (*Optional*) Time period for monitoring if you choose to limit monitoring in this way. Select one of the available time filters from the list. The **Time Filter** list includes all the time filters that the Administrator has created.

NOTE
A time filter applied to a trap uses the time zone of the Harvester.

4. (*Optional*) Create a Rate-based trap by providing the following information:
For example, suppose that you create a Rate-based trap and establish thresholds for both the inbound and outbound traffic. The trap is triggered when the threshold is met during the defined period.
   – **Thresholds: Rate**: Setting to base the trap threshold on data transfer rate. Use the context-sensitive fields that are added for this trap type.
     - **Rate: In**: Inbound data transfer speed that acts as a threshold value. Define the number of bits, kilobits, megabits, or gigabits per second, according to the unit of measurement selected.
     - **Rate: Units of Measure**: Unit of measurement for data transfer. Select bits per second (bps), kilobits per second (kbps), megabits per second (Mbps), or gigabits per second (Gbps).
     - **Rate: In: minutes**: Number of minutes of inbound threshold violation that generates a trap
     - **Rate: Out**: Threshold for outbound data transfer. Enter the number of bits, kilobits, megabits, or gigabits per second, according to the unit of measure for the inbound threshold.
     - **Rate: Out: minutes**: Number of minutes of outbound threshold violation that generates a trap
   – **Protocol**: Protocol for the monitored traffic. Select the protocol in the **Protocol Index** dialog. The trap applies to the selected interfaces and protocol.
   – **ToS**: (*Optional*) Type of Service (ToS) of the monitored traffic The trap applies to the selected interfaces, protocol, and ToS. To monitor all ToS traffic, select **All**.
   – **Time Filter**: (*Optional*) Time period for monitoring if you choose to limit monitoring in this way. Select one of the available time filters from the list. The **Time Filter** list includes all the time filters that the Administrator has created.

   NOTE
   A time filter applied to a trap uses the time zone of the Harvester.
5. (*Optional*) Create a Volume-based trap by providing the following information:
   – **Thresholds: Volume**: Setting to base the trap threshold on data volume. Use the context-sensitive fields that are added for this trap type.
     - **Volume: In**: Inbound data volume that acts as a threshold. Define the number of bytes, kilobytes, megabytes, gigabytes, or terabytes, according to the unit of measurement selected.
     - **Volume: Units of Measure**: Unit of measurement for data transfer. Select bytes, kilobytes (kB), megabytes (MB), gigabytes (GB), or terabytes (TB).
     - **Volume: Out**: Inbound data volume that acts as a threshold. Enter the number of bytes, kilobytes, megabytes, gigabytes, or terabytes, according to the unit of measure for the inbound threshold.
     - **Volume: Out: minutes**: Number of minutes of outbound threshold violation that generates a trap.
   – **Protocol**: Protocol for the monitored traffic. Select the protocol in the **Protocol Index** dialog. The trap applies to the selected interfaces and protocol.
   – **ToS**: (*Optional*) Type of Service (ToS) of the monitored traffic The trap applies to the selected interfaces, protocol, and ToS. To monitor all ToS traffic, select **All**.
   – **Time Filter**: (*Optional*) Time period for monitoring if you choose to limit monitoring in this way. Select one of the available time filters from the list. The **Time Filter** list includes all the time filters that the Administrator has created.

NOTE
A time filter applied to a trap uses the time zone of the Harvester.

6. (*Optional*) Create a Flow-based trap by providing the following information:
   – **Thresholds: Flows**: Setting to base the trap threshold on the number of flows. Use the context-sensitive fields that are added for this trap type.
     • **Flows**: Total: Number of inbound flows that acts as a threshold value. Define the number by flows per minute, thousands of flows per minute, or millions of flows per minute, according to the unit of measurement selected.
     • **Flows: Units of Measure**: Unit of measurement for data transfer. Select flows/minute, thousands of flows/minute, or millions of flows/minute.
     • **Flows: minutes**: Number of minutes of threshold violation that generates a trap
   – **Time Filter**: (*Optional*) Time period for monitoring if you choose to limit monitoring in this way. Select one of the available time filters from the list. The **Time Filter** list includes all the time filters that the Administrator has created.

     NOTE
     A time filter applied to a trap uses the time zone of the Harvester.
7. Click **Submit** when the selections are complete.
   The trap is deployed.

   NOTE
   Traps are sent to the destination that is defined in the application settings.

Change a Trap Definition

1. Click the trap description in the **Trap Configuration** page trap list.
   The **Trap Configuration** page changes to edit mode.
2. Make updates in the **Trap Configuration** page.
3. Click **Submit**. The trap is updated.

Delete a Trap Definition

1. Click the trap description in the **Trap Configuration** page trap list.
   The **Trap Configuration** page changes to edit mode.
2. Click the **Delete** button that appears in edit mode.
3. Verify the deletion when prompted.

Configure Trap Destinations

Configure destinations for the traps that you and operators create.

- Set the trap destination in the **Application Settings** page to display traps as events in the Performance Center Console.
- If you also want to generate Watchdog traps, configure the trap destination on the **Watchdog Settings** page in the NFA console.

Follow these steps to enable traps to be displayed in the Performance Center Console:

1. Display the **Application Settings** page:
   a. Select **Administration** from the NFA console menu.
      The **Administration** page opens.
   b. Select **System, Application Settings** from the menu on the left side of the page.
      The **Application Settings** opens.

2. Locate the **Trap Destination** field.
3. Verify that the **Trap Destination** field value matches the appropriate IP address:
   – (CA PC) The NFA console or stand-alone server that is registered as a data source
   – (CA NPC) The Event Manager server

   To check this value in CA Performance Center, make sure the **Trap Destination** IP address matches the **Host Name** value in CA Performance Center. If the host IP address is not included in the data source name, check the **Host Name** value by completing the following steps:
   a. Select **Admin**, **Data Sources** in the Performance Center Console.
      The **Manage Data Sources** page opens.
   b. Right-click the DX NetOps data source and select **Edit** from the menu.
      The **Edit Data Source** dialog opens.
   c. Check the **Host Name** value.

Follow these steps to set the destination for Watchdog traps:

1. Display the **Watchdog Settings** page:
   a. Select **Administration** from the NFA console menu.
      The **Administration** page opens.
   b. Select **Health, Watchdog Settings** from the menu on the left side of the page.
      The **Watchdog Settings** page opens and displays the current settings.
2. Verify that the Watchdog settings are correct, including the **Trap Destination**:
   Enter the IP address of the server that hosts the trap receiver. The Watchdog Services send SNMP to the **Trap Destination** address.
3. Click **Save** when you finish editing the settings.
   The settings are saved. Messages are sent out for any new traps that are generated.

Optional Tasks:

- Verify that the events are displayed on the **Events Display** page (CA PC) or the **Event List** page (CA NPC). If the page does not show the events as expected, verify that the following conditions are met:
  – The logs show that events have been generated and forwarded to the Event Manager.
  – The Event Manager host name is resolvable by the DNS server for DX NetOps.
  – The **Trap Destination** value on the **Application Settings** page in the NFA console matches the IP address of the NFA console or stand-alone server that is registered as a data source.
- Configure traps for external programs.

Set Up Traps for External Fault Management Programs

You can integrate traps that DX NetOps generates with other network management programs. The traps provide the following information:

- Interface that is affected by the threshold
- Protocol that is affected by the threshold
- Direction of traffic that is affected by the threshold (in, out, or both)
- Threshold that was crossed (for example, 1.23 Mb/s)
- Actual observed traffic that triggered the trap (for example, 1.30 Mb/s)
- Whether the notification indicates a newly observed threshold violation or a cleared threshold violation. For a cleared threshold violation, the reason for clearance is included. The reasons are:
  – Rate fell below the threshold
  – No data was observed for the last time period
  – A time filter prevented data from being considered

Configure Traps for External Programs

Configure DX NetOps traps to collate events with external programs and to supply useful data to the external programs.

Follow these steps:

1. Access the MIB file.
   The MIB contains information about the contents of the traps that DX NetOps sends. The MIB file is located in the following directory: *install_path*\reporter\MIB .
2. Compile the MIB into the network management program, and configure the program to match DX NetOps traps logically.
   A trap is sent when the program observes a new threshold violation and again when the condition is cleared. Configure the network management program to collate these two events, so you clear the warning condition when the program sends the clear condition trap. To accomplish the collation configure the program to look at the following values in the MIB:
   - NetQoSTrafficFlowEntry
   - NetQoSTrafficFlowDataEventStart , which signifies that the trap is new
   - NetQoSTrafficFlowDataEventStop , which signifies that the trap has been cleared

   For more information about defining rules for intelligent trap handling, refer to the documentation for the network management program.
3. Create and deploy DX NetOps traps, if you have not already done so.
4. Verify that the trap destination contains the IP address of the server that hosts the fault management program.
   Traps are sent to the destination established on the **Application Settings** page.

Troubleshoot Issues with Integrated Traps

Review trap settings to correct problems with the DX NetOps trap data that external fault management programs receive.

Follow these steps:

1. Verify that the trap destination is set to the IP address of the host server for the fault management program.
2. Verify that the traps are configured properly.

If you have checked these settings and you still do not receive traps as expected, contact CA Support for help.

Backing Up and Restoring Data

Use the information here as a reference to manually backup and restore the DX NetOps databases.

You can back up some files automatically, by adding the appropriate directories to your regular backup routine:

- Customized configuration files: Custom locations (Any server)
- Historical (15-Minute) data on a stand-alone server or a two-tier distributed deployment: *install_path*\Netflow\datafiles\ReaperArchive15 (Stand-alone or Harvester server)
- High-resolution (1 minute) data: *install_path*\Netflow\datafiles\ReaperArchive (Stand-alone or Harvester server)
- Flow Forensics (raw) data: *install_path*\Netflow\datafiles\HarvesterArchive (Stand-alone or Harvester server)

WARNING

- Run backups concurrently. If you restore data from backups that have different timestamps, problems can result. Ensure that your backed-up data files are timestamped with the same hour. On two-tier systems, backups should be done as simultaneously as possible across systems.
- Store backups to a remote location to guard against the possibility of a hardware or operating system failure on the main server. For example, back up the databases to an administrative share or mapped network drive.
- When a database drop occurs, all procedures in the `mysql.proc` table for that dropped database are dropped.

Before you back up large databases, consider how much disk space the backups will require and the lifespan of the files you are backing up. You probably will not want to back up the raw flow data (`.NFA` files) or back up the entire `datafiles` directory.

Databases to Back Up

DX NetOps uses several databases to store configuration data, reporting data, 15-minute (historical) data, and high resolution (1-minute) data. This section describes databases to consider for backups and gives general recommendations for backup frequency. Data is used differently in different environments, however, so your priorities for safeguarding against data loss could vary.

By excluding some directories, you can safely backup your data without stopping services or collecting data. Always exclude any `*Work` directories in the `datafiles` directory.

All Servers

- Customized configuration files: Back up any other customized configuration files--files that you customized or that were customized by CA Support.
  Location: Files with a `.config` , `.conf` , or `.ini` extension that are located anywhere in the DX NetOps installation path.
  Recommendation: Daily backup

Single Sign-On Program

Back up any customized Single Sign-On configuration settings on the SSO server, which might be the Performance Center server. If you lose customized Single Sign-On settings, you might not be able to log in.

- Single Sign-On (SSO) configuration files, as described in the Single Sign-On article in the CA Performance Management documentation.

NFA Console (Distributed Deployment)

- Reporter database: Contents include the previous 24 hours of Enterprise Overview data, settings, reports, inventory, and synchronization information.
  Recommendation: Weekly backup

Harvester (Distributed Deployment)

- Historical (15-minute) database (archive15 database on a two-tier distributed deployment): The contents of these datafiles include the 15-minute data that is stored for the reporting routers and interfaces.
  Location: *install_path*`\Netflow\datafiles\ReaperArchive15`
  Exclude `*.tmp`
  Recommendation: Weekly backup
- Harvester configuration database: The harvester configuration data is essential to perform the relational mapping that provides access to the 15-minute data. It provides information about devices and interfaces to enable polling, such as persistent IDs for interfaces.

Recommendation: Daily backup

- (*Optional*) Flow Forensics data (HarvesterArchive database): Many administrators do not back up Flow Forensics data because of its short storage life; a maximum of 24 hours. When you decide whether to back up this database, consider the value that this single day of data has in your particular circumstances.
  Location: *install_path*\Netflow\datafiles\HarvesterArchive Exclude *.tmp
- (*Optional*) High-resolution (1-minute) database (archive database): Many administrators do not back up 1-minute data because its high volume requires long backup times.
  The 1-minute data is stored for one month by default.
  Location: *install_path*\Netflow\datafiles\ReaperArchive
  Exclude *.tmp
  Recommendation: Daily backup
- Customized Data Retention configuration files: If you have customized any data retention settings, back up the data retention configuration database.
  Recommendation: Daily backup

  NOTE
  It is unusual to customize data retention settings, except with the assistance of CA Support. Changes to data retention settings can cause problems as the demands on drive space rise.

Stand-Alone Server

- Reporter database: Contents include the previous 24 hours of Enterprise Overview data, settings, reports, inventory, and synchronization information.
  Recommendation: Weekly backup
- Historical (15-minute) data (archive15 database): The contents of this database include the 15-minute data that is stored for the reporting routers and interfaces.
  Location: *install_path*\Netflow\datafiles\ReaperArchive15
  Exclude *.tmp
  Recommendation: Weekly backup
- Harvester configuration database: The harvester configuration data is essential to perform the relational mapping that provides access to the 15-minute data. It provides information about devices and interfaces to enable polling, such as persistent IDs for interfaces.
  Recommendation: Daily backup
- (Optional) Flow Forensics data (HarvesterArchive database): : Many administrators do not back up Flow Forensics data because of its short storage life; a maximum of 24 hours. When you decide whether to back up this database, consider the value that this single day of data has in your particular circumstances.
  Location: *install_path*\Netflow\datafiles\HarvesterArchive Exclude *.tmp
- (Optional) High-resolution (1-minute) data files (archive database): Many administrators do not back up 1-minute data because its high volume requires long backup times.
  The 1-minute data is stored for one month by default.
  Location: *install_path*\Netflow\datafiles\ReaperArchive
  Exclude *.tmp
  Recommendation: Daily backup
- Customized Data Retention database: If you have customized any data retention settings, back up the data retention configuration database.

  NOTE
  It is unusual to customize data retention settings, except with the assistance of CA Support. Changes to data retention settings can cause problems as the demands on drive space rise.

  Recommendation: Daily backup

Back Up the Data

Follow these steps:

1. Determine which DX NetOps databases and files to back up.
   The databases and files to back up for DX NetOps are listed in the following table.

Database	Stand-Alone Server	Harvester Servers (Distributed)	NFA Console Server (Distributed)
reporter	Important	N/A	Important
harvester	Important	Important	N/A
archive15	Recommended	Recommended	N/A
Customized Files	Important	Important	Important
data_retention	Important if customized	Important if customized	N/A
HarvesterArchive	Optional, rarely backed up	Optional, rarely backed up	N/A
archive	Recommended	Recommended	N/A

2. Copy each of the target directories or files to a remote location.
   - Customized configuration files: Various locations
   - HarvesterArchive database: *install_path*\Netflow\datafiles\HarvesterArchive
   - Archive database: *install_path*\Netflow\datafiles\ReaperArchive
   - Archive15 database: *install_path*\Netflow\datafiles\ReaperArchive15
   - Single Sign-On (SSO) configuration files: Back up the following files and directories on the SSO server, which might be the Performance Center server:
     - *install_path*\jre\lib\security directory
     - *install_path*\Portal\Jetty\etc\keystore file
     - *install_path*\Portal\SSO\start.ini file
     - *install_path*\Portal\SSO\etc directory
     - *install_path*\Portal\SSO\conf\wrapper.conf file
     - *install_path*\Portal\SSO\webapps\sso\configuration directory
3. Back up the following databases to a remote location, using `mysqldump` . Back up the `reporter` database last, regardless of the deployment architecture.
   - Customized data_retention database (Stand-alone or Harvester server): `data_retention`
   - harvester database (Stand-alone or Harvester server): `harvester`
   - reporter database (Stand-alone or NFA console): `reporter`

     ```
     mysqldump --routines --events -u root <dbname> --skip-lock-tables > dbbackupname.sql
     ```

     For example, on the NFA console:

     ```
     mysqldump --routines --events -u root reporter --skip-lock-tables > reporterbackup.sql mysqldump --
     routines --events -u root mysql proc > proc.sql
     ```

     On the Harvesters:

     ```
     mysqldump --routines --events -u root harvester --skip-lock-tables > harvesterbackup.sql
     mysqldump --routines --events -u root data_retention --skip-lock-tables > data_retentionbackup.sql
      mysqldump --routines --events -u root mysql proc > proc.sql
     ```
4. (Optional) Verify that the `mysqldump` was successful by checking that the size of the backup is over 1 KB.

   NOTE
   More information:

   See the mysqldump documentation.

Restore the Backups

These steps are for restoring data on a Windows server, but the database path is the same for a Linux server.

Follow these steps:

1. Log in with administrator rights.
2. Restore each of the target directories or files from its remote location to its original location:
   - Customized configuration files: Various locations (Any server)
   - HarvesterArchive database: *install_path*\Netflow\datafiles\HarvesterArchive (Stand-alone or Harvester server)
   - Archive database: *install_path*\Netflow\datafiles\ReaperArchive (Stand-alone or Harvester server)
   - Archive15 database: *install_path*\Netflow\datafiles\ReaperArchive15 (Stand-alone or Harvester server)
3. Restore each of the databases. Restore the
   `reporter`
   database first, regardless of the deployment architecture.
   a. reporter database: `reporter` (Stand-alone or NFA console)
   b. Customized data_retention database: `data_retention` (Stand-alone or Harvester server)
   c. harvester database: `harvester` (Stand-alone or Harvester server)

   TIP

   For best results, restore to a clean installation.

```
mysql –e “drop database <dbname>;”
mysql -e "create database <dbname>;"
mysql -u root <dbname> < dbbackupname.sql
mysql –u root mysql < proc.sql
```

Recommendations for Preserving Data Integrity

To ensure data integrity and to prevent the corruption of the DX NetOps databases, implement the following recommendations on the servers or hardware systems you use for running DX NetOps components:

- Exclude the following directories from real-time antivirus scans:
  - `C:\Windows\Temp`
  - *install_path* and all its subdirectories.
- Do not implement drive space compression.
- Do not install any third-party software, except for the following types of software: antivirus, system management, and time synchronization.
- Install important Microsoft updates. Use discretion when you decide whether to install optional updates.
- Defragment the hard disk drive infrequently. Frequent defragmentation is not necessary: DX NetOps components typically write sequentially to their database so data fragmentation is minimized.

Manage Address-Hostname

IP addresses can be automatically assigned by Dynamic Host Configuration Protocol (DHCP), and addresses can become outdated. You can list, edit, delete or expire one or multiple IP addresses. You can expire stale (outdated) IP addresses to schedule them for a refresh. You also can change the frequency of DNS name updates when you edit an address. You can configure the frequency at which the address-hostname association must be checked. By default, the resolution frequency is three months. The NFA maintains only the latest resolved hostname against the IP address.

The program checks the DNS server and refreshes the DNS name for each expired address.

Follow these steps:

1. Display the **Address-Hostname Configuration** page:
   a. Select **Administration** from the NFA console menu. The **Administration** page opens.
   b. Select **Addresses** from the **Reporting** menu. The **Address-Hostname Configuration** page opens.
2. (Multi-domain environment only) Select the tenant-domain combination that contains the address you want to refresh.
3. **List IP Addresses:**
   – Enter an IP address or type * to list all hosts.
   – Click **List** to view IP addresses.
4. **Hostname Resolution**:
   a. Select an IP address and click **Edit**.
   b. Change the **Hostname** on the **Address-Hostname Configuration** page, if required.
   c. Select one of the following **Hostname Resolution** method that suits your strategy.
      - Do not perform DNS name resolution
      - Automatically resolve, never expire
      - Automatically resolve, resolve again every <custom_duration>
   d. Click **Submit** to save the changes.
5. **Delete an IP Address:**
   a. Select the IP address that you want to change.
   b. Click **Delete**.
   c. Confirm deletion when prompted.
6. **Expire an IP Address:**
   a. Select the IP address that you want to expire.
   b. Click **Expire**.
   c. Confirm expiration when prompted. The selected addresses are scheduled to have their DNS resolution refreshed. The refresh process is typically run within five minutes.

IP Address and Hostname Historical Data

Data Collection

DX NetOps supports stand-alone and two-tier architecture distributed deployments.

The product components work together to collect, process, and store flow data; display the data in reports; and generate traps, events, and scheduled reports.

Two-Tier Architecture

A two-tier architecture deployment consists of the NFA console and one or more Harvesters.

The deployment footprint is reduced, so you have fewer component types to upgrade and maintain. Data handling requires fewer steps and files are not transferred as frequently.

A stand-alone deployment uses the two-tier architecture: the stand-alone server hosts the NFA console and Harvester software.

Data Collection in a Two-Tier Deployment

The NFA console and Harvester components work together in the following way on a 2-tier architecture deployment:

Harvester

Distills the raw flows from the routers, parses the data, and compiles historical (15-minute) data and 1-minute data. The Harvester stores the following data:

- Raw flow data
- 1-minute resolution data
- Historical (15-minute) data

> **NOTE**
> It is important for the Harvester server to have adequate storage space.

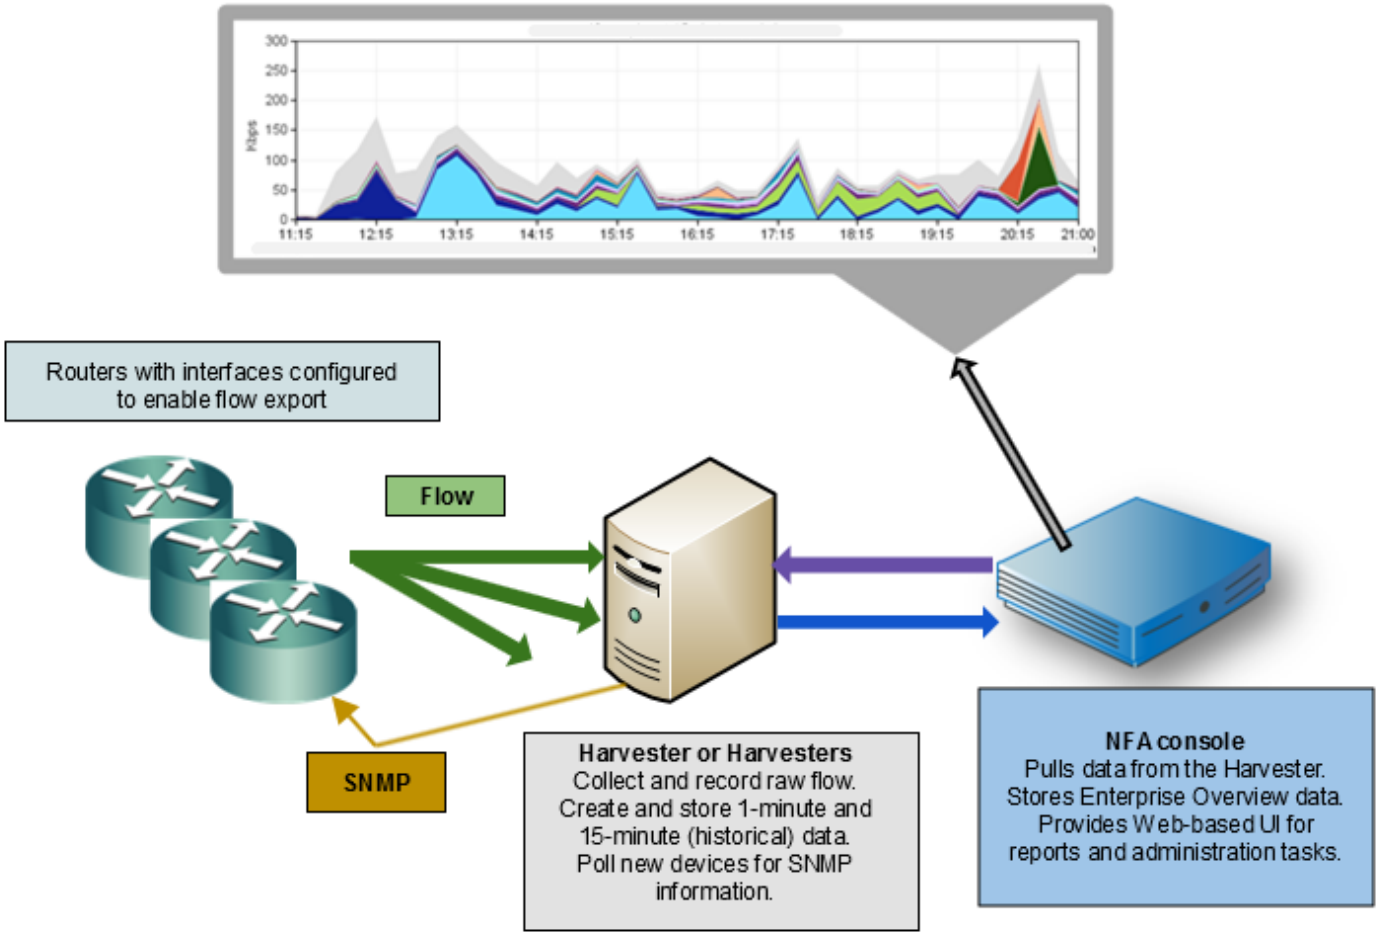
NFA console

Gathers data from the Harvester as needed and displays report data in the web interface. Stores Enterprise Overview data.

Supplies a web-based user interface for administrative tasks and reports and stores the Enterprise Overview data. Reports consist of the following data:

- Enterprise Overview data that is stored locally
- 1-minute data and 15-minute data that is stored on the Harvester

Figure 100: Data Collection in a Two-Tier Deployment



Enterprise Overview Data

The Enterprise Overview data are collected and displayed on the **Enterprise Overview** page. For each report, a maximum of 12 interfaces, protocols, or hosts is included from across the enterprise. Enterprise Overview views are based on the previous 24-hours of data collection. The data are displayed in the following reports:

- **Interface Utilization**
  Selected by: User-defined thresholds for interface capacity utilization.
- **Top Interfaces - In** (inbound traffic) and **Top Interfaces - Out** (outbound traffic)
  Selected by: Amount of interface capacity that was utilized during thereport period. The utilization calculation is based on data volume and interface speeds, The interface speeds are derived from SNMP polling.
- **Top Protocols**
  Selected by: Volume of traffic that used the protocols.
  - **Top Interfaces for Protocol**
    Selected by: Interface traffic volume for the protocol that you clicked in the **Top Protocols** view.
  - **Top Hosts for Protocol**
    Selected by: Host traffic volume for the protocol that you clicked in the **Top Protocols** view.
- **Top Hosts**

Selected by: Volume of total traffic that the hosts generated.

- **Top Interfaces for Host**
  Selected by: Interface traffic volume for the host that you clicked in the **Top Hosts** view.
- **Top Protocols for Host**
  Selected by: Protocol traffic volume for the host that you clicked in the **Top Hosts** view.

Data Lifespan: Enterprise Overview data is retained for 1 month by default.

Storage Location: The data is stored on the NFA console.

Disable Top Protocols and Top Hosts

You can disable **Top Protocols** and **Top Hosts** by changing the default value of **DisableEOVData.**

Follow these steps:

1. Login to Harvester Database:

```
mysql -P3308 harvester
```

2. Execute the following query to change the value of **DisableEOVData**.

```
update parameter_descriptions set defaultvalue = 'Y' where parameter =
 'DisableEOVData';
```

3. Restart CA NFA Repear service.

15-Minute Data

The following types of data are collected and stored as 15-minute resolution data by default.

Overall Traffic

- Total IP, TCP, and UDP traffic that travels in and out of each interface
- Flows and bytes of flow traffic that travels in and out of each interface
- Total flow traffic from each router

While 15-minute data reflect totals for each interface, Enterprise Overview data reflects totals for all interfaces. For example, Enterprise Overview data includes the Top N protocols for all interfaces. The 15-minute data includes the Top N protocols for each interface.

Hosts
Traffic to and from the top 50 IP hosts

Conversations
Traffic for the top 50 IP conversations

Protocols

- *Overall:* Top 100 protocols in and out of each interface
  Reserved Seating rules let you include specific protocols in the top protocols group regardless of their traffic volume.
- *Protocol-Hosts:* Traffic to and from the top 10 hosts for the top 20 protocols
- *Protocol-Conversations:* Traffic for the top 10 conversations for the top 20 protocols

ToS

- *Overall:* Total IP traffic in and out of each interface for each ToS value
- *ToS-Protocols:* Traffic for the top 20 protocols for the top 5 non-zero ToS values
- *ToS-Hosts:* Traffic for the top 10 hosts for the top 5 non-zero ToS values
- *ToS-Conversations:* Traffic for the top 10 conversations for the top 5 non-zero ToS values

AS

- Top 100 source and destination AS values
- Top 20 next hop addresses for each AS value

AS traffic is stored for 100 days by default.

Data Lifespan: Each data type has a default maximum storage period, as shown in the following list:

- Overall traffic: 372 days or 12.4 months
- Protocols (Top 100): 372 days or 12.4 months
- Hosts, Protocol-Hosts, and ToS-Hosts: 67 days
- Conversations (Top 50), Protocol-Conversations, and ToS-Conversations: 67 days
- ToS and ToS-Protocols: 372 days or 12.4 months
- AS: 100 days

Minimum Thresholds: To be included in a 15-minute data report, data traffic must meet or exceed the default minimum thresholds for the 15-minute period:

- Protocols: 50 KB
- Hosts: 100 KB
- Conversations: 100 KB
- ToS: No minimum
- AS: No minimum

Storage Location: Historic (15-minute) data is stored on the Harvester in a two-tier deployment.

Reports: 15-minute data is often used for examining trends and performing capacity analysis. This data appears in the following reports:

- Interface reports that show more than 2 hours of data
- Custom reports
- Analysis reports
- Performance Center views and reports that show more than 2 hours of DX NetOps data

1-Minute Data

The following types of data are stored as 1-minute resolution data by default.

Hosts
Traffic to and from the top 300 IP hosts

Conversations
Traffic to and from the top 300 IP conversations

Protocols

- *Overall:* Top 150 protocols for traffic that travels in and out of each interface
- *Hosts:* Traffic to and from the top 25 hosts that use the top 25 protocols
- *Conversations:* Traffic for the top 25 conversations that use the top 25 protocols

ToS

- *Protocols:* Traffic for the top 25 protocols that use the top 5 ToS values
- *Hosts:* Traffic for the top 25 hosts that use the top 5 ToS values
- *Conversations:* Traffic for the top 25 conversations that use the top 5 ToS values

Data Lifespan: The default maximum storage period for 1-minute data is 1 month.

Storage Location: The 1-minute data is stored on the Harvester in two-tier deployments.

Reports: This type of data is often used for troubleshooting and granular analysis. The data appears in the following reports, provided that the reports are configured to show time ranges of 2 hours or less:

- Interface views and reports
- Performance Center views and reports that show less than 2 hours of DX NetOps data

Raw Data

Raw data is used for even more granular analysis in **Flow Forensics** reports. Raw data is stored on the Harvester for a maximum of 24 hours by default.

IP Address and Hostname Historical Data

The NFA maintained only the latest resolved hostname against the IP address previously. From NFA 10.0.3, we maintain the historical data of the IP address and hostname association.

The following are some benefits of such reverse DNS resolution:

- Identify the domain name of the originator
- Identify the name of the internet service provider assigned to a particular IP address
- Associate host with the IP address
- Whitelist the hosts
- Trace header field for SMTP e-mail, tracking web sites users
- Use it as an anti-spam technique

> **NOTE**
>
> **More Information:**
>
> For more information on how to view the IP Address and Hostname historical data, see IP Address and Hostname API.
>
> Also, see the Manage Address-Hostname page,

Data Retention

The Data Retention Service attempts to prune historical data from DX NetOps when the percentage of free disk space crosses the percentage threshold specified by the `freeSpacePercentage` attribute in the `parameter_descriptions` table in the harvester database. The default value for this percentage threshold is 10%. This means that when there is less than 10% available disk space, the data retention service begins removing data, starting with the oldest data first.

The pruning service runs checks every minute to determine whether there is a need to start cleaning out data (to prevent disk space from being fully consumed). If there is enough disk space, the pruning only occurs once each day to reduce the data to the “max” threshold in the `data_retention.datastores` table. So for some time periods of the day, you can see more than 24 hours’ worth of `.nfa` files.

When data retention determines it is time to prune, the service deals with three main categories of data to prune:

1. NetFlow Archive Data – “Raw” NetFlow data, including NetFlow template data (`.nfa` and `.nta` files). Typically keep 24 hours of this data.

2. Reaper Archive Data – 1-minute summarized data（archive database). Typically keep 30 days of this data.
3. Historical Archive Data – 15-minute summarized data (archive15 database). Typically keep 1 year of this data.

With each pass of pruning, three attempts are made to free disk space, each with a slightly different method:

1. Prune to Max – this is pruning the data to our default thresholds based on type of data (24 hours for raw NetFlow, 30 days for 1-minute data, 1 year for 15-minute data). If pruning to this level results in enough free space, no other pruning is performed.
2. Prune to Min – this will attempt to prune data to meet the minimum free space threshold (10% is the default). Any data required to meet this threshold will be deleted, starting with the oldest data first. If pruning to this level results in enough free space, no other pruning is performed. This level of pruning is also incremental, which means that as soon as the required free space is available, pruning stops until it is needed again.
3. Prune All Data – this will attempt a more aggressive form of the minimum free space pruning. This can result in pruning all data of a given type and is only used as a last resort

The data retention service logs its various pruning activities. If it is unable to free enough disk space to bring free space back above the threshold, it logs as such and tries again at its next scheduled interval.

If you find that you are unable to keep the amount of historical data you need, you should strongly consider either getting a larger disk, or redistributing some of the NetFlow traffic your harvester is receiving to another harvester.

NOTE

- Service Management

Reference

This section contains the following articles:

CA Network Flow Analysis Service Management

To start, stop, or check the status of services, you can use the Windows Services window or the Linux Service Configuration window.

The DX NetOps and CA Anomaly Detector services are described briefly in the following table. The **Stand-Alone** column shows which services reside on a two-tier stand-alone server. The other server columns show where the services reside in a two-tier distributed deployment. The **Anomaly Detector** services run on the installation server for that program, which may be the stand-alone, NFA console, or separate CA Anomaly Detector server.

Service	Stand-Alone	Harvester	Console	Anomaly Detector
CA NFA Collection and Poller Webservices (Linux: nfa_collpollws) Provides web service interfaces for the NFA console to communicate with the Harvester and Poller (stand-alone and Harvester servers)	Yes	Yes	N/A	N/A

CA NFA Data Retention (Linux: nfa_dataretention) Manages trimming to enforce volume and date limits for retaining data files. 2-tier: 15-minute, 1-minute, and Flow Forensics data (Stand-alone/Harvester)	Yes	Yes	N/A	N/A
CA NFA DNS/SNMP Proxies (Linux: nfa_proxies) Handles SNMP and DNS requests from the Poller. Uses port 8081 by default.	Yes	Yes	N/A	N/A
CA NFA File Server (Linux: nfa_filewebservice) 2-tier: In a distributed deployment, hosts the web service on the Harvesters to handle file requests from the NFA console Pump service.	Yes	Yes	Yes	N/A
CA NFA Harvester (Linux: nfa_harvester) Runs the Harvester/ collector process.	Yes	Yes	N/A	N/A
CA NFA Host Resolver Service Performs hostname lookup for any host that has anomalies detected by CA Anomaly Detector.	Yes	N/A	N/A	Yes
CA NFA Hunter Tracker Service Starts and stops the AnomalyDetector process for CA Anomaly Detector.	Yes	N/A	N/A	Yes
CA NFA Poller (Linux: nfa_poller) Initiates and handles SNMP requests to the devices that export flow to the product.	Yes	Yes	N/A	N/A
CA NFA Pump General file transfer service that is used between the Harvesters and the NFA console.	N/A	Yes	Yes	N/A

CA NFA Reaper (Linux: nfa_reaper) Runs the Reaper process, which processes incoming files and writes out files for 1-minute, 15-minute, and some Enterprise Overview data.	Yes	Yes	N/A	N/A
CA NFA RibSource Provides a static interface--a RIB or Report Information Base interface--to provide the DX NetOps data that appears in Performance Center views.	Yes	N/A	Yes	Yes
CA Performance Center SSO Runs the Single Sign-On authentication software, so users can navigate between the DX NetOps console and Performance Center without signing on again.	Yes	N/A	Yes	N/A
CA MySql (Linux: mysql) Runs the standard MySQL instance using port 3308 and stores MySQL configuration data.	Yes	Yes	Yes	Yes
NetQoS NQMySql (Linux: nfa_mysqlCSE) Runs the Custom Storage Engines and provides an interface to run queries against the Flow Forensics data.	Yes	Yes	N/A	N/A
NetQoS Reporter Manager Service Runs maintenance threads in the background to handle the interoperation of the components.	Yes	N/A	Yes	N/A
NetQoS Reporter/ Analyzer General Services Maintain log retention in the reporter/Logs directory and handles data retention for Enterprise Overview data.	Yes	N/A	Yes	N/A

NetQoS Reporter/ Analyzer Pump Service Collecting and processing Enterprise Overview data from Harvesters.	Yes	N/A	Yes	N/A
NetQoS Reporter/ Analyzer Query Services Act as the interface for Custom reports and Analyses.	Yes	N/A	Yes	N/A
NetQoS ReporterAnalyzer Report Service Executes Custom reports, Analyses, Flow Forensics, and Site to Site reports.	Yes	N/A	Yes	N/A
NetQoS Reporter/ Analyzer Watchdog Polls components for status information, in order to provide administrators with warnings. Also runs simple database integrity checks.	Yes	N/A	Yes	N/A

Service Logs

The service logs are described in the following table. The initial part of each path is the DX NetOps installation path, such as the default locations (`C:\CA\NFA` on a Windows server or `/opt/CA/NFA` on a Linux Harvester server). The table lists the service log file names and locations on Windows and Linux servers, along with any available configuration file to control the log level setting.

Service / Log Information	Stand-Alone	Harvester	Console
CA NFA Collection and Poller Webservices (Linux: nfa_collpollws) Log: `\Netflow\Logs\collpollws-wrapper.log`	Yes	Yes	N/A
CA NFA Data Retention (Linux: nfa_dataretention) Log: `\Netflow\Logs\dataretention-wrapper.log`	Yes	Yes	N/A

CA NFA DNS/SNMP Proxies (Linux: nfa_proxies) Log: `\Netflow\Logs\proxies-wrapper.log`	Yes	Yes	N/A
CA NFA File Server (Linux: nfa_filewebservice) Log: `\Netflow\Logs\fileserver-wrapper.log`	Yes	Yes	N/A
CA NFA Harvester (Linux: nfa_harvester) Log: `\Netflow\Logs\harvester-wrapper.log`	Yes	Yes	N/A
CA NFA Poller (Linux: nfa_poller) Log: `\Netflow\Logs\poller-wrapper.log`	Yes	Yes	N/A
CA NFA Reaper (Linux: nfa_reaper) Log: `\Netflow\Logs\RealtimeReaperErrors<yyyy-mm-dd>.log`	N/A	Yes	N/A
CA NFA RibSource Log: `\Reporter\RIB\NFA\webapps\NFARS\WEB-INF\logs\application.log`	Yes	N/A	Yes

CA Performance Center SSO
Logs:
`\Portal\SSO\logs\SSOService.log`
`\Portal\SSO\logs\wrapper-<yyyy-mm-dd>.log`
	Yes	N/A	Yes

DNS Proxy Web Service
Log:
`\ProxyServices\Logs\DnsProxyWSLog<yyyy-mm-dd>.log`
Log level setting (NFA console only):
`\ProxyServices\Web.config`
`<add key="LogLevel" value="6"/>`
Default value: 4
	Yes	N/A	Yes

NetQoS MySql (Linux: mysql) Log: `\MySql\data\<server_name>.err`	Yes	Yes	Yes
NetQoS NQMySql (Linux: nfa_mysqlCSE) Log: `\Netflow\Logs\oursql_error.log`	N/A	Yes	N/A
NetQoS Reporter Manager Service Log: `\Reporter\Logs\Manager Service Log<yyyy-mm-dd>.log` Log level setting: `\Reporter\ReporterAnalyzer.ManagerService\bin\ReporterManagerService.exe.config` `<setProperties Severity="6" />` Default value: 4	Yes	N/A	Yes
NetQoS Reporter Manager Service thread logs in the `\Reporter\Logs\` directory: MigrationService: `MigrationLog<yyyy-mm-dd>.log` PollerSyncService: `CollectorSyncServiceLog<yyyy-mm-dd>.log` System Maintenance Service: `ManagerService_MaintenanceLog<yyyy-mm-dd>.log`	Yes	N/A	N/A
NetQoS Reporter/Analyzer General Services Log: `\Reporter\Logs\nqservErrors<yyyy-mm-dd>.log`	Yes	N/A	Yes

NetQoS Reporter/Analyzer Pump Service Log: \Reporter\Logs \PumpLog<yyyy-mm-dd>.log Log level setting: \Reporter \NetQoS.ReporterAnalyzer.PumpService \bin\ NetQoS.ReporterAnalyzer.PumpService.exe.config <setProperties Severity="6"/> Default value: 4	Yes	N/A	Yes

Flow Cloner Configuration Files

You can codify the `FlowCloneDef.ini` to suit your requirement. This section provides the following information:

NOTE

More Information: Introduction to Flow Cloner

Examples of Flow Cloner Configuration Files

The following examples show the contents of a modified `FlowCloneDef.ini` file for a single-NIC server and for a multiple-NIC server environment.

Example: Default Input NIC and Port

In this example, the Flow Cloner uses the first available NIC to send the cloned data to hosts 192.100.0.100 and 192.160.0.100. The destination hosts listen for the data on UDP port 9995.

The example has a line for each host that receives the cloned data. These lines begin with the */dest ip=* token, followed by the host IP address. A semicolon precedes the comments at the end of the line.

```
/use defaults; take default setup

/dest ip=192.100.0.100; send cloned packets to ddev1
```

```
/dest ip=192.160.0.100; send cloned packets to gdev3
```

Example: Custom Input NIC and Port

In this example, the Flow Cloner uses a specified NIC (190.0.0.100) to send the cloned data to the hosts (10.0.0.000, 192.100.0.100, and 192.160.0.100). The Harvesters listen for the original incoming data on UDP port 9994.

> **NOTE**
> If you specify a custom */port* value, it must match the harvester listening port and the destination port that you used to configure the flow. The port values must match or no flow data is cloned.

```
/listen ip=190.0.0.100; Use 190.0.0.100 to send the cloned packets /
port=9994; Listen on port 9994 instead of the default port 9995

/dest ip=10.0.0.000 ; send cloned packets to 10.0.0.000

/dest ip=192.100.0.100; send cloned packets to ddev1

/dest ip=192.160.0.100; send cloned packets to gdev3
```

Example: Custom Input NIC and Destination Port

In this example, the Flow Cloner uses a specified NIC (190.0.0.100) to send the cloned data to host 10.0.0.000. The Harvesters that receive the cloned data listen on UDP port 9996.

```
/listen ip=190.0.0.100; Use 190.0.0.100 to send the cloned packets /
dest port=9996; Listen for the cloned data on port 9996

/dest ip=10.0.0.000 ; send cloned packets to 10.0.0.000
```

Conventions

Observe the following conventions for `FlowCloneDef.ini` files:

- Header line -- Begin the `FlowCloneDef.ini` file with a single line, which contains all of the header token-value entries.
- Destination host lines -- Follow the header line with a line for each destination host. Use the following format /dest ip=<X.X.X.X>, where <X.X.X.X> is the IP address of the destination host. You can put the destination host lines in any order, but the dest ip= lines must follow the header line.
- Tokens -- Precede all values in the file with a token that identifies which type of value is defined. Precede each token with a **|** or */* character to signal that a token follows.
  Tokens are ignored if they are:
  - Unsupported
  - Entered incorrectly
  - Have no specified values

  The */use defaults* token is ignored if the header line also contains one or more token-value entries.
- Commenting Out Content:

- Entire line -- Enter a semicolon (;) at the beginning of the line. The entire line is ignored.
- Content from a particular point to the start of the next token -- Enter a semicolon (;) at the start of the content to ignore.
- Everything from a particular point to the end of the line -- Enter two semicolons (;;) at the start of the content to ignore.

Characteristics of Cloned Packets

Cloned IP packets have the following characteristics:

- ToS value of cloned packets = 0 (zero), regardless of the original packet value. This characterizes the ToS value of the cloned packets that contain the flows. The ToS values of the traffic that the flows describe are not affected.
- Sender port = 10,000, regardless of the sender port of the original packet
- Time To Live (TTL) value = 255, regardless of the TTL value of the original packet
- Fragment ID - Arbitrary number

Network Flow Analysis OData API

DX NetOps (NFA) offers APIs that enables you to extract data from the DX NetOps or perform Administration operations.It enables integration between DX NetOps and other external applications.

NOTE

The Network Flow Analysis OData API currently supports only English Locale.

The DX NetOps OData API uses the OData v4.0 industry standard. For more information on documentation of this standard, see OData v4.0 web page.The Open Data Protocol (OData) enables the creation of REST-based data services, which allows resources to be defined in a data model and be identified by using the Uniform Resource Locators (URLs).

NFA Entities / Operations	Read	Add	Single Edit	Bulk Edit	Single Delete	Bulk Delete	Merge	Enable/ Disable
Routers	Yes	No	Yes	Yes	Yes	Yes	No	Yes
Interfaces	Yes	No	Yes	Yes	Yes	Yes	Yes	No
Interface Aggregations	Yes	Yes	Yes	No	Yes	Yes	No	No
Interface Template	Yes	Yes	Yes	No	Yes	No	No	No
Available Interface	Yes	No	No	No	Yes	No	No	Yes
Custom Virtual Interface	Yes	Yes	Yes	No	Yes	Yes	No	No
Harvester	Yes	Yes	Yes	No	Yes	No	No	No
Application Settings	Yes	No	Yes	No	No	No	No	No
Reporter Health	Yes	No	No	No	No	No	No	No
Harvester Health	Yes	No	No	No	No	No	No	No
Flow Statistics	Yes	No	No	No	No	No	No	No

Watchdog Settings	Yes	No	Yes	No	No	No	No	No
Application Mapping	Yes	Yes	Yes	No	Yes	Yes	No	No
Port Priority Rules	Yes	Yes	Yes	No	Yes	Yes	No	No
Reserved Seating	Yes	Yes	Yes	No	Yes	Yes	No	No
AS Names	Yes	No	Yes	No	No	No	No	No

NOTE

CA NFA lets you perform only **Read** operation on the Reporter Health, Harvester Health, Flow Statistics, Domain, SNMP Profiles, and Reporter entities.

API Details

The CA NFA OData API URL consists of three parts, which are Service root URL, Resource path and Query options.

Syntax:

```
<Service Root URL>/<Resource Path>?<Query Options>
```

Where,

- **Service Root URL**
  Identifies the root of an CA NFA OData service. A GET request to this URL returns the format-specific service document. The service root URL must terminate in a forward slash.

  NOTE

  The CA NFA OData API uses 8981 port number.

  To change the default port, update the value of the **ReporterAnalyzer.ODataServicePort** in the ReporterAnalyzer.ini file and restart the CA NFA OData service.

  If NFA is integrated with CAPC, the new port value is synced in the next poll cycle of CAPC or you may perform a manual resync with NFA data source.
- **Resource Path**
  Resources exposed by a CA NFA OData service is addressed by a corresponding resource path URL, which allows client to interact with a resource aspect.
- **Query Options**
  The query options part of an OData URL specifies three types of information, which are system query options, custom query options, and parameter aliases.
  The system query options are query string parameters that control the amount and order of the data returned for the resource identified by the URL. The names of all system query options are optionally prefixed with a dollar ($) character. The custom query options provide an extensible mechanism for service-specific information to be placed in a URL query string.

Example:

```
http://127.0.0.1:8981/path/SampleService.svc/Categories(1)/Products?$top=2&
$orderby=Name
```

Authentication

All users who have DX NetOps credentials can use the CA NFA OData API. To log in to the CA NFA OData API, use your DX NetOps credentials. The CA NFA OData API uses Single Sign-On (SSO) for credential authentication.

You can perform HTTP Basic authentication to log in to CA NFA OData API, which is built in the HTTP protocol. The client sends a HTTP request with the authorization header that contains the basic word followed by a space and a `base64-encoded` string username:password. For example, to authorize as ***demo/p@55w0rd,*** the client must send

```
Authorization:
Basic ZGVtbzpwQDU1dzByZA==
```

where **ZGVtbzpwQDU1dzByZA==** is the base64 encoded string of ***demo:p@55w0rd.***

About

The API for the About page displays the following details about your DX NetOps installation:

- Version history
- Licensed Devices in Use
- License Utilization

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/ProductInfo()
```

Method

GET

Sample Request

```
http://127.0.0.1:8981/odata/api/ProductInfo()
```

Sample Response

```
{
 "@odata.context": "$metadata#com.ca.nfa.odata.productInfo",
 "NetworkFlowAnalysisVersionHistory": [
 {
 "Version": "9.3.3.0",
 "Description": "Network Flow Analysis 9.3 (build 0)",
 "InstallDate": "10/06/2017 11:28:17 AM",
 "Update": "3"
 },
 {
 "Version": "10.0.0",
 "Description": "CA Network Flow Analysis 10.0 (build 0)",
 "InstallDate": "02/02/2019 08:44:45 PM",
 "Update": 0
 }
```

```
 ],
 "LicensedDevicesInUse": 75,
 "LicenseUtilization": "150.0%"
}
```

Metadata

The structure of CA NFA OData API service is declared in Metadata as defined by OData specification. The Metadata defines the contract such that users knows which requests can be executed, displays the structure of the result and how a service can be navigated.

CA NFA OData services expose their entity model at the metadata URL, formed by appending `$metadata` to the service root URL.

Request URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/$metadata
```

You can request a particular format of metadata either by using the Accept header or by using the `$format` system query option.

For Example:

```
http://host/service/$metadata?$format=json
```

Sample Request

```
http://127.0.0.1:8981/odata/api/$metadata
```

Sample Response

```

Entity API

The CA NFA OData API can be used for processing different service requests like, you can request the service for a list of entities, a single entity or for a selected property.You can define the `content-type` to retrieve the response in different format.

> **NOTE**
>
> : CA NFA OData API supports the content-type only in XML or JSON format. By default, the content type is JSON.

- **Example of content-type in JSON format**

```
http://127.0.0.1:8981/odata/api/routers?$format=application/
json;odata.metadata=minimal
```

- **Example of content-type in XML format**

```
http://127.0.0.1:8981/odata/api/routers?$format=application/xml
```

Entity Collection

This API displays collection of entities.

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/<EntitySet Name>
```

Method

GET

Parameters

The following table includes the mandatory parameter.

Parameters	Description
EntitySet Name	Indicates the type of entity set. For more information on list of valid EntitySet Name, see Metadata .

Sample Request

This following request illustrates entity collection API for Routers Entity type.

```
http://127.0.0.1:8981/odata/api/routers
```

Sample Response

The following response displays all records for Routers entity set.

```
{
  "@odata.context": "$metadata#Collection(com.ca.nfa.odata.router)",
  "value": [
    {

```

Single Entity

This API displays the details of a specified entity, entity type with the property reference.

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/<EntitySet Name>(<PropertyRef Name value>)
```

Method

GET

Parameters

The following table includes the mandatory parameters.

Parameters	Description
EntitySet Name	Indicates the type of the entity set. For more information about list of valid EntitySet Name, see Metadata.
PropertyRef Name value	Indicates the value of the PropertyRef Name. For more information about list of valid PropertyRef Name, see Metadata.

Sample Request

This sample request displays the details of the router id 1500002.

```
http://127.0.0.1:8981/odata/api/routers(1500002)
```

Sample Response

```
{
"@odata.context": "$metadata#routers",
"ID": 1500002,
"routerAddress": "127.0.0.1",
"sysDescr": "127.0.0.1",

```

Entity Property

This API displays the value of a specified property for a given entity type.

Resource URL

```
http://<nfa odata host>:<nfa odata port>/odata/api/<EntitySet Name>(<PropertyRef Name
 value>)/<Property Name>
```

Method

GET

Parameters

The following table includes the mandatory parameter.

Parameters	Description
EntitySet Name	Indicates the type of the entity set. For more information about list of valid EntitySet Name, see Metadata.
PropertyRef Name value	Indicates the value of the Property reference name. For more information about list of valid PropertyRef Name, see Metadata.
Property Name	Indicates the type of property. For more information about list of valid Property Name, see Metadata.

Sample Request

This sample request displays the value of the UpdatedOn property, of the interface id 291.

```
http://127.0.0.1:8981/odata/api/interfaces(4)/UpdatedOn
```

Sample Response

```
{
 "@odata.context": "../$metadata#interfaces/UpdatedOn",
 "value": 1539615618
```

```
}
```

Limiters

You can use the limiters to restrict the returned data or to control the behavior of API. The following limiters are available in the CA NFA API.

Limiter	Value	Description
defaultExpandTopLimit	10	Displays the top 10 values for a expanded NavigationProperty. To override this limiter, see the Override System Default Limiters section.
expandMaxTopLimit	2000	Indicates that the maximum top limit that can be expanded for a NavigationProperty is 2000.
requestTimeout	30	Indicates that the default request time out of an API is 30, beyond which the request displays the following error message "Request has been accepted. Request timed out due to no response from the server". To override this limiter, see the Override System Default Limiters section.
maxRequestTimeout	120	Indicates that the maximum request time-out of an API is 120 seconds.
requestThreadPoolCoreSize	10	Indicates that the default request thread pool core size is 10 seconds.
requestThreadPoolMaxSize	50	Indicates that the maximum request thread pool core size is 50 seconds.
defaultQueryTimeout	10	Indicates that the default single query time-out value is 10 seconds, beyond which the query timed-out error appears. To override this limiter, see the Override System Default Limiters section.
maxQueryTimeout	60	Indicates that the maximum query time-out value is 60 seconds.
defaultPageSize	10	Indicates that the default number of data that will be visible in a page is 10. To override this limiter, see the Override System Default Limiters section.
maxPageSize	1000	Indicates that the maximum number of data that will be visible in a page is 1000.
enableMultiTenancy	false	Indicates whether you can enable or disable MultiTenancy.

You can perform the following operations using Limiters:

Read System Default Limiters

The API displays the list of system default limiters and its values.

Resource URL

http://<nfa odata host>:<nfa odata port>/odata/api/SystemDefaults()

Method

GET

Sample Request

```
http://127.0.0.1:8981/odata/api/SystemDefaults()
```

Sample Response

```
{
 "@odata.context": "$metadata#com.ca.nfa.odata.limiters",
 "defaultExpandTopLimit": 10,
 "expandMaxTopLimit": 10,
 "requestTimeout": 30,
 "maxRequestTimeout": 120,
 "requestThreadPoolCoreSize": 10,
 "requestThreadPoolMaxSize": 50,
 "defaultQueryTimeout": 10,
 "maxQueryTimeout": 60,
 "defaultPageSize": 10,
 "maxPageSize": 1000
"enableMultiTenancy": false
}
```

Update System Default Limiters

You can update the system default limiter values at the application level for all APIs. Locate the com.ca.nfa.odata.ODataLimiters.cfg file, and update the system default limiter values as required.

> **NOTE**
>
> The updated values are visible in the system without restarting. Once the values are updated in the com.ca.nfa.odata.ODataLimiters.cfg file, it is considered as the new default values for all APIs.

Override System Default Limiters

You can override the following limiters:

- **defaultExpandTopLimit**
  You can override this parameter by using the $top system query parameter in $expand.
  Resource URIL
  *http://<nfa odata host>:<nfa odata port>*odata/api/*<EntityType Name>*
  $expand=protocols($top=*<Enter value lesser than expandMaxTopLimit>*)
  Sample Request
  This example overrides the defaultExpandTopLimit to 100.

```
http://127.0.0.1:8981/odata/api/interfaces?$expand=protocols($top=100)
```

- **requestTimeout**
  You can override this parameter by using the custom query parameter, timeout.
  Resource URL
  *http://<nfa odata host>:<nfa odata port>*odata/api/*<EntityType Name>*?timeout=*<Enter value lesser than maxRequestTimeout>*
  Sample Request
  This example overrides the requestTimeout to 40.
  ```
  http://127.0.0.1:8981/odata/api/interfaces?timeout=40
  ```

- defaultQueryTimeoutYou can override this parameter by using the custom query parameter, queryTimeOut.
  Resource URL
  *http://<nfa odata host>:<nfa odata port>*odata/api/*<EntityType Name>*?queryTimeOut=*<Enter value lesser than maxQueryTimeout>*
  Sample Request
  This example overrides the defaultQueryTimeout to 100 for an Interface entity.
  ```
  http://127.0.0.1:8981/odata/api/interfaces?queryTimeOut=100
  ```
- **defaultPageSize**
  You can override this parameter by entering the required value for the maxpagesize parameter in HTTP header.**Sample HTTP Header**
  This example overrides the defaultPageSize to 100.
  ```
  Prefer:odata.maxpagesize=100
  ```

Query Options

CA NFA OData service supports querying collections of entities, complex type instances, and primitive values. You can apply query option to any selected property by appending a semi-colon to the list of query options. The query options are enclosed within parentheses.

The various categories of query options available in DX NetOps APIs are:

Custom Query Options

Custom query option provides additional information to the CA NFA OData service by including them in the URL query string. Custom query options must not begin with a $ or @ character.

The list of supported custom query parameters are:

Custom Query Parameter	Description
startTime	UNIX timestamp that indicates the beginning time for NFA metric data. If you do not specify the start time, the start time is one hour before the specified end time.
endTime	UNIX timestamp that indicates the end time for NFA metric data. If you do not specify the end time, the end time is one hour from the specified start time.
resolution	Specifies the target data. Valid values are, **min1** or **min15**, which indicates 1 minute or 15 minute respectively.

queryTimeOut	Overrides the defaultQueryTimeout system default limiter for query execution that is present in CA NFA OData limiters. The values are entered in seconds.
timeout	Overrides the requestTimeout system default limiter for HTTP Request that is present in CA NFA OData limiters. The values are entered in seconds.

NOTE

: We recommend you to enter the startTime and endTime. But, If the startTime and endTime are not specified, by default, the UNIX timestamp is last one hour when the query was hit.

Request URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/<Entity Type>(<PropertyRef Name value>)/<NavigationProperty>?<Custom Query parameter>=<Value of Custom Query parameter>
```

Method

GET

Parameters

Parameters	Description
Entity Type	Indicates the entity type. For more information about the list of valid Entity Type, see Metadata.
PropertyRef Name value	Indicates the value of the PropertyRef Name. For more information about the list of PropertyRef Name, see Metadata.
Custom Query parameter	Indicates the type of Custom Query parameter. The list of supported custom query parameters are: • startTime • endTime • resolution • queryTimeOut • timeout

Examples

The list of examples for Custom Query Options are as follows:

Example for startTime

Sample Request

```
http://127.0.0.1:8981/odata/api/interfaces(3)/hosts?startTime=1541894400
```

Sample Response

```
{

"@odata.context": "$metadata#hosts",

  "inoctets": 7950000,
  "outoctets": 795000
  }
  ]
}
```

System Query Options

DX NetOps OData API uses System Query Options to control the limit, and order of the data returned for a resource. System Query Options can be specified in the query string parameters for the resource that is identified by the URL. The names of all system query options are optionally prefixed with a dollar (`$`) character.

The following rules apply for GET, PATCH, and PUT requests:

- Resource paths indicating a single entity, a complex type instance, a collection of entities, or a collection of complex type instances allow `$expand` and `$select` .
- Resource paths indicating a collection, allows `$filter` , `$count, $orderby, $skip` , and `$top` .
- Resource paths ending in `/$count` allows `$filter` .
- Resource paths not ending in `/$count` or allows `$format` .

For, a URL with POST request, the return type determines the applicable system query options that a service may support. The rules are same as GET request.

POST requests to an entity set follow the same rules as GET requests that return a single entity.

> **NOTE**
>
> : Do not apply system query option to a DELETE request.
>
> CA NFA OData API rejects the request that contains any unsupported system query options.

An OData service may support some or all of the system query options defined. If a data service does not support a system query option, it must reject any request that contains the unsupported option.

The same system query option must not be specified more than once for any resource, even if it is prefixed with a $.

The list of valid system query options are:

Select

The `$select` system query option enables you to request the CA NFA OData service to return a specific property. The service returns a specified content with any expanded available navigation or stream properties. Also, it may return additional information.
The value of the $select query option is a comma-separated list of properties, qualified action names, and qualified function names. You can also request all declared properties and dynamic structural properties using a star (*).
When a $select query option is not specified, the service may return full set of properties or default set of properties.

NOTE

The default set of properties must include all key properties.

Resource URL

```
http://<nfa odata host>:<nfa odata port>/odata/api/<EntityType Name>?$select=<Property Name>
```

TIP

To display multiple properties for a given entity, separate each property name by a comma.

Method

GET

Parameters

The following table includes the mandatory parameter.

Parameters	Description
EntityType Name	Indicates the type of entity. For more information about list of valid EntityType Name, see Metadata.
Property Name	Indicates the property type of an Entity. For more information about list of Property Name, see Metadata.

Sample Request

This sample request displays all the IfType and ID of Interface entity.

```
http:/127.0.0.1:8981/odata/api/interfaces?$select=IfType,ID
```

Sample Response

```
{
 "@odata.context": "$metadata#interfaces(ID,IfType)",
 "value": [
 {
 "ID": 1,
 "IfType": "WAN"
 },
 {
 "ID": 2,
 "IfType": "WAN"
 },
 {
 "ID": 3,
 "IfType": "WAN"
 },
 {
 "ID": 4,
 "IfType": "WAN"
 }
```

```
]
}
```

Sample Request

This sample request displays all properties of Interface entity.

```
http://127.0.0.1:8981//odata/interfaces?$select=*
```

Sample Response

```
{
 "@odata.context": "$metadata#interfaces(*)",
 "value": [
 {
 "ID": 283,

  "HarvesterAddress": "127.0.0.1"
  },
  {
  "ID": 291,
  "AgentType": "Physical",
  "RouterAddress": "127.0.0.1",
  "Description": "",
  "InSpeed": 0,
  "OutSpeed": 0,
  "IfIndex": 4,
  "PersistentIfIndex": 9,
  "IfType": "WAN",
  "UpdatedOn": 1526877024,
  "Enabled": "N",
  "LastData": 1527153321,
  "HarvesterAddress": "127.0.0.1"
  }
  ]
 }
```

Filters

The $filter system query option allows clients to filter a collection of resources that are addressed by a request URL. The expression that is specified with $filter is evaluated for each resource in the collection.

The items for which the expression is set are included in the response and the responses are omitted when:

- The resources for which the expression is set to false or to null.
- The reference properties are unavailable due to permissions.

Note: The operators **Equal (eq)** and **Not Equal (ne)** support only **numeric** values. When you need to filter based on **string** values use the **contains** operator.

The list of valid filter operators are as follows:

Comparison Operator

Operator	Description	Example
eq	Equal	InSpeed eq 100
ne	Not equal	InSpeed ne 100
gt	Greater than	InSpeed gt 100
ge	Greater than or equal	InSpeed ge 100

lt	Less than	InSpeed lt 100
le	Less than or equal	InSpeed le 100

Logical operators

Operator	Description	Example
and	Logical AND	InSpeed gt 100 and OutSpeed lt 1000
or	Logical OR	InSpeed gt 100 or OutSpeed lt 1000
not	Logical negation	not InSpeed gt 100

Arithmetic Operators

Operator	Description	Example
add	Addition	Price add 5 gt 10
sub	Subtraction	Price sub 5 gt 10
mul	Multiplication	Price mul 2 gt 2000
div	Division	Price div 2 gt 4
mod	Modulo	Price mod 2 eq 0

Grouping Operators

Operator	Description	Example
( )	Precedence grouping	(InSpeed lt 100 InSpeed le 100) ge 100

Arithmetic Operators

Operator	Example
contains	contains(CompanyName,'freds')
endswith	endswith(deviceName,'1')
startswith	startswith(AgentType,'Alfr')
length	length(PersistentIfIndex) eq 19
indexof	indexof(CompanyName,'lfreds') eq 1
substring	substring(CompanyName,1) eq 'lfreds Futterkiste'
tolower	tolower(AgentType) eq 'virtual'
toupper	toupper(AgentType) eq 'VIRTUAL'
concat	concat('AgentType', RouterAddress) eq 'AgentType, RouterAddress'

Math Function

Operator	Example
round	round(Freight) eq 32
floor	floor(Freight) eq 32
ceiling	ceiling(Freight) eq 33

Resource URL

```
http://<nfa odata host>:<nfa odata port>/odata/api/<EntityType Name>?$filter=<Property
 Name><space><Filter Operator><space><Property Name>(<ProperyRef Name value>)
```

Method

GET

Parameters

The following table includes the mandatory parameter.

Parameters	Description
EntityType Name	Specifies the name of the entity type.
Property Name	Indicates the property type of an Entity.
Filter Operator.	Specifies the valid list of filter operator.
Property Name	Indicates the Property type.
ProperyRef Name value	Specifies the value of property reference.

Sample Request

This example uses the eq filter option to display the router Id 150002**.**

```
http://127.0.0.1:8981/odata/api/routers?$filter=ID eq (1500002)
```

Sample Response

```
 {
"@odata.context": "$metadata#routers",
"value": [
{
"ID": 1500002,
"routerAddress": "127.0.0.1",
"sysDescr": "127.0.0.1",

```

Expansion

The expand system query option indicates the related entities and stream values that must be represented inline. The CA NFA OData service must return the specified content, and may return additional information.

Simple Expansion

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/<EntityType Name>(<PropertyRef Name Value>)?$expand=<EntityType Name>
```

Method

GET

Parameters

The following table includes the mandatory parameter.

Parameters	Description
EntityType Name	Indicates the type of entity. For more information about list of valid EntityType Name, see Metadata.
PropertyRef Name	Indicates the property type of an entity. For more information about list of valid EntityType Name, see Metadata.

Sample Request

This sample API expands the details of host entity for interface ID 3.

```
http://127.0.0.1:8981/odata/api/interfaces(109)?$expand=hosts
```

Sample Response

```
{
"@odata.context": "$metadata#interfaces(hosts())",
 "ID": 109,
 "AgentType": "Physical",
 "RouterAddress": "127.0.0.1",
 "IfIndex": 1,
 "PersistentIfIndex": 1,
 "RouterId": "1500001",
 "RouterName": "127.0.0.1",
 "Name": "Interface 1",
 "Description": "",
 "IfType": "Token Ring",
 "InSpeed": 101,
 "OutSpeed": 121,
 "Linked": "N",
 "LastData": 1553473820,
 "UpdatedOn": 1553389258,
 "HarvesterAddress": "127.0.0.1",
 "DomainId": "1",
 "Enabled": "Y",
 "hosts": [
 {
 "protocol": 0,
 "inoctets": 1500000,
 "host": "127.0.0.1",
 "outoctets": 150000,
 "interface": 1,
 "router": "127.0.0.1",
 "timestamp": 1553442300
 },
 {
 "protocol": 0,
 "inoctets": 150000,
 "host": "127.0.0.1",
 "outoctets": 1500000,
 "interface": 1,
 "router": "127.0.0.1",
 "timestamp": 1553442300
 },
 {
 "protocol": 65536,
 "inoctets": 1500000,
 "host": "127.0.0.1",
 "outoctets": 150000,
 "interface": 1,
 "router": "10.0.9.13",
```

```
 "timestamp": 1553442300
 }
 ]
}
```

You can also use expand query with:

- System query options like select, top, skip, count, and filter.
- Custom query options like startTime, endTime, resolution, queryTimeOut, and timeout.

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/<EntityType Name>(<PropertyRef Name
 Value>)?$expand=<EntityType Name>&<list of other system or custom query operator>
```

Method

GET

Parameters

The following table includes the mandatory parameter.

Parameters	Description
EntityType Name	Indicates the type of entity. For more information about list of valid EntityType Name, see Metadata.
PropertyRef Name	Indicates the Property Reference name of an entity. For more information about list of valid PropertyRef Name, see Metadata.

Sample Request

```
http://127.0.0.1:8981/odata/api/interfaces(110)?$expand=conversations($top=8;$skip=2;
$count=true;$filter=protocol eq
 0),protocols($top=2)&startTime=1526891820&endTime=1553445000
```

Sample Response

```
{
 "@odata.context": "$metadata#interfaces(protocols(),conversations())",
 "ID": 110,
 "AgentType": "Physical",
 "RouterAddress": "127.0.0.1",
 "IfIndex": 2,

```

Expansion with Utilization

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/interfaces?$expand=utilization&
$apply=groupby((utilization/protocol),aggregate(Utilization))&startTime=<Start
 time>&endTime=<end time>&resolution< MIN1 or Min15>
```

Method

GET

Parameters

The following table includes the optional parameter.

Parameters	Description
startTime	UNIX timestamp that indicates the beginning time for NFA metric data. If you do not specify the start time, the start time is one hour before the specified end time.
endTime	UNIX timestamp that indicates the end time for NFA metric data. If you do not specify the end time, the end time is one hour from the specified start time.
resolution	Specifies the target data. Valid values are, **min1** or **min15**, which indicates 1 minute or 15 minute respectively. By default, the value is 15 minutes.

Sample request

```
http://127.0.0.1:8981/odata/api/interfaces?$expand=utilization&
$apply=groupby((utilization/
protocol),aggregate(Utilization))&startTime=1541480880&endTime=1541480980&resolution=MIN1
```

Sample Response

This sample response expands the utilization entity type of an Interface entity, and then groups the utilization data based on the protocol, start time, end time.

}
```

Navigation

The navigation property is similar to the DX NetOps console user interface. The navigation property name is optionally followed by a `/$count` path segment, and optionally a parenthesized set of expand options like, filtering, sorting, selecting, paging, or expanding the related entities.

The lists of options available in Navigation are:

Simple Navigation

NOTE

The action that you perform on NFA API is the same as in NFA console. The list of possible scenarios for Navigation in NFA console are as shown in the table:

For this Interface (entity name), display	Navigation
the interface selected from the previous column>, show me	Hosts (protocols)
Conversations	

Protocols (toss)

Hosts

Conversations

Protocols (hosts)

Protocols Conversations (conversations)

asNextHop

Resource URL

```
http://<nfa odata host>:<nfa odata port>/odata/api/<EntityType Name>(<PropertyRef
Name>)/<EntityType Name>(<PropertyRef Name>)
```

Method

GET

Parameters

The following table includes the mandatory parameter.

Parameters	Description
EntityType Name	Indicates the name of the entity type. For more information about the list of valid EntityType Name, see Metadata.
PropertyRef Name	Indicates the property reference name of the entity. For more information about the list of valid PropertyRef Name, see Metadata.

Sample Request

This example illustrates navigation from Interfaces to Hosts.

```
http://127.0.0.1:8981/odata/api/interfaces(9)/hosts?
&startTime=1526891820&endTime=1526896858&resolution=min15
```

Sample Response

```
{
"@odata.context": "$metadata#hosts",
"value": [
{
"router": "127.0.0.1",
"interface": 9,
"timestamp": 1526892300,
"protocol": 0,
"host": "127.0.0.1",
"inoctets": 1200000,
"outoctets": 12000000
},
{
"router": "127.0.0.1",
"interface": 9,
"timestamp": 1526892300,
"protocol": 0,
"host": "127.0.0.1",
"inoctets": 12000000,
"outoctets": 1200000
},
{
"router": "127.0.0.1",
"interface": 9,
```

```
 "timestamp": 1526892300,
 "protocol": 0,
 "host": "127.0.0.1",
 "inoctets": 795000,
 "outoctets": 7950000
 },
 {
 "router": "127.0.0.1",
 "interface": 9,
 "timestamp": 1526892300,
 "protocol": 0,
 "host": "127.0.0.1",
 "inoctets": 7950000,
 "outoctets": 795000
 }
 ]
}
```

Navigation with Host Filter

Sample Request

```
 http://127.0.0.1:8981/odata/api/interfaces(79)/protocols(0)/hosts?
$top=10&amp;startTime=1536754500 &amp;endTime=1537289100 &amp;
$filter=contains(host,'8.8.8.80')
```

Navigation with Conversation Filter

Sample Request

```
 http://127.0.0.1:8981/odata/api/interfaces(79)/conversations?startTime=1536754500
 &amp;endTime=1537289100 &amp;$filter=contains(DestHost,'80.80.80.80' )
```

Navigation With Conversation to Protocols

Sample Request

```
 http://127.0.0.1:8981/odata/api/interfaces(79)/
conversations(SrcHost='127.0.0.1',DestHost='127.0.0.1')/protocols?$top=10&amp;
$count=true&amp;startTime=1536754500 &amp;endTime=1537289100
```

Navigation with asNum

Sample Request

```
 http://127.0.0.1:8981/odata/api/interfaces(79)/asNums?
&startTime=1536754500&endTime=1537289100&resolution=min15
```

Navigation with asNextHop

Sample Request

```
 http://127.0.0.1:8981/odata/api/interfaces(79)/asNextHop?
&startTime=1536754500&endTime=1537289100&resolution=min15&
$filter=contains(nexthop,'172.168.0.1')
```

Navigation with asNum to asNextHop

Sample Request

```
 http://127.0.0.1:8981/odata/api/interfaces(79)/asNums(0)/asNextHop?
&startTime=1536754500&endTime=1537289100&resolution=min15
```

Orderby

The $orderby system query option specifies the order in which items are returned from the CA NFA OData service. The value of the $orderby system query option contains a comma-separated list of expressions whose result are used to sort the items. The expression can include a suffix 'asc' for ascending or 'desc' for descending, separated from the property name by one or more spaces. If asc or desc is not specified, the service must order by the specified property in ascending order. You can order the entities based on different harvesters. You can also use the order by with the Expand operation.

Resource URL

```
http://<nfa odata host>:<nfa odata port>/odata/api/<EntityType Name>?$orderby=<Property
 Name 1>, <Property Name 2>
```

Method

GET

Parameters

The following table includes the mandatory parameter.

Parameters	Description
EntityType Name	Indicates the type of entity. For more information about list of valid EntityType Name, see Metadata.
Property Name 1, Property Name 2	Indicates the property of a given Entity type. For more information about list of valid Property Name, see Metadata.

Sample Request

This example displays list of `availableInterfaces` entity data `orderby`

```
ifIndex
```

property.

```
http://127.0.0.1:8981/odata/api/availableInterfaces?$orderby=ifIndex
```

Sample Response

```
{
 "@odata.context": "$metadata#availableInterfaces",
 "value": [
 {
 "ID": 1,
 "routerId": 1500001,
 "name": "10.0.9.20",

 "enabled": "N",
 "LastFlow": 1541996116,
 "IpAddr": null
 }
 ],
}
```

Top, Skip and Count

The `$top` system query option indicates the top number of items in the queried collection to be included in the result.

The `$skip` system query option indicates the number of items in the queried collection that are to be skipped and not included in the result. You can request a particular page of an item by combining `$top` and `$skip`.

The $count system query option indicates the clients to display a count of the matching resources in the response. The `$count` query option has a Boolean value of `true` or `false`.

- `true`: Indicates the client to display a count of the matching resources.
- `false`: Indicates the client not to display a count of the matching resources.

Resource URL

```
http://<nfa odata host>:<nfa odata port>/odata/api/<EntityType Name>?$top=<value>&
$skip=<value>&$count=<value>
```

Method

GET

Parameters

The following table includes the mandatory parameter.

Parameters	Description
EntityType Name	Indicates the type of entity. For more information about list of valid EntityType Name, see Metadata.

Sample Request

This sample API performs the following operations:

- Displays top 3 values of router entity.
- Skips the first value in router entity.
- Displays the total count of matching resources.

```
http://127.0.0.1:8981/odata/api/routers?$top=3&$skip=1&$count=true
```

Sample Response

```
{
 "@odata.context": "$metadata#routers",
 "@odata.count": 3,
 "value": [
 {
 "ID": 1500002,
 "routerAddress": "127.0.0.1",

}
```

Pagination

The pagination option lets you view the records in chunks on multiple pages by limiting number of records on each page. By default, this API display 10 records per page. If there are more than ten records for an entity, then it displays the first ten records in the first page followed by a link to the next set of pages.

NOTE

: You can increase the number of records to be displayed per page by setting the required value for the `maxpagesize` parameter in HTTP Header. The maximum limit to display the records per page is 2000. For more information about overriding maxpagesize, see Limiters.

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/<EntitySet Name>
```

Method

GET

Parameters

The following table includes the mandatory parameter.

Parameters	Description
EntitySet Name	Indicates the type of entity set. For more information about list of valid EntitySet Name, see Metadata.

Sample Request

The following request displays the ten records in application settings entity.

```
http://127.0.0.1:8981/odata/api/applicationSettings
```

Sample Response

```
{
"@odata.context": "$metadata#applicationSettings",
"value": [
{
"Parameter": "agentAWOLLimit",
"Label": "Interface Data Absence Limit",
"Value": "44h"
},
{
"Parameter": "AppMap_TCPRebasePort",
"Label": "TCP Rebase Port",
"Value": "8000"
},
{
"Parameter": "AppMap_TOSMask",
"Label": "ToS Mask",
"Value": "254"
```

```
},
{
"Parameter": "AppMap_UDPRebasePort",
"Label": "UDP Rebase Port",
"Value": "7000"
},
{
"Parameter": "autoEnableInterfaces",
"Label": "Auto-Enable Interfaces",
"Value": "True"
},
{
"Parameter": "defaultTZ",
"Label": "Default Time Zone",
"Value": "GMT"
},
{
"Parameter": "DNSDomains",
"Label": "DNS Domains",
"Value": "aa-"
},
{
"Parameter": "dropToZero",
"Label": "Show Trendline Zeroes",
"Value": "True"
},
{
"Parameter": "emailFromAddress",
"Label": "From Address",
"Value": "<no default>"
},
{
"Parameter": "emailSMTPServer",
"Label": "SMTP Server",
"Value": "aaa"
}
],
"@odata.nextLink": "http://127.0.0.1:8981/odata/api/applicationSettings?$skiptoken=10"
}
```

Pagination with `$top` System Query Option

Pagination can be combined with the `$top` system query option using the GET method. The `$top`

query is applied first and then the records are paginated.

Sample Request

In this example, the `$top` is set to 23 and the `maxpagesize` parameter is not overridden. The response displays ten records each on the first page, and the second page, and three records in the third page.

```
http://127.0.0.1:8981/odata/api/interfaces?$top=23
```

> **NOTE**
>
> : Pagination displays 10 data per page followed by a link to the next set of pages. By default, expansion displays only 10 records. You can increase the display limit by using the `$top` system query parameter in `$expand`. The maximum limit of expand is 2000 record per page, beyond which the data is chunked. To retrieve larger data sets, use Navigation.
>
> For more information about using Navigation, see Navigation.

Drill Down Operations

The CA NFA drill down feature provides the following benefits to a Network Administrator:

Benefits of Drill Down:

- Enhanced visibility to information from NFA
- Ability to generate reports on the fly
- Pinpoint the root cause of issues that help reduce outages
- Improved network data analysis

The CA NFA OData API provides the following drill-down options:

- Expansion
- Navigation

Entity Operations

The CA NFA OData API lets you perform the administrative operations on following CA NFA entities:

> **NOTE**
>
> **More Information:**
>
> Administration Page Options

Routers and Interfaces

In CA NFA OData API, the `availableInterfaces` entity refers to interfaces that you can view on the **Available Interfaces** page, in the CA NFA Console. The `availableInterfaces` entity lists the interfaces that are not enabled and do not have source of collected data.
In CA NFA OData API, the `Interfaces` entity refers to the interfaces that you can view on the **Active Interfaces** page, in the CA NFA Console. The `Interfaces` entity lists only the interfaces that have contributed to collected data at some time and custom virtual interfaces.
The action of an entity in NFA API is same as action in the CA NFA Console. For more information on Administration page, see Administration Page.

Routers

This section explains the following supported operations on routers:

Edit Router - Single

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/routers(PropertyRef Name value)
```

Method

PATCH

Payload

```
{
"snmpVersion": <snmp version value>,
"snmpPort": <snmp portvalue>,
"routerName": "<Router name>",
"templateId": <template ID value>,
"domainID": <domain ID value>,
"profileId": <profile ID value>
}
```

NOTE

- The valid snmpVersion values are 1, 2 or 3.
- Enter the template Id greater than or equal to 1.

Sample Request

```
http://127.0.0.1:8981/odata/api/routers(1500004)
```

Sample Payload

```
{
"snmpVersion": 2,
"snmpPort": 123,
"routerName": "127.0.0.1",
"templateId": 5,
"domainID": 1,
"profileId": 5
}
```

Sample Response

There is no response for this API.

NOTE
Editing the domain ID of a router updates the associated tenant ID.

Edit Routers - Bulk

This API enables you to update the values of the multiple entities having similar properties, at once. You can edit the following properties using this API.

- SNMP Profile
- Domain

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/routers/com.ca.nfa.odata.editRouters
```

Method

POST

Payload

```
{
"RouterIds": [<Enter the list of Router_IDs separated by a comma>],
"snmpVersion": <snmp version value>,
"snmpPort" : <snmp port value>,
"templateId" : <template id value>,
"profileId" : <profile id value>
"domainID" : <domain id value>
}
```

NOTE

The valid snmpVersion values are 1, 2 or 3.

Sample Request

```
http://127.0.0.1:8981/odata/api/routers/com.ca.nfa.odata.editRouters
```

Sample Payload

```
{
 "RouterIds": [1500012,1500013],
"snmpVersion": 3,
"snmpPort": 1654,
"templateId": 1,
"profileId": 4,
"domainID" :1
}
```

Sample Response

```
{
  "@odata.context": "$metadata#Collection(com.ca.nfa.odata.router)",
  "value": [
    {
      "routerUpdatedOn": 1599147491,

```

Delete Router - Single

This API allows you to delete a single router.

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/routers(<router_id>)
```

Method

DELETE

HTTP Headers

```
Content-Type:application/json; odata.metadata=minimal
```

Parameters

The following table includes the mandatory parameters.

Parameters	Description
router_id	Indicates the router id that you wish to delete from a router entity set.

Sample Request

The following request illustrates the delete action for the router id 1500002.

```
http://127.0.0.1:8981/odata/api/routers(1500002)
```

Sample Response

There is no response for this API.

Delete Router - Bulk

The following code is a reference metadata section for deleting bulk router action.

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/routers/
com.ca.nfa.odata.deleteRouters
```

Method

POST

Payload

```
"RouterIds":[1500008,1500009]
```

Sample Request

The following request illustrates the delete action for bulk delete router entity.

```
http://127.0.0.1:8080/odata/api/routers/com.ca.nfa.odata.deleteRouters
```

Sample Payload

```
"RouterIds":[150032,123894,222891,100034]
```

Sample Response

```
{
"@odata.context": "$metadata#Collection(com.ca.nfa.odata.router)",
"value": [
{

```
}
]
}
```

Interfaces

This section explains the following supported operations on interfaces:

Edit Interfaces - Single

To edit a single entity, use HTTP PATCH Method to send the request.

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/interfaces(PropertyRef Name value)
```

Method

PATCH

Payload

```
{
"Description": <Value>,
"InSpeed" : <Value>,
"OutSpeed" : <Value>,
"IfType" : <Value>,
"Name" : <Value>,
"DomainId" : <Value>
}
```

Sample Request

```
http://127.0.0.1:8981/odata/api/interfaces(10)
```

Sample Payload

```
{
"Description":"interfaceupdate",
"Name":"Interface1111",
"InSpeed":100,
"OutSpeed":101,
"IfType":"WAN",
"DomainId":1
}
```

Sample Response

There is no response for this API.

Edit Interfaces - Bulk

This CA NFA OData API enables you to update values of the multiple entities having similar properties at once.

> **NOTE**
>
> This Bulk Edit API is applicable only for few properties of Interfaces.

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/interfaces/
com.ca.nfa.odata.editInterfaces
```

Method

POST

Payload

```
{
"InterfaceIds":[<List of Interface_ID s separated by a comma>],
"InSpeed" : <value>,
"OutSpeed": <value>,
"IfType" : <value>,
"DomainId": <value>
}
```

Sample Request

```
http://127.0.0.1:8981/odata/interfaces/com.ca.nfa.odata.editInterfaces
```

Sample Payload

```
{
"InterfaceIds":[943,944],
"InSpeed":100,
"OutSpeed":100,
"IfType":"WAN",
"DomainId":3
}
```

Sample Response

```
{
    "@odata.context": "$metadata#Collection(com.ca.nfa.odata.interfaces)",
    "value": [
        {
            "ID": 943,
            "AgentType": "Physical",
            "RouterAddress": "127.0.0.1",
            "RouterId": 1500016,
            "Description": "interface Description",
            "InSpeed": 10000000,
            "OutSpeed": 1000000,
            "IfIndex": 4,
            "PersistentIfIndex": 5,
            "IfType": "WAN",
            "UpdatedOn": 1602590969,
            "Enabled": "N",
            "LastData": 1602673218,
            "HarvesterAddress": "10.80.89.28",
```

```
            "Name": "Interface 1",
            "TrafficStatus": null,
            "DomainId": 1,
            "DomainName": null,
            "Subnet": [],
            "ComponentAgentIds": []
        },
        {
            "ID": 944,
            "AgentType": "Physical",
            "RouterAddress": "127.0.0.1",
            "RouterId": 1500016,
            "Description": "",
            "InSpeed": 127,
            "OutSpeed": 149,
            "IfIndex": 6,
            "PersistentIfIndex": 8,
            "IfType": "WAN ATM AAL5",
            "UpdatedOn": 1602590969,
            "Enabled": "N",
            "LastData": 1602673218,
            "HarvesterAddress": "127.0.0.1",
            "Name": "Interface 6",
            "TrafficStatus": null,
            "DomainId": 10,
            "DomainName": null,
            "Subnet": [],
            "ComponentAgentIds": []
        }
    ]
}
```

Merge Interfaces

The CA NFA OData API lets you merge two interfaces, similar to Merging interfaces in DX NetOps console.

Resource URI

```
 http://<nfa odata host>:<nfa odata port>/odata/api/interfaces/
com.ca.nfa.odata.mergeInterfaces
```

Method

POST

Payload

```
{
```

```
"interface1" : <Interface_ID>,
 "interface2" : <Interface_ID>,
 "deleteSource" : <true/false>,
"isOverLap" : <true/false>
}
```

Parameters

The following are the parameters in payload:

Parameters	Description
interface1	Indicates the Interface id for the first interface as set in the interface table.
interface2	Indicates the Interface id for the second interface as set in the interface table.
deleteSource	Indicates if the source must be deleted after merging. Valid values are: • **true** : Indicates that the source must be deleted. • **false:** Indicates that the source must not be deleted.
isOverLap	This parameter indicates if overlapped data must be merged. Valid values are: • **true:** Indicates that the overlapped data must be merged. • **false** : Indicates that the overlapped data must not be merged and displays the user an appropriate message to proceed.

NOTE
Either of the Interface1 or Interface2 can be source, while the other will be destination.

Sample Request

```
http://10.13.91.413:8981/odata/api/interfaces/com.ca.nfa.odata.mergeInterfaces
```

Sample Payload

```
 {
"interface1" : 46,
"interface2" : 31,
"isOverLap" : true,
"deleteSource":false
}
```

Sample Response

```
 {
"@odata.context": "$metadata#Collection(com.ca.nfa.odata.interfaces)",
"value": [
{
"ID": 31,
"AgentType": "Physical",
"RouterAddress": "10.0.42.2",
```

```
"Description": "edge network",
"InSpeed": 1000000000,
"OutSpeed": 1000000000,
"IfIndex": 4,
"PersistentIfIndex": 7,
"IfType": "LAN-ET",
"UpdatedOn": 1551158203,
"Enabled": "Y",
"LastData": 1551344433,
"HarvesterAddress": "10.238.80.99",
"Name": "Fa1/1"
},
{
"ID": 46,
"AgentType": "Physical",
"RouterAddress": "10.0.42.3",
"Description": "",
"InSpeed": 1000000000,
"OutSpeed": 1000000000,
"IfIndex": 4,
"PersistentIfIndex": 6,
"IfType": "LAN-ET",
"UpdatedOn": 1551158203,
"Enabled": "Y",
"LastData": 1551189619,
"HarvesterAddress": "10.238.80.99",
"Name": "Fa1/1"
}
]
}
```

Delete Interface - Single

This API allows you to delete a single interface.

NOTE

The API to delete single interface and interface aggregation are the same

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/interfaces(<interface_id>)
```

Method

DELETE

Parameters

The following table includes the mandatory parameters.

Parameters	Description
interface_id	Indicates the interface id that you wish to delete from Interfaces entity set.

Sample Request

The following request illustrates the delete action for the interface id 3051.

```
http://127.00.1:8981/odata/api/interfaces(3051)
```

Sample Response

There is no response for this API.

Delete Interfaces - Bulk

The API allows you to delete multiple interface aggregations in bulk.

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/interfaces/
com.ca.nfa.odata.deleteInterfaces
```

Method

POST

Payload

```
{
"InterfaceIds":[<Enter the list of Interface_ids separated by a comma>]
}
```

Sample Request

The following request illustrates the bulk delete action for interfaces entity.

```
http://127.00.1:8981/odata/api/interfaces/com.ca.nfa.odata.deleteInterfaces
```

Sample Payload

```
{
"InterfaceIds" : [123,402]
}
```

Sample Response

```
{
"@odata.context": "$metadata#Collection(com.ca.nfa.odata.interfaces)",
"value": [
{
```

```
"ID": 123,
"AgentType": "Physical",
"RouterAddress": "127.0.0.1",
"Description": "Device209",
"InSpeed": 1000000000,
"OutSpeed": 1000000000,
"IfIndex": 1,
"PersistentIfIndex": 1,
"IfType": "LAN-ET",
"UpdatedOn": 1544529750,
"Enabled": "Y",
"LastData": 1546937182,
"HarvesterAddress": "127.0.0.1",
"Name": "Device209"
},
{
"ID": 402,
"AgentType": "Physical",
"RouterAddress": "127.0.0.1",
"Description": "127.0.0.1",
"InSpeed": 0,
"OutSpeed": 0,
"IfIndex": 7,
"PersistentIfIndex": 4,
"IfType": "WAN",
"UpdatedOn": 1544598925,
"Enabled": "Y",
"LastData": 1545139819,
"HarvesterAddress": "127.0.0.1",
"Name": "127.0.0.1"
}
]
}
```

Available Interface

This section explains the following supported operations on available interface:

Enable Available Interface - Single

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/availableInterfaces(<PropertyRef Name value>)/com.ca.nfa.odata.enableInterface
```

Method

POST

Parameters

Parameter	Description
PropertyRef Name	Indicate the interface ID of the availableInterfaces entity type. For more information about list of availableInterfaces, see Metadata.

Sample Request

```
http://127.00.1:8981/odata/api/availableInterfaces(11)/com.ca.nfa.odata.enableInterface
```

Sample Response

```
{
"@odata.context": "$metadata#com.ca.nfa.odata.availableInterfaces",
"ID": 11,
"routerId": 1500002,
"name": "Interface 1",
"description": "127.0.0.1",
"speed": 0,
"ifMapId": 10,
"ifIndex": 9,
"ifDescr": "Interface 1",
"ifType": 1,
"ifName": "",
"portName": "",
"vrfName": "",
"ifAlias": "",
"UpdatedOn": 1542306913,
"enabled": "true",
"LastFlow": 1541996116,
"IpAddr": null
}
```

Enable Available Interfaces - Bulk

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/
availableInterfaces/com.ca.nfa.odata.enableInterfaces
```

Method

POST

Payload

```
{
  "InterfaceIds":[<List of Interface_ids separated by a comma>]
}
```

Sample Request

```
http://127.0.0.1:8981/odata/api/availableInterfaces/com.ca.nfa.odata.enableInterfaces
```

Sample Payload

```
{
"InterfaceIds":[1,3,10]
}
```

Sample Response

```
{
"@odata.context": "$metadata#Collection(com.ca.nfa.odata.availableInterfaces)",
"value": [
{
"ID": 1,
"routerId": 1500001,
"name": "127.0.0.1",
"description": "127.0.0.1",
"speed": 0,
"ifMapId": 1,
"ifIndex": 1,
"ifDescr": "Interface 1",
"ifType": 1,
"ifName": "",
"portName": "",
"vrfName": "",
"ifAlias": "",
"UpdatedOn": 1542306911,
"enabled": "true",
"LastFlow": 1541996116,
"IpAddr": null
},
{
"ID": 3,
```

```
"routerId": 1500002,
"name": "127.0.0.1",
"description": "127.0.0.1",
"speed": 0,
"ifMapId": 3,
"ifIndex": 1,
"ifDescr": "Interface 1",
"ifType": 1,
"ifName": "",
"portName": "",
"vrfName": "",
"ifAlias": "",
"UpdatedOn": 1542306912,
"enabled": "true",
"LastFlow": 1541996116,
"IpAddr": null
},
{
"ID": 10,
"routerId": 1500002,
"name": "127.0.0.1",
"description": "127.0.0.1",
"speed": 0,
"ifMapId": 9,
"ifIndex": 8,
"ifDescr": "Interface 8",
"ifType": 1,
"ifName": "",
"portName": "",
"vrfName": "",
"ifAlias": "",
"UpdatedOn": 1542306913,
"enabled": "true",
"LastFlow": 1541996116,
"IpAddr": null
}
]
}
```

Disable Available Interface - Single

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/availableInterfaces(<InterfaceId
 value>)/com.ca.nfa.odata.disableInterface
```

Method

POST

Sample Request

```
http://127.0.0.1:8981/odata/api/
availableInterfaces(43)/com.ca.nfa.odata.disableInterface
```

Sample Response

```
{

"@odata.context": "$metadata#com.ca.nfa.odata.availableInterfaces",
"ID": 43,
"routerId": 1500006,
"name": "Interface 1",
"description": "",
"speed": 0,
"ifMapId": 1,
"ifIndex": 1,
"ifDescr": "Interface 1",
"ifType": 1,
"ifName": "",
"portName": "",
"vrfName": "",
"ifAlias": "",
"UpdatedOn": 1551354673,
"enabled": "false",
"LastFlow": 1556632817,
"IpAddr": null
}
```

Disable Available Interfaces - Bulk

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/
availableInterfaces/com.ca.nfa.odata.disableInterfaces
```

Method

POST

Payload

```
{
  "InterfaceIds":[<List of Interface_ids separated by a comma>]
}
```

Sample Request

```
http://127.0.0.1:8981/odata/api/availableInterfaces/com.ca.nfa.odata.disableInterfaces
```

Sample Payload

```
{
"InterfaceIds" : [483,484,485]
}
```

Sample Response

```
{

"@odata.context": "$metadata#Collection(com.ca.nfa.odata.availableInterfaces)",
"value": [
{
"ID": 483,
"routerId": 1500037,
"name": "Gi4/29",
"description": "Rac. non utilise",
"speed": 1000000000,
"ifMapId": 37,
"ifIndex": 37,
"ifDescr": "GigabitEthernet4/29",
"ifType": 6,
"ifName": "Gi4/29",
"portName": "",
"vrfName": "",
"ifAlias": "Rac. non utilise",
"UpdatedOn": 1553360767,
"enabled": "false",
"LastFlow": 0,
"IpAddr": null
```

```
},
{
"ID": 484,
"routerId": 1500037,
"name": "Gi4/30",
"description": "Rac. non utilise",
"speed": 1000000000,
"ifMapId": 38,
"ifIndex": 38,
"ifDescr": "GigabitEthernet4/30",
"ifType": 6,
"ifName": "Gi4/30",
"portName": "",
"vrfName": "",
"ifAlias": "Rac. non utilise",
"UpdatedOn": 1553360767,
"enabled": "false",
"LastFlow": 0,
"IpAddr": null
},
{
"ID": 485,
"routerId": 1500037,
"name": "Gi4/31",
"description": "Rac. non utilise",
"speed": 1000000000,
"ifMapId": 39,
"ifIndex": 39,
"ifDescr": "GigabitEthernet4/31",
"ifType": 6,
"ifName": "Gi4/31",
"portName": "",
"vrfName": "",
"ifAlias": "Rac. non utilise",
"UpdatedOn": 1553360767,
"enabled": "false",
"LastFlow": 0,
"IpAddr": null
}
]
}
```

Delete Available Interface

From DX NetOps 10.0.1, you can delete an interface from the available interfaces.

NOTE

When you delete an interface that is reachable through the SNMP, the interface is added back after the next SNMP poll.

Resource URI:

```
http://<nfa odata host>:<nfa odata port>/odata/api/availableInterfaces(<Enter the
 Available_Interface_ID to be deleted>)/com.ca.nfa.odata.deleteAvailableInterface
```

Method

POST

Sample Request

```
http://127.0.0.1:8981/odata/api/availableInterfaces(442)/
com.ca.nfa.odata.deleteAvailableInterface
```

Sample Response

```
{
"@odata.context": "$metadata#com.ca.nfa.odata.availableInterfaces",
 "ID": 442,
 "routerId": 1500023,
 "name": "Interface 7",
 "description": "",
 "speed": 0,
 "ifMapId": 4,
 "ifIndex": 7,
 "ifDescr": "Interface 7",
 "ifType": 1
 "ifName": "",
 "portName": "",
 "vrfName": "",
 "ifAlias": "",
 "UpdatedOn": 1548839196,
 "enabled": "Y",
 "LastFlow": 1548927084,
 "IpAddr": null
}
```

Interface Template

This section explains the following supported operations on interface template:

Add Interface Template

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/interfaceTemplate
```

Method

POST

Payload

```
{
"name": "<Enter the Interface template Name>",
"nameTemplate": "<Enter valid Interface name>",
"descriptionTemplate": "<Enter Valid Interface Description>"
}
```

NOTE

: The list of valid nameTemplate and descriptionTemplate values are:

- **[DeviceAlias]**: Indicates the Device alternate name.
- **[DeviceName]:** Indicates the Device Name.
- **[ifType]**: Indicates the If Type.
- **[ifIndex]**: Indicates the If Index.
- **[portName]**: Indicates the Port Name
- **[ifName]**: Indicates the If Name.
- **[ifAlias]**: Indicates the If Alternname Name
- **[ifDescr]**: Indicates the If Descriptions

You can also enter multiple nameTemplate and descriptionTemplate values by separating them with a | symbol.

Example 1: Add single value

Sample Request

This example illustrates single value for name, nameTemplate and descriptionTemplate.

```
http://127.0.0.1:8981/odata/api/interfaceTemplate
```

Sample Payload

```
{
"name": "test sample 3",
"nameTemplate": "[ifIndex]",
"descriptionTemplate": "[ifIndex]"
}
```

Sample Response

A new templateId is created for the sample payload parameter values.

```
{
"@odata.context": "$metadata#interfaceTemplate",
"templateId": 19,
```

```
"name": "test sample 3",
"nameTemplate": "[ifIndex]",
"descriptionTemplate": "[ifIndex]"
}
```

Example 2: Add multiple value

Sample Request

This example illustrates multiple values for nameTemplate and descriptionTemplate.

```
http://127.0.0.1:8981/odata/api/interfaceTemplate
```

Sample Payload

```
{
"name": "test sample 4",
"nameTemplate": "[ifType|ifIndex]",
"descriptionTemplate": "[ifType|ifIndex]"
}
```

Sample Response

A new template id is created for the given sample payload parameter values.

```
{
"@odata.context": "$metadata#interfaceTemplate",
"templateId": 20,
"name": "test sample 4",
"nameTemplate": "[ifType|ifIndex]",
"descriptionTemplate": "[ifType|ifIndex]"
}
```

Edit Interface Template

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/interfaceTemplate(<Enter the
 template_id to be updated>)
```

Method

PATCH

Payload

> **NOTE**
>
> : You can edit only the nameTemplate and descriptionTemplate properties for the **global-default** Interface Template.

The properties that you can edit for an Interface Template, other than **global-default** are:

```
{
"name": "<Enter the Interface template Name>",
"nameTemplate": "<Enter a valid Interface name>",
"descriptionTemplate": "<Enter a Valid Interface Description>"
```

```
}
```

NOTE

: The list of valid nameTemplate and descriptionTemplate values are:

- DeviceAlias
- DeviceName
- ifDescr
- ifAlias
- ifName
- portName
- ifIndex
- ifType

Sample Request

```
http://127.0.0.1:8981/odata/api/interfaceTemplate(1234)
```

Sample Payload

In this sample, the properties that you can edit for a Interface Template other than **global-default** are:

```
{
"name": "test123376",
"nameTemplate": "[ifmapid]",
"descriptionTemplate": "[ifmapid]"
}
```

Sample Response

There is no response for this API.

Delete Interface Template

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/interfaceTemplate(<Enter the
 template_id to be deleted>)
```

Method

DELETE

NOTE

: You cannot delete any property for the **global-default** Interface Template.

Sample Request

```
http://127.0.0.1:8981/odata/api/interfaceTemplate(123)
```

Sample Payload

```
{
"interfaceTemplate":[123]
}
```

Sample Response

There is no response for this API.

Interface Aggregations

This section explains the following supported operations on Interface Aggregations

Add Interface Aggregation

Resource URI

```
 http://<nfa odata host>:<nfa odata port>/odata/api/interfaces/
com.ca.nfa.odata.createInterfaceAggregation
```

Method

POST

Payload

```
{
"InterfaceIds" : [<Enter a valid ID>],
"Name" : "<Name of the Interface Aggregation>",
"Description" : "<Description of the interface Aggregation>",
"IfType" : "<Interface Aggregation Type>",
"InSpeed" : <Inspeed value> ,
"OutSpeed" : <Outspeed Value>
}
```

> **NOTE**
>
> You can also enter multiple InterfaceIds values by separating them with a comma (,) within the square brackets .

Example 1: Add single InterfaceId

Sample Request

This example illustrates single value for InterfaceIds,.

```
 http://127.0.0.1:8981/odata/api/interfaces/com.ca.nfa.odata.createInterfaceAggregation
```

Method

POST

Sample Payload

```
 {
"InterfaceIds" : [446],
"Name" : "test1",
"Description" : "test",
"IfType" : "WAN",
"InSpeed" : 10 ,
"OutSpeed" : 11
}
```

Example 2: Add multiple InterfaceId

Sample Request

This example illustrates multiple values for `InterfaceIds` .

```
http://127.0.0.1:8981/odata/api/interfaces/com.ca.nfa.odata.createInterfaceAggregation
```

Sample Payload

```
 {
"InterfaceIds" : [447,673,224],
"Name" : "test2",
"Description" : "test2",
"IfType" : "WAN",
"InSpeed" : 10 ,
"OutSpeed" : 11
}
```

Sample Response

```
 {
"@odata.context": "$metadata#Collection(com.ca.nfa.odata.interfaces)",
"value": [
{
"ID": 255,
"AgentType": "Aggregate",
"RouterAddress": "127.0.0.1",
"Description": "Description interface Aggregation2",
"InSpeed": 100000,
"OutSpeed": 1000,
"IfIndex": 255,
"PersistentIfIndex": 255,
"IfType": "WAN",
"UpdatedOn": 1554274019,
"Enabled": "Y",
"LastData": 0,
"HarvesterAddress": "127.0.0.1",
"Name": "Interface Aggregation10"
}
]
}
```

Get Interface Aggregations

URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/interfaces?
$filter=contains(AgentType, 'Aggregate')
```

Method

GET

Sample Request

```
http://127.0.0.1:8981/odata/api/interfaces?$filter=contains(AgentType, 'Aggregate')
```

Sample Response

```
 {
    "@odata.context": "http://localhost:8981/odata/api/
$metadata#interfaces(ID,AgentType,RouterAddress,Description,InSpeed,OutSpeed,IfIndex,Persistent
    "value": [
        {
            "InSpeed": 1,
            "IfType": "WAN",
            "Description": "",
            "PersistentIfIndex": 188,
            "Enabled": "Y",
            "RouterAddress": "0.0.0.1",
            "Name": "test",
            "AgentType": "Aggregate",
            "DomainId": 1,
            "LastData": 0,
            "OutSpeed": 1,
            "IfIndex": 188,
            "UpdatedOn": 1601359065,
            "ID": 188,
            "HarvesterAddress": "10.74.241.110",
            "TrafficStatus": "Red",
            "DomainName": "Default Domain",
            "Subnet": [],
            "ComponentAgentIds": [
                153,
                154
            ]
        }
    ]
}
```

NOTE

"ComponentAgentIds" property with the child interface ids is added to the Interface Aggregations.

Get Single Interface Aggregation

URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/interfaces(<interfaceaggregationid>)
```

Method

GET

Sample Request

```
http://127.0.0.1:8981/odata/api/interfaces(188)
```

Sample Response

```
{
    "@odata.context": "http://localhost:8981/odata/api/
$metadata#interfaces(ID,AgentType,RouterAddress,Description,InSpeed,OutSpeed,IfIndex,Persistent
$entity",
    "InSpeed": 1,
    "IfType": "WAN",
    "Description": "",
    "PersistentIfIndex": 188,
    "Enabled": "Y",
    "RouterAddress": "0.0.0.1",
    "Name": "test",
    "AgentType": "Aggregate",
    "DomainId": 1,
    "LastData": 0,
    "OutSpeed": 1,
    "IfIndex": 188,
    "UpdatedOn": 1601359065,
    "ID": 188,
    "HarvesterAddress": "10.74.241.110",
    "TrafficStatus": "Red",
    "DomainName": "Default Domain",
    "Subnet": [],
    "ComponentAgentIds": [
        153,
        154
    ]
}
```

Edit Interface Aggregation

This API is enhanced to edit the ComponentAgentIds for the single interface aggregation entity, this feature is not supported for the bulk interface edit.

URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/interfaces(<interfaceaggregationid>)
```

Method

PATCH

Sample Request

```
http://127.0.0.1:8981/odata/api/interfaces(188)
```

Sample Payload

```
{
    "Description": "aggregate interface update",
    "Name": "Interface aggregate",
    "InSpeed": 2000000,
    "OutSpeed": 20000000,
    "IfType": "WAN",
    "DomainId":1,
     "ComponentAgentIds": [
                153
           ]
}
```

Sample Response

There is no response for this API.

Delete Interface Aggregation

Interface aggregations can be deleted using the existing delete interfaces APIs. See the following APIs for more details:

Delete Interface - Single

Delete Interfaces - Bulk

Custom Virtual Interface

This section explains the following supported operations on Custom Virtual Interface

Add Custom Virtual Interface

Resource URI

```
 http://<nfa odata host>:<nfa odata port>/odata/api/interfaces/
com.ca.nfa.odata.createCustomVirtualInterface
```

Method

POST

Payload

```
{
"InterfaceId" : <Enter a valid ID>,
"Name" : "<Name of the Interface Aggregation>",
"Description" : "<Description of the interface Aggregation>",
"IfType" : "<Custom Virtual Interface Type>",
"InSpeed" : <Inspeed value> ,
"OutSpeed" : <Outspeed Value>,
"Subnet" :<Subnet value>
}
```

Example 1: Add Single Subnet

Sample Request

Create a Custom Virtual Interface with single Subnet:

```
  http://127.0.0.1:8981/odata/api/interfaces/
com.ca.nfa.odata.createCustomVirtualInterface
```

Method

POST

Sample Payload

```
 {
"InterfaceId" : 11,
"Name" : "testCVI",
"Description" : "CVI",
"IfType" : "WAN",
"InSpeed" : 10 ,
"OutSpeed" : 11 ,
"Subnet" :["10.0.0.4/22"]
}
```

Sample Response:

```
 {
"@odata.context": "$metadata#Collection(com.ca.nfa.odata.interfaces)",
"value": [
{
"ID": 537,
"AgentType": "Virtual",
"RouterAddress": "127.0.0.1",
"Description": "CVI",
"InSpeed": 10,
"OutSpeed": 11,
"IfIndex": 0,
"PersistentIfIndex": 2147483729,
"IfType": "WAN",
"UpdatedOn": 1546247778,
"Enabled": "Y",
"LastData": 0,
"HarvesterAddress": "127.0.0.1",
"Name": "testCVI"
}
]
}
```

Example 2: Add Multiple Subnet

Sample Request

Create a Custom Virtual Interface with multiple Subnets:

```
 http://127.0.0.1:8981/odata/api/interfaces/
com.ca.nfa.odata.createCustomVirtualInterface
```

Method

POST

Sample Payload

```
 {
"InterfaceId" : 12,
"Name" : "testCVI1",
"Description" : "CVI",
"IfType" : "WAN",
"InSpeed" : 10 ,
"OutSpeed" : 11 ,
"Subnet" :[
"10.0.0.4/22",
"10.0.0.9/3",
"10.0.0.9/22"
]
}
```

Sample Response:

```
{
    "@odata.context": "$metadata#Collection(com.ca.nfa.odata.interfaces)",
    "value": [
        {
            "ID": 11,
            "AgentType": "Virtual",
            "RouterAddress": "127.0.0.1",
            "RouterId": null,
            "Description": "CVI",
            "InSpeed": 1391671,
            "OutSpeed": 14393,
            "IfIndex": 0,
            "PersistentIfIndex": 2147483653,
            "IfType": "WAN ATM",
            "UpdatedOn": 1603098194,
            "Enabled": "N",
            "LastData": 0,
            "HarvesterAddress": "127.0.0.1",
            "Name": "testCVI",
            "TrafficStatus": null,
            "DomainId": null,
            "DomainName": null,
```

```
            "Subnet": [],
            "ComponentAgentIds": []
        }
    ]
}
```

Get Custom Virtual Interface

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/interfaces?$filter=
 contains(AgentType,'Virtual')
```

Sample Request

```
http://127.0.0.1:8981/odata/api/interfaces?$filter= contains(AgentType,'Virtual')
```

Method

GET

Sample Response:

```
{
"@odata.context": "http://localhost:8981/odata/api/
$metadata#interfaces(ID,AgentType,RouterAddress,Description,InSpeed,OutSpeed,IfIndex,Persistent
"value": [
  {
"InSpeed": 2000000,
"IfType": "WAN",
"Description": "interface updatemani",
"PersistentIfIndex": 2147483650,
"Enabled": "Y",
"RouterAddress": "10.0.40.33",
"Name": "Interface -edit apimani",
"AgentType": "Virtual",
"DomainId": 1,
"LastData": 0,
"OutSpeed": 20000000,
"IfIndex": 0,
"UpdatedOn": 1600937363,
"ID": 185,
"HarvesterAddress": "10.74.241.110",
"TrafficStatus": "Red",
"DomainName": "Default Domain",
"Subnet": [
  "1.1.1.0/24"
],
"ComponentAgentIds": [],
}
],
```

```
}
```

Edit Custom Virtual Interface

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/
interfaces(<CustomVirtualInterface_ID>)
```

Sample Request

```
http://127.0.0.1:8981/odata/api/interfaces(185)
```

Method

PATCH

Sample Payload

```
{
"Name": "Interface-edit2",
"Subnet": [
                                "1.1.1.0/24",
                                "10.10.10.10/24"
                ]
}
```

Sample Response

There is no response for this API.

Delete Custom Virtual Interface

Custom Virtual Interfaces can be deleted using the existing delete interfaces APIs. See the following APIs for more details:

Delete Interface - Single

Delete Interfaces - Bulk

System

The following options are available in System:

Harvester

Harvester supports the following options:

> **NOTE**
>
> **More Information:**
>
> Administration Page Options

Read All Harvesters

This API displays all Harvester records:

Resource URI

http://<*nfa odata host*>:<*nfa odata port*>/odata/api/harvesters

Method

GET

Sample Request

```
http://127.0.0.1:8981/odata/api/harvesters
```

Sample Response

```
{
"@odata.context": "$metadata#harvesters",
"value": [
{
"HarvesterId": 2,
"LastPullCheckpoint": 1545212329,
"PortDefinitionsLastDeployed": 0,
"HarvesterAddress": "127.0.0.1",
"DomainId": 3,
"FlowEnabledLastModified": 0,
"ManagementServerPort": 8080,
"DomainName": "Domain A",
"DomainDescription": "Domain A for FellsCargo",
"FlowEnabledLastDeployed": 0,
"LastPushCheckpoint": 1545212344,
"ApplicationMappingLastDeployed": 0,
"ReservedSeatingLastDeployed": 0,
"TrapDefinitionsLastDeployed": 1541748300,
"TenantId": 9,
"Description": "Single box configuration"
},
{
"HarvesterId": 5,
"LastPullCheckpoint": 0,
"PortDefinitionsLastDeployed": 0,
"HarvesterAddress": "127.0.0.1",
"DomainId": 1,
"FlowEnabledLastModified": 0,
"ManagementServerPort": 8080,
"DomainName": "Default Domain",
"DomainDescription": "The default domain for devices, interfaces, interface addresses
and networks.",
"FlowEnabledLastDeployed": 0,
"LastPushCheckpoint": 0,
"ApplicationMappingLastDeployed": 0,
"ReservedSeatingLastDeployed": 0,
```

```
 "TrapDefinitionsLastDeployed": 0,
 "TenantId": 8,
 "Description": "Test Harvesters2"
 },
]
 }
```

Read Single Harvester

The following API displays the details of the specified harvester:

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/harvesters(HarvesterId=<Value of the harvester ID>)
```

Method

GET

Sample Request

```
http://127.0.0.1:8981/odata/api/harvesters(HarvesterId=2)
```

Sample Response

```
{
"@odata.context": "$metadata#harvesters",
"HarvesterId": 2,
"HarvesterAddress": "127.0.0.1",
"Description": "Single box configuration",
"ManagementServerPort": 8080,
"FlowEnabledLastModified": 0,
"FlowEnabledLastDeployed": 0,
"LastPushCheckpoint": 1545212832,
"LastPullCheckpoint": 1545212820,
"ApplicationMappingLastDeployed": 0,
"PortDefinitionsLastDeployed": 0,
"ReservedSeatingLastDeployed": 0,
"TrapDefinitionsLastDeployed": 1541748300,
"DomainId": 3,
"DomainName": "Domain A",
"DomainDescription": "Domain A for FellsCargo",
"TenantId": 9
}
```

Add Harvester

NOTE
Adding/Editing any non-harvester IP will give timeout error as response.

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/harvesters
```

Method

POST

Payload

```
{
"HarvesterAddress": "<Enter the harvester address that you wish to add >",
"Description":"<Enter the Description>",
"DomainId":<Enter the Domain Id>
}
```

Sample Request

```
http://127.0.0.1:8981/odata/api/harvesters
```

Sample Payload

```
{
"HarvesterAddress": "0.0.0.7",
"Description":"Testing Purpose",
"DomainId": 1
}
```

Sample Response

```
{
"@odata.context": "$metadata#harvesters",
"HarvesterId": 9,
"HarvesterAddress": "0.0.0.7",
"Description": "Testing Purpose",
"ManagementServerPort": null,
"FlowEnabledLastModified": null,
"FlowEnabledLastDeployed": null,
"LastPushCheckpoint": null,
"LastPullCheckpoint": null,
"ApplicationMappingLastDeployed": null,
"PortDefinitionsLastDeployed": null,
"ReservedSeatingLastDeployed": null,
"TrapDefinitionsLastDeployed": null,
"DomainId": 1,
"DomainName": null,
```

```
 "DomainDescription": null,
 "TenantId": null
}
```

Edit Harvester

NOTE

Harvester does not allow bulk edit option, hence you must edit one harvester at a time.

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/harvesters(HarvesterId=<Value of the harvester ID>)
```

Method

PATCH

Payload

```
{
"Description":"<Enter the Description>",
"DomainId":<Enter the Domain Id>
}
```

Sample Request

```
http://127.0.0.1:8981/odata/api/harvesters(HarvesterId=33)
```

Sample Payload

```
{
"Description":"Single box configuration Modified",
"DomainId": 3
}
```

Sample Response

There is no response for this API.

Delete Harvester

NOTE

You can delete only one harvester at a time.

Request URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/harvesters(HarvesterId=<Value of the harvester ID>)
```

Method

DELETE

Sample Request

```
http://127.0.0.1:8981/odata/api/harvesters(HarvesterId=33)
```

Sample Response

There is no response for this API.

Application Settings

The following are the options available in application setting:

More Information: View System Status

Read All Application Setting

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/applicationSettings
```

Method

GET

Sample Request

```
http://127.0.0.1:8981/odata/api/applicationSettings
```

Sample Response

```
{
 "@odata.context": "$metadata#applicationSettings",
 "value": [
 {
 "Parameter": "agentAWOLLimit",
 "Label": "Interface Data Absence Limit",
 "Value": "4h"
 },
 {
 "Parameter": "AppMap_TCPRebasePort",
 "Label": "TCP Rebase Port",
 "Value": "9000"
 },
 {
 "Parameter": "AppMap_TOSMask",
 "Label": "ToS Mask",
 "Value": "255"
```

```
 },
 {
 "Parameter": "AppMap_UDPRebasePort",
 "Label": "UDP Rebase Port",
 "Value": "8000"
 },
 {
 "Parameter": "autoEnableInterfaces",
 "Label": "Auto-Enable Interfaces",
 "Value": "True"
 },
 {
 "Parameter": "defaultTZ",
 "Label": "Default Time Zone",
 "Value": "GMT"
 },
 {
 "Parameter": "DNSDomains",
 "Label": "DNS Domains",
 "Value": ""
 },
 {
 "Parameter": "dropToZero",
 "Label": "Show Trendline Zeroes",
 "Value": "False"
 },
 {
 "Parameter": "emailFromAddress",
 "Label": "From Address",
 "Value": "<no default>"
 },
 {
 "Parameter": "emailSMTPServer",
 "Label": "SMTP Server",
 "Value": "<no default>"
 }
 ],
 "@odata.nextLink": "http://localhost:8981/odata/api/applicationSettings?$skiptoken=10"
}
```

Read a Specific Application Setting

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/applicationSettings('<Application
 Setting's Parameter name>')
```

Method

GET

Sample Request

```
http://127.0.0.1:8981/odata/api/applicationSettings('AppMap_TCPRebasePort')
```

Sample Response

```
{
 "@odata.context": "$metadata#applicationSettings",
 "Parameter": "AppMap_TCPRebasePort",
 "Label": "TCP Rebase Port",
 "Value": "9000"
}
```

Edit Application Setting

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/applicationSettings('<Application
 Setting's Parameter name>')
```

Method

PATCH

Payload

```
{

   "Value": "<Enter the new value>"

}
```

Sample Request

```
http://127.0.0.1:8981/odata/api/applicationSettings('showNotes')
```

Sample Payload

```
{

   "Value": "False"
```

```
}
```

Sample Response

There is no response for this API.

Health

Using the DX NetOps you can find the health of the network that you monitor. The following options are available in Health:

Reporter Health

The Reporter Health displays the important information related to reporter console. It tell about the DB connection status and related metrics like DB tables, DB repairs, and DB failures. It also tells about the pump service status, RIB service status, SSO status, SNMP Status, Memory Utilization, and report status.

Display Reporter Health

The following API displays reporter health data.

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/reporterHealth
```

Method

GET

Sample Request

```
http://127.0.0.1:8981/odata/api/reporterHealth
```

Sample Response

```
{
 "@odata.context": "$metadata#reporterHealth",
 "value": [
 {
 "UpdateTime": 1547195785,
 "SNMPStatus": "Failed",
 "MemoryUtilization": 0,
 "DBConnectStatus": "Successful",
 "GeneralServiceStatus": "Unknown",
 "PumpServiceStatus": "Unknown",
 "QueryServiceStatus": "Unknown",
 "ReportServiceStatus": "Unknown",
```

```
 "RibServiceStatus": "Unknown",
 "SSOServiceStatus": "Unknown"
 }
 ]
}
```

Harvester Health

The harvester health shows the different metrics of the network that you monitor. Th following options are available in Harvester Health:

Display All Harvester Health

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/harvesterHealth
```

Method

GET

Sample Request

```
http://127.0.0.1:8981/odata/api/harvesterHealth
```

Sample Response

```
{
 "@odata.context": "$metadata#harvesterHealth",
 "value": [
 {
 "PollerDBRepairs": 0,
 "CollectorPollerWSStatus": "Unknown",

}
```

Edit Watchdog

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/watchDogSettings('<Watchdog setting's
 Parameter value>')
```

Method

PATCH

Payload

```
{
"Value": "<Enter the new value of the Watchdog setting's Parameter>"
}
```

Sample Request

```
http://127.0.0.1:8981/odata/api/watchDogSettings('watchdogTrapDestination')
```

Sample Payload

```
{
"Value": "127.0.0.1"
}
```

Sample Response

There is no response for this API.

Flow Statistics

Flow Statistics determines the overall load for each harvester. The flow statistics allows you to make decisions about where new flows should be sent, whether rebalancing is needed. You can view the flow rates on harvesters for the last day, last week, or last 30 days.

NOTE

Application Mapping

DX NetOps 10.0.1 supports the application mapping API.

Using the application mapping, you can discover and map all your entities and their inter-dependencies. DX NetOps supports the ToS, host, and subnet applications. The Application Mapping API lets you manage the entities in the following ways:

More Information: Set Up Application Mapping

Application Mappings

Read Single Entity

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/applicationMappings(applicationMappings_Id)
```

Method

GET

Sample Request

```
http://127.0.0.1:8981/odata/api/applicationMappings(108)
```

Sample Response

```
{ "@odata.context": "$metadata#applicationMappings",
"protocol": -1,
"description": "11",
"nbar2EngineId": -1,
"endPort": -1,
"nbar2ApplicationId": -1,
"Name": "test",
"ip": "127.0.0.1",
"tos": 12,
"newPort": 11,
"mask": 0,
```

```
"ruleType": "Tos",
"ID": 108,
"beginPort": -1
}
```

Read Bulk Entity

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/applicationMappings
```

Method

GET

Sample Request

```
http://127.0.0.1:8981/odata/api/applicationMappings
```

Sample Response

```
{ "@odata.context": "http://localhost:8981/odata/api/$metadata#applicationMappings",
"value":
[
{
 "protocol": -1,
 "description": "11",
 "nbar2EngineId": -1,
 "endPort": -1,
 "nbar2ApplicationId": -1,
 "Name": "test",
 "ip": "127.0.0.1",
 "tos": 12,
 "newPort": 11,
 "mask": 0,
 "ruleType": "Tos",
 "ID": 108,
 "beginPort": -1 },
 { "protocol": -1,

 "tos": 1,
 "newPort": 11,
 "mask": 0,
 "ruleType": "Tos",
 "ID": 109,
 "beginPort": -1
```

```
}
]
}
```

Create ToS (Type of Service)

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/applicationMappings
```

Method

POST

Payload

```
{
"ruleType" : "<Enter the rule type>",
"Name" : "<Enter the application mapping name>",
"newPort" : "<Enter a value between 0 and 65535>",
"tos" : "<Enter the ToS>"
}
```

Sample Request

```
http://127.0.0.1:8981/odata/api/applicationMappings
```

Sample Payload

```
{
"ruleType" : "All",
"Name" : "Tes1t",
"newPort" :23457,
"tos" : 66
}
```

Sample Response

```
{
 "@odata.context": "$metadata#applicationMappings",
 "ID": 150,
 "description": null,
 "protocol": null,
 "tos": 66,
 "ip": null,
 "mask": null,
 "beginPort": null,
 "endPort": null,
 "newPort": 23457,
 "nbar2EngineId": null,
 "nbar2ApplicationId": null,
 "ruleType": "All",
 "Name": "Tes1t"
```

```
}
```

Create Host

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/applicationMappings
```

Method

POST

Example 1

Payload

```
{
"ruleType" : "<Enter the rule type>",
"Name" : "<Enter the application mapping name>",
"newPort" : "<Enter a value between 0 and 65535>",
"beginPort" : "<Enter a value between -1 and 255>>",
"tos" : "<Enter a value between -1 and 255>",
"protocol" : "<Enter-1>",
"ip" : "<Enter the Host IP address>"
}
```

Sample Request

```
http://127.0.0.1:8981/odata/api/applicationMappings
```

Sample Payload

```
{
 "ruleType" : "Host",
 "Name" : "Test22",
 "newPort" :123,
 "beginPort" :-1,
 "tos" : -1,
 "protocol" : -1,
 "ip" : "127.0.0.1"
}
```

Sample Response

```
{
 "@odata.context": "$metadata#applicationMappings",
 "ID": 152,
 "description": null,
 "protocol": -1,
 "tos": -1,
 "ip": "127.0.0.1",
 "mask": null,
 "beginPort": -1,
 "endPort": null,
```

```
 "newPort": 123,
 "nbar2EngineId": null,
 "nbar2ApplicationId": null,
 "ruleType": "Host",
 "Name": "Test22"
}
```

Example 2

Payload

```
{
"ruleType" : "<Enter the rule type>",
"Name" : "<Enter the rule name>",
"newPort" : "<Enter a value between 0 and 65535>",
"beginPort" : "<Enter a value between 0 and 65535>",
"tos" : "<Enter a value between -1 and 255>",
"protocol" : "<Enter 6 or 17>",
"ip" : "<Enter the Host IP address>"
}
```

Sample Request

```
http://127.0.0.1:8981/odata/api/applicationMappings
```

Sample Payload

```
{
"ruleType" : "Host",
"Name" : "Test211",
"newPort" :888,
"beginPort" :211,
"tos" : -1,
"protocol": 6,
"ip": "127.0.0.1"
}
```

Sample Response

```
{
"ID": 155,
"description": null,
"protocol": 6,
"tos": -1,
"ip": "127.0.0.1",
"mask": null,
"beginPort": 211,
"endPort": null,
"newPort": 888,
"nbar2EngineId": null,
"nbar2ApplicationId": null,
"ruleType": "Host",
```

```
"Name": "Test211"
}
```

Create Subnet

For Subnet app mapping of type TCP, protocol value must be 6 and for UDP protocol value must be 17.

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/applicationMappings
```

Method

POST

Payload

```
{
"ruleType" : "<Enter the rule type>",
"Name" : "<Enter the application mapping name>",
"newPort" : "<Enter a value between 0 and 65535>",
"beginPort" : "<Enter a value between 0 and 65535>",
"endPort" : "<Enter a value between 0 and 65535>",
"protocol" : "<Enter 6 or 17>",
"ip" : "<Enter the Host IP address>"
"mask": "<Enter a value between 0 and 32>"
}
```

Sample Request

```
http://127.0.0.1:8981/odata/api/applicationMappings
```

Sample Payload

```
{
"ruleType" : "Subnet",
"Name" : "Test4",
"newPort" :23411,
"beginPort" :255,
"endPort" : 255,
"protocol": 6,
"ip": "127.0.0.1",
"mask": 22
}
```

Sample Response

```
{
 "@odata.context": "$metadata#applicationMappings",
 "ID": 156,
 "description": null,
 "protocol": 6,
 "tos": null,
 "ip": "127.0.0.1",
```

```
 "mask": 22,
 "beginPort": 255,
 "endPort": 255,
 "newPort": 23411,
 "nbar2EngineId": null,
 "nbar2ApplicationId": null,
 "ruleType": "Subnet",
 "Name": "Test4"
}
```

Edit ToS (Type of Service)

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/
applicationMappings(applicationMappings_id)
```

Method

PATCH

Payload

```
{
"ruleType" : "<Enter the rule type>",
"Name" : "<Enter the application mapping name>",
"newPort" : "<Enter a value between 0 and 65535>",
"tos" : "<Enter the ToS>"
}
```

Sample Request

```
{
"ruleType" : "All",
"Name" : "Tes1t",
"newPort" :23457,
"tos" : 66
}
```

Sample Response

There is no response for this API.

Edit Host

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/
applicationMappings(applicationMapping_id)
```

Method

PATCH

Example 1

Payload

```
{
"ruleType" : "<Enter the rule type>",
"Name" : "<Enter the application mapping name>",
"newPort" : "<Enter a value between 0 and 65535>",
"beginPort" : "<Enter a value between -1 and 255>>",
"tos" : "<Enter a value between -1 and 255>",
"protocol" : "<Enter-1>",
"ip" : "<Enter the Host IP address>"
}
```

Sample Request

```
{
"ruleType" : "Host",
"Name" : "Test22",

"protocol" : -1,
"ip" : "127.0.0.1"
}
```

Sample Response

There is no response for this API.

Example 2

Payload

```
{
"ruleType" : "<Enter the rule type>",
"Name" : "<Enter the rule name>",
"newPort" : "<Enter a value between 0 and 65535>",
"beginPort" : "<Enter a value between 0 and 65535>",
"tos" : "<Enter a value between -1 and 255>",
"protocol" : "<Enter 6 or 17>",
"ip" : "<Enter the Host IP address>"
}
```

Sample Request

```
{
"ruleType" : "Host",
"Name" : "Test2",
"newPort" :23457,
"beginPort" :255,
"tos" : -1,
"protocol": 6,
"ip": "127.0.0.1"
```

```
}
```

Sample Response

There is no response for this API.

Edit Subnet

For the Subnet app mapping of type TCP, the protocol value must be 6 and for UDP protocol value must be 17.

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/
applicationMappings(applicationMapping_id)
```

Method

PATCH

Payload

```
{
"ruleType" : "<Enter the rule type>",
"Name" : "<Enter the application mapping name>",
"newPort" : "<Enter a value between 0 and 65535>",
"beginPort" : "<Enter a value between 0 and 65535>",
"endPort" : "<Enter a value between 0 and 65535>",
"protocol" : "<Enter 6 or 17>",
"ip" : "<Enter the Host IP address>"
"mask": "<Enter a value between 0 and 32>"
}
```

Sample Request

```
{
"ruleType" : "Subnet",
"Name" : "Test4",
"newPort" :23411,
"beginPort" :255,
"endPort" : 255,
"protocol": 6,
"ip": "127.0.0.1",
"mask": 22
}
```

Sample Response

There is no response to this API.

Delete Single Entity

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/
applicationMappings(applicationMappings_id)
```

Method

DELETE

Payload

```
{
"ApplicationMapping_Id": [<Enter id of the application mapping that should be deleted>]
}
```

Sample Request

```
http://127.0.0.1:8981/odata/api/applicationMappings(108)
```

Sample Response

There is no response to this API.

Delete Bulk Entities

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/applicationMappings/
com.ca.nfa.odata.removeApplicationMappings
```

Method

POST

Payload

```
{
ApplicationMappingIds: [<Enter the list of ApplicationMapping_Ids separated by a comma>]
}
```

Sample Request

The following request illustrates the bulk delete of application mapping entities.

```
http://127.0.0.1:8080/odata/api/routers/com.ca.nfa.odata.removeApplicationMappings
```

Sample Payload

```
{ "ApplicationMappingIds":[4, 5] }
```

Sample Response

```
{
 "@odata.context": "$metadata#Collection(com.ca.nfa.odata.applicationMappings)",
 "value": [
 {
 "ID": 4,
 "description": "",
 "protocol": -1,
 "tos": 123,
 "ip": "127.0.0.1",
 "mask": 0,
 "beginPort": -1,
 "endPort": -1,
 "newPort": 125,
```

```
 "nbar2EngineId": -1,
 "nbar2ApplicationId": -1,
 "ruleType": "All",
 "Name": "locus-map"
 },
 {
 "ID": 5,
 "description": "",
 "protocol": -1,
 "tos": 124,
 "ip": "127.0.0.1",
 "mask": 0,
 "beginPort": -1,
 "endPort": -1,
 "newPort": 125,
 "nbar2EngineId": -1,
 "nbar2ApplicationId": -1,
 "ruleType": "All",
 "Name": "ftp"
}
 ]
}
```

Predefined Application Mappings

To get all predefined Application Mappings, use predefined application mappings API.

Read Single Entity

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/predefinedApplicationMappings
```

Method

GET

Payload

None

Sample Request

```
http://127.0.0.1:8981/odata/api/applicationMappings
```

Sample Response

```
{
    "@odata.context": "http://127.0.0.1:8981/odata/api/$metadata#predefinedApplicationMappings",
    "value": [
        {
            "newPort": 0,
            "Description": "TCP Fragments",
            "Name": "fragment",
            "ID": 630,
```

```
        "portType": "tcp"
    },
    {
        "newPort": 1,
        "Description": "TCP Port Service Multiplexer Port",
        "Name": "tcpmux",
        "ID": 68,
        "portType": "tcp"
    },
    {
        "newPort": 2,
        "Description": "Remote Job Entry Protocol",
        "Name": "rje",
        "ID": 69,
        "portType": "tcp"
    },
    {
        "newPort": 3,
        "Description": "Compression Process",

            "ID": 78,
            "portType": "tcp"
        }
    ],
    "@odata.nextLink": "http://127.0.0.1:8981/odata/api/predefinedApplicationMappings?$skiptoken=10"
}
```

Create NBAR2 Application Mapping Rule

Resource URI

`http://<nfa odata host>:<nfa odata port>/odata/api/applicationMappings`

Method

POST

Payload

```
{
  "ruleType": "<Enter the rule type>",
  "Name": "<Enter the application mapping name>",
  "Description": "<Enter the mapping description>",
  "nbar2EngineId": <Enter the NBAR2 Engine ID>,
  "nbar2ApplicationId": <Enter the NBAR2 Application ID>,
  "newPort": <Enter a value between 0 and 65535>
}
```

Sample Request

`http://127.0.0.1:8981/odata/api/applicationMappings`

Sample Payload

```
{
  "ruleType": "NBAR2",
  "Name": "NBAR2_NBAR2",
  "Description": "NBAR2_NBAR2",
  "nbar2EngineId": 13,
  "nbar2ApplicationId": 664421,
  "newPort": 32324
}
```

Sample Response

```
{
"@odata.context": "$metadata#applicationMappings",
"ID": 1,
"Description": "NBAR2_NBAR2",
```

```
"protocol": null,
"tos": null,
"ip": null,
"mask": null,
"beginPort": null,
"endPort": null,
"newPort": 32324,
"nbar2EngineId": 13,
"nbar2ApplicationId": 664421,
"ruleType": "NBAR2",
"Name": "NBAR2_NBAR2"
}
```

Edit NBAR2 Application Mapping Rule

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/
applicationMappings(NBar2Application_ID)
```

Method

PATCH

Payload

```
{
  "ruleType": "<Enter the rule type>",
  "Name": "<Enter the application mapping name>",
  "Description": "<Enter the mapping description>",
  "nbar2ApplicationId": <Enter the NBAR2 Application ID>
}
```

Sample Request

```
http://127.0.0.1:8981/odata/api/applicationMappings(1)
```

Sample Payload

```
{
  "ruleType": "NBAR2",
  "Name": "NBAR2_NBAR2_EDIT",
  "Description": "NBAR2_NBAR2_EDIT",
  "nbar2ApplicationId": 664422
}
```

Sample Response

There is no response for this API.

Get Single Port Traffic Status

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/applicationMappings/
com.ca.nfa.odata.PortTrafficStatus(port=<port number>)
```

Method

GET

Sample Request

```
http://127.0.0.1:8981/odata/api/applicationMappings/
com.ca.nfa.odata.PortTrafficStatus(port=161)
```

Sample Response

```
{
"@odata.context": "http://127.0.0.1:8981/odata/api/
$metadata#com.ca.nfa.odata.portTrafficStatus",
"PortName": "snmp"
}
```

Port Priority Rules

You can set port priority values based on the actual networking requirements.

This section explains the following supported operations on port priority rules using the API:

More Information: Work with Port Priorities

Get Port Priority Rules

This API allows you to get the list of port priority rules.

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/portPriorityRules
```

Method

GET

Sample Request

```
http://127.0.0.1:8981/odata/api/portPriorityRules
```

Sample Response

```
{
    "@odata.context": "http://localhost:8981/odata/api/
$metadata#portPriorityRules(ID,portType,startPort,endPort,Description)",
    "value": [
        {
            "startPort": 1080,
            "portType": "TCP",
            "Description": "Socks",
            "ID": 1,
            "endPort": 1080
        },
        {
            "startPort": 1352,
            "portType": "TCP",
            "Description": "Lotus Notes",
            "ID": 2,
            "endPort": 1352
        },
        {
            "startPort": 1352,
            "portType": "UDP",
```

```
        "Description": "Lotus Notes",
        "ID": 3,
        "endPort": 1352
    },
    {
        "startPort": 1433,
        "portType": "TCP",
        "Description": "Microsoft SQL Server DBMS Server",
        "ID": 4,
        "endPort": 1433
    },
    {
        "startPort": 1434,
        "portType": "UDP",
        "Description": "Microsoft SQL Server DBMS Monitor",
        "ID": 5,
        "endPort": 1434
    },
    {
        "startPort": 1494,
        "portType": "UDP",
        "Description": "ICA",
        "ID": 6,
        "endPort": 1494
    },
    {
        "startPort": 1494,
        "portType": "TCP",
        "Description": "ICA",
        "ID": 7,
        "endPort": 1494
    },
    {
        "startPort": 1521,
        "portType": "TCP",
        "Description": "Oracle",
        "ID": 8,
        "endPort": 1521
    },
    {
        "startPort": 2000,
        "portType": "TCP",
        "Description": "SCCP (CM Encore)",
        "ID": 9,
        "endPort": 2002
    },
    {
        "startPort": 2049,
        "portType": "TCP",
        "Description": "NFS",
        "ID": 10,
        "endPort": 2049
    }
```

```
    ],
"@odata.nextLink": http://localhost:8981/odata/api/portPriorityRules?timeout=120&$skiptoken=10
```

Get Single Port Priority Rule

This API allows you to get a single port priority rule.

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/portPriorityRules(portPriorityRuleID)
```

Method

GET

Sample Request

```
http://127.0.0.1:8981/odata/api/portPriorityRules(168)
```

Sample Response

```
{
    "@odata.context": "$metadata#portPriorityRules",
    "ID": 168,
    "portType": "UDP",
    "startPort": 1080,
    "endPort": 1080,
    "Description": "Socks"
}
```

Create Port Priority Rules

This API allows you to create a port priority rule.

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/portPriorityRules
```

Method

POST

Payload

```
{
    "startPort": <start port value>,
    "portType": "<port type value>",
    "endPort": <end port value>,
    "Description": "<description details>"
}
```

Sample Request

```
http://127.0.0.1:8981/odata/api/portPriorityRules
```

Sample Payload

```
{
    "startPort": 1080,
    "portType": "UDP",
    "endPort": 1080,
    "Description": "Socks"
}
```

Sample Response

```
{
    "@odata.context": "$metadata#portPriorityRules",
    "ID": 168,
    "portType": "UDP",
    "startPort": 1080,
    "endPort": 1080,
    "Description": "Socks"
}
```

Update Port Priority Rules

This API allows you to update a single port priority rule. This API does not support bulk edits.

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/portPriorityRules(portPriorityRuleID)
```

Method

PATCH

Payload

```
{
    "startPort": <start port value>,
    "portType": "<port type value>",
    "endPort": <end port value>,
    "Description": "<description details>"
}
```

Sample Request

```
http://127.0.0.1:8981/odata/api/portPriorityRules(168)
```

Sample Payload

```
{
    "startPort": 1080,
    "portType": "UDP",
    "endPort": 1080,
    "Description": "Socks_Change"
}
```

Sample Response

There is no response for this API.

Delete Port Priority Rules

This API allows you to delete a single port priority rule.

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/portPriorityRules(portPriorityRuleID)
```

Method

DELETE

Sample Request

The following request illustrates the delete action for the port priority rule id 168.

```
http://127.0.0.1:8981/odata/api/portPriorityRules(168)
```

Sample Response

There is no response for this API.

Bulk Delete Port Priority Rules

The following code is a reference metadata section for deleting bulk port priority rules.

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/portPriorityRules/com.ca.nfa.deletePortPriorityRules
```

Method

POST

Payload

```
 "RuleIds":[<List of rule_ids separated by a comma>]
```

Sample Request

The following request illustrates the delete action for bulk delete port priority rules.

```
http://127.0.0.1:8981/odata/api/portPriorityRules/com.ca.nfa.deletePortPriorityRules
```

Sample Payload

```
{
    "RuleIds": [106,107]
}
```

Sample Response

```
{
    "@odata.context": "$metadata#Collection(com.ca.nfa.odata.portPriorityRules)",
    "value": [
        {
            "ID": 106,
            "portType": "TCP",
            "startPort": 1000,
            "endPort": 1050,
            "Description": "Uday3"
        },
        {
            "ID": 107,
            "portType": "TCP",
            "startPort": 1000,
            "endPort": 1010,
            "Description": ""
        }
    ]
}
```

Validation Checks

Following data validations must be considered while entering the values.

- Combination of PortType, StartPort, and EndPort should be unique.
- Values for PortType should be either ‘TCP’ or ‘UDP’.
- Values for ports should be from 0 through 65535.
- Length of description should be fewer than 120 characters.

Reserved Seating Rules

You can create Reserved Seating rules to help ensure that reports include the port and protocol combinations that interest you, regardless of traffic volume or rates.

This section explains the following supported operations on reserved seating rules using the API:

More Information: Create, Change, or Delete Reserved Seating Rules

Get Reserved Seating Rules

This API allows you to get the list of reserved seating rules.

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/reservedSeatingRules
```

Method

GET

Sample Request

```
http://127.0.0.1:8981/odata/api/reservedSeatingRules
```

Sample Response

```
{
    "@odata.context": "http://localhost:8981/odata/api/
$metadata#reservedSeatingRules(ID,protocol,port,description)",
    "value": [
        {
            "protocol": 6,
            "port": 4444,
            "description": "Reserved Seating Test",
            "ID": 3
        },
        {
            "protocol": 17,
            "port": 4444,
            "description": "Reserved Seating Test",
            "ID": 4
        },
        {
            "protocol": 6,
            "port": 8080,
            "description": "Reserved Seating Test 8080",
            "ID": 5
        },
        {
            "protocol": 17,
            "port": 8080,
```

```
            "description": "Reserved Seating Test 8080 UDP",
            "ID": 6
        }
    ]
}
```

Get Single Reserved Seating Rule

This API allows you to get a single reserved seating rule.

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/reservedSeatingRules(reservedSeatingRuleID)
```

Method

GET

Sample Request

```
http://127.0.0.1:8981/odata/api/reservedSeatingRules(4)
```

Sample Response

```
{
    "@odata.context": "http://localhost:8981/odata/api/
$metadata#reservedSeatingRules(ID,protocol,port,description)/$entity",
    "protocol": 17,
    "port": 4444,
    "description": "Reserved Seating Test",
    "ID": 4
}
```

Create Reserved Seating Rules

This API allows you to create a reserved seating rule.

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/reservedSeatingRules
```

Method

POST

Payload

```
{
    "protocol": <protocol value>,
    "port": <port value>,,
    "description": "<description details>"
}
```

Sample Request

```
http://127.0.0.1:8981/odata/api/reservedSeatingRules
```

Sample Payload

```
{
    "protocol": 17,
    "port": 8080,
    "description": "Reserved Seating Test 8080 UDP"
```

```
}
```

Sample Response

```
{
    "@odata.context": "http://localhost:8981/odata/api/
$metadata#reservedSeatingRules(ID,protocol,port,description)/$entity",
    "protocol": 17,
    "port": 8080,
    "description": "Reserved Seating Test 8080 UDP",
    "ID": 6
}
```

Update Reserved Seating Rules

This API allows you to update a single reserved seating rule. This API does not support bulk edits.

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/reservedSeatingRules(reservedSeatingRuleID)
```

Method

PATCH

Payload

```
{
    "protocol": <protocol value>,
    "port": <port value>,,
    "description": "<description details>"
}
```

Sample Request

```
http://127.0.0.1:8981/odata/api/reservedSeatingRules(5)
```

Sample Payload

```
{
    "protocol": 17,
    "port": 8080,
    "description": "Reserved Seating Test 8080 UDP Update"
}
```

Sample Response

There is no response for this API.

Delete Reserved Seating Rules

This API allows you to delete a single reserved seating rule.

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/reservedSeatingRules(reservedSeatingRuleID)
```

Method

DELETE

Sample Request

The following request illustrates the delete action for the reserved seating rule id 5.

```
http://127.0.0.1:8981/odata/api/reservedSeatingRules(5)
```

Sample Response

There is no response for this API.

Bulk Delete Reserved Seating Rules

The following code is a reference metadata section for deleting bulk reserved seating rules.

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/reservedSeatingRules/
com.ca.nfa.odata.deleteReservedSeatingRules
```

Method

POST

Payload

```
 "RuleIds":[<List of rule_ids separated by a comma>]
```

Sample Request

The following request illustrates the delete action for bulk delete reserved seating rules.

```
http://127.0.0.1:8981/odata/api/reservedSeatingRules/com.ca.nfa.odata.deleteReservedSeatingRules
```

Sample Payload

```
{
    "RuleIds": [4,5]
}
```

Sample Response

```
{
    "@odata.context": "$metadata#Collection(com.ca.nfa.odata.reservedSeatingRules)",
    "value": [
        {
            "ID": 4,
            "protocol": 17,
            "port": 4444,
            "description": "Reserved Seating Test"
        },
        {
            "ID": 5,
            "protocol": 6,
            "port": 8080,
            "description": "Reserved Seating Test 8080"
        }
    ]
}
```

Validation Checks

Following data validations must be considered while entering the values.

- Combination of protocol and port should be unique.
- Values for protocol should be either 6 for TCP and 17 or UDP.
- Values for port should be from 0 through 65535.
- Length of description should be fewer than 100 characters.

AS Names

Interface reports that show data about Autonomous System (AS) traffic typically label the AS traffic by name and number. Administrators can customize AS names to make the AS references in reports shorter or more descriptive.This section explains the following supported operations on AS Names using the API:

More Information: Customize AS Names

Get AS Names

This API allows you to get the list of AS Names.

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/asNames
```

Method

GET

Sample Request

```
http://127.0.0.1:8981/odata/api/asNames
```

Sample Response

```
{
    "@odata.context": "http://localhost:8981/odata/api/
$metadata#asNames(ASNumber,Description,isBaseDescription)",
    "value": [
        {
            "isBaseDescription": "true",
            "Description": "LVLT-1 - Level 3 Communications, Inc.",
            "ASNumber": 1
        },
        {
            "isBaseDescription": "true",
            "Description": "DCN-AS - University of Delaware",
            "ASNumber": 2
        },
        {
            "isBaseDescription": "true",
            "Description": "MIT-GATEWAYS - Massachusetts Institute of Technology",
            "ASNumber": 3
        },
        {
            "isBaseDescription": "true",
            "Description": "ISI-AS - University of Southern California",
            "ASNumber": 4
        },
        {
```

```
            "isBaseDescription": "true",
            "Description": "SYMBOLICS - Symbolics, Inc.",
            "ASNumber": 5
        },
        {
            "isBaseDescription": "true",
            "Description": "BULL-NETWORK for further information please visit http://www.bull.com",
            "ASNumber": 6
        },
        {
            "isBaseDescription": "true",
            "Description": "UK Defence Research Agency",
            "ASNumber": 7
        },
        {
            "isBaseDescription": "true",
            "Description": "RICE-AS - Rice University",
            "ASNumber": 8
        },
        {
            "isBaseDescription": "true",
            "Description": "CMU-ROUTER - Carnegie Mellon University",
            "ASNumber": 9
        },
        {
            "isBaseDescription": "true",
            "Description": "CSNET-EXT-AS - CSNET Coordination and Information Center (CSNET-CIC)",
            "ASNumber": 10
        }
    ],
    "@odata.nextLink": "http://localhost:8981/odata/api/asNames?$skiptoken=10"
}
```

NOTE

If you do not provide domainId in the request, default domainId 1 is considered and AS Names for that domain are returned.

To get the AS Names for a different domain other than the default domain, add the domainId parameter in the request.

URI: http://127.0.0.1:8981/odata/api/asNames?domainId=2

Method: GET

Get Single AS Name

This API allows you to get a single AS Name.

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/asNames(asNameID)
```

Method

GET

Sample Request

```
http://127.0.0.1:8981/odata/api/asNames(1)
```

Sample Response

```
{
    "@odata.context": "http://localhost:8981/odata/api/
$metadata#asNames(ASNumber,Description,isBaseDescription)/$entity",
    "isBaseDescription": "true",
    "Description": "LVLT-1 - Level 3 Communications, Inc.",
    "ASNumber": 1
}
```

NOTE

If you do not provide domainId in the request, default domainId 1 is considered and AS Names for that domain are returned.

To get the AS Names for a different domain other than the default domain, add the domainId parameter in the request.

Sample Request: http://127.0.0.1:8981/odata/api/asNames(1)?domainId=2

Edit AS Names

This API allows you to update a single AS name. This API does not support bulk edits.

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/asNames(asNameID)
```

Method

PATCH

Payload

```
{
    "Description": "<description to be updated",
    "DomainId": <domainId>
}
```

Sample Request

```
http://127.0.0.1:8981/odata/api/asNames(1)
```

Sample Payload

```
{
    "Description": "new updated as description",
    "DomainId": 1
}
```

Sample Response

There is no response for this API.

NOTE

- DomainId must be included in the payload to get the AS Names of the specified domain.
- Description is the only field that is editable and must be included in the payload to edit.

Reset AS Name

This API allows you to reset AS Name.

Resource URI

```
http://<nfa odata host>:<nfa odata port>/odata/api/asNames(asNameID)/com.ca.nfa.odata.reset
```

Method

POST

Sample Request

```
http://127.0.0.1:8981/odata/api/asNames(1)/com.ca.nfa.odata.reset
```

Sample Response

```
{
    "@odata.context": "$metadata#com.ca.nfa.odata.asNames",
    "ASNumber": 1,
    "Description": "LVLT-1 - Level 3 Communications, Inc.",
    "isBaseDescription": "true"
}
```

NOTE

This API resets the description of AS Name that is associated to the specified AS for the default domainId 1.

If you want to reset the same AS for a different domain, add the domainId in the request.

Sample Request: http://127.0.0.1:8981/odata/api/asNames(1)/com.ca.nfa.odata.reset?domainId=2

IP Address and Hostname

Network Flow Analysis 10.0.3 supports the IP Address and Hostname API.

NOTE

More Information:

Manage Address-Hostname

IP Address and Hostname Historical Data

The API is used to fetch the data for hostnames associated with IP addresses.

Resource URI

```
http://{nfa odata host>:<nfa odata port>/odata/api/addressesHostNames
```

Method

GET

Sample Request

```
http://127.0.0.1:8981/odata/api/addressesHostNames
```

Payload

Not Applicable

Sample Payload

Not Applicable

Response

```
  {
"@odata.context": "http://127.0.0.1:8981/odata/api/

```

SNMP router Refresh

Using ODATA API, you can now perform SNMP router refresh.

The new SNMP refresh ODATA API perform the below functionalities.

1. Discovers the SNMP profile that is needed for given router. If not assigned already, assign the SNMP profile to the router.
2. Runs the refresh functionality which is similar to console refresh functionality and reports the status as Success or Fail.
3. Updates router information if any router configuration changes like sysName, sysDesc.
4. Adds the newly added interfaces for a given router.
5. Updates the interfaces information for a given router.

> **NOTE**
> While performing the refresh, you must pass the routerId in the request.

Below are few example scenarios:

If the Router does not exist:

Method

POST

Sample Request:

```
http://<nfa odata host>:<nfa odata port>/odata/api/routers(routerID)/
com.ca.nfa.snmprefresh
```

Sample Response:

```
{
    "error": {
        "code": "404",
        "message": "No Data exists for this key"
    }
 }
```

If any SNMP Router:

Method

POST

Sample Request:

```
http://<nfa odata host>:<nfa odata port>/odata/api/routers(routerID)/
com.ca.nfa.snmprefresh
```

Sample Response:

```
{
    "@odata.context": "$metadata#com.ca.nfa.odata.csnmprefresh",
    "status": "Refresh successful",
    "profileName": "public",
    "refreshRouter": [
        {
            "address": "10.84.200.33",
            "sysName": "Sim34608:nhplt0058.nwie.net",
            "sysDescr": "Linux nhplt0058.nwie.net 3.10.0-1062.1.2.el7.x86_64 #1 SMP Mon
 Sep 16 14:19:51 EDT 2019 x86_64",
            "sysUpTime": 0,
            "ifNumber": 0,
            "updatedOn": 1590127948
        }
    ],
    "refreshInterface": [
        {
            "routerAddress": "10.84.200.33",
            "persistentId": 295,
            "ifIndex": 300000,
            "snmpDataIsValid": false,
            "ifSpeed": 0,
            "inSpeed": 0,
            "outSpeed": 0,
```

```
            "ifType": 0,
            "updatedOn": 1589527628,
            "ifName": "",
            "ifAlias": "",
            "ifDescr": "",
            "ifIpAddr": "",
            "portName": "",
            "vrfName": ""
        },
{
----if any more routers
}

 ]
}
```

If any Non-SNMP Router:

Method

POST

Sample Request:

```
http://<nfa odata host>:<nfa odata port>/odata/api/routers(routerID)/
com.ca.nfa.snmprefresh
```

Sample Response:

```
{
    "@odata.context": "$metadata#com.ca.nfa.odata.csnmprefresh",
    "status": "Refresh Failed",
    "profileName": "Profile not found",
    "refreshRouter": [],
    "refreshInterface": []
}
```

If any Retired Router:

Method

POST

Sample Request:

```
http://<nfa odata host>:<nfa odata port>/odata/api/routers(routerID)/
com.ca.nfa.snmprefresh
```

Sample Response:

```
{
    "error": {
        "code": "404",
        "message": "No Data exists for this key"
    }
```

```
}
```

Troubleshooting

This section contains the following articles:

Installation Troubleshooting

This section provides some troubleshooting tips for problems that are revealed by prerequisite tests. Prerequisite tests can generate warnings or failure notices. If you receive a warning, you can correct the problem immediately or after the installation or upgrade software runs. Failures must be corrected before you can continue. Most of the troubleshooting topics are for prerequisite failures.

> **NOTE**
> Many prerequisite tests rely on general indicators to identify problem areas. Passing a prerequisite test is not a guarantee that everything is configured properly. It is important to meet all of the server requirements, verify that supported versions of the required software are installed and complete all of the configuration tasks.

The following prerequisite tests are run:

Test	Description	Warning or Failure	Server
SC.exe	Verifies that SC.exe is installed on the server.	Failure	Windows servers
Browser	Checks the Registry for a browser. Verifies that a supported browser version is installed.	Warning	Stand-alone Distributed: NFA console
DEP	Verifies that the `winmgt` service is running.	Warning	Stand-alone Distributed: NFA console, Harvester (Windows)
FIPS Algorithm Policy	Verifies that the FIPS Algorithm policy is not enabled.	Verify automatic fix or Failure	Stand-alone Distributed: NFA console
IIS Installed	Verifies that the `wcsvc` service is running.	Warning	Stand-alone Distributed: NFA console
IIS Version	Checks the Registry for IIS version 7.0, 7.5, 8.0, or 8.5.	Warning	Stand-alone Distributed: NFA console
Unsupported Windows Dot Net detected	Checks for .NET 4.6.2 installation.	Failure	Windows servers
NPC Installation Detected	Checks to ensure that NPC is not installed on the server.	Failure	Stand-alone Distributed: NFA console
SNMP	Verifies that the snmp service is running and the process ID is present.	Warning	Stand-alone Distributed: NFA console, all Harvesters
Windows 2012 Detected	Verifies that the server is running Windows Server 2012 for new installs.	Failure	Windows servers

Unsupported Red Hat System Detected	Checks that the Harvester server is running Red Hat Enterprise Linux 6.7 or 6.8 for new installs.	Failure	Distributed: All Linux Harvester servers

NOTE

More information:

- Configure DEP
- Install .NET Framework
- Install IIS, ASP, COM+, and SNMP
- Configure SNMP on Windows servers
- Configure SNMP on Linux servers?

FIPS Algorithm Policy Is Enabled

Valid on Console only

When I click **Next** in the License Agreement screen in the installation or upgrade program for the NFA console, a **Pre-requisite Check Warning** message opens, which includes the following text:

"The FipsAlgorithmPolicy registry key for this system is set to enabled. If the following key is enabled, Windows will not allow certain algorithms to run..."

The error message opens because a system check found the FipsAlgorithmPolicy key in the Windows Registry, which indicates that the Federal Information Processing Standard (FIPS) 140 cryptographic standard is enabled. While this policy is enabled, the server can run only the cryptographic algorithms that have been submitted to and approved by the National Institute of Standards and Technology (NIST).

This restriction can cause problems connecting to databases through Open Database Connectivity (ODBC). Problems with DX NetOps connectivity may result.

To disable the FipsAlgorithmPolicy Registry key, click **OK** in the **Pre-requisite Check Warning** message. The FIPS algorithm policy is disabled and does not restrict database connections.

NPC Installation Detected

Valid on Console

If you attempt to launch the installation or upgrade program on a server that has NetQoS Performance Center installed, an error message opens, and the installation is canceled.

DX NetOps cannot be installed on the same server as CA NetQoS Performance Center. NPC must be completely removed before you proceed with the DX NetOps installation or upgrade.

SC.exe Is Not Installed

Valid on Console or Harvester

When I click **Next** in the **License Agreement** screen of the installation or upgrade program, an error message opens, which begins with the following text:

```
sc.exe is not installed. The installer was unable to find "sc.exe" in the System32 folder.
```

A system check did not find the Service Control command (the `sc.exe` file) in the `Windows/System32` directory. The Service Control command is used for communicating with the Service Controller during command line operations. If the file is missing, the installation or upgrade program exits.

The `sc.exe` file is included with the Windows Server software by default. To correct the problem, restore the missing `sc.exe` from your Windows Server installation software, Windows Resource Kit, or other resource.

Troubleshoot SNMP Issues

This section discusses troubleshooting issues with SNMP:

SNMP Is Not Enabled

Symptom:

When I click **Next** in the **License Agreement** screen of the installation or upgrade program, an SNMP warning message opens. The message reads:

```
Pre-requisite Check Warning
The following issues were found:
SNMP is not enabled.
While not required before installation, some functionality may not work correctly if these are not addressed.
```

Solution:

The SNMP warning message opens because the prerequisite check does not find that the snmpd daemon is running. You can correct the problem when the warning appears or you can proceed with the installation or upgrade. In any case, DX NetOps does not run properly until you configure SNMP and make sure that the snmpd daemon is running.

Use the following procedure to check the SNMP status on a Linux server.

Follow these steps:

1. Enter the status command in a terminal window:

   ```
   service snmpd status
   ```

   The command returns the process ID of the snmpd daemon. If the return text does not list a process ID for the snmpd daemon, it is not running.

Profile not Found

An error message **Profile not found** appears when I click **Discover** router on Enable Interface Page.

Symptom:

SNMP v3 profile does not get discovered for a router.

Solution:

SNMP profile Username must be unique for a NFAConsole. Select a unique user name for the SNMP profile of the router.

Windows Server 2012 R2 or 2016 Required for New Installs

A new installation of or upgrade to DX NetOps 9.5.0 can only be done on Windows Server 2012 R2 or 2016 systems. It cannot be done on Windows Server 2008 R2 systems.

If you attempt to do an installation or upgrade, a dialog box displays in the installer informing you that you are using an unsupported operating system and the installation quits.

```
Unsupported Windows system detected
```

```
It appears that you are not running a Windows 2012 system. Currently, the only supported
 versions include Windows 2012.

Please contact CA support for assistance in upgrading your system and refer to your
 installation guide for more details

regarding system requirements for performing upgrades. This installer will now exit.

OS Detected: [USER'S OS LISTED HERE]
```

This is true for the following installed components:

- NFA console
- Harvester
- Anomaly Detector
- Flow Cloner

Red Hat Enterprise Linux 6.x or 7.x Required for New Installs

A new installation of the DX NetOps 9.3.8 Harvester can only be done on RHEL 6.7, 6.8 or 7.3 systems. It cannot be done on RHEL 5.6 systems.

If you attempt to do a clean install or an upgrade of an existing installation, a dialog box displays in the installer informing you that you are using an unsupported operating system and the installation quits.

```
Unsupported Red Hat system detected

It appears that you are not running a Red Hat Enterprise Linux

Server 6.7+ system. Currently, the only supported versions include

Red Hat Enterprise Linux Server 6.7 and above. Please contact CA

Support for assistance in upgrading your system and refer to your

installation guide for more details regarding system requirements

for performing upgrades. This installer will now exit.

OS Detected: <User's OS version>
```

This is true for the following installed components:

- Linux Harvester

MySQL-Generated Errors During Installation or Upgrade

The MySQL database installation or restore errors include:

- During MySQL database backup:

  - MySQL Database Backup Failed
    An error occurred while attempting to create database backups needed for the MySQL upgrade. See `C:\CA\NFA\MySql_Backups\Backup_Log.log` for more information, or contact CA Support for help in upgrading your product.
    The upgrade is cancelled.
- During MySQL database restore:
  - MySQL Database Restore Failed
    An error occurred while attempting to restore the database backups created for the MySQL upgrade. See `C:\CA\NFA\MySql_Backups\Backup_Log.log` for more information, or contact CA Support for help in upgrading your product.

Troubleshoot Data Collection

As flow starts going to the routers, then to DX NetOps, the flow data is processed and stored on the DX NetOps component servers. If data does not appear in reports as expected, a core troubleshooting approach is to check whether the data files are present on the servers.

This article shows administrators how to check the file systems on DX NetOps servers to verify that data files are being collected.

Prerequisites

This procedure assumes that you:

- Installed the DX NetOps software on the servers that collect and process the data.
- Configured your NetFlow or NetFlow-compliant flow to be exported to DX NetOps.

Once you set up and configure DX NetOps to receive flow, verify that the appropriate data files are collected.

Verify Data Collection in a Stand-Alone Configuration

Ensure that the appropriate data files are collected on a stand-alone system by verifying that valid `.nfa` files are present.

If the `.nfa` files are not present, wait for an hour and check again.

Follow these steps:

Verify that valid NetFlow archive (`.nfa`) files are present:

1. Log in as a user who has administrator privileges for DX NetOps.
2. Locate the following directory:
   `<install_path>\Netflow\datafiles\HarvesterArchive`
3. Verify that the `HarvesterArchive` directory contains valid NetFlow archive files, `.nfa` files that are larger than 0 KB in size.
4. (Recommended) If you do not find valid `.nfa` files, complete the following troubleshooting tasks:
   - Verify that the CA NFA Harvester service is running. If the service is not running, start it.
   - If the Harvester is not receiving data, verify that it listens for data on the same port that was used to configure flow export from the Harvester interfaces. If the ports do not match, modify the `NetflowPacketListenPort` value in the Harvester database `harvester.parameter_descriptions` table.
   - Review the log file:
     `<install_path>\NetFlow\Logs\harvester-wrapper.log`
     If you consult with CA Support for a resolution, supply this log or refer to the errors in it.
     To change the logging level, change `enableDebugLogging=false` to `enableDebugLogging=true` in
     `<install_path>\Netflow\bin\harvester.properties`

Verify Data Collection in a Two-Tier Distributed Deployment

Ensure that the appropriate data files are collected in a two-tier distributed deployment by verifying that Harvester servers have valid `.nfa` files.

If the `.nfa` files are not present, wait for an hour and check again.

Follow these steps:

Verify that valid NetFlow archive (`.nfa`) files are present on the Harvester server:

1. Log in as a user who has administrator privileges for DX NetOps.
2. Locate the following directory on the Harvester server:
   `<install_path>\Netflow\datafiles\HarvesterArchive`
3. Verify that the `HarvesterArchive` directory contains valid NetFlow archive files (`.nfa` files that are larger than 0 KB in size).
4. (Recommended) If you do not find valid `.nfa` files, complete the following troubleshooting tasks:
   - Verify that the CA NFA Harvester service is running. If the service is not running, start it.
   - Review the log file:
     `<install_path>\NetFlow\Logs\harvester-wrapper.log`
     If you consult with CA Support for a resolution, supply this log or refer to the errors in it.
   - To change the logging level, change `enableDebugLogging=false` to `enableDebugLogging=true` in
     `<install_path>\Netflow\bin\harvester.properties`
5. Repeat these steps for any additional Harvester servers.

Troubleshoot Harvester Connection Errors

This section shows CA Network Flow Analysis administrators how to troubleshoot certain Harvester connection error messages.

Custom Report Fails to Connect to Database

Symptom:

Status is "Error".

Status Message is: "Failed to complete baseline calculation: The connection to the database has been lost."

Solution:

1. Verify network connections to all Harvester servers.
2. Ensure that the Harvester service is running on all Harvester servers.
3. Ensure that the NetQoS Reporter/Analyzer Query Services service is running on the NFA Console.
4. Select the custom report, then select **Run**.

Troubleshoot a WSDL Access Error

Symptom:

When I try to add a Harvester, I receive an error that says the WSDL could not be accessed during discovery. The error text is:

"An error occurred during the discovery process. The following information may be helpful. Failed to access the WSDL at: http://localhost:8081/snmp?wsdl. It failed with: Got Server returned HTTP response code: 403 for URL: http://localhost:8081/snmp?wsdl while opening stream from http://localhost:8081/snmp?wsdl"

Solution:

Test polling failed due to a conflict on port 8081, the port that is used by default for the CA NFA DNS/SNMP Proxies service. Port 8081 may be in use by some other program, such as an anti-virus program.

To resolve the problem, change the port setting for the other program or for the CA NFA DNS/SNMP Proxies service. To change the CA NFA DNS/SNMP Proxies service port setting, complete the following steps.

Follow these steps:

1. Log in to the Harvester server with an account that has administrator privileges.
2. Stop the following services on the Harvester server.
   - CA NFA Collection and Poller Webservices (nfa_collpollws on Linux Harvesters)
   - CA NFA DNS/SNMP Proxies (nfa_proxies on Linux Harvesters)
   - CA NFA Poller (nfa_poller on Linux Harvesters)
3. Navigatetomysqlata command line prompt and enter the following commands or input statements:

   ```
   use Harvester;

   select * From settings;
   ```

   The `SnmpProxyAddress` and `SnmpProxyPort` key names and current values are shown.
4. Change the `SnmpProxyPort` key setting, for example, by entering the following command or input statement:

   ```
   Update settings set value = '8089' where name='SnmpProxyPort';
   ```

   In this example, the port for the CA NFA DNS/SNMP Proxies service is changed to 8089.
   Do not change the setting for the `SnmpProxyAddress` key. The only supported value for this key is "localhost."
5. Navigate to *$INSTALL_DIR\NFA\REPORTER\NetQoS.ReporterAnalyzer.ManagerService\bin* folder.
6. Edit the **ReporterManagerService.exe.config** file and update the port number from 8081 to 8089 in the following tag.

   ```
   <add key="DnsProxyClient.JavaDnsProxyUrl" value="http://{0}:8081/dns"/
   >
   to

   <add key="DnsProxyClient.JavaDnsProxyUrl" value="http://{0}:8089/dns"/>
   ```

7. Restart the following services on the Harvester server.
   - CA NFA Collection and Poller Webservices (nfa_collpollws on Linux Harvesters)
   - CA NFA DNS/SNMP Proxies (nfa_proxies on Linux Harvesters)
   - CA NFA Poller (nfa_poller on Linux Harvesters)

   You are now ready to add the Harvester in the NFA console Harvester window.

Troubleshoot a TCP 10060 Error

Symptom:

When I try to add a Harvester, I receive a connection error that is similar to the following one:

"Could not connect to http://<address>:8066/collector. TCP error code 10060: A connection attempt failed because the connected party did not properly respond after a period of time, or established connection failed because connected host has failed to respond <address>:8066."

Solution:

Verify that the following conditions are met:

- You correctly entered the IP address of the Harvester or stand-alone server.
- The DX NetOps services are running on the Harvester or stand-alone server, including the CA NFA Collection and Poller Webservices (nfa_collpollws on Linux Harvesters).
- If the Harvester is installed on a different server than the NFA console, you confirmed that the Harvester server is running. You also confirmed that the Harvester is configured as described in the DX NetOps installation instructions.

Troubleshoot Importing Application Mapping Rules

These are some of the error messages that may be displayed when importing rules for application mapping. When importing is complete, the command returns error messages for any failed imports, then lists the fields for the failed rules.

If the rule import file contains column definition errors, the import operation fails. If the file contains errors in rule definitions, the import operation skips each faulty rule and continues with the next rule.

Notes about the **Description** field:

- All of the rule fields must be populated with values except the optional **Description** (desc) field. The rule line must include the comma for the desc field, however.
- If **Description** field values contain internal commas, the rule import fails. The import utility does not support commas inside **Description** values.

A column named 'XXX' already belongs to this DataTable

The import file contains a duplicate of the column named in the error message. The column name is shown in place of 'XXX'.
Troubleshooting: Delete the duplicated column.

An invalid ApplicationMapping

One of the following problems occurred while you were updating existing rules:

- The import file specifies the `appID` of the original rule incorrectly.
- The specified `appID` corresponds to a rule that has been deleted.

Troubleshooting: Verify that the `appID` is entered correctly and that its rule still exists. You can export the current rules to a `.csv` file. The export file includes the `appID` s for all of the current rules.

Application Mapping object is not valid: An existing record is already in use

Both of the following conditions were met:

- You are using the file format for importing a new rule.
- One of the rule definitions in the import file has the same field values as an existing rule.

Troubleshooting: If this error occurs rarely, you may want to edit the rules individually on the **Application Definitions** page. You can update a group of existing rules by using the `racmd` command.

Application Mapping object is not valid: An invalid protocol was entered

The import file may have a misspelled column name or may include an invalid column. This error may also occur if a rule has an invalid value for a required field (a field other than **desc**).
Troubleshooting: Verify that the following elements are correct in the import file:

- – Field values: Rule definitions have supported field values. The values are entered correctly.
  – Format: The correct columns are included in the file. The column names are spelled correctly.

Application Mapping object is not valid: IP cannot be blank

The error may occur if either of the following conditions is met:

- – An NBAR2 rule is missing the NBAR2 application ID value.
  – A Host (server) rule is missing the server IP address value.

Troubleshooting: Add the missing value to the rule definition.

Application Mapping object is not valid: Mask must be between 0 and 32

The Subnet rule has an unsupported Mask value.
Troubleshooting: Specify a Mask value between 0 and 32.

Application Mapping object is not valid: ToS must be between 0 and 255

The All (ToS) rule has an unsupported ToS value.
Troubleshooting: Specify a ToS value between 0 (all ToS) and 255.

Error: Missing parameter name from -params list

The rule has no specified value for one of the required fields.
Troubleshooting: Verify that all of the required field values are included. All field values are required except for **desc**.
To display help for the command, enter:

```
setapplicationmapping
```

Troubleshoot CA Unified Infrastructure Management - CA Network Flow Analysis Integration

The starting point for any troubleshooting should be the CA Unified Infrastructure Management (CA UIM) server.

- Look in *install_path* `/probes/network/nfa_inventory`
  – `nfa_inventory.txt` is the log file for the probe
  – `discovery.json` is a CTD graph dump of the query results from the discovery server for the SNMP profile sync
  – If debug logging is enabled, you'll also see `graphDump.txt` and `internalGraph.json` files
  – Creating an empty directory here named `debug` will get you more CTD traces
- On the NFA console, look in `ConsoleErrorsLog*.log` and `WebServicesQueryLog*.log` for exceptions.
  – When CA UIM is registered as a portal, the **portalUrl** parameter will be set in the system_settings table.
- SNMP credentials synced from UIM will have a prefix of "UIM-" and a suffix of the ID assigned to it. For example, "UIM-public-1".

Users and Groups

The "Manage Reports" permission no longer functions as a pseudo-super user. This permission now allows users to create, edit, and run reports within the scope that their group membership (permission sets) defines.

Check User Mapping

The concept of an Account doesn't exist in DX NetOps, but there are Group and Permission Set concepts (Permission Sets being a specialization of a group). The mapping is:

- CA UIM Account maps to DX NetOps Permission Set
- CA UIM Origin maps to DX NetOps Group
- CA UIM ACL maps to DX NetOps Roles/Rights
- CA UIM User/Contact maps to DX NetOps User

This means:

- For each CA UIM Account, CA NFA creates a Permission Set.
- Each CA NFA Permission Set has access to Interface Groups that correspond to each CA UIM Origin in the CA UIM Account.
- For each CA UIM ACL, a CA NFA Role is created with rights that correspond to the ACL permissions specified in CA UIM.

  NOTE
  CA UIM adds the CA NFA rights, prefixed with NFA, to facilitate this mapping.
- For a CA UIM User/Contact, a CA NFA User is created with access to the CA NFA Permission Set corresponding to the CA UIM Account, and having the CA NFA Role created corresponding to the ACLs.

Troubleshoot Administration Links Failing in the CA NFA Console

Problem:

The following error occurs when clicking **SNMP Profiles** in the **Administration** page:

```
Microsoft VBScript runtime error '800a01fa'
Class not defined: 'SettingsDB'
/nqsrv_nav.asp, line 111
```

A browser on a remote client machine may show an **HTTP 500 Internal Server Error**.

Cause:

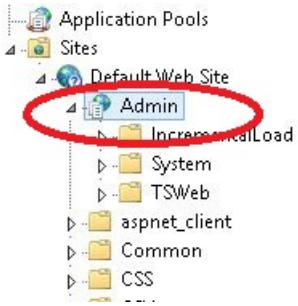
CA NFA was installed without all of the prerequisites. The problem persists even after uninstalling CA NFA, installing the prerequisites, and reinstalling CA NFA.

Solution:

The installer may have created an **Admin** application pool in IIS. The uninstaller is unable to remove the **Admin** application pool (which will have a blue globe icon), so future installs will install into the existing application pool.

Follow these steps:

1. Start IIS Manager.
2. Expand **Default Web Site**.
3. Check whether there is a blue globe icon next to **Admin**. This means that **Admin** is listed as an application.



4. Right-click **Admin** (with the globe icon) and select **Remove**.
5. Run the following from a command prompt:

   ```
   IISRESET
   ```
6. Log in to CA NFA and verify that the links on the **Administration** page now work properly.

Troubleshoot Migrating NBAR2 Application Mappings

If you are migrating a CA NFA installation where NBAR2 application mappings are used, the following log file is created by the installer. It contains details about the import of new NBAR2 application mappings:

```
CA\NFA\REPORTER\racmd\Install_RaCmd_Import_NBAR2.log
```

The following errors may be present in the log file:

- `Application Mapping object is not valid: An existing record is already in use`
  - Indicates that a duplicate entry was not imported. It is normal for these errors to be present.
- `Port XXXXX is already used by an existing application mapping. Using port YYYYY instead.`
  - Indicates that an existing application mapping (of any type) is already using the port listed in `nbar2.csv` , and the mapping was successfully imported using a different port.
- `Port XXXXX is already used by an existing application mapping.`
  - Indicates that a suitable unused port was not found, and the mapping was not imported.

A list of mappings that failed to import (including duplicates) can be found at the end of the log file.

Troubleshoot Missing Data in Reports That Have a Time Filter Applied

Problem

I do not see data in reports that have a Time Filter applied.
The `\Reporter\logs\WebServiceQuery*log` contains errors like:

```
archive@10.0.0.1:3307
Unknown or incorrect time zone: 'UTC'
set time_zone = ?TimeZone;
(0.0000 ms)
at NetQoS.Data.MySqlDataComponentBase.OpenConnection(MySqlConnection connection)
at NetQoS.Data.MySqlDataComponentBase.ExecuteDataTable(MySqlConnection connection, String sql, DataTable
 table, DataParameter[] dataParameters)
at NetQoS.Data.MySqlDataComponentBase.ExecuteDataTable(MySqlConnection connection, String sql, DataParameter[]
 dataParameters)
at NetQoS.Data.MySqlDataComponentBase.ExecuteDataTable(String sql, DataParameter[] dataParameters)
at NetQoS.ReporterAnalyzer.Data.Archive.ArchiveDc.TopTypesOfService(String sourceTable, DateTime utcStartTime,
 DateTime utcEndTime, String timeZone, List`1 whereClauseExpressions, DataDirection dataDirection, Nullable`1
 resolution, UInt32 topTypesOfServiceCount)
```

Cause

This will happen if the installation or upgrade of your Harvesters does not install all values into the `time_zone*` tables on the 3307 instance of MySql.

Resolution

> **NOTE**
> Troubleshoot MySQL Time Zone Tables

Troubleshoot Interface Names

Problem:

An error message similar to the following occurs in the DX NetOps UI:

```
Server Error in '/RA' Application

A potentially dangerous Request.Form value was detected from the client

(ctl00_ContentPlaceHolder1_ManageGroups1_ctl01__dualList_left_hf="...IRCUIT ID
 <XXXXXX350nullCA...").

Description: Request Validation has detected a potentially dangerous client input value,
 and processing of the request has been aborted.

This value may indicate an attempt to compromise the security of your application, such
 as a cross-site scripting attack.
```

Solution:

Rename interfaces so that they do not contain the characters < or >.

> **NOTE**
> **More information:**
>
> Working with Interfaces and Routers

Troubleshoot MySQL Time Zone Tables

After the installation or upgrade of your Harvesters, you might need to install all values into the `time_zone*` tables on the 3307 instance of MySQL.

Follow these steps:

1. Download the `3307_time_zone_tables.sql` file from the ftp link below to your Harvesters:
   ftp://ftp.ca.com/pub/netqos/product_patches/NFA/9.3.3/
   Rename the downloaded file to remove the `.txt` from the end of the filename.
2. Open a command prompt and run the following command from the directory where you saved the `.sql` file:
   `mysql -P3307 mysql < 3307_time_zone_tables.sql`
3. Restart the `Netqos NQMySql` service on the Harvesters.
4. On the NFA Console, recycle all of the `CA MySql` services.

CA NFA and CA Anomaly Detector Connection Issue

When you change the default password for the CA NFA MySQL users using the NFA MySQL User Password Change Utility, you must change the password for the CA NFA MySQL users in the CA Anomaly Detector database.

Follow these steps:

1. Log in to the NetQos MySQL using nsas user.
2. Open the `parameter_descriptions`

table.

3. Set the property value for the following fields with the same password you set for the CA NFA MySQL users:

```
netflow_reporter_db_conn_string
harvester_db_conn_string
```

4. Save and close the MySQL.

CA Anomaly Detector

Your network is one of your most critical resources--and one of your most vulnerable assets. Security threats affect network performance, and the reverse is also true. Whenever the network team makes even a small change, such as adding a new user, security and performance can be compromised.

CA Anomaly Detector gives you visibility into highly variable server and client traffic patterns. The program continually monitors baselines and rapidly analyzes the multiple flow patterns that may indicate misconfiguration, malicious attacks, or poor application delivery.

CA Anomaly Detector provides insight into customary network performance, traffic composition, and traffic volumes. The product alerts you when it detects certain types of data or patterns of anomalous behavior. Unlike other performance analysis products that are limited to one or two common traffic patterns, CA Anomaly Detector alerts you to anomalous behavior by using the powerful infrastructure that is already provided through the following allied products:

- NetFlow data distillation by DX NetOps,
- SNMP collection by CA NetVoyant,
- TCP application performance from CA Application Delivery Analysis, and
- Voice and video performance from CA Unified Communications Monitor.

By leveraging the data that your CA product suite collects, CA Anomaly Detector performs behavior analysis and security monitoring with minimal configuration and with no need for ongoing data entry.

Get Started with CA Anomaly Detector

To get started with CA Anomaly Detector, complete the following tasks:

1. Verify that the installation server meets the following requirements and recommendations:
   - Upgrades: Verify that the existing software is supported for upgrade
   - Operating system
   - (*Recommended*) Hardware specifications.
   - Installation and upgrade prerequisites.
2. Verify that a supported version of Performance Center is installed in your environment: CA Performance Center supported version, or CA NetQoS Performance Center 6.2.
3. Install or upgrade to the latest version of CA Anomaly Detector and DX NetOps.
4. Register CA Anomaly Detector as a data source for Performance Center.
5. (*CA PC deployment*) Enable CA Anomaly Detector configuration functions in the NFA console.
6. Add DX NetOps and any other products that you want CA Anomaly Detector to monitor.
7. Enable the monitored products so their data is accessible to CA Anomaly Detector.
8. Configure the firewalls.
9. (*Optional*) Review the default sensor configurations and make any necessary changes.
10. (*Optional*) Configure targets for alerts, to send Syslog or SNMP trap messages when alerts are triggered.

Features and Benefits

CA Anomaly Detector goes beyond intrusion detection and other more static security tools to take a broader view of the network. The program can monitor your entire network from end to end. Instead of painstakingly applying a fixed set of rules to traffic, CA Anomaly Detector uses a set of dynamic algorithms to create and continually modify a unique profile of the network. The program uses this profile in combination with efficient mathematical analysis to determine whether network traffic is anomalous.

In addition to detecting suspicious or damaged packets, CA Anomaly Detector identifies abnormally high flow and volume sources that can indicate a variety of issues. The program easily scales to create integrated monitoring and reporting across your enterprise. You receive alerts about potential problems, such as:

- Infected hosts
- Victims of infected hosts
- Unauthorized application servers
- Misconfigured servers

Operating in real time, the program identifies fan-out, SYN-only, and ICMP flood traffic that usually indicates a spreading virus, worm, or port-scanning activity. The program also alerts you to:

- Null routing and TTL-expired traffic--helping you identify poorly configured ACLs or routing loops
- Large ICMP or DNS packets that may indicate tunneling activities
- Sources of fragmented packets that double-load network devices and that can ultimately result in retransmission of TCP traffic. These symptoms can signal a frag attack. Knowledge about such sources enables you to make configuration changes that can improve network or application performance.

The program reports only the essential data you need to secure your system and stop intrusions, other security issues, and performance problems. Report views are shown in the Performance Center console, where they contribute to an enterprise-wide perspective on network performance and health.

CA Anomaly Detector provides the following benefits:

- Trending, with per-host breakdown of anomaly sources for timely, precise troubleshooting
- Enterprise-wide correlation of anomalous behavior, broken out per host so you get a full perspective of how key servers behave
- Identification of attacks before symptoms appear so you can prevent of downtime; isolate viruses quickly, and resolve problems
- Accurate and complete data, collected by leveraging existing flow collection infrastructure for easy installation and configuration
- Lightweight reporting of essential data, giving you quick access to crucial information for identifying anomaly causes
- Integration with the following related products for enterprise-wide reporting on network health and application performance from a single console:
  - CA NetQoS Performance Center or CA Performance Center
  - DX NetOps
  - CA Application Delivery Analysis
  - CA NetVoyant
  - CA Unified Communications Monitor

Probability Thresholds

CA Anomaly Detector uses a sophisticated mechanism to help avoid false positives, minimizing the number of alerts that do not correspond to true anomalies. The program uses probability threshold settings that you can customize to control the sensitivity of alert triggering. The thresholds are called probability thresholds because they are keyed to the probability that an actual anomaly has been detected.

In addition to a probability component, the threshold mechanism also relies on the following factors:

- A unique network profile that is based on statistics and the observation of typical operations
- Configurable alert levels, which are a function of the unique profile
- Statistical analysis to determine whether observed network behavior is anomalous or is within the normal range

To determine whether current data is anomalous, the detection process takes all previous data into account to create a statistics-based network profile. Using the profile as a reference, the anomaly detection process estimates and prioritizes any potentially anomalous network activity, based on percentiles and calculates the probability that the observed behavior is anomalous. The entire system is dynamic: It is updated each time it runs to ensure reliability and accuracy.

Correlated Anomalies

Correlated anomalies reduce alarm overload and help cull out false positives so you can focus on the events that are most likely to be issues. CA Anomaly Detector provides an **Enterprise-Wide Correlated Anomalies** view that highlights correlated anomalies. You can navigate from this view to more detailed information while you investigate. A correlated anomaly meets the following minimum requirements:

- Contains three or more anomaly instances
- Has an anomaly index of 2.0 or more
- Originates from a single device

An anomaly index of 2.0 or more indicates the presence of two or more primary anomalies or one primary anomaly and two or more secondary anomalies.

This cross-data source, temporal clustering provides actionable workflows that support a fast, proactive response to issues.

Data Collection in CA Anomaly Detector

Data is monitored in DX NetOps databases by querying flow data directly from the Harvesters. If you add other products for monitoring, data is gathered for analysis from their databases. You can configure CA Anomaly Detector to monitor data from the following products:

- (Required) DX NetOps
- (Optional) CA Application Delivery Analysis
- (Optional) CA NetVoyant
- (Optional) CA Unified Communications Monitor

The anomalies that are detected are shown on the Anomaly Detector page views, which are accessible in the Performance Center Console.

CA Anomaly Detector Scalability

CA Anomaly Detector is highly scalable. The program does not retain a large amount of data. It collects and analyzes only the results of data analysis from the data sources that it is configured to analyze.

The MySQL database does not overload easily. For example, after several weeks of running CA Anomaly Detector at a large enterprise, the database growth rate was equivalent to 4 GB per year. The typical growth rate in testing is 160,000 database rows per day.

Although you can run CA Anomaly Detector with most Harvesters, some limitations apply. In our testing, the following configurations were the maximum configurations that had acceptable performance:

- Linux-based Harvester that runs a maximum of 2 million flows per minute
- Windows-based Harvester that runs a maximum of 4 million flows per minute and does not run the Flow Cloner
- Windows-based Harvester that runs a maximum of 2 million flows per minute and runs the Flow Cloner

We support using a single instance of CA Anomaly Detector to monitor the following data sources:

- DX NetOps: Single instance (*Required*)
- CA NetVoyant: Two instances (*Optional*)
- CA Application Delivery Analysis: Two instances (Optional)
- CA Unified Communications Monitor: Two instances (*Optional*)

Installation and Upgrade

This section describes the installation and configuration procedures that you perform specifically for CA Anomaly Detector.

Co-Installation

You can install CA Anomaly Detector on the same server that hosts DX NetOps software or on a separate server. However, even though installing it on the NFA console is supported, it is highly recommended to have CA Anomaly Detector on a separate server.

WARNING
Installing CA Anomaly Detector on the same server as DX NetOps is only recommended for short trials.

The following table shows the supported configurations for co-installing CA Anomaly Detector with related software.

- With DX NetOps: You can install CA Anomaly Detector on a server that already hosts a stand-alone DX NetOps deployment or the NFA console in a distributed deployment.
- With other related software: You cannot install CA Anomaly Detector on a server that hosts any of the following software:
  - CA Performance Center (CA PC)
  - CA NetQoS Performance Center (CA NPC)
  - CA Application Delivery Analysis (CA ADA)
  - CA Unified Communications Monitor (CA UC Monitor)
  - CA NetVoyant

Components Installed on a Single Server	Supported?
CA Anomaly Detector (AD) with no other related software	Yes
NFA stand-alone (Harvester + NFA console software) + AD	Yes, not recommended
NFA console + AD	Yes, not recommended
CA NPC + the current release of DX NetOps or AD	No
CA PC + AD or any DX NetOps component	No
CA ADA, CA UC Monitor, or CA NetVoyant + AD	No

Prerequisites

Before you install or upgrade CA Anomaly Detector, perform the following tasks:

- If you are co-installing CA Anomaly Detector on a server with DX NetOps, complete the DX NetOps installation or upgrade before you install CA Anomaly Detector.

You can install CA Anomaly Detector on the server that hosts a stand-alone DX NetOps deployment or the NFA console server in a distributed deployment.

- (Recommended) Review the topology of your network. For example, create a diagram of your network and its connections to ensure that you monitor the correct devices for the traffic that interests you.
- (Recommended) Collect information about the Performance Center deployment, including the locations and IP addresses for all related components.
- Verify that you have access to the servers that host Performance Center and the products you want to monitor. Make sure that all of the products are configured and functioning properly, including flow configuration on the routers.
- Prepare the server as described for DX NetOps.
- Stop other programs from running during the installation or upgrade.
- Restart all servers to ensure that all operating system patches are applied.
- Ensure that no one else is logged in to the server during the installation or upgrade.
- Download the installation and upgrade files.
- Check the `nsas` database.
- Stop the services.
- Back up the database and restart the services.

Download the Installation and Upgrade File

Copy the file to the installation server whether you plan to install the software locally or remotely. This ensures that you have access to the file.

1. Get the file for installing or upgrading the components:
   a. Log in to support.ca.com.
   b. Navigate to the **Download Center**: For example, select **Download Center** from the **Support** menu in the left pane.
   c. Select the following navigation options:
      - Select a Product: Select "DX NetOps - MULTI-PLATFORM" to display the links for the NFA console, Harvester (Windows), Harvester (Linux), and CA Anomaly Detector installation and upgrade ISO files.
      - Select a Release: Select **10.0**
      - Select a Gen Level: Select **1**
   d. Download the ISO file from the **Product Components** list that is displayed.

      TIP
      An ISO file is an archive file that contains the contents of an optical disk. Each one of the available ISO files contains the files for installing or upgrading the component named in the file link.
2. Perform one of the following tasks:
   – Burn the ISO file to a CD-ROM or DVD.
   – Extract the contents of the ISO file by using an ISO image software application. Many free ISO image applications are available.
3. Extract the appropriate file to the installation server:
   – `ADSetupx.x.x.exe`

You can install or upgrade the software locally or remotely.

Install CA Anomaly Detector

Complete the steps in this topic to install CA Anomaly Detector on a Windows server or virtual machine.

If the CA Anomaly Detector and any related software components are co-installed, install the software in the order described in Co-Installation. The installation steps are written with the expectation that you have already installed any related products that will be co-located with CA Anomaly Detector.

NOTE
More information:

- Make sure that the server has the necessary components installed before installing CA Anomaly Detector. See CA Anomaly Detector Scalability.
- Download the installation file. See Download the Installation and Upgrade File.

Follow these steps:

1. Log in to the CA Anomaly Detector server as a user who is a member of the Administrators group.
2. Verify that the ISO file is downloaded. The ISO file contains the `ADSetupx.x.x.exe` file, the installation or upgrade program for CA Anomaly Detector.
   Copy the `ADSetupx.x.x.exe` file to the CA installation server, even if you plan to install the software remotely.
3. If the server will host any DX NetOps software, install or upgrade the other software before you proceed.
4. Double-click the `ADSetupx.x.x.exe` file in Windows Explorer.
   The installation program opens.
5. Verify that **English** is selected, then click **OK**.
   The **Welcome** screen opens.
6. Click **Next**.
   The **Pre-Installation Summary** screen opens.
7. Review the information, then click **Install**.
   The **Choose Install Folder** screen opens.
8. (Optional) Specify a custom installation location:
   a. Click **Choose** in the **Choose Install Folder** screen to change the installation location.
      Use the same installation folder for CA Anomaly Detector and the NFA console or stand-alone installation. The default location is `C:\CA\NFA` . We recommend that you install CA Anomaly Detector on a non-system drive.
   b. Click **Next** when the installation path setting is correct.
      The **Installing AD** screen opens. When the installation is complete, the **Install Complete** screen opens and verifies that the installation was successful.
9. (Optional) If errors occurred during the installation, see the following log for details:

   install_path`\AD_Install_<timestamp>`
10. Click **Done** in the **Install Complete** screen.
    The installation program closes.
11. (Optional) Verify that the services are running:
    a. Click **Start**, **Programs**, **Administrative Tools**, **Services**.
    b. Verify that the AD-related services have the status **Started**:
       - CA NFA Host Resolver Service
       - CA NFA Hunter Tracker Service
       - CA MySql

Upgrade CA Anomaly Detector

Complete these steps to upgrade CA Anomaly Detector on a Windows server or virtual machine.

The DX NetOps and CA Anomaly Detector must be on the same release level. Upgrade any previous version of CA Anomaly Detector that is currently installed.

If CA Anomaly Detector is co-installed on a server with DX NetOps (CA NFA), complete the CA NFA installation or upgrade before you install or upgrade CA Anomaly Detector. The upgrade steps are written with the expectation that you have already upgraded any related products that will be co-located with CA Anomaly Detector.

Upgrade Prerequisites

Check the nsas Database

We recommend that you check the `nsas` database before upgrading. You can use the `mysqlcheck` command to verify that the database tables are set up properly. The check can correct some types of problems and can help you avoid an upgrade failure. You can run `mysqlcheck` without stopping the MySQL service.

If the CA Anomaly Detector software is on an upgraded NFA console server or stand-alone server, you may have already checked the `nsas` database as part of the earlier upgrade.

Follow these steps:

1. Log in to the installation server as a user with administrator privileges.
2. Check the nsas database: Enter one of the following `mysqlcheck` commands at a command or shell prompt:
   - To check the tables in all of the applicable databases on the server (`reporter`, `harvester`, `data-retention`, and `nsas` databases):
     ```
     mysqlcheck --all-databases
     ```
   - To check all of the tables in a single database:
     ```
     mysqlcheck --databases db_name
     ```
     where *db_name* = Name of the database to check
   - Example:
     ```
     mysqlcheck --databases nsas
     ```

   You do not need to specify the path to the database. The `mysqlcheck` command finds any or all databases that use the default port (port 3308).
   The command checks each table, attempts to repair any problems, then analyzes and optimizes the table. The return text lists the database tables that were checked and reports the status for each one.
   If the table passed the check, "OK" follows the table name. If a warning is returned and is followed by "OK," the problem was resolved. If unresolved errors occur, contact CA Support.

Stop the Services

To prepare for backing up the database, stop the services on the installation server for CA Anomaly Detector.

Follow these steps:

1. Log in as a user who has administrator privileges for the product.
2. Open the **Services** window: Click **Start, Control Panel, Administrative Tools, Services**.
3. If CA Anomaly Detector is installed on the CA Network Flow Analysis stand-alone server, stop the CA NFA Harvester service and wait 15 minutes.
   Data file processing completes.
4. Stop the remaining services, as listed in the following table.

Service	Stand-Alone NFA with AD	NFA Console with AD	Anomaly Detector (not co-installed)
CA NFA Collection and Poller Webservices	Yes	N/A	N/A
CA NFA Data Retention	Yes	N/A	N/A
CA NFA DNS/SNMP Proxies	Yes	N/A	N/A
CA NFA File Server	Yes	Yes	N/A
CA NFA Harvester	Yes	N/A	N/A

CA NFA Host Resolver Service	Yes (if AD is co-installed)	Yes (if AD is co-installed)	Yes
CA NFA Hunter Tracker Service	Yes (if AD is co-installed)	Yes (if AD is co-installed)	Yes
CA NFA Poller	Yes	N/A	N/A
CA NFA Reaper	Yes	N/A	N/A
CA NFA RibSource	Yes	Yes	Yes
NetQoS MySql	Yes	Yes	Yes
NetQoS NQMySql	Yes	N/A	N/A
NetQoS Reporter Manager Service	Yes	Yes	N/A
NetQoS Reporter/Analyzer General Services	Yes	Yes	N/A
NetQoS Reporter/Analyzer Pump Service	Yes	Yes	N/A
NetQoS Reporter/Analyzer Query Services	Yes	Yes	N/A
NetQoS Reporter/Analyzer Watchdog	Yes	Yes	N/A
NetQoS ReporterAnalyzer Report Service	Yes	Yes	N/A

5. If CA Anomaly Detector is installed on the DX NetOps stand-alone server or NFA console server, check the following directory:

   install_path\Netflow\datafiles\HarvesterWork

   When the `HarvesterWork` directory is empty, you can back up the database.
6. The services are restarted automatically during the upgrade process.

Back Up the Databases and Restart the Services

Before you upgrade, back up the `nsas` database.

Important: Run backups concurrently. If you restore data from backups that have different timestamps, problems can result. Ensure that your backed-up data files are timestamped with the same hour.

Store backups to a remote location to guard against the possibility of a hardware or operating system failure on the main server. For example, back up the databases to an administrative share or mapped network drive.

Follow these steps:

1. Log in as a user who has administrator privileges for the product.
2. Connect to the server:
   Open a Remote Desktop session.
   Initiate a Terminal Services or VNC session to the installation server.
3. Copy each target directory and file to a remote location.
4. Restart the services.

NOTE

More information:

- Compatibility Matrix
- Windows Servers

Upgrade CA Anomaly Detector

Follow these steps:

1. Log in as a user who has administrator privileges for DX NetOps.
2. Verify that the ISO file is downloaded. The ISO file contains `ADSetupx.x.x.exe` , the installation or upgrade program for CA Anomaly Detector.
   Copy the `ADSetupx.x.x.exe` file to the CA Anomaly Detector installation server, even if you plan to install the software remotely.
3. If the server will host any DX NetOps software, install or upgrade the other software before you proceed.
4. Double-click the `ADSetupx.x.x.exe` file in Windows Explorer.
   The installation program opens.
5. Verify that **English** is selected, then click **OK**.
   The **Prior Installation Detected** message opens.
6. Review the information, then click **OK**.
   If the existing software version is not supported for upgrade, upgrade to the supported version.
   If the existing version is supported for upgrade, the **Welcome** screen opens.
7. Click **Next**.
   The **Pre-Installation Summary** screen opens.
8. Review the information, then click **Install**.
   The **Installing AD** screen opens. When the upgrade is complete, the **Install Complete** screen opens.
9. (Optional) If errors occurred during the upgrade, see the following logs for details:
   - General installation log: *install_path*\AD_Install_*<timestamp>*
   - Upgrade log: *install_path*\migrator\migrator.log
10. Click **Done** in the **Install Complete** screen.
    The program closes.
11. (Optional) Verify that the services are running:
    a. Click **Start**, **Programs**, **Administrative Tools**, **Services**.
    b. Verify that the AD-related services have the status **Started**:
       - CA NFA Host Resolver Service
       - CA NFA Hunter Tracker Service
       - NetQoS Mysql
12. Verify that the software is upgraded to the correct version: To display the revision history and verify the current software version, complete the following steps:
    a. Open a Command Prompt window
    b. Start MySQL by entering the following command:
       ```
       mysql nsas
       ```
    c. Display the revision history by entering the following command:
       ```
       select * from revision_history
       ```
13. Complete any post-upgrade configuration tasks.

Configure CA Anomaly Detector

The tasks described here assume that you have completed the steps for pre-installation and installation or upgrade of CA Anomaly Detector.

Be prepared to configure the firewalls to allow communication between CA Anomaly Detector and other components.

Enable TLS for CA Anomaly Detector Data

The Anomaly Detector data can be secured using Transport Layer Security (TLS). The general procedure is:

1. Create a certificate that acts as a Certificate Authority (*CA*) certificate.
2. Use that certificate to generate a new certificate signed by the *CA* for the Anomaly Detector.

Follow these steps:

On the NFA console, use `openssl` to generate a new certificate signed by the Certificate Authority (*CA*) for the Anomaly Detector:

1. Set the `OPENSSL_CONF` environment variable for the `openssl` configuration file.
   ```
   set OPENSSL_CONF=install_path\Tools\openssl\bin\openssl.cfg
   ```
2. Use `openssl` to generate a self-signed certificate, to act as the certificate authority (*CA*) certificate. The `openssl` command can be found on the NFA Console, in the *install_path*`\tools\openssl\bin` directory.
   a. Generate the private key:
      ```
      openssl genrsa -des3 -out nfa-ad-key.pem 2048
      ```
   b. Generate a Certificate Signing Request:
      ```
      openssl req -new -key nfa-ad-key.pem -out nfa-ad.csr
      ```
   c. Remove the passphrase from private key:
      ```
      copy nfa-ad-key.pem nfa-ad-key.pem.orig
      openssl rsa -in nfa-ad-key.pem.orig -out nfa-ad-key.pem
      ```
   d. Generate a certificate signed by the console acting as a *CA*:
      ```
      openssl x509 -req -days 1825 -in nfa-ad.csr -CA nfa-ca-cert.pem -CAkey nfa-ca-key.pem -set_serial
       <unique_num> -out nfa-ad-cert.pem
      ```

On the Anomaly Detector server:

1. Create a directory named *install_path*`\certs` for storing certificates.
2. Copy the *CA* certificate file and the AD certificate files to the `certs` directory created in step 1.
3. Edit *install_path*`\MySql\my.ini` and uncomment these lines:
   ```
   require_secure_transport=true
   tls_version=TLSv1,TLSv1.1,TLSv1.2
   ssl-ca=install_path/certs/nfa-ca-cert.pem
   ssl-cert=install_path/certs/nfa-ad-cert.pem
   ssl-key=install_path/certs/nfa-ad-key.pem
   ```
   Edit all occurrences of these lines. Use appropriate names for the `*.pem` files, and restrict the versions of TLS by removing those you do not wish to allow.
4. Reboot the server to restart all services.

Register CA Anomaly Detector

To display CA Anomaly Detector data in views, you must add CA Anomaly Detector as a data source for Performance Center.

Follow these steps:

1. Display the **Data Source List** page:
   a. Log in to the Performance Center console as a user with administrator privileges, if you are not already logged in.
   b. Select **Admin**, **Data Sources**.

The page for managing data sources opens: **Manage Data Sources** (CA PC) or **Data Source List** (CA NPC).

2. Click **Add** (CA PC) or **New** (CA NPC).
   The dialog for adding a data source opens.
3. Specify values for the following options:
   - **Source Type**: Select **Anomaly Detector** from the list.
     All related products and selected third-party integrations are listed in the **Source Type** list regardless of whether they are installed in your environment. If a data source type is not listed, check to see if you have already registered the maximum number of data sources for that type.
   - **Status**: Select **Enabled**.
   - **Host Name**: Enter the IP address or name of the server that hosts the CA Anomaly Detector software.
   - **Protocol**: Select the protocol to use for contacting CA Anomaly Detector.
     Select https if your network uses SSL for communications. If you select the https option, verify that you have configured the system correctly for https access. For more information, see the Single Sign-on article in the CA Performance Management documentation.
   - **Port**: Enter the port for CA Anomaly Detector.
     The port you specify depends on the protocol you select. The recommended port for the http protocol is 80. The recommended port for the https protocol is 443. If you plan to use SSL for communication with Performance Center, see the Single Sign-on article in the CA Performance Management documentation.
   - **Web Console**: Confirm whether the **Web Console** address is the same as the **Host Name**. If it is different, click the **Same as above** check box to provide the **Web Console** information.
     The default setting is for the **Web Console** address to be the same as the **Host Name**.
   - **Web Console: Same as Data Source**: Confirm whether the same IP address, port, and protocol are used for the **Web Console** as for the host server. If any of the values are different, clear the **Same as above** check box to provide the **Web Console** information.
   - **Display Name**: (Optional) Enter a user-friendly name for the data source. This name is shown on the **Admin** menu under **Product Settings**.
     If you do not specify a name, a default name is generated automatically. The default name consists of the data source type combined with the host name. For example, you can specify `AnomalyDetector_London` as the **Display Name** in place of a default name like `AnomalyDetector@xxx.x.x.xx`.
   - **Enabled**: Select the **Enabled** check box.
4. Click **Test** to verify that the connection to CA Anomaly Detector works.
   If the connection fails, verify that the server name or IP address is accurate for the source type. If the connection fails again, contact CA Support.
5. Click **Save** when the settings are complete and the connection test has succeeded.
   You return to the main page, which shows CA Anomaly Detector in the list of data sources.

Enable Configuration in the NFA Console

If your deployment includes CA Performance Center, you use the NFA console to perform administration tasks for CA Anomaly Detector. Skip this task if your deployment includes CA NetQoS Performance Center.

Follow these steps:

1. Log in to the NFA console as a user with administrator privileges, if you are not already logged in.
2. Click **Administration**. The **Administration** page opens.
3. Click **Alerts, Anomaly Detector** from the menu on the left side of the page. The **Anomaly Detector** page opens with the **View Monitored Products** page displayed.
4. Click **Add/Edit Anomaly Detector**. The **Add/Edit Anomaly Detector** dialog opens.
5. Select values for the following options:
   - **Protocol**: Select the protocol to use for contacting CA Anomaly Detector.

Select https if your network uses SSL for communications. If you select the https option, verify that you have configured the system correctly for https access. For more information, see the Single Sign-On article in the CA Performance Management documentation.

- **IP Address**: Enter the IP address of the server that hosts the CA Anomaly Detector software that you want to administer.

6. Click **Save**.
   You return to the **Anomaly Detector** page. The configuration options are now enabled, so you can add products for CA Anomaly Detector to monitor.

Add Products to Monitor

The next step is to add DX NetOps (CA NFA) as a monitored product for CA Anomaly Detector. You also have the option to add more products that CA Anomaly Detector can monitor for anomalies. This task is described in the following topics:

CA Performance Center

You must add an instance of DX NetOps for CA Anomaly Detector to monitor. You also have the option to add any other products that you want to monitor for anomalies. This topic describes how to complete this task in a CA Performance Center deployment.

Follow these steps:

1. Log in to the CA Performance Center console as a user with administrator privileges, if you are not already logged in.
2. Click **Admin**, **Data Source Settings**: *Name of the CA Anomaly Detector instance that you want to configure*.
   The **Anomaly Detector** page opens in the NFA console.
3. Click **Add** at the bottom of the **Anomaly Detector** page (**View Monitored Products** tab).
   The **Add Monitored Product** dialog opens.
4. Add a CA NFA instance as a monitored product: Specify values for the following options:
   - **Type**
     Select the product name from the list: DX NetOps.
     If DX NetOps is not listed, verify that you have not already registered an instance as a monitored product. You can register only one instance to a single instance of CA Anomaly Detector.
   - **IP Address**
     Enter the IP address of the CA NFA server.
5. Click **Save**.
   The **Anomaly Detector** page shows the NFA console that you added. All of the currently configured Harvesters are added as potential data collectors on the **Collection Sources** tab, but the Harvesters are not enabled at this point.
6. (Optional) Add another monitored product: Repeat the previous two steps until you have all of the monitored products that you need.
   - If you add CA NetVoyant Enterprise, enter the IP address of the individual pollers instead of the NetVoyant Master Console.
   - You can monitor multiple instances of some products, as listed in Software Compatibility.

   The list of monitored products page reflects your changes. CA Anomaly Detector contacts the product to add the collection sources to the **View Collection Sources** tab.

CA NetQoS Performance Center

You must add an instance of DX NetOps for CA Anomaly Detector to monitor. You also have the option to add any other products that you want to monitor for anomalies. This topic describes how to complete this task in a CA NetQoS Performance Center deployment.

Follow these steps:

1. Log in to the CA NetQoS Performance Center console as a user with administrator privileges, if you are not already logged in.
2. Click **Admin**, **Product Settings**: Name of the CA Anomaly Detector instance.
   The **Monitored Products** page opens with the **View Monitored Products** tab displayed.
3. Click **New**.
   The **New Monitored Product** page opens.
4. Add DX NetOps as a monitored product: Specify values for the following options:
   - **Type**
     Select the product name from the list: DX NetOps.
     If DX NetOps is not listed, verify that you have not already registered an instance as a monitored product. You can register only one instance to a single instance of CA Anomaly Detector.
   - **IP Address**
     Enter the IP address of the CA NFA server.
5. Click **Save**.
   The **Monitored Products** page now shows the instance of DX NetOps that you added. All of the currently configured Harvesters are added as potential data collectors on the **Collection Sources** tab, but the Harvesters are not enabled at this point.
6. (*Optional*) Add another monitored product: Repeat the previous two steps until you have all of the monitored products you need.
   - If you add CA NetVoyant Enterprise, enter the IP address of the individual pollers instead of the CA NetVoyant Master Console.
   - You can monitor multiple instances of some products.

   The list of monitored products page is updated to show your changes. CA Anomaly Detector contacts the product to add the collection sources to the **View Collection Sources** tab.

Enable the Monitored Products' Collection Sources

After you add products for CA Anomaly Detector to monitor, enable the products so that monitoring can begin.

This task is described in the following sections:

When you add DX NetOps as a monitored product, the Harvesters that are configured with the DX NetOps instance are added automatically as possible data collection sources. You can enable as many or as few Harvesters as you need. Special considerations apply when you enable Harvesters, as described in *Best Practices: Slow Harvester Rollout*.

The product databases are the collection sources for the CA Application Delivery Analysis, CA NetVoyant, and CA Unified Communications Monitor products.

CA Performance Center

This topic describes how to enable the monitored products for CA Anomaly Detector in a deployment that includes CA Performance Center. As soon as the products are enabled, CA Anomaly Detector can begin monitoring their data for anomalies.

Follow these steps:

1. Log in to the NFA console as a user with administrator privileges, if you are not already logged in.
2. Display the list of collection sources for CA Anomaly Detector:
   a. Select **Administration**.
      The **Administration** page opens.
   b. Select **Alerts, Anomaly Detector** from the menu on the left side of the page.

The **Anomaly Detector** page opens.

c. Click the **View Collection Sources** tab.
The collection sources are displayed in a table.

3. Select the name of each collection source that you want to enable.

NOTE
Special considerations apply when you enable Harvesters, as described in *Best Practices: Slow Harvester Rollout*.

4. Click **Enable**.
CA Anomaly Detector begins to monitor the selected collection sources. The source shows as **Enabled** in the **State** column.

CA NetQoS Performance Center

This section describes how to enable the monitored products for CA Anomaly Detector in a deployment that includes CA NetQoS Performance Center. As soon as the products are enabled, CA Anomaly Detector can begin monitoring their data for anomalies.

Follow these steps:

1. Log in to the CA NetQoS Performance Center console as a user with administrator privileges, if you are not already logged in.
2. Select **Admin**, **Product Sources**: Name of the Anomaly Detector instance.
The **Monitored Products** page opens with the **View Monitored Products** page displayed.
3. Click the **View Collection Sources** tab.
The collection sources are displayed in a table.
4. Select a collection source that you want to enable.

NOTE
Special considerations apply when you enable Harvesters, as described in *Best Practices: Slow Harvester Rollout*.

5. Click **Edit**.
The **Edit Collection Source** dialog opens.
6. Select the **State** check box to enable the collection source.
7. Click **Save**.
You return to the list of collection sources. The **State** value is updated to reflect your change. CA Anomaly Detector begins to monitor the collection source.

Best Practices: Slow Harvester Rollout

When you enable a Harvester for monitoring, performance demands for the Harvester increase. CA Anomaly Detector queries the Harvesters for flow data every 15 minutes. The Harvesters in turn search the flow archive, a cache of raw flow data, for the requested data. Searches can include millions of flows.

We strongly recommend that you enable Harvesters gradually. For example, enable two or three Harvesters, wait 15 minutes, then check the query time for the Harvesters on the **View Collection Sources** page. Query times should be less than 15 minutes.

To check Harvester errors in the NFA console, open the NFA console, click **Administration**, and click the **Harvester** icon.

The program may take as long as 15 minutes to query newly added Harvesters. The current reporting interval must be completed before the program can query the newly added Harvesters.

You can add a maximum of 10 Harvesters to a single instance of CA Anomaly Detector.

Configure Firewalls

Modify your firewall as needed to enable CA Anomaly Detector and the Harvesters to communicate. In addition, review your Access Control Lists (ACLs) and make any changes that are needed.

The following ports are used by default for communication:

- CA Anomaly Detector server to the Harvester ports:
  - TCP 3307 (MySQL server)
  - UDP 161 (Watchdog services)
- CA Anomaly Detector server to other servers that host data sources (NFA console, CA Application Delivery Analysis, CA NetVoyant, and CA Unified Communications Monitor):
  - TCP 3308 (MySQL server)
- CA Anomaly Detector server ports (outbound):
  - UDP 514 (Syslog alerting)
  - UDP 162 (SNMP alerting)
- Performance Center server to the CA Anomaly Detector server:
  - TCP/HTTP 80, if http is used for communication
  - TCP/HTTPS 443, if https is used for communication
- CA Performance Center to the CA Anomaly Detector server:
  - TCP 8681, which CA PC uses to request data for the views

Sensor Configuration

Most sensors are enabled by default, even sensors that do not have a collection source. The inactive sensors have no effect on data analysis until the appropriate data source is added. If you disable inactive sensors, remember to manually enable them again when you add the corresponding collection source.

Probability Thresholds

The probability threshold is a sensitivity setting that increases or decreases the likelihood that the sensor will send out alerts when it detects a monitored behavior.

The default threshold for all sensors is 90% probability. As you raise the probability threshold, fewer alerts are likely to be sent and it is more likely that real issues triggered the alerts.

Probability Threshold	Number of Anomalies Reported
Lower	More
Higher	Less

If you monitor a device that has a known issue, you may want to raise the probability threshold to prevent false alerts. A lower probability setting may be better for a critical item that is fairly stable, so that you are notified about issues early.

White List

Use the White List to exclude servers from monitoring and from views when you edit a sensor configuration. The White List typically consists of hosts that are known to be safe.

Do not add a host to the White List if the host is important and the host may be vulnerable to attack. For example, do not add DNS servers to the White List even though these servers may generate spurious anomalies. As CA Anomaly Detector continues to gather data about typical behavior, it should create fewer spurious anomalies for hosts like DNS servers.

Absolute Thresholds

You have the option to set an absolute threshold so that alerts are generated when the threshold is violated, provided that alerts are enabled. Absolute thresholds are applied before probability thresholds.

The following table lists the sensors and units of measure for absolute thresholds.

Sensor	Looks For:	Unit of Measure
Buffer Misses	Pattern in buffer misses	buffer misses
Congestion Sources	Sources of overloading based on ICMP Source Quench	flows
Destination Unreachable Sources	High-volume sources of network, host, or port unreachable messages	host or port unreachable messages
Dropped Packets	Pattern in queue drops	dropped packets
Fragmented Packet Sources	Large sources of fragmented packets	fragmented packets
Frags And Loss Sources	Sources of fragmentation and packet loss	flows
High and Variable Vol-In	Highest-volume and variability destinations	bytes in
High and Variable Vol-Out	Highest-volume and variability sources	bytes out
High Flow Sources	Top sources of data flows	flows
High Packet Fan Out	Sources of the largest fan-out traffic patterns	destination hosts
Incoming Discard Rate	Pattern in incoming discards	discard rate
Incoming Error Rate	Pattern in incoming errors	error rate
Large DNS Packet Sources	Large sources of DNS packets that are larger than normal	flows
Large ICMP Packet Sources	Large sources of ICMP packets that are larger than normal	flows
Non-local Sources	Top sources of non-local traffic	non-local traffic
Packet Load	Pattern in bytes per packet to server	bytes per packet
Previously Null Routed Srcs	Hosts with high volumes of traffic that is no longer null-routed	flows
Refused Sessions	Pattern in refused sessions	percent
Retransmission Time	Pattern in retransmissions	seconds
RST-Only Sources	Highest-volume sources of RST-only flows	flows
SYN/RST-Only Packet Srcs	Highest-volume sources of SYN/RST-only flows	flows
SYN-Only Packet Sources	Highest-volume sources of SYN-only flows	flows
TTL Expired Sources	High-volume sources of TTL expired packets	flows
Voice Call DoS	DoS in voice calls	calls per minute
Voice Call Fan Out	Pattern in fan-out of voice calls	call ratio
Voice Server Distress	Call Server Distress	Volume Weighted Error Ratio

Configure Sensor Thresholds and Options

You can configure sensors to have different probability thresholds and to include the following optional features: absolute thresholds, alerts, and host exclusions.

Follow these steps:

1. Display the **Data Source List** page:
   a. Log in to the Performance Center Console as a user with administrator privileges, if you are not already logged in.
   b. Select **Admin**, **Data Sources**.
      The page for managing data sources opens: **Manage Data Sources** (CA PC) or **Data Source List** (NPC).
2. Click the name of the CA Anomaly Detector instance that you want to configure.
   The **Monitored Products** page opens.
3. Click **View Sensors**.
   The **Sensors** page opens and displays the first group of sensors. Click the page numbers at the bottom to page through the sensor list.
4. Double-click the row for the sensor that you want to edit. The **Edit Sensor** page opens.
5. Edit any of the following options that you want to change:
   – **Probability Threshold**: (*Optional*) Change the numeric value to change the probability threshold.
   The probability threshold determines the likelihood that the sensor will send out alerts when it detects the behavior it monitors.
   – **Absolute Threshold**: (*Optional*) Enter a numeric value to create an absolute threshold.
   Enter the absolute threshold value based on the unit of measure for the sensor. An absolute threshold signals an anomaly if the threshold is exceeded. The anomaly triggers an alert if you select the **Alert** option.
   Absolute thresholds are applied before probability thresholds. The program continues to calculate the percentiles for the host/sensor combination even if you set an absolute threshold. These calculations are used if the absolute threshold is removed later or if the probability threshold is exceeded first. An anomaly is created if either threshold is exceeded.
   – **Alert**: (*Optional*) Select the **Alert** check box to send alerts when the probability or absolute threshold is exceeded. This option is enabled for most sensors by default. The exceptions are sensors that are most useful when you monitor correlated anomalies (that is, when alerts are triggered for multiple types of sensors).
   – **State**: Select the **State** box to enable the sensor or clear the check box to disable the sensor.
   – **IP address**: (*Optional*) Enter a host IP address and click **Add** to add the host to the White List, so the host is excluded from anomaly reporting:
   The IP address appears in the **White List** field.
   – **White List**: (*Optional*) Highlight a host in the **White List** field and click **Remove** to delete the host from the White List.
6. Close the **Edit Sensor** page: Click **Save** or **Cancel**.
   You return to the **Sensors** page, which reflects any changes that you saved.

Configure Alert Targets

Alerts are enabled for most sensors by default. The anomalies that result are displayed in the Anomaly Detector page views. You can also receive anomaly information by configuring the alerts to trigger Syslog messages, SNMP trap messages, or both.

Syslog Alerts

Alerts are enabled for most sensors by default, but messages for the alerts are not sent to a Syslog server unless you configure the target for Syslog messages.

About Syslog Alerting

The alerting feature lets you specify parameters for alerts to be sent to a CEF-compliant Syslog server. Syslog is a standard protocol for handling log messages in a heterogeneous environment. A Syslog server that is running a syslog daemon collects log messages, and sometimes filters and processes the messages. The log messages pass to the Syslog server from devices on the network such as routers and switches.

Each syslog message corresponds to a single alert for an anomaly cluster or for a basic anomaly. An anomaly cluster alert contains details about the basic anomalies in the cluster. The details can give the appearance of multiple entries in the message.

The alert format complies with the Common Event Format (CEF) standard. The message type formats are described in the following topics:

Configure the Target for Syslog Messages

Configure Syslog alerting to identify a target Syslog server that will receive messages when sensors report a threshold violation. If Syslog alerting is not configured, the alerts that sensors generate may appear in the **Anomaly Detector** page views, but no messages are sent to report the alerts.

Prerequisites for Syslog Alerting:

- Set up a Syslog server.
- Configure a service on the Syslog server to read syslog messages from CA Anomaly Detector.

Follow these steps:

1. Display the **Data Source List** page:
   a. Log in to the Performance Center Console as a user with administrator privileges, if you are not already logged in.
   b. Select **Admin**, **Data Sources**.
      The page for managing data sources opens: **Manage Data Sources** (CA PC) or **Data Source List** (CA NPC).
2. Click the name of the CA Anomaly Detector instance that you want to configure.
   The **Monitored Products** page opens.
3. Click **View Alert Targets**.
   The **Alert Targets** page opens.
4. Double-click the **syslogging** row.
   The **Edit Alert Target** page opens.
5. Specify the **Target**: Enter the IP address or DNS hostname of the system that will receive the Syslog information.
6. Select one or both of the following options to enable the alert:
   – **Basic State**: Send alerts whenever any single sensor detects an anomaly that crosses a threshold.
   – **Cluster State**: Send alerts only when the requirements for a correlated anomaly are met.
   This is the recommended setting for first-time use of CA Anomaly Detector. If you have already disabled alerts for the sensors that are irrelevant to you, the recommended setting is **Basic State**.
7. Click **Save**.
   You return to the **Alert Targets** page, which reflects any changes you saved.

Best Practices:

Alerts are enabled for most sensors by default so that when you start using CA Anomaly Detector, you can review a wide range of anomalous behaviors with a minimum of configuration. If you use Syslog alerting and you select the **Basic State** option at this stage, you may see so many anomalies that you cannot determine which ones are significant.

If you begin by selecting the **Cluster State** option for alert targets, the anomalies you see are much more likely to be significant. You can quickly determine which sensors are useful to you. At this point you can disable alerts for the other sensors, then start using the **Basic State** option. This produces an expanded set of results for the anomaly types that interest you. The anomalies from the other sensors are eliminated.

To explore all of the potential anomaly cluster types, you may want to enable any disabled sensors. In this case, use the **Cluster State** option.

SNMP Trap Alerts

You can enable SNMP traps to be sent to a third-party network monitoring program. If you enable SNMP trap alerts, an SNMP trap is sent each time a threshold violation triggers an alert. You also can set the alert to be triggered only by a correlated anomaly.

Multiple targets for SNMP traps are not supported.

Follow these steps:

1. Configure the trap receiver to listen for traps from the CA Anomaly Detector server.
   Use the MIB file to import the CA Anomaly Detector Object IDs (OIDs) into your trap receiver. The MIB file is located in the following directory on the CA Anomaly Detector server:
   install_path\NQAD\MIB\NetQoS-AnomalyDetector-mib
   The steps for importing the OIDs and configuring the trap receiver are specific to the trap receiver.
2. Display the **Data Source List** page: Select **Admin**, **Data Sources**.
   The page for managing data sources opens: **Manage Data Sources** (CA PC) or **Data Source List** (CA NPC).
3. Click the name of the Ca Anomaly Detector instance that you want to configure. The **Monitored Products** page opens.
4. Click **View Alert Targets**. The **Alert Targets** page opens.
5. Double-click the **snmp_traps** row. The **Edit Alert Target** page opens.
6. Specify the **Target**: Enter the IP address or DNS hostname of the system that will receive the SNMP traps.
7. Select one or both of the following options to enable the alert:
   – **Basic State**: Send alerts whenever any single sensor detects an anomaly that crosses a threshold.
   – **Cluster State**: Send alerts only when the requirements for a correlated anomaly are met.
   This is the recommended setting for first-time use of CA Anomaly Detector. If you have already disabled alerts for the sensors that are irrelevant to you, the recommended setting is **Basic State**.
8. Click **Save**.
   You return to the **Alert Targets** page, which reflects any changes you saved.

Example of a Basic Anomaly Message

A Syslog Basic Anomaly message reports an alert for a single anomaly instance. The following example shows the message fields for a Basic Anomaly message:

```
02-12-2009 17:51:42 Local0.Alert 10.0.23.138 Feb 12 17:51:42 sk23-138 CEF:0|
NetQoS|AnomalyDetector|2.0.12.1|23|Frags and Loss Sources|5|
src=XXX.XX.X.XXX start=2/12/2009 5:36:00 PM msg=metric 2 anomaly probability 1%. A router close
```

The sixth CEF field, the `msg=metric` field, identifies the sensor type that detected the violation. The sensor type in the example is Frags and Loss Sources. The main body of the CA Anomaly Detector information follows `msg=` .

```
msg=metric METRICVALUE anomaly probability PROBVALUE%. OptionalROUTERINFOVALUE
```

where:

- **METRICVALUE**
  Actual value, expressed in the units of measure for the sensor. This value is an integer with a value over 0 in the example. The data type is double, and double.maxvalue is positive 1.79769313486232e308. The significance of the

integer depends on the sensor type. For example, the integer for a FanOut sensor represents the number of hosts with which the source IP communicated.

- **PROBVALUE%**
  The percentage of anomaly probability, expressed as a value between 1 and 100. In the example, the value is 1. This value is the statistical probability that a sensor has detected anomalous traffic. You can use thresholds to suppress Syslog messages when the probability is low. You can specify the threshold for each sensor independently.
- **ROUTERINFOVALUE**
  (Optional) The optional ROUTERINFOVALUE field is provided for anomalies that are based on NetFlow. The close router and interface information is derived from the router that sent the flow data.

  ```
  A router close to the issue (for further analysis or ACL) is ROUTERIPADDRESSVALUE and IN inte
  ```

  where:
  - **ROUTERIPADDRESSVALUE**
    IP address of the router, as reported by NetFlow.
  - **INIFINDEX**
    Interface (IF) index on the incoming interface of the router, as reported by NetFlow.

    NOTE
    If you want to write a parser to handle Syslog Basic Anomaly or Anomaly Cluster messages, specify a value for the
    `msg=`
    field. The other fields are in the CEF standard format, and you do not need to specify their values.

Example of an Anomaly Cluster Message

A Syslog Anomaly Cluster message reports an alert for a group of anomalies. The following example shows the message fields for an Anomaly Cluster message:

```
02-12-2009 17:51:42 Local0.Alert 10.0.23.138 Feb 12 17:51:42 sk23-138 CEF:0|
NetQoS|AnomalyDetector|9.2.0.1|2161393963:1234482300|AnomalyCluster|10|
src=xxx.212.65.43 start=2/12/2009 5:45:00 PM msg=AnomalyCluster: anomalies included Frags, Frag
interfaces close to the issue (for further analysis or ACL) are 10.00.00.100 : 12, 10.00.30.100
```

The sixth CEF field identifies the sensor types that detect the violation. The message contains multiple sensor types, so the sixth CEF field always has the value AnomalyCluster. The list of sensor types is contained in the message body. The `msg` field format is as follows:

```
msg=AnomalyCluster: anomalies included LISTOFANOMALIESVALUE anomalyScore CLUSTERSCOREVALUE max
%. OptionalROUTERINFOVALUE
```

where:

- **LISTOFANOMALIESVALUE**
  List of the anomalies in the cluster, which is comma-delimited in the following manner: fanOut, SYNOnly, and topNullRoutes.
- **CLUSTERSCOREVALUE**

Weighted severity value. The cluster score is the weighted count of anomalies. Secondary role anomalies, such as flows, volume in, and volume out, count as 0.5. All other anomalies count as 1.

- **PROBVALUE**
  Maximum anomaly probability of the anomalies in the cluster. The PROBVALUE field is similar to the field in the basic anomaly message, except that it identifies the maximum probability across all the anomalies in the cluster.
- **ROUTERINFOVALUE**
  (Optional) The optional ROUTERINFOVALUE field is provided for anomalies that are based on NetFlow. The close router and interface information is derived from the router that sent the flow data. The format for ROUTERINFOVALUE is as follows:

  ```
  Routers/
  interfaces close to the issue (for further analysis or ACL) are ROUTERandINTERFACElistVALUE
  ```

  where:
  - **ROUTERandINTERFACElistVALUE**
    List of the router IP addresses and the associated incoming IF index. For example, enter 199.30.15.30 : 1, 199.30.15.30 : 1, 199.30.15.30 : 1. The router : interface pairs follow the same order as the anomaly types that are reported in the LISTOFANOMALIESVALUE field.

Uninstall CA Anomaly Detector

CA Anomaly Detector 9.3.0 and later includes an option to uninstall the product, which you can use after an installation or upgrade.

If CA Anomaly Detector is installed on the same server as DX NetOps, uninstalling CA Anomaly Detector disables DX NetOps.

You should be able to install and uninstall the software once or twice without any problem. If you have ongoing problems, contact CA Support rather than continuing to install and uninstall the software.

As an alternative to using the Uninstaller, you can uninstall the software from the **Control Panel**. The program is listed as AD in the Windows **Add or Remove Programs** or **Programs and Features** window.

Follow these steps:

1. Log in as a user who has administrator privileges for DX NetOps.
2. Perform the following preliminary steps:
   - Open the **Services** window and verify that the NetQoS MySql service is running. If the service is not running, start it.
   - If the installation server is also used to host Performance Center, back up your data and configuration files.
   - Exit from all applications, with no exceptions.
3. If you plan to uninstall both CA Anomaly Detector and DX NetOps (CA NFA) from the same server, uninstall the CA NFA software first.
4. Start the Uninstaller for CA Anomaly Detector: In *install_path*\Uninstall\NQAD , double-click AD_Uninstaller.exe
   The **Uninstall** window opens.
5. Click **Next** if you are ready to proceed.
   When you click **Next**, the **Cancel** button is disabled. The Uninstaller has no Undo option - once you begin uninstalling the software, you cannot restore the deleted files automatically.
   The uninstall program removes the program and data files, including the following CA NFA and MySQL elements:

- Registry entries
- Shortcuts, links, and aliases
- Most files
- Some directories

As the uninstaller runs, the screen displays progress messages. When the process completes, the screen displays a list of the directories and files that were not deleted.
Note: Leave the file system undisturbed while uninstallation is in progress. Do not attempt to view the progress in Windows Explorer, for example.
Once the program finishes, the **Uninstall Complete** screen opens.

6. Click **Done** to close the program.
   Wait a few minutes to allow the helper process to finish the final cleanup.
   Some files are not deleted until this phase is finished. Once the final cleanup is finished, the Uninstaller itself is deleted.

Notes:

- The uninstallation log is at: *install_path*\AD_Uninstall_<timestamp>.txt .
- You can manually delete any remaining CA Anomaly Detector directories, files, and services. If other related software is installed on the server, do not delete the MySQL service.
- If you make an unsuccessful attempt to reinstall the software, contact CA Support.

CA Anomaly Detector Views in Performance Center

CA Anomaly Detector is a CA Infrastructure Management product that gives you visibility into the highly variable traffic patterns of servers and clients. The program continually monitors behaviors and rapidly analyzes multiple network data patterns to search for signs of misconfiguration, malicious attacks, or poor application delivery. CA Anomaly Detector can send alerts for as many as 27 types of potential anomalies from a number of data sources, depending on which data sources are the product is configured to monitor:

- Flow distillation by DX NetOps
- SNMP collection by CA NetVoyant
- TCP application performance from CA Application Delivery Analysis
- Voice and video performance from CA Unified Communications Monitor

To see the predefined CA Anomaly Detector reports, go to one of the following locations:

- (CA PC) Open the CA Performance Center Console and select **Dashboards**, **Operations Displays: Anomaly Detector**.
- (NPC) Open the CA NetQoS Performance Center Console and select **Reports**, **Operations: Anomaly Detector**.

> **NOTE**
> To view the reports, your user account must be assigned a role that gives you access to the report menu. User account settings are managed in the Performance Center Console, as described in the *Administrator* information for your Performance Center version.

You can customize the Anomaly Detector page to meet your specific needs.

Built-in CA Anomaly Detector Views on the Anomaly Detector Page:

- Anomaly Activity
- Anomaly Detector Overall Status
- Enterprise-Wide Correlated Anomalies
- Top Anomalies by Host
- Top Anomalies by Interface
- Top Enterprise-Wide Network Anomalies

Additional View that You Can Add to a Custom Page:

- Enterprise-Wide Anomalies

Display Predefined Views

The predefined CA Anomaly Detector views are displayed in the Performance Center Console. To see the views, open the **Anomaly Detector** page:

- (CA PC) Select **Dashboards**, **Operations Displays**: **Anomaly Detector** in the CA Performance Center Console.
- (NPC) Select **Reports**, **Operations**: **Anomaly Detector** in the CA NetQoS Performance Center Console.

To see the views, your user account must have a role that gives you access to the view menu. User account settings are managed in the Performance Center Console.

Customize Predefined Views

Change Reporting Time Frame

To change the reporting time frame for the views on the Anomaly Detector page, use the controls at the top of the page in one of the following ways:

- Choose a reporting time frame from the drop-down list.
- Click the scroll button on the left or right side of the date to move the reporting period forward or backward by a day.
- Click the start date or end date and select a new date from the calendar that opens.
- Click the starting hour, starting minute, ending hour, or ending minute and select a new value from the drop-down list.

For more information, see Set a Custom Time Frame.

Other View Customizations

You can also customize the view page to change which views are included, the view order, the page layout, the page title, and the label of the menu option that opens the page. To access these editing options, select **More** in the upper right corner, then select **Edit Dashboard** (CA PC) or **Edit Report** (NPC).

For more information about how to customize view pages, see the *Administrator* information for your version of Performance Center.

For more information, see:

- Change the View Settings
- Zoom In to Narrow the Time Frame

Links and Detail Pages

Links are included in some views to help kickstart anomaly troubleshooting. Links take you to pre-configured reports or to a general page of additional detail. The following views include links:

- **Enterprise-Wide Correlated Anomalies**
- **Enterprise-wide Anomalies**
- **Anomaly Drill-In**

Click one of the links for more information.

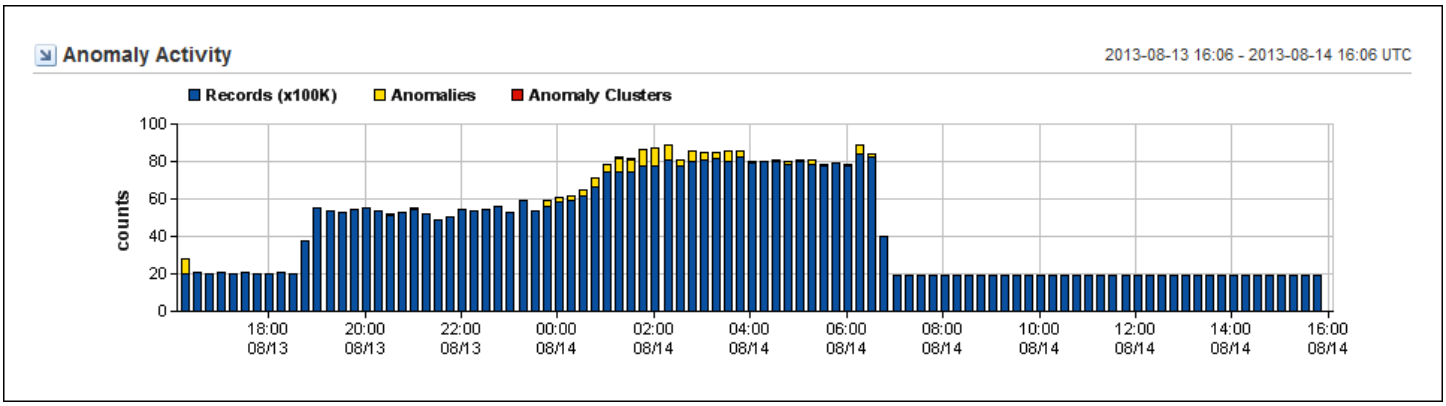
- **Date** Link

Click the *Date* link to go to the **Anomaly Trend** view. This view shows the value and probability of the anomaly over time.

- **Discovered by** Link
  Click a *Discovered By* link to view details. The type of anomaly determines the link destination:
  – DX NetOps Anomalies: **Router** or **Interface** page in the Performance Center Console
  – Anomalies from other data sources: Main page for the originating product
- **Host** Link
  Click a *Host* link to go to more granular information about the device that has the anomaly. Clicking a **Host** link can be the first step in troubleshooting the anomaly.
  Host link destinations are based on the sensor type. For many DX NetOps sensors, the **Host** link opens the page for defining a Flow Forensics report in the NFA console, which has pre-populated report filters.

Anomaly Activity

The **Anomaly Activity** view displays anomalous activity as a bar chart. This view gives you a visual overview of how many anomalies and anomaly clusters occurred in comparison to all of the records that were processed.



The example graphic shows the number of records in the hundreds of thousands (Y-Axis) over a 24-hour period. Activity is shown along the X-Axis each time the program runs (usually at 15-minute intervals).

You can edit the following view settings:

- Time frame for all views on the page.
  By changing the time frame for the page, you can discover when the issue began and look for patterns.
- View title and context.

This view is included by default on the **Anomaly Detector** page in the Performance Center Console. The example graphic shows the view as it appears in the CA NetQoS Performance Center Console.

Anomaly Detector Overall Status

The **Anomaly Detector Overall Status** table shows the number of records that were processed during the selected time frame, the number of anomalies, and the number of anomaly clusters.

You can edit the following view settings:

- Time frame for all views on the page
- View title and context

This view is included by default on the **Anomaly Detector** page in the Performance Center Console.

Top Enterprise-Wide Network Anomalies

The **Top Enterprise-Wide Network Anomalies** pie chart shows the top anomaly types for the reporting time frame.

This view shows the type of network traffic that had the highest proportion of anomalous traffic. This data may give you the first insight into poor network performance.

The legend identifies the number of instances and the colors for each anomaly type. Anomaly types are named for the corresponding sensors.

The **Top Enterprise-Wide Network Anomalies** view is most useful for tracking sudden changes in network behavior. For example, suppose that the Enterprise-Wide Network Anomalies view shows that the Large DNS Packet Sources category accounts for 25% of all potentially anomalous behavior for the past week. If the summary indicates that Large ICMP Packets account for 50% of such traffic today, you would follow up with an investigation.

You can edit the following view settings:

- Time frame for all views on the page
- View title and context

This view is included by default on the **Anomaly Detector** page in the Performance Center Console.

Top Anomalies by Host

The **Top Anomalies by Host** pie chart shows the top anomalous hosts, ranked by the number of anomalies for the reporting time frame. A maximum of 10 hosts are included. The number of instances is shown next to each pie slice.

You can edit the following view settings:

- Time frame for all views on the page
- View title and context

This view is included by default on the **Anomaly Detector** page in the Performance Center Console.

Top Anomalies by Interface

The **Top Anomalies by Interface** pie chart shows the anomalies for the top interfaces, ranked by number of anomalies. A maximum of 10 anomalies are included. The number of instances is shown next to each pie slice.

You can edit the following view settings:

- Time frame for all views on the page
- View title and context

This view is included by default on the **Anomaly Detector** page in the Performance Center Console.

Enterprise-Wide Correlated Anomalies

The **Enterprise-Wide Correlated Anomalies** table summarizes the anomalous behaviors that are most likely to be damaging to the network. This view identifies network locations that you can begin investigating if you suspect malicious activity.

Anomaly clusters are better indicators for problems than single anomalies. Many types of attacks involve multiple instances of anomalous network behavior. Instances are often clustered around a group of a few hosts at first, then the behavior spreads in a fan-out behavior. In a fan-out behavior, seemingly unrelated devices are affected and unexpected traffic is produced from multiple sources.

Correlation is performed by using an algorithm that considers the typical patterns for each type of monitored network traffic.

An anomaly is *correlated* when the following requirements are met:

- Three or more anomaly instances exist.
- Two different anomaly types are present or have an Anomaly Index above 2.0.
- One device is the source of the anomalies.

You can edit the following view settings:

- Time frame for all views on the page
- View title and context

This view is included by default on the **Anomaly Detector** page in the Performance Center Console.

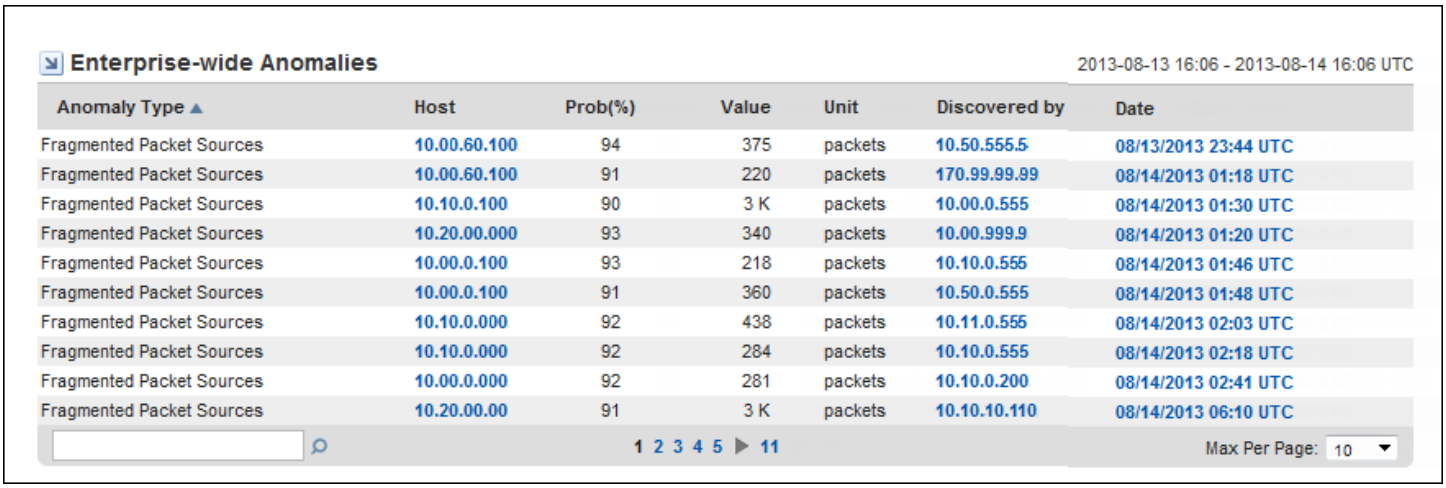
The view provides the following information about anomalous network behavior:

- **Host**
  The IP address of the host that displays the anomalous behavior. The host may be a client computer, a server, a router, or an interface. The program attempts to resolve the hostname of the IP address and displays that name in the **Host** field.
- **Anomaly Index**
  The count of the anomalies in the cluster, weighted by their role as either primary or secondary. The anomaly correlation algorithm compares each particular behavior to the typical patterns for the network traffic type. The higher the index number, the more severe the issue is.
- **Types**
  The number of different types of anomalous network behavior that occurred during the reporting period.
- **Date**
  The date and time of the first correlated anomaly on the host.
  The time may vary by up to 15 minutes from the time when the flows actually took place. Data is pulled from the Harvesters for analysis at 15-minute intervals.
- **Date Link**
  Click the *Date* link in the **Enterprise-Wide Correlated Anomalies** view to go to the **Anomaly Detector Drill-In** table.

Enterprise-Wide Anomalies

The **Enterprise-Wide Anomalies** view is a comprehensive summary of the anomalous behavior during the reporting time frame, with details about the anomaly type, location, and size.

This view is useful for beginning an investigation of problem behavior or for initiating troubleshooting procedures to stem an attack. The view provides more detailed information about the anomalies you see in other views. This view also identifies network locations to begin investigating.



Enterprise-wide Anomalies 2013-08-13 16:06 - 2013-08-14 16:06 UTC

Anomaly Type ▲	Host	Prob(%)	Value	Unit	Discovered by	Date
Fragmented Packet Sources	10.00.60.100	94	375	packets	10.50.555.5	08/13/2013 23:44 UTC
Fragmented Packet Sources	10.00.60.100	91	220	packets	170.99.99.99	08/14/2013 01:18 UTC
Fragmented Packet Sources	10.10.0.100	90	3 K	packets	10.00.0.555	08/14/2013 01:30 UTC
Fragmented Packet Sources	10.20.00.000	93	340	packets	10.00.999.9	08/14/2013 01:20 UTC

Fragmented Packet Sources	10.20.00.00	91	3 K	packets	10.10.10.110	08/14/2013 06:10 UTC

1 2 3 4 5 ▶ 11 Max Per Page: 10

You can edit the following view settings:

- Time frame for all views on the page
- View title and context

This view is not included by default on the **Anomaly Detector** page in the Performance Center Console. To see this view, add it to a page or to a new custom page. The graphic shows an example view in the CA NetQoS Performance Center Console.

The view provides the following information about anomalous network behavior:

- **Anomaly Type**
  The type of anomalous behavior.
- **Host**
  The name or IP address of the host on which the anomalous behavior is detected. The host may be a client system, a server, a router, or an interface. The program attempts to resolve the hostname of any IP address and displays that name in this field.
- **Probability**
  The calculated likelihood that flagged packet flows are truly anomalous.
  Probability is expressed as a percentage. For example, if the probability for an anomaly type is 91%, the packet flows that triggered the reported anomalous behavior are calculated to have a 91% probability of being truly anomalous. In this case, the packet flows have a low probability of occurring normally on this network.
- **Date**
  The date and time that the anomalous behavior is detected. The time may vary by up to 15 minutes from the time when the flows actually took place. Data is pulled from the Harvesters for analysis at 15-minute polling intervals.

Anomaly Drill-In

If you drill into an anomaly cluster from the **Enterprise-wide Correlated Anomalies** view, the **Anomaly Drill-In** table opens. For each anomaly, the table lists the probability, value, originating router and interface, and the time that the anomaly occurred. You can use the **Date** link to drill into a trend chart that shows the value and probability over time.

The **Anomaly Drill-In** view provides the following information about each anomaly:

- **Anomaly Type**
  The type of anomalous behavior.
- **Host**

The name or IP address of the host on which the anomalous behavior is detected. The host may be a client system, a server, a router, or an interface. The program attempts to resolve the hostname of any IP address and displays that name in this field.

- **Host Link**
  Click a *Host* link to go to more granular information about the device that has the anomaly. Clicking a **Host** link may be the first step in troubleshooting the anomaly.
  Host link destinations are based on the sensor type. For many DX NetOps sensors, the Host link opens the page for defining a Flow Forensics report in the NFA console, which has pre-populated report filters.
- **Prob(%)**
  The calculated likelihood that flagged packet flows are truly anomalous.
  Probability is expressed as a percentage. For example, if the probability for an anomaly type is 91%, the packet flows that triggered the reported anomalous behavior are calculated to have a 91% probability of being truly anomalous. In this case, the packet flows have a low probability of occurring normally on this network.
- **Value**
  The value that triggered the report of anomalous behavior, expressed in the units of measure shown in the Unit column. For example, the value could be the number of gigabytes of data in the anomalous flow.
- **Metric/Unit**
  The unit of measurement that is used to express the Value, such as packets, flows, or destination hosts (dest hosts).
- **Discovered by**
  The router, interface, or data source that detected the anomalous data.
- **Discovered by Link**
  Click a *Discovered By* link to view details. The link destination is determined by the type of anomaly:
  - DX NetOps Anomalies: Router or interface page in the Performance Center Console
  - Anomalies from other data sources: Main page for the originating product
- **Date**
  The date and time that the anomalous behavior is detected. The time may vary by up to 15 minutes from the time when the flows actually took place. Data is pulled from the Harvesters for analysis at 15-minute polling intervals.
- **Date Link**
  Click the *Date* link to go to the Anomaly Trend view. This view shows the value and probability of the anomaly over time.

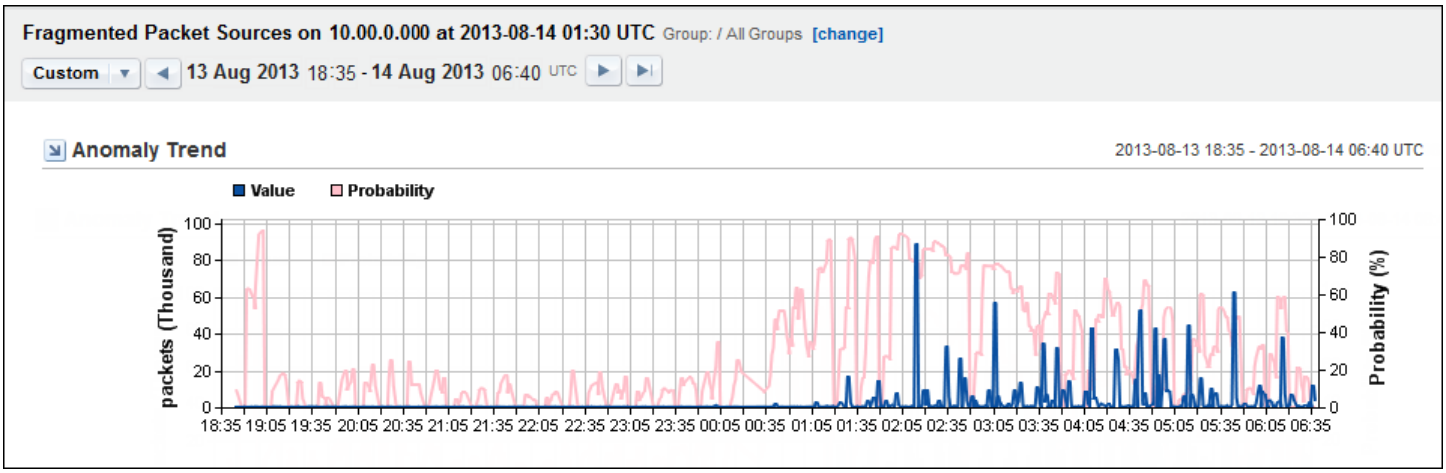
You can edit the following view settings:

- Time frame.
- View title.

> **NOTE**
> If your deployment includes CA Performance Center, you can use the **Zoom** feature to interactively limit the time frame.

Anomaly Trend

The **Anomaly Trend** view shows the value and probability of the anomaly over time. To display this trend chart, click a link in the **Date** column in either the **Anomaly Drill-in** view or the **Enterprise-Wide Anomalies** view. The following example shows an **Anomaly Trend** view in the CA NetQoS Performance Center Console.



The view shows the pattern of deviation from normal network behavior. You can see when the behavior began and how severe the behavior was. A longer term view can help to determine patterns over days, weeks, or months.

The recorded values are shown as a blue trend line on the X-Axis. The probability that the behavior is a true anomaly is shown as a pink trend line on the Y-Axis.

You can edit the following view settings:

- Time frame
- View title

Note: If your deployment includes CA Performance Center, you can use the **Zoom** feature to interactively limit the time frame.

CA Anomaly Detector Sensors and Troubleshooting

CA Anomaly Detector provides a diverse set of sensors that search for potential network anomalies in the collected data.

Most sensors are enabled by default. The sensors become active as soon as you add the supporting data source to CA Anomaly Detector. You can disable sensors or apply filtering to exclude selected devices for individual sensors.

Sensor configuration also includes a probability factor. This factor controls sensor sensitivity and frequency of alerts.

CA Network Flow Analysis Sensors

DX NetOps provides information to help you understand how application traffic affects your network performance. DX NetOps enables you to see which applications are using bandwidth, who is using the bandwidth, and when. This knowledge helps you can timely and cost-effective decisions to optimize network performance.

When you add DX NetOps as a data source for Performance Center, the Harvesters are added automatically as possible data sources for CA Anomaly Detector. Special considerations apply when you enable Harvesters as data sources.

RST-Only Sources

The RST-Only Sources sensor looks for the following types of connections:

- Hosts that send out RST TCP packets with no ACK packets to acknowledge an open connection to a server.
- Servers that receive only RST packets from certain hosts with no ACK or SYN packets.

Troubleshooting an RST-Only Sources Alert

An alert from the RST-Only Sources sensor could indicate one of the following issues:

- A server that is running out of resources for an active application.
  Investigate whether a server upgrade is needed.
- A server that has a previously active application, which has become inactive.
  Try restarting associated application services.
- Users who are connecting to the wrong server.
  Check for DNS issues and correct any issues that you find.
- A host that is the victim of port-scanning activity.
  Identify and use the firewall or ACL to block the offending host from sending data on the network while you investigate.

Fragmented Packet Sources

The Fragmented Packet Sources sensor looks for sources of packet fragmentation. Packet fragmentation may indicate poor application delivery or "frag attacks" that can circumvent Access Control Lists (ACLs) and stateless firewalls.

Troubleshooting a Fragmented Packet Sources Alert

An alert from the Fragmented Packet Sources sensor may indicate one of the following issues:

- A Layer 3 network maximum transmission unit (MTU) mismatch.
  Check the MTU settings on the affected interfaces. Interfaces on the same router can have different MTU settings. Any IP packets that exceed the configured maximum number of bytes are broken into fragments. Stateless firewalls in particular often drop packet fragments.
- A "frag attack" that is designed to exhaust network resources.
  Packets can be fragmented normally by routers if the packets exceed the MTU size on a router interface. In this case, a flag is set in the IP header to indicate that the segment is a fragment. The packets continue until the end of fragment (EOF) flag is set. In a frag attack, fragmented packets are sent in a steady stream, but a packet with the EOF flag set is never sent. The packets eventually fill the receive buffer on the target host and disable it.
  If you suspect a frag attack, identify and block the offending host from sending data on the network by using a firewall or ACL.
- Attempted reconnaissance or fingerprinting.
  Fragmented packets may indicate that an attacker is probing the host for system credentials, such as operating system level and known vulnerabilities.
  Identify and block the offending host from sending data on the network by using a firewall or ACL.

Even though a host who communicates with another host across a VPN tunnel is a legitimate source for fragmented packets, the host is still a source of increased packet load. Adjusting the MTU on the host with the VPN client can help.

CA Anomaly Detector currently cannot actually identify the sources of packet fragmentation. The software can identify only the original source of the IP packet. Any Layer 3 device along the path may be the source of the actual act of fragmenting the packet.

Large DNS Packet Sources

The Large DNS Packet Sources sensor looks for DNS requests that are larger than usual. Such packets might indicate tunneling attempts or data ex-filtration. Data ex-filtration is a network security violation in which a user discreetly attempts to send data from an internal network to an external location.

Troubleshooting a Large DNS Packet Sources Alert

If you suspect data ex-filtration, click the link for the offending host to investigate the suspected user by using a **Flow Forensics** report in the NFA console. You can also use other packet-inspection tools to identify the data that was sent.

Large ICMP Packet Sources

The Large ICMP Packet Sources sensor looks for ICMP packets that are unusually large. Large packets might indicate tunneling attempts or data ex-filtration. Data ex-filtration is a network security violation in which a user discreetly attempts to off-load data from an internal network to an external location.

Troubleshooting a Large ICMP Packet Sources Alert

If you suspect data ex-filtration, click the link for the offending host and investigate the suspected user in a **Flow Forensics** report in the NFA console. You also can use a packet-inspection tool to identify the data that was off-loaded.

TTL Expired Sources

The TTL Expired Sources sensor looks for possible router misconfiguration, such as routing loops, by monitoring for time to live (TTL) expiration messages.

Troubleshooting a TTL Expired Sources Alert

An alert from the TTL Expired Sources sensor could indicate one of the following issues:

- A network configuration issue such as a routing loop or equipment problem. A routing loop occurs when packets are routed incorrectly so that they travel in a continuous circle. The loop typically occurs when a router or line fails before routine notifications about the link failure have had time to reach the other network routers. Routing loops often appear when network changes are made.
  Try to identify and correct any network outage that becomes apparent. Try to find any "black hole" network ranges and check the associated routers.
- Heavy traceroute activity.
  Investigate any unusual traceroute activity to determine whether the activity is legitimate. For example, investigate whether the traceroute activity is performed for testing or troubleshooting.

Congestion Sources

The Congestion Sources sensor monitors ICMP Source Quench messages by looking for devices that are overwhelmed by incoming traffic.

If the packet receiver experiences congestion, it sends a source quench message to the packet sender, which causes the sender to initiate a TCP slow start. This has a significant negative impact on performance. CA Anomaly Detector reports the host that is the source of the overwhelming traffic and indicates which congested router reported the issue.

Troubleshooting a Congestion Sources Alert

Look at the load on the device that issues the source quench message. Legitimate traffic may be overloading the device.

If the host is under attack, correlated anomalies are likely to appear in the **Enterprise-Wide Correlated Anomalies** view.

Previously Null Routed Sources

The Previously Null Routed Sources sensor aggregates data about traffic from null-routed sources. The sensor reports on the hosts with the highest volume of normally-routed traffic that previously had null-routed traffic.

Troubleshooting a Previously Null Routed Sources Alert

An alert from the Previously Null-Routed Sources sensor could indicate that Access Control Lists (ACLs) are applied inconsistently across the enterprise. ACL problems could result from a security violation.

Audit all ACLs to ensure that they are properly configured and conform to established network access and usage policies. Try to determine whether the ACLs have unauthorized modifications.

It is also possible that the host is sending malicious traffic in various ways and the ACLs are catching some of that traffic. It might be worthwhile to investigate the type of traffic that the ACLs do not block. To do this, use the **Host** link on the **Anomaly Drill-in** to run a **Flow Forensics** report in the NFA console.

SYN/RST-Only Packet Sources

The SYN/RST-Only Packet Sources sensor looks for hosts that send out unusually large amounts of SYN-RST packets. This behavior could indicate a SYN or RST flood.

Troubleshooting an SYN/RST-Only Packet Sources Alert

An alert from the SYN/RST-Only Packet Sources sensor could indicate that someone is attempting to hack into the network. Specifically, SYN-RST packets are associated with attempts to bypass a firewall perimeter.

SYN/RST-only packet flows signal a connection establishment request that is immediately followed by a reset request, which is not characteristic of normal TCP behavior. This behavior typically indicates scanning activity, which might include OS fingerprinting.

SYN-Only Packet Sources

The SYN-Only Packet Sources sensor looks for:

- Hosts that send out only SYN TCP packets with no corresponding ACK packets to acknowledge an open connection to a server
- Servers that receive only SYN packets from certain hosts with no corresponding ACK or RST packets.

Requests for a server connection without establishing a valid socket are typical of a denial-of-service attack by using SYN packet reflection.

Troubleshooting a SYN-Only Packet Sources Alert

An alert from the SYN-Only Packet Sources sensor could indicate a worm infection or a SYN flood, which is a type of denial of service attack.

A SYN flood involves a series of SYN TCP packets that contain invalid source IP addresses. The target server is unable to establish a valid connection in response to the SYN request, but it still allocates the necessary resources and waits until a timeout expires for the ACK packet from the requesting host. The server is quickly brought to a standstill by trying to process invalid connection requests.

If you suspect a denial of service attack, use CA Anomaly Detector to identify each offending host, then use firewalls or ACLs to try to block the host from sending data on the network. You also can take the affected server offline.

High Packet Fan Out

The High Packet Fan Out sensor looks for packets that fan out from a single host to many hosts. Packet fanning is typical of a spreading virus or worm. A High Packet Fan Out anomaly is a primary type of anomaly, which typically occurs in conjunction with another type of anomaly.

Troubleshooting a High Packet Fan Out Alert

An alert from the High Packet Fan Out Sources sensor may indicate a spreading virus or worm infection. Some viruses or worms operate by creating "zombie" hosts that spread the infection in a fan-out pattern.

If you suspect a virus infection, use CA Anomaly Detector to identify each offending host, then use a firewall or ACL to try to block the host from sending data on the network. You also can take the affected server offline.

High and Variable Volume-Out

The High and Variable Volume-Out sensor tracks host volume and detects sudden changes in server output. These changes may indicate server misconfiguration, virus infection, or unauthorized activity, such as BitTorrent server activity. These conditions produce a secondary type of alert, which typically occurs with another type of anomaly.

Troubleshooting a High and Variable Volume-Out Alert

An alert from the High and Variable Volume-Out sensor may indicate one of the following issues:

- Server misconfiguration.
  Find the source of the anomalous traffic and investigate the activity.
- A new authorized or unauthorized application that is deployed on the network.
  Find the source and investigate. Such behavior may indicate the presence of a BitTorrent or other peer-to-peer file-sharing server.
  Peer-to-peer file-sharing or other unauthorized activity often consumes excessive network resources. This type of activity potentially can expose your enterprise to copyright-infringement legal action.

High and Variable Volume-In

The High and Variable Volume-In sensor tracks host volume and detects sudden changes in incoming volume. These changes may indicate server misconfiguration, virus infection, or unauthorized activity, such as BitTorrent server activity. The activity produces a secondary type of alert, and it typically occurs together with another type of anomaly.

Troubleshooting a High and Variable Volume-In Alert

An alert from the High and Variable Volume-In sensor may indicate one of the following issues:

- Server misconfiguration.
  Find the source of the anomalous traffic and investigate the activity.
- A new authorized or unauthorized application that is deployed on the network.
  Find the source and investigate. The behavior may indicate the presence of a BitTorrent or other peer-to-peer file sharing server.
  Peer-to-peer file-sharing or other unauthorized activity often consumes excessive network resources. This type of activity potentially can expose your enterprise to copyright-infringement legal action.

High Flow Sources

The High Flow Sources sensor tracks host flows and detects sudden changes in output that may indicate server misconfiguration, virus infection, or unauthorized activity, such as BitTorrent server activity.

Troubleshooting a High Flow Sources Alert

An alert from the High Flow Sources sensor may indicate an increase in connections. The increase is often caused by the introduction of a new authorized or unauthorized application on the network.

Find the source and investigate. The behavior may indicate the presence of a BitTorrent or other peer-to-peer file sharing server.

Peer-to-peer file-sharing or other unauthorized activity often consumes excessive network resources. This type of activity potentially can expose your enterprise to copyright-infringement legal action.

Frags and Loss Sources

The Frags and Loss Sources sensor looks for sources that cause packet loss by monitoring "Fragment reassembly time exceeded" messages. Packet fragmentation can be used to circumvent blocking rules on some firewalls.

Troubleshooting a Frags and Loss Sources Alert

Fragmentation and packet loss occurs when you deploy high bit-rate Windows Media content.

Fragmentation can cause retransmissions when some fragments fail to arrive in time so that the packet is lost. Reliable protocols such as TCP retransmit all of the fragments in order to recover from the loss of a single fragment.

Dest Unreachable Sources

The Dest (Destination) Unreachable Sources sensor looks for unusually high levels of network traffic that fails to reach the destination designated by the packet. The sensor operates by monitoring ICMP return codes, whether for a network, host, or port. This type of traffic flood consumes bandwidth on the affected link, which causes reduced performance for the link's legitimate users.

Troubleshooting a Dest Unreachable Sources Alert

An ICMP flood (also known as *Ping flood* or *Smurf attack*) is one source of a Destination Unreachable Sources alert. This type of Denial of Service attack sends large amounts of ICMP packets or over-sized ICMP packets to a system. The goal of the attack is to crash the system's TCP/IP stack so that the system stops responding to TCP/IP requests.

An ICMP attack can come in many forms. An ICMP flood is typically accomplished by broadcasting a large number of ICMP pings or UDP packets. The attack sends so much data to the system that it slows down enough to disconnect from normal business applications due to timeouts.

If you suspect a Denial of Service attack, use CA Anomaly Detector to identify each offending host, then use a firewall or ACL to try to block the host from sending data on the network. You also can set up an ACL that blocks external traffic to the affected host or you can take the affected server offline.

Non-Local Sources

The Non-Local sensor is turned off by default. Consult with your technical representative to determine whether this sensor is beneficial for your network.

The Non-Local sensor looks for traffic that does not have either a private source or destination IP address. The sensor assumes that the enterprise uses private IP addresses internally--that the majority of traffic has a private source or destination IP address.

For example, suppose a system in the network has a fake external IP address and the system sends messages to another fake external IP address. The resulting traffic can stop legitimate network traffic by tying up the routers and interfaces closest to that system.

Depending on your enterprise network configuration, legitimate traffic may flow between non-private IP addresses. If this is the case, your technical representative may be able to help you configure the sensor to exclude IP address ranges and avoid false alerts.

Troubleshooting a Non-Local Alert

Determine whether the non-private IP addresses are used for legitimate traffic. If the traffic is not legitimate, use the router and interface information that CA Anomaly Detector provides to apply ACLs to mitigate the traffic while you locate the offending source device.

CA NetVoyant Sensors

CA NetVoyant is a performance analysis and reporting software package that automates the collection, analysis, and reporting of critical device data. Using Simple Network Management Protocol (SNMP), CA NetVoyant automatically polls and correlates data from devices on your network. Data from routers, switches, servers, RMON2 probes, frame relay circuits, logical segments, and wide area links are collected and organized to give you information about your network.

CA Anomaly Detector contacts the CA NetVoyant database to gather data for analysis. The following sensors are used to detect anomalies in the data that CA NetVoyant collects that could indicate an issue with your network.

Incoming Discard Rate

The Incoming Discard Rate sensors look for patterns of incoming packets that are dropped even though they contain no errors.

Troubleshooting an Incoming Discard Rate Alert

An Incoming Discard Rate alert may indicate one of the following issues:

- Overutilization
- Denial of service
- VLAN misconfiguration

This alert may also result from inbound policing on the interface. QoS policies affect discards-in and discards-out counters, depending on whether the QoS policy is inbound or outbound.

Incoming Error Rate

The Incoming Error Rate sensor looks for patterns in incoming errors.

Troubleshooting an Incoming Error Rate Alert

Incoming Errors typically relate to CRC or other physical layer conditions and are not due to QoS, routing, or configuration issues.

Dropped Packets

The Dropped Packets sensor looks for patterns in queue drops.

Troubleshooting a Dropped Packets Alert

Dropped packets, or queue drops, may indicate buffer depletion. Input queue drops typically occur when a packet is process-switched. A process switch means that the router cannot use a preferable route-cache method, such as fast switching or Cisco Express Forwarding (CEF), to handle the forwarding decision. If input drops are still present, it implies that there is simply too much traffic. Output drops are caused by a congested interface.

Buffer Misses

The Buffer Misses sensor looks for patterns in buffer misses. Buffer failures are one of the most common reasons for packet drops.

Troubleshooting a Buffer Miss Alert

Look at the buffers on your router to determine whether they are configured properly.

CA Unified Communications Monitor Sensors

CA Unified Communications Monitor (UCM) ensures the availability and performance of Cisco Voice over IP (VoIP) systems. The program passively monitors the VoIP call setup traffic and the call quality for IP phones, call servers, and voice gateways and keeps a continuous record of VoIP call setup performance and call quality from one end of the network to the other.

CA Anomaly Detector contacts the UCM database to gather data for analysis. The following sensors are used to detect anomalies in the UCM data, which may indicate an issue with your VoIP network.

Voice Call Fan Out

The Voice Call Fan Out sensor looks for patterns in voice call fanouts. In a fanout, a single IP phone calls a large number of unique phone numbers in a short time.

Troubleshooting a Voice Call Fanout Alert

The IP address of the phone that originates the call fanout is identified in the anomaly event. Investigate the phone at this address to determine why it originates fanout calls. Use the CA Unified Communications Monitor dashboard to determine which calls were made in the fanout time frame.

Voice Call DoS

The Voice Call DoS sensor looks for a single phone that calls repeatedly over a short time. This type of attack differs from other Denial of Service (DoS) attacks because of its low volume. It only takes about 10 calls per minute to keep a phone ringing all the time. A traditional intrusion detection system might not catch the attack.

Troubleshooting a VoIP DoS Attack Alert

The anomaly event identifies the IP address of the phone that is called. Check to see who is calling the phone. Use the CA Unified Communications Monitor dashboard to determine which calls were made during the attack time frame.

Voice Server Distress

The Voice Server Distress sensor looks for calls that are not completed, which are going through a specific call server. The calls are either abandoned or they fail setup. The abandons and failures are weighted with the call volume to determine whether to flag a server. Even if the condition does not result from a security attack on the server, it is still a performance anomaly that warrants investigation.

Troubleshooting a Voice Server Distress Alert

The anomaly event identifies the IP address of a call server that has a large percentage of errored or abandoned calls. Use the CA Unified Communications Monitor dashboard to look at the details of calls that are attempted, completed, and in error for the call server during the anomaly time frame.

CA Application Delivery Analysis Sensors

CA Application Delivery Analysis provides end-to-end performance monitoring through reports and views that show historically normal performance for users and metrics that cross acceptable performance thresholds. CA Application Delivery Analysis gathers troubleshooting information and helps you determine the origin of an application, network, or server performance problem.

CA Anomaly Detector contacts the CA Application Delivery Analysis database to gather data for analysis. The following sensors are used to detect anomalies in the data collected by CA Application Delivery Analysis that might indicate an issue with your network.

Retransmission Time

The Retransmission Time sensor looks for patterns in retransmissions.

TCP retransmission behavior has a significantly negative effect on application performance and network use. Communication across the affected connection can slow to a halt until a missing segment is retransmitted successfully. Only a limited number of missing segments can remain outstanding at any time.

Troubleshooting a Retransmission Time Alert

An anomaly in retransmission delay typically is caused by several critical components:

- Congested Path: Retransmission delay can increase when interfaces between the clients and servers are congested.
- QoS: A misapplied QoS policy for a particular application might cause increased buffer or queue drops.
- Backup/Routing Issue: A change in the per hop route might cause the issue. Additional retransmission delay could result from routing changes that add congestion to a pipe that is already congested or a pipe that is smaller, such as a backup link.

Identify sources of packet loss along the traffic paths. Keep in mind that the paths going to the server may be different from the paths coming from the server. If that is the case, analyze all paths.

Refused Sessions

The Refused Sessions sensor looks for a pattern in refused sessions. Refused session counts could indicate a SYN attack or a server that cannot respond to all requests.

Troubleshooting a Refused Sessions Alert

A server tends to stop fulfilling and refusing sessions when it reaches its capacity to handle more data. Sessions could also be refused because a load balancer is sending heart beat messages to the servers.

Refused Sessions counts could also result when legitimate traffic overloads a server that has inadequate resources for additional TCP session requests.

An alert may indicate a SYN or RST flood. If this is the case, the anomaly should be visible in the **Enterprise-Wide Correlated Anomalies** view.

Packet Load

The Packet Load sensor looks for changes in the number of bytes per packet that goes to a particular server. Applications that run on servers typically have a fairly constant ratio between the number of packets they receive in requests for their service and the packet volume. This sensor looks for anomalous changes in that ratio.

Troubleshooting a Packet Load Alert

In WAN applications, you want to have as much data in each packet as the maximum transmission unit (MTU) allows. Applications that have less data in the packets have to wait longer to get data across the network. Analyze whether the application is loading the packets fully to send to remote users.

An alert may indicate varying implementation of the clients or it may indicate that unexpected clients are trying to subvert the server.
